Mr. BRYANT did not think the proposal to investigate the legal accounts was other than a reasonable one. At the same time he could not see that a special committee should be appointed. As one of the Council's treasurers it was his duty to look into these accounts and if the matter were remitted to the finance committee they should look into it in the course of the next few months, report to the executive committee their conclusions, and the executive committee could then report to the Council.

Mr. HORSLEY said that would not meet his view. He wanted a direct report to the Council without the intervention of the executive committee. The special committee he had in prospect would consist of the finance committee, which included the two treasurers, with Sir William Thomson and Dr. Bruce and, he hoped, himself added.

Mr. BROWN trusted Mr. Horsley's motion would be accepted. A very large question was involved. Legal work had increased very much of late, and owing to the amendment of the penal procedure it would go on increasing. There certainly should be this special committee of inquiry from which they might hope to receive suggestions for a valuable alteration in their procedure, and Mr. Horsley ought as certainly to be a member of it. Mr. Horsley certainly had had facilities for making himself acquainted with this particular branch of the work of the Council and he (Mr. Brown) thought that Mr. Horsley must have satisfied the Council that there was a case for a special committee whose investigation might result in increased efficiency and economy as well.

Mr. BRYANT remarked that it was in the power of a committee to ask the help of any member of the Council, and he could see no reason why they should not get help from Mr. Horsley in this case. He moved as an amendment:—

That the finance committee be instructed to inquire into the conduct of the legal business of the Council and into the cost incurred thereby, and to report to Council.

Sir DYCE DUCKWORTH seconded the amendment but said that he conceived the whole discussion which had taken place to be a purely academic one and he had no reason to think that were the proposal adopted they would save a five-pound note in a twelvemonth. He was sorry to hear that the Council had no confidence in its finance committee or its treasurers. They might say "No, no," but he repeated what he had said because it was what the motion and discussion on it amounted to. He, however, would remind the Council that all the acts of the executive were constantly guided by legal advice. They were not lawyers, and he, who saw all the accounts, thought the charges of their legal advisers extremely moderate for high-class lawyers. There was no doubt the Council's expenditure in recent years had been on the increase, but that was due partly to exceptional circumstances which would not arise every year and partly to greater activity on the part of the Council in prosecuting cases of misbehaviour, and activity always meant expense. But he could not conceive that there would be any material saving by any alteration in the legal procedure of the Council. He had no more confidence in cheap law than in cheap physic.

Mr. BRUDENELL CARTER said the Council had to show confidence in their legal advisers, and for his part he thought that their work had been conducted in the most efficient and satisfactory manner. He should hesitate to support either of the proposals before the Council, and in the circumstances what he intended to do was to vote for the amendment, and if that were carried vote against it when it became the substantive motion.

Dr. MACALISTER was prepared to proceed in somewhat the same lines. Supposing, however, a committee were appointed Mr. Horsley should not be a member of it because he had published innuendoes and attacks on the legal advisers, and it was much more fitting that he should make

his charges against them to a committee of which he should not be a member or, as he would be, a judge.

Dr. LEECH looked upon the matter as more than a financial one. He thought that there should not only be an inquiry by a special committee, but that Mr. Horsley should be a member of that committee.

Dr. PETTIGREW, who declared himself in favour of the amendment, did not take the view that the motion reflected on either the finance committee or the treasurers. He should have liked if Mr. Horsley had brought forward a specific case, but instead of doing so he had been very general and wished the Council to pass a vote of want of confidence in their legal advisers. It was a very serious matter to cast grave reflections on the conduct of the legal advisers in this way. In the absence of specific facts he should support the amendment.

Sir C. NIXON was of opinion that the amendment simply meant a direction to the finance committee to report to the executive committee a justification of what they had done. Seeing that Mr. Horsley had special knowledge why should not the committee he asked for be appointed with him as a member of it.

Dr. LOMBE ATTHILL was also of opinion that Mr. Horsley should be a member of any special committee on the subject.

Dr. MCVAIL asked if the committee wanted was really going to decide whether Mr. Muir Mackenzie had given the Council good or bad legal advice, whether he was a good or bad lawyer. That was what the motion meant. He was sorry. His experience was that Mr. Muir Mackenzie had advised the Council admirably. In every case in which they had followed his advice they had been right. In one case they did not follow Mr. Muir Mackenzie's advice and they were wrong. Their expenditure just now was something like £10,000 a year, but last year, though they had a great number of cases, the law expenses were only £769. One thing the Council must make certain about was that they were right before proceeding with a case. In that respect they differed from a society, which might get law cheap as they had a special responsibility. Supposing Mr. Horsley said that he had looked into particular documents, that would not be sufficient for them. They ought also to see the documents and form their own opinion on them. He did not think the expenses for their legal advice had been excessive and he could not support anything whatever that reflected upon Mr. Muir Mackenzie. He should not vote for either the motion or the amendment. It was rather a serious thing indeed for the amendment to have been put before the Council, particularly by its two treasurers.

Mr. TEALE agreed with Dr. McVail that they had been well advised. His recollection was that of the cases they had taken into court on the advice of Mr. Muir Mackenzie they had not lost a single one. Were they now to say that they had lost confidence in their legal advisers and were they at the same time going to say that they were to throw away all the experience which Mr. Muir Mackenzie had acquired of the Council's work and procedure? It would require more extraordinary reasons for making a change than any that had been suggested to cause him to do other than object to the motion.

Sir RICHARD THORNE reminded the Council that in addition to its having been pointed out that practically there was an unbroken record of successes in favour of their legal advisers the Council had not heard a single syllable of reflection upon them.

On an appeal by Mr. CARTER Mr. BRYANT consented, with the leave of the Council, to withdraw the amendment.

The PRESIDENT said that he thought Dr. McVail had made a very wise speech and that no case had been made out for the motion. The Council had heard certain statements of a more or less vague kind in its support, but nothing beyond that; and undoubtedly it was a vote of censure on their legal advisers—in his judgment an ill-advised vote of censure which would make him depart from the presidential rule on this occasion by giving his vote against the motion.

Mr. HORSLEY, in replying on the debate, declared that an innocent motion had been gradually twisted into what was called a vote of censure. His proposal was no vote of censure. Had he intended to move a vote of censure he would have framed his motion in terms to unmistakeably show what it was. What he contended was that the legal business of the Council was managed at present in regard to its technical and medical aspects at an extravagant cost. If they took the outside penal cases as an example they would find that they were paying more than they might do, for in paying their solicitor and some one else instructed by him they were paying more than they would need to disburse if the cases were entirely undertaken in the one hand. As to Mr. Muir Mackenzie he did not think they paid that gentleman a farthing too much. His fees as assessor and also for opinions were remarkably moderate. At the same time he knew that Mr. Muir Mackenzie had been asked for counsel's opinion when it was not necessary.

The PRESIDENT: Who requisitioned the opinion? Was it not the Council?

Mr. HORSLEY could not say. He thought the general citing of opinion unnecessarily asked on medical matters was a specific case that might satisfy the Council there was some need for inquiry. To him it certainly showed there was a defect in the conduct of their legal business. Then there was the Whitefoord case. Facts which came out *in camerâ* in regard to that were just the kind of facts he should want the committee to report upon. He was satisfied that amendments in their legal procedure could be introduced with advantage to the Council and its funds.

On a division the motion was rejected by 18 votes to 9, two members declining to vote and one being absent.

The Council adjourned.

WEDNESDAY, MAY 25TH.

The Council met again to-day, when all the members were present except Sir John Batty Tuke. Sir William Turner occupied the chair.

In revising the minutes the Council decided to speak of the "alleged" infringement of the rights and privileges of the members in connexion with Mr. Horsley's statement about access to documents.

Reciprocity of Medical Practice.

Mr. HORSLEY moved:—

That the late President's letter of July 1st, 1897, addressed to the Privy Council on the matter of medical practice in Italy and the publication advertised by the Council, entitled "Reciprocity of Medical Practice in Relation to Foreign Countries," be and are hereby rescinded and withdrawn.

His object in putting this motion on the paper was, he said, that the profession should have a distinct statement from the Council on this very important question of reciprocity of practice between ourselves and foreign countries. There was practically only one country between which and the United Kingdom reciprocity could be said to exist—and that was Italy. It was therefore with considerable feeling that the English practitioners in Italy wrote to this Council last year and asked their help practically to oppose a measure which had been put forward by the Italian Government. This appeal led to a letter being sent to the Privy Council by the President in accordance with a resolution of the Council. In a letter which he addressed to the President he pointed out that a passage in it was not correct. That passage stated that in accordance with the Reciprocity Report "foreign practitioners can practise medicine in Great Britain without restriction. But such foreign practitioners must not take any name or title implying that they are registered." He believed that this statement was not correct as regards the Medical Act, and it was certainly not correct as regards the Apothecaries Act. Further, he would like to point out in relation to the legal question of what liberties were enjoyed by foreigners that the clause of the Act upon which Section 3 of the Reciprocity Report was based clearly indicated that it was not intended that foreigners should have unrestricted practice in this country. If they referred to the Act of 1858 they would find it set forth in Section 56 that "nothing in the said Act contained shall prevent any person not a British subject who shall have obtained from any foreign university a degree or diploma of doctor in medicine, and who shall have passed the regular examinations entitling him to practise medicine in his own country, from being and acting as the resident physician or medical officer of any hospital established exclusively for the relief of foreigners in sickness, provided always that such person is engaged in no medical practice except as such resident physician or medical officer." It was quite clear that the person who drafted that section intended that foreign practitioners were quite at liberty to come here and to occupy positions in certain charitable institutions but they were not to engage in other practice. That was borne out by Section 3 of the Reciprocity Report, which said: "Hospitals established for foreigners may be attended by

foreign practitioners who are entitled to practise in their own country and who are not engaged in other medical practice." He would like to say a word on the general question because there had been a good deal of misapprehension on the part of their friends both at home and abroad. No one would for a moment object to any distinguished foreign practitioner coming to this country and engaging in consultation with British colleagues and exercising the practice of his profession in that way. Many of them had enjoyed the assistance of their foreign colleagues. But there was a great difference between that and practising habitually. Until other countries gave full reciprocity to this country their graduates ought not to be able to come here and practise habitually for gain. This Council had already attempted in a liberal spirit to introduce reciprocity, but its attempts had not been very successful. The reciprocity that the Council extended to America in relation to medical practice had to be withdrawn. Returning to his motion he would say that this Reciprocity Report of the Council was not clear and was not absolutely in accordance with the facts, and he submitted that the best course would be to withdraw the report and also the too wide statements in the letter of July 1st, 1897.

Sir WILLIAM THOMSON formally seconded the motion.

Dr. MACALISTER said he did not see very well how they could withdraw and rescind what had already been sent to the Privy Council and to foreign Governments and what appeared in the minutes of their proceedings. There were numerous instances of entries in their minutes in regard to subjects upon which the opinion of the Council had progressed and in connexion with which the early reports came to be deemed insufficient, but nobody had suggested that these reports should be rescinded and withdrawn. They were simply succeeded by something which was considered more effective. His second objection to the proposal was much stronger and it was this, that it was a roundabout and tortuous method of getting the support of this Council for a contention which Mr. Horsley made and which he had urged in the public prints regarding an opinion of his own. In more than one letter to the public prints he had put forward the opinion, in which he stood in splendid isolation from all legal authorities, that the Medical Acts protect practice and not merely registration. The whole of his argument was directed towards that and by means of this motion he meant to try to get the support of the General Medical Council for argumentative purposes. Without making any pretence to legal knowledge he (Dr. MacAlister) claimed that the statement in the memorandum or treatise was perfectly correct. Foreigners were free to practise medicine in this country and the Medical Acts did nothing to prevent them. They could not practise as apothecaries in England and Wales without being subject to certain penalties—penalties, however, which since 1815 had never been enforced, and which, so far as he was aware, were never likely to be enforced by the Apothecaries' Society.

Mr. CARTER said he was practically the author of the letter objected to and he could explain its history. In drafting it he had before him the statement in the Reciprocity Report to which exception was taken. This statement had been submitted to the President of the Privy Council and had been approved by him. He apprehended that the President of the Privy Council would not approve of anything of this kind without bringing it under the notice of the officials of his department, who would if necessary take legal advice, and having approved the statement the President of the Privy Council undertook to bring it before the notice of the different European Governments through the Secretary of State for Foreign Affairs. To ask the Council to rescind a letter resting upon such authority seemed to him puerile. As to the Apothecaries Act he had the information from Mr. Upton, the solicitor of the Society, that although the Act had been put in force against the owners of bogus diplomas who were practising as notorious quacks it had never been put in force—and he (Mr. Upton) believed no attempt would be made to put it in force—against respectable men holding legitimate qualifications entitling them to practise in their own country and who might settle in this country. He (Mr. Carter) trusted that the Council would not listen to the proposal which had been made.

Dr. GLOVER said he could not quite agree with Dr. MacAlister and Mr. Carter in their representation on this subject, though he hoped Mr. Horsley would not refuse to withdraw his motion. He considered this statement in the Reciprocity treatise very defective and very lax and he thought the Council and the profession were indebted to Mr. Horsley for emphasising the need for greater care as regards definitions. To say that foreign practitioners might practise medicine in Great Britain without restrictions was not correct. The Apothecaries Act might be enforced against them at any moment and whether enforced or not it represented the state of the law.

Mr. TICHBORNE said that the Apothecaries' Hall of Dublin held the same power in Ireland as the Apothecaries' Society of London did in England. Every apothecary who practised in Ireland without the authority of the Hall was liable to a penalty of £20.

Mr. BROWN said there was nothing in the Apothecaries' Act which could interfere with foreign practitioners so long as they did not give out medicine. He regretted much that this should be the state of things, but of course the only thing to do was to alter the law.

Sir RICHARD THORNE pointed out that the treatise simply stated the conditions under which the foreign practitioners were allowed to practise in this country and there could not be the slightest doubt that they were allowed to practise under those conditions. He would gladly see the greatest stringency of reciprocity if he could, but that was not the question now before the Council. The whole question was what was allowed in England and Wales, and it was perfectly clear that all that was named in this document was allowed, was deliberately allowed, and was continued to be allowed. Therefore there was nothing to rescind and absolutely nothing to withdraw.

Dr. BRUCE contended that the 56th Section of the Medical Act of 1858 quoted by Mr. Horsley pointed to this—that the Act recognised no right of a foreigner to practise except in the class of hospital there described.

Dr. MACALISTER said that Section 56 must be read with reference to Section 36 which said that no person could hold certain hospital and other appointments who was not registered under the Act. Section 36 barred the foreigner from acting in a hospital and Section 56 removed the bar so far as a certain class of hospital was concerned.

Sir WILLIAM THOMSON said he did not think that the observations of Dr. MacAlister and Mr. Carter had advanced matters much, and he still felt that Mr. Horsley had made a *primâ facie* case. Whether technically or legally Mr. Horsley's view was right he was not prepared to say, but it appeared to him that he had made out his case that this Council had held two totally different attitudes with regard to this question.

Sir CHRISTOPHER NIXON said it seemed to him an extraordinary thing that whilst this Council was taking such trouble to bring the profession under their control and to exercise a very wise surveillance over its practice they should have foreigners practising in this country absolutely outside their control and surveillance. It occurred to him that the best thing for the unqualified assistants who were calling for a special qualification to do was to go to the continent and get a degree there and come back and practise.

Dr. MCVAIL, discussing the treatise, said that those who drew it up had evidently done so with a desire to induce our Government to do their best to induce foreign Governments to admit all British practitioners practising abroad, and in doing that it appeared to him that they had strained the case. Anybody could practise medicine in this country so long as he did not use any title or name which would lead a person of common sense and ordinary judgment to suppose that he was registered, and to say that "foreign practitioners can practise medicine in Great Britain without restriction" was simply to put them on the same footing as a quack with no qualification whatsoever. Therefore he asserted that the statement was misleading and likely to mislead the foreign Governments to whom it was sent. If Mr. Horsley left out the reference to the late President's letter he would be prepared to support him.

Sir WILLIAM GAIRDNER said that in his opinion a good deal of confusion had arisen from not distinguishing between the legal interpretation of the Medical Acts and the spirit in which they were administered. Members of this Council knew that the hospital to which Mr. Horsley was attached in Queen's-square was mainly got up and floated upon the reputation of a great foreign physician who was invited by THE LANCET to come over to this country in order to take his place in the hospital and nobody showed the slightest jealousy about the gentleman settling in London. There was not even a whisper of

objection to the idea of this great man coming and taking up a London consulting practice and, as he told him himself, earning £4000 in the first year. That was an illustration of the state of feeling in this country. No one ever thought for a moment of objecting to the presence of Dr. Brown-Séquard. Dealing with the spirit of the matter, he had no hesitation in saying that the letter of the late President was a perfectly right representation of things in this country. Further, he asserted that he was morally convinced that if there had been at the time of the passing of the Medical Act a whisper of such an interpretation as Mr. Horsley wished to put on Section 40 they would never have got that section or, indeed, the Act at all.

Dr. LEECH said he objected most emphatically to foreigners having a power in this matter which was not possessed by the natives of this country.

At this stage Mr. HORSLEY announced that he was prepared to amend his motion so that it might read, "That the publication advertised by the Council entitled 'Reciprocity of Medical Practice in Relation to Foreign Countries' be referred to the executive committee for revision." He would leave out the reference to the President's letter and with regard to the Reciprocity Report, he said, his only desire was to have it correct.

Dr. MACALISTER, seconded by Dr. HEBON WATSON, moved as an amendment, "That the memorandum on reciprocity be not reprinted."

This amendment was carried by a large majority and was then put as a substantive motion and adopted with the addition of the words, "without further order of the Council."

Mr. HORSLEY moved the further addition of the words, "and that it be withdrawn from among the publications issued by the Council."

Sir DYCE DUCKWORTH said it might simplify things if he told the Council that the Registrar was not aware of a single copy of the memorandum ever having been sold.

Dr. LITTLE defended the memorandum as a correct statement of the facts of the case.

Mr. HORSLEY, replying to some of the speeches, said he repudiated altogether that this proposal of his was a round-about way of getting support for his views about the Medical Acts. Not only so, but it was well known that this question depended on the Apothecaries Act more than it did upon any interpretation of Section 40 of the Medical Act. It was true that there were certain limitations in putting the Apothecaries Act in force, but it was put in force, and most successfully put in force as might be seen from the newspapers. As to Dr. Brown-Séquard, nobody dreamt of objecting to the presence of so distinguished a man amongst them. This, however, was a question of reciprocity, and in 1892 the French Government introduced a law by which English practitioners could not go to practise in Paris.

When a show of hands was taken the PRESIDENT announced that 10 members had declared in favour of Mr. Horsley's rider and 15 had declared against it. Mr. HORSLEY, however, asked that the votes might be recorded, and on this being done it was found that there was a tie—that 14 members had voted for and an equal number against the rider.

The PRESIDENT said this was the first time he had been called upon to give a casting vote, and it was just as well that he should now announce the principle he intended to follow in the matter. He intended to follow the principle followed by the Speaker in the House of Commons, of giving the vote in favour of the existing state of things because there was no majority in favour of a change. In these circumstances his vote would be against Mr. Horsley's rider.

After some further discussion the motion was finally passed in this form:—

That the memorandum on reciprocity be not reprinted without further order of the Council, and that the memorandum be referred to the executive committee for consideration and report.

The Dublin Apothecaries' Hall.

Attention was directed by Dr. MACALISTER to the following order of business:—

Appointment of Assistant Examiner to the Apothecaries' Hall, Dublin, rendered necessary by the resignation of Mr. Chance as set forth in the following communications referred by the Executive Committee to the General Council.

90, Merrion-square, W., Dublin, April 18th, 1898.

SIR,—I beg to resign the office of assistant examiner in surgery in the Apothecaries' Hall of Ireland as I find that the dates on which the final examinations in surgery are to be held clash with my engagements as examiner to the College of Surgeons.

I desire to return my sincere thanks to the Council for the honour which they have done me by appointing me one of their representatives.

I am, Sir, your obedient servant,
ARTHUR CHANCE.

The Registrar of the General Medical Council.

On the receipt of this letter the Registrar, in view of the fact that it was dated on the day that the examination had been announced by the Hall to begin, wrote asking Mr. Chance, for the information of the committee, if he would state whether he officiated at that examination, or intended his resignation to take effect prior to its commencement. The following reply was received:—

90, Merrion-square, W., Dublin, April 21st, 1898.

Dear Sir,—Until I received your letter of the 20th, I had no knowledge that an examination was in progress at the Apothecaries' Hall. I called there to-day and was informed that the next surgical examination would be held in July, and that as yet no candidate had entered for it.

I would be most unwilling to inconvenience the Council.

Yours faithfully,
ARTHUR CHANCE.

Dr. MacAlister said it was hoped that Mr. Chance would reconsider his decision to resign, but after negociations with him he had received a telegram indicating that reconsideration was impossible. In these circumstances the Council had to deal with a matter of urgency and he hoped they would consent to his motion to appoint a committee to consider the appointment of an assistant-examiner in the room of Mr. Chance.

Mr. TICHBORNE seconded, and a committee, including Mr. Brudenell Carter, Dr. Little, Dr. Heron Watson, and Mr. Tichborne, was agreed to.

Council Documents.

The REGISTRAR (Mr. Allen) read the following notice of motion by Dr. Glover:—

That members of the Council who desire access to documents which are the property of the Council be required to obtain leave for inspection either (1) from the Council, (2) from the Executive Committee, or (3) when neither body is in session from the President. The application for leave to be in writing and to state the nature of the documents to which access is desired and also the purpose for which the inspection is to be made.

Dr. GLOVER, in moving in accordance with the foregoing notice, expressed the opinion that enough had already been said on this subject to show that there was necessity for some regulation and at the same time to show that it was the universal wish of the members of the Council to have an opportunity when necessary to consult documents which came into the hands of the Council. It was right that the members should have the means of referring to such documents and he hoped that the modifications and conditions he proposed would be accepted by the Council, and that the working would be such as to give satisfaction to all parties concerned.

Dr. BRUCE seconded the motion.

After some suggestions and alteration of the phraseology of the proposal by the President, Dr. Pettigrew, and Sir Richard Thorne,

Mr. BROWN moved as an amendment:—

That the Registrar be instructed to place, on the first day of each month, on the table in one of the committee-rooms, all petitions, memorials, letters, and documents relating to the business of the Council—communications relating to purely registration business excepted—which may have been addressed to the Council during the previous month, and that they may be open to the inspection of members of the Council during business hours for the first three days in each month.

As this amendment did not find a seconder, the Council proceeded to amend Dr. Glover's motion.

The PRESIDENT suggested that "(3)" should read thus, "When neither body is in session, or about to be in session, from the President."

Mr. TOMES thought the "about to be in session" would operate adversely just at the very time members would consider it was desirable to inspect Council documents. He wished to know how many days "about to be" might mean?

The PRESIDENT did not know that he should be confined to a day or two in his definition. Supposing, however, there was an application made to him on the Friday and the executive committee was to meet on the following Monday, he should certainly say that he would refer the application to the executive committee rather than give a decision in regard to it himself on the Friday.

The alteration was accepted.

The PRESIDENT further suggested that the phrase "to state the nature of the documents to which access is desired" was too narrow. He thought it might be "to specify as far as possible the nature of the documents."

This suggestion was also agreed to.

Dr. PETTIGREW thought that if access to Council documents was obtainable it should be only for the purposes of the Council. The information that might be gleaned from inspection of those documents should not be given to the public before it was made known to the Council. He suggested the amendment of the motion by the addition of the words "no information so obtained shall be made public without the leave of the Council."

Sir RICHARD THORNE felt the need of some such words as these, seeing that many of the documents must contain matter affecting the character of individuals.

Ultimately Dr. PETTIGREW consented to adopt the following words: "All information so obtained shall be regarded as strictly confidential."

Some discussion also took place in regard to documents in penal cases.

Dr. MCVAIL was of opinion that in no case should these be open to inspection.

The PRESIDENT, while agreeing, wished to have the chair protected.

Dr. MACALISTER thereupon suggested that leave to inspect documents relating to penal cases should not be obtained except from the Council.

This suggestion met the final difficulty, and Dr. Glover's motion was unanimously passed in the following form:

That members of the Council who desire access to documents which are the property of the Council be required to obtain leave for inspection either (1) from the Council, (2) from the Executive Committee, or (3) when neither body is in session or about to be in session from the President. The application for leave to be in writing and to specify as far as possible the nature of the documents to which access is desired and also the purpose for which the inspection is to be made. Leave to inspect documents relating to penal cases not to be obtained except from the Council. All information so obtained shall be regarded as strictly confidential.

The PRESIDENT suggested that this would be a Standing Order, but no motion to the effect was made.

Midwives Bill.

The REGISTRAR read the following letter from the secretary of the Midwives Bill Committee, remitted by the executive committee to the General Council:—

MIDWIVES BILL COMMITTEE.
Office: 12, Buckingham-street,
Strand, W.C., May 19th, 1898.

Regulation of the Practice of Midwives.

SIR,—On May 2nd the Lord President of the Privy Council received a deputation of the promoters of the Midwives Registration Bill now before Parliament. The Lord President entered fully into the subject and pressed on the promoters of the measure the extreme desirability of their coming to some definite understanding with the medical profession as represented by the General Medical Council.

As directed by the Lord President, the Midwives Bill Committee at their last meeting resolved to approach the General Medical Council with the view of making such alterations in the present Bill as would secure for it the support of the General Medical Council or of arriving at a clear understanding with regard to the lines upon which another Bill should, in their opinion, be framed. With this object the promoters of the Bill have appointed seven delegates, four of whom are members of the Midwives Bill Committee, one being Mr. J. B. Balfour, M.P., and the others medical members of that Committee; while the remaining three delegates are members of the Association for promoting Compulsory Registration of Midwives, a body representing a section of the general community in sympathy with the movement.

The promoters of the Bill have carefully studied the recent report of the General Medical Council to the Lord President, and are especially anxious to ascertain the precise bearing of some of the clauses of that report, as well as the opinion of the General Medical Council on some important points not explicitly mentioned in it.

I am therefore instructed by the Midwives Bill Committee to inquire whether the General Medical Council would be willing to receive the above referred to delegates of the promoters of the Bill, or to appoint a committee to confer with them.

I have the honour to be, Sir, your most obedient servant,
ROWLAND HUMPHREYS,
Honorary Secretary, Midwives Bill Committee.
To the President of the General Medical Council.

On the programme there was this notice of motion by Dr. BRUCE:—

That a committee consisting of Sir Richard Thorne, Dr. Glover, and Dr. MacAlister be appointed to confer with the delegates from the Midwives Bill Committee and to report to the Council.

Dr. MCVAIL objected to the form of this notice. He thought it was necessary that the Council should agree to the appointment of a committee before they named the committee.

Dr. BRUCE was quite willing to move for the appointment of the committee, and if his motion was agreed to to nominate the members of whom it should consist. He moved the motion according to notice.

Dr. LOMBE ATTHILL seconded the proposal.

Dr. MCVAIL objected. He said it was a very important step to take to appoint a committee to meet with this Committee on the Midwives Bill. It meant that the Council believed that so far as the two bodies were concerned they were now very near together, and that practically they had only to settle on details. The letter that had been read did not say whether the Midwives Bill Committee had accepted the resolutions on the subject which the Council passed at their special session seven weeks ago. It simply said that they were recommended by the Lord President of the Privy Council to come to terms with the General Medical Council and not by any means that they had accepted generally the conclusions that the Council had come to. If the letter had borne intimation of their acceptance of the Council's conclusions he could have no objection whatever to a committee being appointed to meet the promoters, but the letter did not say that, and considering the importance of the General Medical Council the full discussion on the subject which had taken place in April, and the very emphatic reply the Duke of Devonshire made to the deputation, the very least the promoters of the Bill could have done, if they wanted the General Medical Council to fall into line, was to have stated their general agreement or acceptance of the Council's April conclusions. He did not think they were in a position just then to appoint a committee of the kind proposed. At the same time he certainly would in no way stand against a deputation of that body coming to the Council, as, if it came to the Council, the whole Council would then hear whether the committee in question had decided to accept what the Council agreed to in April, and would be in a position to say that a committee might be appointed to see that a proper Bill was drawn up for the inspection of the Council. Taking the letter as they had it he did not think it justified them in appointing the committee moved for.

Mr. BRUDENELL CARTER pointed out that the letter contained the following passage:—"The Midwives Bill Committee resolved to approach the General Medical Council with the view of making such alterations in the present bill as would secure for it the support of the General Medical Council." He could not help thinking that that was what Dr. McVail wanted.

Dr. MCVAIL: I don't think that is at all full enough.

Mr. HORSLEY thought it was really due to the Council that the letter should have indicated an acceptance of the Council's conclusions on the subject. The Committee said they were anxious to ascertain the precise bearing of some of the clauses of the Council's findings. He could not see what more information could be granted to elucidate the bearing of the clauses in question. What were the clauses that seemed to the Midwives Bill Committee to be obscure? They were not told. He quite admitted that the position of the letter quoted by Mr. Carter did in a general way express the desire of the Midwives Bill Committee to fall into line with the General Medical Council, but it did not actually say that there was no other desire. He must vote against the proposal to appoint a committee.

Sir DYCE DUCKWORTH thought that as a matter of propriety and common sense this Midwives Bill Committee could come and meet the committee of the Council without the slightest fear that anything but good would result. The Committee could not express all they felt in a letter. The only thing he should be inclined to insist upon would be that the members of the Council's committee should be gentlemen who were very firm and knew their own minds, and who would not in any degree be inclined to whittle away the results that after long debate they had arrived at at the special session last April.

Dr. MACALISTER remarked that when he consented to his name being used in connexion with the motion he understood that all the proposed committee was to do was to hear the views of the Midwives Bill Committee and report to the Council. There were to be no negotiations with that Committee.

Dr. LOMBE ATTHILL explained that Dr. MacAlister's view of the position was his also. It would be wasting time if the Council itself received a deputation.

Mr. HORSLEY said that if such was the intention and if this proposed committee was only to hear what delegates had to say without negotiating with them he had no further objection to the motion.

Sir WILLIAM THOMSON remarked that the Midwives Bill

Committee obviously wanted a discussion on the principles of the Bill and that, he thought, passed a good deal beyond the mere reception of delegates and the hearing of what they might say.

Sir C. NIXON thought the Committee in question should state their case in writing to the Council. It would be a mistake to deal with any such body otherwise than by correspondence.

Mr. BRYANT said it had been his privilege to see three or four members of this Midwives Bill Committee, all of whom were extremely anxious to see how they could make a Bill that would embody the opinions of the General Medical Council. They were at present in doubt as to the bearings of some of the Council's April resolutions, and he thought it was only to have information in regard to that that they asked for the interview. Their desire certainly was to have a Bill which would be quite acceptable to the General Medical Council.

Sir WILLIAM GAIRDNER was afraid that the Committee in question wanted the interview with the General Medical Council in order to persuade them to alter as little as possible the old objectionable Bill. They must not have that old Bill again or any one that looked the least like it.

Dr. LEECH said that in the letter the Committee referred to "another Bill." It was very important that the Council should appoint a committee to meet them.

Dr. MCVAIL moved:—

That the Midwives Bill Committee be informed that the General Medical Council is willing to receive a deputation of the Committee during the present session.

It would be better to receive the Committee when and where reporters were present than to have a private meeting from which each member would gain a different impression and endeavour to make it public.

Mr. HORSLEY seconded.

Dr. CHURCH thought it would be more convenient if a committee of the Council received the Midwives Bill Committee.

The Council voted and, rejecting Dr. McVail's proposal by 16 votes to 9, accepted Dr. Bruce's motion by 17 votes to 6 It was consequently agreed that the Midwives Bill Committee should be heard by a committee of the Council.

Dr. BRUCE moved that the committee should consist of Dr. MacAlister, Dr. Glover, and Sir Richard Thorne, all of whom, he said, were intimately acquainted with the subject and were men whose opinions on it were known to be decided.

Dr. LOMBE ATTHILL seconded the motion.

Dr. MCVAIL proposed that Sir Christopher Nixon should also be a member of the committee. He would be an admirable counterpoise to Dr. Glover.

Sir C. NIXON did not want to be a counterpoise. He had no wish to serve on this committee.

Dr. BRUCE remarked that as the ability and influence of Dr. Glover had been given due weight to he had no objection to the proposed counterpoise.

After some conversation the committee of four was agreed to.

The Council adjourned.

THURSDAY, MAY 26TH.

The Council met again to-day and occupied its time mainly with the consideration of penal cases. The proceedings will be duly reported in THE LANCET next week.

DIPHTHERIA IN LONDON.—The deaths from diphtheria in London last week numbered 31, an advance on the preceding week which was to be looked for in view of past experience and of the subnormal total of the week immediately antecendent. Thus the number last week was 31, as compared with 39, 27, and 20 in the three previous weeks, the 31 being 7 below the corrected decennial average for the corresponding week of the period 1888–97. Four of the deaths were credited to Lewisham, whilst Islington, St. Luke, Poplar, and Battersea sanitary areas were each of them credited with 3 deaths. All but 1 of the 31 were of young persons aged under twenty years, 8 being of persons aged over five years. The admissions to hospital in the week were 130 in number, against 110, 133, and 131 in the three preceding weeks; and 953 cases remained under isolation on Saturday last. In the Outer Ring only 8 deaths were last week registered from diphtheria, and of these 4 occurred in the Hendon registration district.

Medical News.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The following gentlemen passed the First Professional Examination for the diploma of Fellow at a meeting of the Examiners:—

Wednesday, May 18th:

Thomas Henry Edwards, St. Thomas's Hospital; Walter Fedde Fedden, St. George's Hospital; William Francis Victor Bonney, M.R.C.S. Eng., L.R.C.P. Lond., M.B., B.S. Lond., Middlesex Hospital; and Henry Simpson Newland, M.R.C.S. Eng., L.R.C.P. Lond., M.B., Ch.B. Adel., Adelaide University and London Hospital.

Twelve gentlemen were referred for six months.

Thursday, May 19th:

Angelo Matteo Crabtree, M.R.C.S. Eng., L.R.C.P. Lond., Alfred Ernest John Lister, and Alexander Robert Tweedie, St. Bartholomew's Hospital; Norman Navarra, Middlesex Hospital; Hermann Balean, London Hospital; James Atkinson Bonnin, M.R.C.S. Eng., L.R.C.P. Lond., M.B., Ch.B. Adel., Adelaide University and London Hospital; and Fergus Menteith Ogilvie, M.R.C.S. Eng., L.R.C.P. Lond., M.B., B.C. Cantab., Cambridge University and St. George's Hospital.

Thirteen gentlemen were referred for six months.

Friday, May 20th:

Tom Pettey, M.R.C.S. Eng., L.R.C.P. Lond., M.D., C.M. Edin., Edinburgh University and Charing-cross Hospital; John Law Adam, M.B., C.M. Aberd., Aberdeen University, Middlesex Hospital, and King's College, London; Leethem Reynolds, B.A. Cantab., Cambridge University and St. Mary's Hospital; John Campin Newman, St. Bartholomew's Hospital; Robert Cyril Turnbull, London Hospital; Richard Warren, B.A. Oxon., Oxford University and London Hospital; and Dudley George Greenfield, Guy's Hospital.

Thirteen gentlemen were referred for six months.

Monday, May 23rd:

Hugh McDowall Parrott, Francis George Cross, and Percy William Leopold Camps, Guy's Hospital; William Henville Lowman, King's College, London; Alfred Bertram Soltau and Benjamin Charles Broomhall, London Hospital; and Thomas Crisp English, St. George's Hospital.

Thirteen gentlemen were referred for six months.

SOCIETY OF APOTHECARIES OF LONDON.—The following candidates have passed in the subjects indicated:—

Surgery.—F. Atthill (Section II.), Charing-cross Hospital; D. Davies, London Hospital; M. Paine (Section I.), Royal Free Hospital; and H. Spinks, Manchester.

Medicine.—E. Fryer and W. J. Henson, Guy's Hospital; F. A. Leete (Section II.) and M. Paine (Section I.), Royal Free Hospital; and C. C. Pratt, St. George's Hospital and Bristol.

Forensic Medicine.—M. Paine, Royal Free Hospital; C. C. Pratt, St. George's Hospital and Bristol; and H. J. Watts, Manchester.

Midwifery.—J. Ash, St. Thomas's Hospital; L. D. B. Cogan, E. Fryer, and W. J. Henson, Guy's Hospital; F. A. Leete, Royal Free Hospital; S. J. Meredith, Birmingham and London Hospital; G. H. Proctor, London Hospital; and H. Spinks, Manchester.

The diploma of the Society was granted to the following candidates: Messrs. J. Ash, W. J. Henson, and H. Spinks.

UNIVERSITY OF LONDON.—At the M.B. examination in May the following candidates passed in the divisions indicated:—

First Division.—Percy Edward Adams, St. Bartholomew's Hospital; Arthur John Cleveland, Guy's Hospital; William Joshua Harding, St. Bartholomew's Hospital; and Aubrey Alfred Montague, St. Thomas's Hospital.

Second Division.—Frederick Holgate Atkinson, Charing Cross Hospital; Joseph Faulkner Dobson, Yorkshire College and General Infirmary, Leeds; William Norwood East, Guy's Hospital; Richard Cullingworth Field, School of Medicine and General Infirmary, Leeds; Richard Truman FitzHugh, Guy's Hospital; Lucy Elizabeth Harris, Royal Free Hospital; Ronald Hatfield, St. Bartholomew's Hospital; William James Hirst, Yorkshire College and General Infirmary, Leeds; Robert Hughes, St. Thomas's Hospital; Frank Harwood Jacob, King's College; John David Jenkins, London Hospital; Richard Kay, Guy's Hospital; William Douglas Knocker, St. Thomas's Hospital; Marian Sanford Linton, B.A., London School of Medicine and Royal Free Hospital; Ethilda Budgt. Meakin Meakin, Royal Free Hospital; Frederic Archibald Hope Michôd, St. Mary's Hospital; Egbert Coleby Morland, B.Sc., St. Bartholomew's Hospital; John Basil Page and Alfred Ernest Payne, St. Mary's Hospital; Clive Rivière, St. Bartholomew's Hospital; Edward Lionel Macpherson Rusby and Justus Martin Schaub, King's College; Reginald Oliver Sibley, St. Mary's Hospital; and Daniel Lloyd Smith, Guy's Hospital.

ROYAL COLLEGE OF SURGEONS IN IRELAND.—Fellowship Examination.—The following candidates having passed the necessary examination have been admitted Fellows of the College:—Mr. A. J. M'A. Blaney, M.B., B.Ch. R.U.I.; Miss R. Cohen, M.B., Univ. Calcutta; Mr. W. J. Corbett, L.R.C.P. & S. Irel.; Mr. J. Dundon, M.B., B.Ch. R.U.I.; Mr. H. S. Jackson, L.R.C.S. Irel.; and Mr. W. Taylor, L.R.C.P. & S. Irel.

PLYMOUTH BOROUGH ASYLUM.—The report of the Plymouth Borough Asylum has just been issued. It states that on Jan. 1st, 1897, there were 243 patients. During the year 98 cases had been admitted, the largest number of any admissions in any previous similar period.

LITERARY INTELLIGENCE.—Messrs. Whittaker and Co. announce that immediately following the publication of the new edition of the British Pharmacopœia they will issue a new and enlarged edition of the "Chemist's Compendium," by Mr. C. J. S. Thompson, which will be entirely revised and brought up to date, with the addition of much new matter and many important features. The additions will include: a complete synopsis of the new edition of the British Pharmacopœia (with essential details); a synopsis of the United States Pharmacopœia; a synopsis of the French Codex; modern remedies, brought up to date of publication; new photographic formulæ; formulæ for preparing medicated wools and surgical dressings; miscellaneous formulæ, including recipes for all well-known unofficial preparations.

BRISTOL ROYAL INFIRMARY.—The case of the Bristol Royal Infirmary *v.* Arlett was heard on May 18th before Mr. Justice Barnes. The governors of the infirmary propounded a will of June 3rd, 1891, by which the late Mr. Charles Jones, M.R.C.S. Eng., L.S.A., of Bristol, had left the whole of his property, between £3000 and £4000, to that institution. The defendant, a widowed sister of the deceased, opposed the will, alleging that her brother was not of sound mind at the time and she set up an earlier will by which she was sole legatee of the property. A verdict was given for the defendant.—The annual distribution of prizes to the students of the Bristol Royal Infirmary took place on May 10th. Sir Charles Cave, Bart., president and treasurer, presided, and after a few words of congratulation to the successful students distributed the prizes and certificates as follows:—Suple medical prize and gold medal, Mr. J. J. S. Lucas; ditto, extra, Mr. S. V. Stock; Suple surgical prize and gold medal, Mr. James Phillips; Clark prize, Mr. J. R. Frost; Tibbits memorial prize, Mr. J. Phillips; Crosby Leonard prize, Mr. M. H. Phillips; ophthalmic prize, Mr. A. B. Cridland; midwifery prize, Mr. F. A. Coates; special midwifery certificates, Mr. F. Cox, Mr. G. H. Irvine, Mr. C. M. Mitchell, Mr. C. Morgan, Mr. E. M. Pearse, and Mr. S. V. Stock.

BIRKENHEAD MEDICAL SOCIETY.—The annual dinner of this society was held on April 30th in the Masonic Hall, the President (Dr. R. Sydney Marsden) being in the chair. There was a large attendance, the three vice-chairs being occupied by Dr. A. C. E. Harris, J.P., Mr. W. C. Cornwall, J.P., and Mr. A. Stewart. Amongst those present were the Rev. Dr. Knox, the President of the Liverpool Medical Institution (Dr. Macfie Campbell), the President of the Literary and Scientific Society (Mr. Nazeby Harrington), Professor Boyce, Professor Carter, Professor Glynn, Professor Rushton Parker, Professor Wallace, and Professor Mitchell Banks of University College, Liverpool; Dr. Barr, Dr. Briggs, Dr. Blood, Dr. Brien, Mr. Butcher, Dr. Caton, Dr. P. Davidson, Dr. W. R. Floyd, Dr. Stanley Hill, Dr. Grimsdale, Dr. Gemmell, Dr. Gorringe, Dr. Hamilton, Mr. Hunt, Dr. F. Johnston, Dr. Lambert, Mr. Marsh, Dr. Murray, Dr. Tawse-Nesbitt, Dr. Permewan, Mr. T. L. Pearson, Dr. Pinkerton, Mr. Shears, and Mr. Vacher, the Borough Coroner, and Mr. Thomas Mansell, L.D.S., and Mr. F. Griffin. After the loyal toast Mr. Vacher proposed "University College, Liverpool," which was responded to by Professor Glynn and Professor Boyce. "The Birkenhead Medical Society" was given by Professor Carter and responded to by Dr. Marsden; and "Kindred Societies" was proposed by Dr. Johnston and replied to by Dr. Macfie Campbell, Mr. Harrington, and Dr. Barr.—The annual meeting of the society was held on May 13th, Dr. R. Sydney Marsden (President) being in the chair. The following gentlemen were elected office-bearers for the ensuing year 1898-99: President: Francis Johnston, M.D., C.M.Glasg. Vice-President: H. Nazeby Harrington, M.R.C.S. Eng. Treasurer: James Pinkerton, M.D. R.U.I. Secretary: William Leask, M.B., C.M. Edin. Librarian: S. Wilkinson, M.R.C.S. Eng. Council: Francis Vacher, M.R.C.P., F.R.C.S. Edin.; W. R. Floyd, B.A., M.B., Ch.B. Cantab.; J. H. Jardon, M.R.C.S. Eng.; A. Herbert Butcher, L.R.C.P. Irel., M.R.C.S. Edin.; and Ellis Pearson, L.R.C.P. & S. Edin. Editor: H. H. Preece, L.R.C.P. & S. Edin. A valedictory address was given by the retiring President, Dr. Marsden.

ON the occasion of the recent visit of the Prince of Wales to Southport the following medical gentlemen were presented to His Royal Highness: Alderman Sir G. Pilkington, Dr. G. H. Pollard (ex-Mayor of Southport), Councillor Thos. Hammond Fisher, and Councillor J. J. Weaver.

PRESENTATION TO A MEDICAL MAN.—Mr. Richard Greene, F.R.C.P. Edin., who has resigned the post of medical superintendent of the Berry Wood County Asylum, Northampton, owing to ill health, is to be the recipient of an illuminated address signed by the members of the committees of visitors of the institution with which he has been connected as medical superintendent for the past twenty years.

THE ROYAL AQUARIUM.—During the Whitsuntide holidays an Art Metal Exhibition, of which his Grace the Duke of Westminster is Hon. President, will be held at the Royal Aquarium. This is the first Art Metal Exhibition yet held in London; it will be complete in every detail. The loan collections will be of immense value and interest and include armour from almost every known collection. Her Most Gracious Majesty the Queen is sending a collection valued at many thousands of pounds.

FALMOUTH.—Sir Joseph Fayrer, now a resident at Falmouth, laid the foundation-stone of an extension of the Falmouth Hotel on May 20th, and in alluding to the climate said that subtropical plants flourished throughout the year there, and rhododendrons and camellias flowered throughout the winter in the open air. Mr. E. Kitto, superintendent of the Falmouth Observatory, submitted returns extending over a period of twenty-five years to prove the equality of the climate with that of the south of France.

WELL WATER IN BRISTOL.—At the meeting of the Bristol Health Committee held on May 17th the medical officer of health (Dr. D. S. Davies) reported that since the extension of the city boundary in November last he had examined 48 samples of the well water-supplies in the extended area of Bristol. Of this number 2 showed no evidence of pollution and one other well required cleansing only; the remaining 45 showed evidence of sewage pollution, in many instances of the grossest possible kind. Steps were immediately taken to close the wells.

MRS. MOLYNEUX, the Australian actress, who has been playing Renée in Mr. Abud's Under the Red Robe Company, is arranging a *matinée* on June 9th in aid of the Convalescent Home for Children in connexion with Charing-cross Hospital. Mr. Gatti has kindly given the Vaudeville Theatre for the occasion; the stage hands are also giving their services. Among those who have generously offered assistance are: Miss Dorothea Baird, Miss Ethel Haydon, Miss Marguerite Cornille, Miss Bessie Wentworth, Mr. Dan Leno, Mr. George Robey, Mr. Harry Randall, Mr. Arthur Roberts, Mr. Dawson Millivans, Mr. Laurence Irving and Mr. Eugene Stratton.

BRITISH MEDICAL TEMPERANCE ASSOCIATION.—The twenty-second annual meeting of this association was held on May 23rd, at the Conjoint Examination Hall, Victoria Embankment, Dr. G. Sims Woodhead presiding. The annual report stated that there had been enrolled during the year 24 new members, 136 student associates, and 1 lay associate, making a total of 486 members, 424 student associates, and 3 lay associates. The names of the successful competitors for prizes for essays on Alcohol and the Nervous System by fourth-years' students were announced, the first being that of Mr. E. A. Boxer, of Edinburgh University, and the second that of Miss L. Beatty, of Queen's College, Belfast. After the meeting a conference was held with medical officers of metropolitan workhouse infirmaries and Poor-law unions, at which a paper on Alcohol in Relation to Sick and Healthy Paupers was read by Mr. W. C. Amery, and discussed by Mr. Spurrell, Dr. Evans, Dr. Potter, Dr. Burton, Dr. Webster, Dr. Ridge, Dr. Stewart, Dr. Morton, and Dr. Poole, and the following resolution was carried unanimously: "That this conference of medical officers of infirmaries with members of the British Medical Temperance Association declares its opinion that medical officers of infirmaries, workhouses and Poor-law districts should reduce the prescription of alcoholic liquors both to

sick and healthy paupers to the lowest possible limits, while feeling that it must leave the matter in the hands of those who are responsible for the medical treatment."

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

Midwives Registration Bill.

THIS measure has been relegated to the twenty-sixth place in the orders for Wednesday, June 8th, when there is not the slightest chance of it being discussed. On Friday, May 20th, Mr. Heywood Johnstone, one of the leading supporters of the Bill, presented in the House of Commons 263 petitions, signed by nearly 12,000 persons, asking the House to act upon the recommendations of the two select committees which have inquired into the question.

New Prison Rules.

The Home Secretary has presented to the Grand Committee of the House of Commons which is engaged in the consideration of the Prisons Bill his new set of rules for prison management. Among other things the new rules reduce the period of solitary confinement to six months and free from this form of punishment altogether the prisoner whose mental or physical condition is in the opinion of the medical officer such as to render it advisable that he should be employed in associated labour. They also provide for open-air exercise in certain cases and they abolish the crank and the treadmill.

The Lunacy Bill.

This Bill has passed through Committee of the whole House of the House of Lords without amendment, and now falls to be considered by the Standing Committee of that chamber.

HOUSE OF COMMONS.

MONDAY, MAY 23RD.

Contaminated Shell-fish.

Mr. Chaplin, in reply to a question by Mr. Loder, said that whenever the state of public business permitted he would introduce the promised measure with regard to sewage-contaminated shell-fish.

Medical Service in Maryborough Prison.

Mr. Arthur O'Connor asked the Secretary to the Treasury whether the note appended to vote 20, of Class 3, of the Civil Service Estimates, to the effect that the post of visiting medical officer of Maryborough Prison was to be abolished on vacancy might be accepted as correct; and whether, if the post was not abolished, it was to be kept for some particular person or would be open for the appointment of the best qualified candidate.—Mr. Hanbury replied that the note to which the hon. Member referred was added to the estimate in connexion with a revision of the salary of the resident medical officer at Maryborough Prison in 1896. That officer's salary was sanctioned by the Treasury on condition that the office of visiting physician should be abolished on a vacancy and that the resident medical officer should then be required to undertake whatever extra duty there might be. He was not aware of any intention to depart from that arrangement.

A Parish Medical Officer and his Appointment.

Sir Leonard Lyell asked the Lord Advocate whether he was aware that the parish council of Stronsay had given notice of dismissal to the parish medical officer, although no grounds of complaint had been made; whether a parish council was within its right in dismissing its doctor without making specific charges; and whether the doctor had any right of appeal to the Local Government Board for an inquiry into the case.—The Lord Advocate replied: I am informed by the Local Government Board for Scotland that it is the case that the Parish Council have given notice of dismissal to their medical officer and that they decline to furnish him with their reasons. They are within their rights in doing so and although I am informed that the Local Government Board have in this case asked the parish council for their reasons I am not aware that the medical officer has any right of appeal in the matter.

Adulteration of Food Products.

Mr. Chaplin announced, in reply to three questions on the subject, that he hoped very shortly to be able to introduce his Bill dealing with the adulteration of food products.

Lead Poisoning in the Potteries.

Sir Matthew White Ridley, replying to questions on this subject, said that he had appointed two experts, one of them a chemist, Dr. Thorpe, the head of the Government laboratory, the other a medical man, Dr. Oliver, who had served already on several dangerous trades committees. He had left the scope of the inquiry to some extent to the discretion of the experts who would be able to follow up any line of inquiry which seemed likely to lead to useful results. The main point, however, would be to ascertain the extent to which various materials recommended as harmless substitutes for carbonate of lead were free from the dangers attending the latter. The suitability of these materials for the purposes of the trade was mainly a question for the manufacturers but it was possible on this point also that experts might render some assistance. Inquiries had been addressed to the chief foreign Governments on the subject but their replies had not yet been received.

Uncertified Deaths in Inverness-shire.

Mr. Weir asked the Lord Advocate whether he was aware that the medical officer of health of Inverness in his report for the year 1897, in calling attention to the numerous uncertified deaths, stated that in the case of six parishes in which the entire number of deaths during the year amounted to 367, as many as 225 of that number were uncertified by a medical practitioner; and would he say whether the Government proposed to take any steps in the matter.—The Lord Advocate replied: I am informed by the Local Government Board that they have observed the statement of the medical officer of health of Inverness-shire as to the excessive number of uncertified deaths in certain parishes. The question has, I understand, been frequently brought under the notice of the Board, but it is difficult to suggest a practical remedy. As the hon. Member is no doubt aware, the general question of death certification was fully reported on by a Select Committee of this House in 1893.

The Midwives Question.

Mr. Heywood Johnstone asked the First Lord of the Treasury if his attention had been drawn to the resolutions passed by the Council of the Royal College of Surgeons of England on May 4th, approving and adopting the report of the General Medical Council on the Midwives Registration Bill, brought in by the right honourable Member for Clackmannan and Kinross, in which it was stated that it was desirable that measures should be taken to protect lying-in women of the poorer classes from the grave risk which they now incur from the unregulated practice of midwives, many of whom were ignorant and unskilful and most of whom pursue their calling without due medical supervision; if he was aware that the question of compulsory registration of midwives had been considered by select committees of this House in two sessions of Parliament, and that both committees had reported unanimously in favour of a system of registration; and whether, having regard to the reports of the select committees and to the opinions recently expressed by the General Medical Council and by the Royal College of Surgeons as to the need for legislation on this subject, he would either give facilities for the discussion of the Bill brought in by the right honourable Member or undertake to deal with it by a Government Bill in the present session of Parliament.—Sir Michael Hicks Beach, replying for Mr. Balfour, said: The facts are in the main as stated, but my hon. friend has omitted to point out that the report of the General Medical Council was far from endorsing the methods proposed in the Bill. I am afraid I cannot give a favourable answer to the last paragraph.

TUESDAY, MAY 24TH.

The Petroleum Inquiry.

Mr. Ascroft asked the Home Secretary whether, having regard to the large number of deaths which annually occur in the United Kingdom in connexion with the use of petroleum and to the great weight of evidence given before the Petroleum Committee in favour of raising the minimum flash point for petroleum, he would invite the Committee to immediately present an interim report upon this portion of the inquiry with a view to the introduction during the present session of a short Bill, with the object of at once checking the deplorable loss of life which now occurs.—Mr. Jesse Collings, who is chairman of the Select Committee, replied to the question as follows: The Committee have finished taking evidence and the report is being prepared and it will be sent to the Department at the earliest possible date.

Medical Practice in India.

Sir Walter Foster asked the Secretary of State for India whether he was aware that at present uneducated and unqualified persons have as much right to practise medicine in India as fully qualified practitioners; and whether in view of the danger to which the Indian people are thereby exposed he would consider the advisability of instituting a system of registration for medical practitioners similar to that which exists in Great Britain and Ireland.—Lord George Hamilton replied: The answer to the first branch of the question is in the affirmative and that to the second branch in the negative. It would be, in my judgment, impossible in the present condition of India to prevent the people of that country from resorting to native practitioners, even though they may be regarded by Europeans as not fully educated or qualified for the work they undertake.

Appointments.

Successful Applicants for Vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward it to THE LANCET Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week for publication in the next number.

ANDERSON, FREDERICK THOMAS, M.D. Brux., F.R.C.S., L.R.C.P. Edin., has been appointed Medical Officer for Atherington Parish by the Barnstaple Board of Guardians.

BARLING, A. S., M.R.C.S., L.R.C.P., has been appointed Surgeon to H.M. Prison in Lancaster Castle.

BARRETT, R. H., L.R.C.P. Lond., M.R.C.S., has been appointed Medical Officer for the Gedney Hill Sanitary District of the Holbeach Union.

BLACK, C., L.R.C.P. Lond., M.R.C.S., has been appointed an Assistant Medical Officer for the Workhouse of the Sheffield Union.

BOWDEN, W. J., M.B., Ch.B. Vict., has been appointed a Medical Officer for the Glossop Union by the Glossop Board of Guardians.

BRABYN, G. W., L.R.C.P., L.R.C.S. Edin., L.F.P.S. Glasg., has been appointed a District Medical Officer for South Wimbledon.

BRANNAN, F., M.B., B.Ch. Irel., has been appointed Medical Officer for the Castledermot (co. Kildare) Dispensary District.

CARRUTHERS, A. E., M.B., B.C. Camb., L.R.C.P. Lond., M.R.C.S., has been appointed Medical Officer for the Fourth Sanitary District of the Bath Union.

CHITALE, V. N., F.R.C.S., L.R.C.P., L.R.C.S. Edin., L.F.P.S. Glasg., has been appointed an Assistant Medical Officer for the Workhouse of the Aston Union.

is constructed of glazed earthenware, holds about 5 litres and has a lid round the inside of the rim of which is placed an indiarubber collar. Attached to the centre of the lid and springing from it are three iron arms the ends of which fit into grooves in the rim of the pan. By means of a screw this three-way iron clamp can be made to hold down the lid tightly and the vessel is practically hermetically sealed until such time as the contents can be safely disposed of. The idea is a good one, but it seems to us that if it were found possible to substitute a band of asbestos for the rubber collar it would be an improvement. The band could then be placed in the fire and effectually cleansed should it become soiled.

"DR." BELL.

THE scoundrel who trades under this name still continues to distribute his filthy little "brochure." His name used to be Henry Walters, and on Jan. 28th, 1896, he was fined at Marlborough police court £20 and six guineas costs for calling himself Dr. Bell. In the 1898 edition of the "brochure" are two letters purporting to be signed by qualified medical men, but neither of their names appears in the Medical Register In our issue of Feb. 1st, 1896, we remarked that Henry Walters was a liar and a swindler and we continue to consider the author of the brochure the same type of character. He may or may not be Henry Walters, but whoever he is he deserves punishment.

"THE POSITION OF THE HOSPITAL MEDICAL OFFICER AS WITNESS AT AN INQUEST."

To the Editors of THE LANCET.

SIRS,—At a coroner's inquest in this hospital, having been ordered to make a post-mortem examination, I was allowed a fee of £1 2s.—one guinea for evidence and one guinea for making the necropsy. Two months later I am asked by the coroner to refund the money as objection has been raised by the county authorities. Am I liable for such a mistake on the part of the coroner and ought I in any case to comply with his request? Awaiting a reply in your next issue,

I am, Sirs, yours faithfully,

May 20th, 1898. HOUSE SURGEON.

*** The fee must be returned. Our correspondent will find a note in THE LANCET of May 21st, page 1415, dealing with the situation. The house surgeon's position is not so hard as that of the honorary staff in most cases.—ED. L.

NIGHT CALLS FROM THE METROPOLITAN POLICE.

To the Editors of THE LANCET.

SIRS,—At 1 A.M. on May 17th I was aroused by a constable of the Metropolitan Police and was requested to come and see a man in a fit. Although suffering from the effects of a chill I went with the constable to see the case. On my arrival I found another practitioner in attendance who came from exactly the opposite direction to that in which I live. I took the constable's number and receiving no further communication from the police after the lapse of a few days I wrote to the police-station and the same day in answer to my note an inspector called who stated that no fee could be paid to me as an order had been made for payment to the other practitioner and only one order was allowed for each case. I believe I have a perfect right to a fee. Can I recover from the police or only from the constable? or is it a fact that the police, although they sent for four different medical men (as I now learn), are only liable to pay one?

I am, Sirs, yours faithfully,

May 20th, 1898. H. C. D.

*** We should like to hear from other practitioners what their experience may be.—ED. L.

LINOLEUM FOR FLOORING IN HOSPITALS.

"F.R.C.S." writes to inquire about the use of linoleum as a flooring in hospitals. We have recently had to answer an exactly similar question. Where hospital floors have got rough, and the joints have shrunk, and the soft parts of the wood have worn away, leaving the knots protruding, the floors have been "jacked" off level and linoleum has been put down, and no doubt in itself it makes a very efficient floor covering. There is less noise from it in walking than from almost anything else and it is easily cleaned with a wet cloth and it does not require scrubbing. The objection to linoleum is that if it is stuck down imperfectly there are interstices between it and the floor and at the edges between the floor and the walls, so that it may be difficult to keep it perfectly clean and sanitary. Compared with the joint of a wood floor, however, it is obviously much more perfect, as there is only one joint in the linoleum as against dozens in the wood.

HOSPITAL DIET IN FRANCE.

IN Paris, the home of centralisation, all the hospitals and asylums are supplied with provisions, &c., under the auspices of a public body known as l'Assistance Publique. Among the articles that have been stocked in charge of this department for consumption during the current year are the following: potatoes, 1,000,000 kilos.; onions, leeks, carrots, and turnips, 425,000 kilos.; dried beans, 120,000 kilos.; lentils, 80,000 kilos.; prunes, 50,000 kilos.; currant jelly, 22,000 kilos.; apricot marmalade 22,000 kilos.; and plum jam, 22,000 kilos. Meat, bread, fresh vegetables, butter, and milk, being perishable, cannot be stocked. The quantity of preserves laid in will probably strike most English readers as very great. Fifty tons of prunes would probably suffice for all the hospitals in Great Britain during many years.

SEX PREDICTION MADE EASY.

THE sex question is so much on the *tapis* just now that the following, which we take from the *New York Medical Journal*, is worth recording:—

"Dr. X——, of Paris (*Medical Brief; Toledo Medical and Surgical Reporter*, May), has discovered an infallible method of determining the sex of the child *in utero*. After a conscientious auscultation and palpation of Madame Z—— he announces that it will be a boy and at the same time notes on his tablets: 'Madame Z——, a girl.' When the accouchement takes place, if the new-comer is a boy, well and good; if it is a girl he exhibits his tablets and assures the mother that she must have misunderstood him."

"PUERPERAL ECLAMPSIA."

IN answer to "R. C.'s" query in THE LANCET of May 21st Mr. Walter T. Colman, Consulting Surgeon to the Hospital for Women, Brighton, points out that he published a paper on One Form of Puerperal Eclampsia in THE LANCET of Sept. 28th, 1889, p. 640, and that he will be pleased to give our correspondent further information if required.

Stoke.—The matter must be one for the individual to decide. If the lectures are not given in order to advance in any way the lecturer's professional position—and the fact that they are to be given away from his home is strong evidence that this is so—we think it would be censorious to raise any objections. With regard to advertisement, if it is correct to give the lectures (the answer to which depends upon the lecturer's motives) there can be no harm in announcing the course in the press.

P A.—Lewes, "Service Chemistry"; Mitchell Bruce, "Handbook of Materia Medica"; Foster, "Text-book of Physiology," 4 vols; Waller. "Introduction to Human Physiology"; Kirke, "Human Physiology"; J. R. Green, "Manual of Botany," 2 vols.; T. J. Arthur, "Outlines of Zoology" (Pentland); F. E. Beddard, "Zoology" (Longmans). This last book is elementary but very clear and good.

L.R.C.P., who writes to us concerning the M.D. Brux., is right in his facts but wrong in his deductions. The names of gentlemen who have received gifts are usually inserted as Mr. ——, with the qualifications following.

Engineer and *Confidential.*—Quack remedies will only make the condition worse. Electrolysis might be tried under medical advice.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

During the week marked copies of the following newspapers have been received: *Cheltenham Free Press, Newry Telegraph, South-Eastern Gazette, North British Daily Mail, Lancashire Express, Cheshire Observer, Manchester Guardian, Times of India, Pioneer Mail, Peterborough Times, Retford News, Builder, Jarrow Express, Batley News, Bridlington Free Press, Wolverhampton Chronicle, Architect, Bury Guardian, Liverpool Daily Post, Suffolk Chronicle, Cromer Post, Southampton Observer, Sussex Daily News, Wilts Standard, Bristol Mercury, Scotsman, Citizen, Bedford Times, Walsall Observer, Northampton Mercury, Alnwick Gazette, Leeds Mercury, Carlisle Express, Agricultural Gazette, Melton Mowbray Times, Surrey Advertiser, Southport Visitor, Sligo Champion, Southport Visitor, Yorkshire Post, Glasgow Herald, Manx Sun, Buxton Advertiser, Ampthill News, Merthyr Express, Dover Standard, Cheltenham Examiner, Western Times, Herald of Wales, Hampshire Advertiser, Newport Advertiser, North Wales Chronicle, Pembrokeshire Times, Shrewsbury Chronicle, Hereford Times, Cambridge Chronicle, Doncaster Gazette, Bexhill-on-Sea Observer, Mid-Devon Times, Isle of Wight Observer, Birmingham Gazette, Civil Service Gazette, Sanitary Record, Local Government Chronicle, Reading Mercury, Mining Journal, Hertfordshire Mercury, City Press, Hong-Kong Weekly Press, Hong-Kong Daily Press, Manchester Courier, Guy's Hospital Gazette, Local Government Journal, Redditch Indicator, West Middlesex Herald, Suffolk Chronicle, Rothesay Express, Hudderfield Examiner, Fraserburgh Herald, Express and Star, Brighton Gazette, Ayr Advertiser, &c., &c.*

Medical Diary for the ensuing Week.

OPERATIONS.

METROPOLITAN HOSPITALS.

MONDAY (30th).—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), St. George's (2 P.M., Ophthalmic 1.15 P.M.), St. Mary's (2.30 P.M.), Middlesex (1.30 P.M.), St. Mark's (2 P.M.), Chelsea (2 P.M.), Samaritan (Gynæcological, by Physicians, 2 P.M.), Soho-square (2 P.M.), Royal Orthopædic (2 P.M.), City Orthopædic (4 P.M.), Gt. Northern Central (2.30 P.M.), West London (2.30 P.M.), Westminster (2 P.M.).

TUESDAY (31st).—London (2 P.M.), St. Bartholomew's (1.30 P.M.), Guy's (1.30 P.M.), St. Thomas's (3.30 P.M.), Middlesex (1.30 P.M.), Westminster (2 P.M.), West London (2.30 P.M.), University College (2 P.M.), St. George's (1 P.M.), St. Mary's (1 P.M.), St. Mark's (2.30 P.M.), Cancer (2 P.M.), Metropolitan (2.30 P.M.).

WEDNESDAY (1st).—St. Bartholomew's (1.30 P.M.), University College (2 P.M.), Royal Free (2 P.M.), Middlesex (1.30 P.M.), Charing-cross (3 P.M.), St. Thomas's (2 P.M.), London (2 P.M.), King's College (2 P.M.), St. Mary's (2 P.M.), National Orthopædic (10 A.M.), St. Peter's (2 P.M.), Samaritan (2.30 P.M.), Gt. Ormond-street (9.30 A.M.), Gt. Northern Central (2.30 P.M.), Westminster (2 P.M.), Metropolitan (2 30 P.M.).

THURSDAY (2nd).—St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), University College (2 P.M.), Charing-cross (3 P.M.), St. George's (1 P.M.), London (2 P.M.), King's College (2 P.M.), Middlesex (1.30 P.M.), St. Mary's (2.30 P.M.), Soho-square (2 P.M.), North-West London (2 P.M.), Chelsea (2 P.M.), Gt. Northern Central (Gynæcological, 2.30 P.M.), Metropolitan (2.30 P.M.).

FRIDAY (3rd).—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), Guy's (1.30 P.M.), Middlesex (1.30 P.M.), Charing-cross (3 P.M.), St. George's (1 P.M.), King's College (2 P.M.), St. Mary's (2 P.M., Ophthalmic 10 A.M.), Cancer (2 P.M.), Chelsea (2 P.M.), Gt. Northern Central (2.30 P.M.), West London (2.30 P.M.).

SATURDAY (4th).—Royal Free (9 A.M. and 2 P.M.), Middlesex (1.30 P.M.), St. Thomas's (2 P.M.), London (2 P.M.), University College (9.15 A.M.), Charing-cross (3 P.M.), St. George's (1 P.M.), St. Mary's (10 P.M.), Cancer (2 P.M.).

At the Royal Eye Hospital (2 P.M.), the Royal London Ophthalmic (10 A.M.), the Royal Westminster Ophthalmic (1.30 P.M.), and the Central London Ophthalmic Hospitals operations are performed daily.

SOCIETIES.

WEDNESDAY (1st). — OBSTETRICAL SOCIETY OF LONDON. — 8 P.M. Specimens will be shown by Mr. Doran, Dr. Burton, Dr. Amand Routh, and others. Papers:—Dr. H. R. Spencer: "Two Cases of Fibromyoma of the Uterus removed by Operation from women under twenty-five years of age.—Dr. Roper: Note on some Difficult cases of Fronto-anterior Positions of the Fœtal Head.

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

TUESDAY (31st).—LONDON POST-GRADUATE COURSE.—Hospital for Skin Diseases, Blackfriars, 4.30 P.M., Dr. Abraham: Lupus Erythematosus.

WEDNESDAY (1st). — LONDON POST-GRADUATE COURSE. — Parkes Museum, Margaret-st., W., 4.30 P.M., Prof. A. Wynter Blyth: Sanitary Appliances.

WEST LONDON POST-GRADUATE COURSE (West London Hospital, W.).—5 P.M. Mr. S. Paget: Surgical Cases.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST (Brompton).—4 P.M. Dr. Maguire: Dynamics of the Chest in Disease.

THURSDAY 2nd). — LONDON POST-GRADUATE COURSE. — Central London Sick Asylum, Cleveland-st., W., 5.30 P.M., Mr. J. Hopkins: Clinical Lecture.

CHARING-CROSS HOSPITAL.—4 P.M. Dr. M. Bruce: Demonstration of Medical Cases (Post-graduate Class.)

THE HOSPITAL FOR SICK CHILDREN (Gt. Ormond-street, W.C.).—4 P.M. Dr. Colman: Demonstration of Selected Cases.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC (Bloomsbury).—3.30 P.M. Dr. Beevor: Lecture.

ROYAL INSTITUTION.—3 P.M. Dr. E. E. Klein: Modern Methods and their Achievements in Bacteriology.

LONDON TEMPERANCE HOSPITAL.—2 P.M. Dr. S. Fenwick: Clinical and Lantern Demonstration to Senior Students—Liver Diseases.

CENTRAL LONDON THROAT, NOSE, AND EAR HOSPITAL (Gray's Inn-road, W.C.)—5 P.M. Dr. D. Grant: Tinnitus Aurium and Vertigo.

FRIDAY (3rd). — LONDON POST-GRADUATE COURSE.—King's College 3 to 5 P.M., Dr. Wilkinson: Actinomycosis and Glanders.

SATURDAY (4th).—ROYAL INSTITUTION.—3 P.M. Dr. R. Caton: The Temples and Ritual of Asklepios at Epidaurus and Athens.

Notes, Short Comments, and Answers to Correspondents.

EDITORIAL NOTICE.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITORS," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.

Lectures, original articles, and reports should be written on one side of the paper only, AND, WHEN ACCOMPANIED BY BLOCKS, IT IS REQUESTED THAT THE NAME OF THE AUTHOR, AND IF POSSIBLE OF THE ARTICLE, SHOULD BE WRITTEN ON THE BLOCKS TO FACILITATE IDENTIFICATION.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers, not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET *should be addressed "To the Manager."*

We cannot undertake to return MSS. not used.

MANAGER'S NOTICE TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, W.C., are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

The rates of subscriptions, post free, either from THE LANCET Offices or from Agents, are:—

Subscriptions (which may commence at any time) are payable in advance.

A WARNING FOR THE NURSERY.

THE *Girl's Own Paper* for May, under the heading "Household Hints," contains a warning which we should like to see printed in every newspaper throughout the kingdom. "Celluloid balls and other toys, though very pretty to look at, should never be given to children, as they are highly inflammable and very dangerous."

A TYPHOID FEVER PAN.

THE excreta of patients suffering from enteric fever form a certain and dangerous source of infection if not properly disposed of. In private houses even the transference of contaminated vessels from the sick room is not infrequently attended with danger, but by the use of a pan such as is made by the Winton Pottery Company, Limited, of Stoke-on-Trent, this danger can be minimised if not actually prevented. The pan, which

ON

EXTRA-UTERINE PREGNANCY.

Delivered at Mason College, Birmingham, on May 11th, 18th, and 25th, 1898,

BY JOHN W. TAYLOR, F.R.C.S. ENG,

PRESIDENT OF THE MIDLAND MEDICAL SOCIETY; SURGEON TO THE BIRMINGHAM AND MIDLAND HOSPITAL FOR WOMEN; CONSULTING SURGEON TO THE WOLVERHAMPTON HOSPITAL FOR WOMEN, ETC.

LECTURE II.[1]

Delivered on May 18th.

THE THREE INVASIONS OF TUBAL PREGNANCY—(1) TUBO-ABDOMINAL, (2) TUBO-LIGAMENTARY, AND (3) TUBO-UTERINE.

1. *Tubo-abdominal Pregnancy (syn., Abdominal or Ventral Pregnancy).*

MR. DEAN AND GENTLEMEN,—When a fœtus which has been already formed within the Fallopian tube escapes from the tube enclosed in its *unruptured membranes* into the abdomen of the mother the pregnancy becomes "abdominal" or "ventral." If the placenta retains its attachment to the tube and receives sufficient blood-supply from the maternal blood-vessels the pregnancy may pursue an uninterrupted course to term and both child and placenta attain mature development within the peritoneal cavity of the mother. The protection of the unruptured amnion, however, appears to be absolutely indispensable for this development. I am aware that in making the statement that a tubal pregnancy thus directly becomes abdominal I am running counter to the accepted teaching of such authorities as Mr. Lawson Tait and Mr. Bland Sutton. The difficulty in believing this lay in the fact that in most of the recorded cases the child has been described as lying naked and uncovered within the peritoneal cavity of the mother. Our leading authorities have argued, and probably argued rightly, that no fœtus at any early age could be so exposed to the peritoneal cavity and its secretion and yet survive. They have accordingly sought for some method of explaining how the facts established by observation—the intra-abdominal position of the child—could possibly arise. The theory advanced is that every extra-uterine pregnancy which has survived the primary rupture of the tube and has continued its development has done so beneath the peritoneum, sheltered within the folds of the broad ligament (see Broad Ligament Pregnancy), that here it has remained until the seventh or eighth month, and then a secondary rupture of the broad ligament cyst has taken place, and the child has escaped among the intestines, "its tissues having arrived at a period of development by that time, which enabled them to resist the efforts of digestion which doubtless would be directed towards them."[2]

Although those of us who had operated on cases of abdominal pregnancy at full term felt that this theory was far-fetched and mistaken, for no broad ligament pouch from which the infant had escaped could then be found, and although the theory was more or less disproved by isolated cases of abdominal pregnancy reported by Dr. Jessop, by Dr. Champneys, by myself, by Dr. Webster, by Dr. Cullingworth, by Dr. Aust Lawrence, and even by Mr. Tait himself, I do not think we could be said to have any good explanation of the mystery to offer until a case on which I operated at the Spark Hill Hospital for Women on Dec. 11th, 1896, brought further light and explained how the child could inhabit the peritoneal cavity of the mother and still survive. On careful examination of the abdominal cavity in this case conducted by myself and my colleagues, Mr. Martin and Mr. Jordan, it was found that a transparent membrane (the amniotic sac) surrounded the fœtus and protected it in every direction, and that this was invisible on the surface of the intestine, but could be demonstrated as a film passing from coil to coil and completing the sac in which the pregnancy had developed. The case was reported by me to the Obstetrical Society of London in 1897, and the following account of the operation and parts removed is copied from the Transactions of the society.

"*Operation.*—On Dec. 11th, 1896, assisted by my colleagues, Mr. Martin, Mr. Jordan, and Dr. Sturge, I opened the abdomen in the middle line and found that the peritoneum immediately below the incision was thickened and incorporated with some kind of sac containing a dead but non-putrid fœtus. On opening this the child was found lying in the abdomen bathed in a small quantity of dark blood fluid. In this some caseous particles were floating. The head of the child lay uppermost and formed the globular protuberance which had been noticed near the liver. The intestines were visibly covering the body of the child and the great omentum, forming in one part a thick fleshy body of considerable thickness, passed across the child to a broad attachment on the upper part of the placenta. The latter was situated at the lower pole of the pregnancy and covered the pelvis. The parts of the child nearest to the incision were the lower limbs and after pulling the feet outside and enlarging the incision to admit of the passage of shoulders and head the child was extracted. The cord was then divided and the child removed. On looking into the abdomen the peritoneal cavity appeared to be directly open as in an ordinary abdominal section. The coils of intestine, the lower part of the stomach, and the great omentum were all plainly visible and separate loops of intestine could be brought out of the incision and examined. On very close observation it was first noticed by Mr. Martin and afterwards confirmed by myself and Mr. Jordan that a very thin transparent pellicle or membrane was reflected over all, or nearly all, of these viscera and that notwithstanding the apparent free exposure of the peritoneal cavity there was in all probability a thin, filmy, transparent sac enclosing the pregnancy, not capable of separation or differentiation from the peritoneum of any viscus over which it was reflected except where passing from one to another, as from one coil of intestine to another or from intestine to placenta. Only under these circumstances was the membrane visible.

"*Removal of the placenta.*—The placenta was of ordinary size and covered the pelvic inlet 'like the lid of a saucepan' incompletely closed, the edge of the placenta being exposed and free on the left side of the pelvis but closely applied to the abdominal wall on the right side where the cord was situated. The attachments of the placenta were: (1) a thick band or rope of omentum which was firmly attached to the upper or serous edge of the placenta on the left side; (2) several thin attachments or adhesions of small intestine and cæcum to the same surface; these appeared to be possible of explanation as reflections of the thin sac layer (amnion) from the intestine to the placenta; and (3) the deep pelvic attachments of the under surface of the placenta, which at this stage were hidden from view by the placenta itself. The band of omentum was ligatured in sections and divided; then the adhesions to the bowel were separately tied and cut through. By tilting up the free (left) edge of the placenta it was now possible to discover a broad band of attachment below it in the pelvis. This was seized by a pair of Doyen's elastic forceps and divided. When this had been done a further part became accessible and it was found possible by gentle manipulation to secure either by forceps or ligature all pelvic attachments before separation, so that the placenta was finally removed without any loss of blood, and therefore with a clear field for deliberate operative work throughout. Below the placenta, in the pelvic portion of the sac, was found quite a collection of caseous masses (remains of the vernix caseosa), which was cleared out of the pelvis partly by the fingers and partly by a douche of warm water which was used for washing out the abdomen. The main attachments, which had been temporarily clamped by forceps, were found to come from the right broad ligament. These were ligatured in sections beneath the forceps and the forceps were then removed.

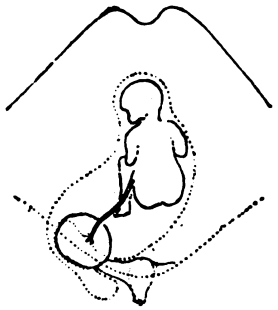
"On examination of the pelvis where the placenta had been it was evident that the same arrangement of sac existed here as in the upper abdomen—that is, a fine transparent membrane could be traced throughout and formed a limiting layer between the usual viscera of the abdomen, pelvis, and placenta on the one hand and the child on the other. On replacing the placenta in position this membrane

[1] Lecture I. was published in THE LANCET of May 28th, 1898.
[2] Tait: Lectures on Ectopic Pregnancy, p. 59.

could be traced below the placenta to the bottom of the pelvis on the right side; it was then reflected over the broad ligament and all its attachments to the under surface of the placenta. From this it could be traced all over the placenta except where intestine or omentum was adherent to its surface. Two-thirds (at least) of the placental margin was free, and this was consequently smooth, glistening, and everywhere covered by the thin membrane of the sac. Owing to this disposition of the sac within the pelvis the outline of the normal pelvic viscera, the uterus, tubes, and ovaries was considerably obscured, so much so that it was impossible to say whether the right ovary had been removed with the placenta or whether it had been left in the pelvis below the reflections of the sac.

"The abdomen was closed with silkworm-gut sutures and a drainage-tube left in the lower angle of the wound. The after-progress of the case was satisfactory and uneventful except for some chronic suppuration in the lower part of the wound. This appeared to be kept up by caseous remains which had been imperfectly removed, as on more than one occasion some caseous particles were observed in the discharges. The patient was discharged convalescent on Jan. 25th, 1897.

"*Description of parts removed.*—The child weighs 7 lb. and is a male fœtus which has undergone full development within the abdomen of the mother. The nails of the fingers extend some distance beyond the finger-tips and are firm and horny. The testes appear to be within the scrotum and the hair of the head is abundant but short. The trunk and limbs are perfectly developed; the head is rather large in proportion to the rest of the body and is bent or twisted to the right, so that the left (or extended) side of the neck and face appears to be permanently larger than the right, the head being fixed laterally towards the right shoulder. There are no signs of decomposition. Closely applied to the head of the child is a perfect cap of membrane and between this and the head of the child is a considerable quantity of caseous matter. This is the only part where any membranous covering or sac can be distinguished. The umbilical cord and its fœtal attachment are in every respect normal. The placenta weighs 3 lb.; it is thick and fleshy and of fairly normal consistence. On its upper service and edge it is marked by (1) the insertion of the cord excentrically placed; (2) by the attachment of a divided thick band of tissue, probably omental; and (3) by several large distended vessels almost unsupported by any tissue, but directly attached to the placental surface or edge. (These appear to be portions of adherent omentum which have been changed into congeries of dilated veins.) The shape of the placenta is peculiar; the bulk of it is circular, with an excentric cord inserted near one border (the right). Beyond this and separated from it by a deep sulcus is a crescentic mass of placental tissue attached to the main placenta by its horns and lower surface. On the surface of this crescentic part is a pale red fringed mucous patch, which appears to be the fimbriated end of a Fallopian tube. No further trace of tubal structure can be made out on microscopic examination and on section of the mass it appears to consist throughout of placental tissue. The under surface of the placenta is in many parts as smooth and free as its upper surface, but it is marked by a long strip of raw surface running across the placenta, with a bend or angle in its course. This marks the attachment of the placenta to the right broad ligament.



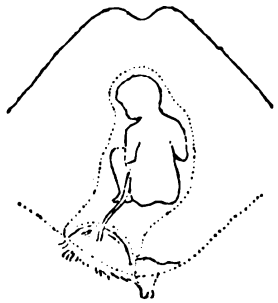
"*Remarks.*—The pregnancy may be regarded as originally one of the right Fallopian tube, which, by gradual erosion or giving way of the upper part of the tube, has passed with unruptured membranes into the abdominal cavity. The deep sulcus on the upper surface of the placenta probably marks the line of separation in the tube where the ovum escaped upwards into the abdomen. From the spread out internal surface of the (ruptured) tube the placenta has continued growing and has so altered or taken up its structure in process of growth as to render little but the fimbriated end recognisable. The placenta has derived its blood-supply from the vessels of the broad ligament and from the great omentum.

"The case is remarkable for possessing no history of any tubal rupture (or acute illness corresponding to this) throughout the whole course of the pregnancy. The conditions and opportunities for observation during the time of operation were unusually good, but in spite of this the exact state of the upper pole of the pregnancy and its relation to the abdominal viscera must be determined by circumstantial evidence as it could not be directly seen from the incision. From the fact that the head of the child is closely covered by a cap of membrane, between which and the scalp is a copious deposit of caseous material, while below this any evidence of a membranous sac is wanting (except the tear of separation around the forehead and occiput), it may be concluded, I think, that the upper part of the amniotic sac—the membrane forming the extreme upper pole of the pregnancy—has been removed with the fœtus; and that, so far as this is concerned, the abdominal cavity has been directly opened. Below this, towards the centre of the pregnancy, the sac has become incorporated with the peritoneum so that no separation could be made between the two and no indication of the presence of a sac could be seen except at its reflection from one viscus to another as already described. At a lower level still—at the 'lower pole' of the pregnancy—the sac was considerably thickened, forming, together with the peritoneum at the lower part of the abdominal incision, a membranous wall fully one-eighth of an inch in thickness. Even here, however, no definite dissection could be made between 'sac' on the one hand and 'peritoneum' on the other."

The importance of the case just quoted in the present state of our knowledge cannot be over-estimated. It effectually disposes of much of the theory now current on the subject of advanced extra-uterine gestation. On page 464 of Allbutt and Playfair's System of Gynæcology (1896) Mr. Bland Sutton writes: "Observation has demonstrated the fact that in all tubal pregnancies which survive the primary rupture and continue their development the gestation sac is formed in part by the expanded tube, but mainly by the layers of the mesometrium. The proper appreciation of this fact has done much to simplify our knowledge of tubal pregnancy and no one has more strongly insisted upon its correctness than Lawson Tait." That this is altogether mistaken is now, I believe, a certainty. The case of abdominal pregnancy here described is a tubal pregnancy which has survived the primary rupture and continued its development, in which the gestation sac is formed by the amnion alone or at most by the fœtal membranes and tube, the layers of the mesometrium are intact, and the expanded tube is entirely taken up and metamorphosed by the growth of the placenta.

A diagrammatic representation of the pregnancy (Fig. 19)

FIG. 19.



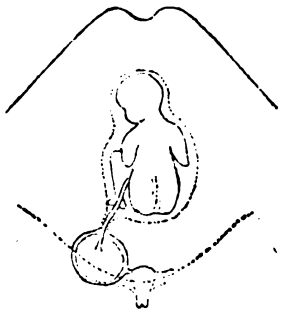
in which the omental attachments are omitted as non essential, may help to make this important variety of extra-uterine pregnancy clearer and to elucidate the relations of its sac. The essentials of the pregnancy are the fixed placenta growing mainly or entirely from the tube to which it was originally attached and the child enclosed simply in its amniotic sac, moving so far as the delicate sac permits it within the abdomen of the mother. The amniotic sac may be in some places separable from both mother and child, in other parts it may be quite inseparable from the peritoneal covering of the abdominal viscera within the maternal abdomen. The condition is produced in the most simple manner. The pregnancy begins within the tube and grows there until it can grow no longer. Then by rupture or by some slow separation of the tube equivalent to rupture the tube is opened up. The child within its amniotic sac escapes upwards into the abdomen, the placenta remains attached to the inner surface of the tube, and from this, spread out and flattened by the rupture, the placenta continues to grow.

But this case not only tends to disprove the broad ligament

theory as of universal or even general application. It serves another and more important purpose. If the cases of abdominal pregnancy be carefully considered in the light of the explanation here offered it will be found that most, indeed very nearly all, of the recorded cases in which no definite sac has been found admit of a similar interpretation. In Mr. Jessop's case it is stated that "the peritoneal lining, though natural on its free surface, appeared thick and velvety in section," and later we read: "A few bands of unorganised lymph of a very friable nature lying upon, but not adherent to, the intestines were readily removed by sponging and about an ounce of a clear serum was found in the peritoneal cavity." The definite amount of serum here mentioned is decidedly suggestive of some unrecognised limiting sac and not of free fluid welling up from the pouch of Douglas out of sight. In Bandl's case, quoted by Mr. Tait, the fœtus was enclosed in a "pocket formed by false membranes." In Dr. Champneys' case the references to some filmy kind of sac are still more obvious. We read: "The layer immediately covering the fœtus was a dull white membrane." Again: "On the child's vertex a patch of thin, sodden-looking membrane was seen and except a shred of similar material removed from the wound (probably torn from the head during delivery) no membranes were seen or felt." In the report of the dissection of the child we read: "There was a sort of cap of sodden membrane (amnion) on the vertex which was covered with dark hairs," and in the report of the necropsy of the mother: "The fœtal surface [of the placenta] was also marked by a remnant of membranes which hardly extended beyond the placenta." The similarity between this case and those which I have myself reported is, I think, clear and unmistakeable.

The lower pole of the pregnancy does not always take the form described in the case I have just reported and depicted in the illustration. In a case on which I operated at term, both mother and child surviving, the amniotic sac stopped short at the placental insertion as in normal intra-uterine pregnancy and the raw under-surface of the placenta had extended or grown beyond its tubal site and was attached to the posterior surface of the uterus, the sigmoid flexure and the pelvic wall as well as to the tube. But though I failed to fully understand it at the time I am now quite satisfied that the pathological relations of the fœtus were exactly similar to those I have described as present in the preceding case. The ragged margin of the amnion in this case may still be seen attached to the placenta and the rest of the sac was probably continued as a transparent covering or sheath over the small intestines and the under surface of the great omentum around the space from which I removed the child. The conditions met with in this case are diagrammatically represented in Fig. 20. The salient

FIG. 20.



features which separate it from the preceding case will be recognised at once on comparing the accompanying diagrams.

There are two other conditions under which the placenta may be found in advanced abdominal pregnancy. In the first the tube, although excessively expanded, may retain its individuality and the placenta be found still lying within it. In one case of this kind, the case of Dr. Halliday Croom, minutely examined and described by Clarence Webster, he states, "A large, well-formed, recently dead fœtus was removed from a sac which extended nearly up to the liver and which had in the lower part of the abdomen a thick anterior wall. There was an excessive amount of amniotic fluid. The uterus was enlarged, elevated, and drawn towards the right side. The placenta was in a separate sac to the left side of the pelvis—a thick viscoid mass extending 2 in. above the brim. The gestation sac was double, one containing the fœtus, the other the placenta. The former was that part of the peritoneal cavity behind the stomach, transverse colon, and great omentum; the latter consisted of the enormously dilated Fallopian tube lying in front of the uterus and extending vertically from the utero-vesical pouch to the fourth lumbar vertebra. Though quite distinct from one another they were connected by means of the umbilical cord and amnion; this membrane lined the secondary (peritoneal) sac and passed into the substance of the primary (tubal) sac.

Another case very similar to this was reported by Mr. Tait to the Obstetrical Society in 1892 under the title of "A Case of Ectopic Pregnancy in which the Fœtus seems to have been Developed to the Full Time in the Peritoneal Cavity, still retaining its Amniotic Covering." In the report of this case we read: "The child was lying loose in the abdominal cavity except that all its upper surface had become adherent to the omentum and to the anterior parietal peritoneum. The child was still enclosed in its membranes, but the liquor amnii had entirely disappeared. The umbilical cord went straight down to a round, smooth, globular mass about the size of a cocoanut, which occupied the pelvic cavity and was adherent to the surrounding tissues. The question of the removal of the placenta, which this substance really was, occupied my mind for a few seconds. On making tentative efforts to separate the globular mass I found that it peeled out with considerable ease, much as a broad ligament cyst would, and after it was separated down to a pedicle which was the cornu of the uterus it became perfectly evident that the globular mass was the right Fallopian tube." Following the graphic method previously employed to illustrate the relations of the placenta this form may be diagrammatically represented as in the accompanying illustration (Fig. 21).

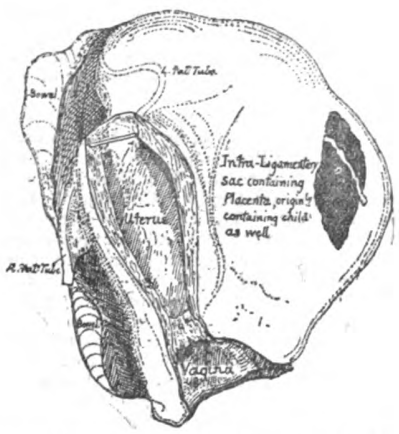


FIG. 21.

Finally, there is one specimen which shows that the abdominal position of the fœtus may be associated with an intra-ligamentary placenta. For a long time I failed to find any certain evidence that advanced abdominal pregnancy was ever the outcome or sequel of secondary rupture from the broad ligament into the abdomen. But in examining the various specimens to be met with in London I came across a most valuable one in the St. Thomas's Hospital Museum (No. 2491) which shows that this is a possible, though, I believe, a very rare, occurrence. The accompanying illustration (Fig. 22) is a drawing of my own made directly from the specimen itself. There is a large sac formed by the left broad ligament on one side of the uterus—the uterus, indeed, forms a kind of appendage to its wall—the left Fallopian tube courses over its summit and directly underneath this lies the attachment of the placenta. On the outer side of the sac is a rather large lacerated opening through which the fœtus passed into the abdominal cavity. The specimen is said to be taken from a woman who died at the full period of gestation. Although the sac is a large one it is scarcely of sufficient size to have contained a full-time fœtus, and therefore it is at all events highly probable that in the later months of pregnancy the fœtus surrounded by its amnion was strictly abdominal in position as in the other cases I have been describing. If so, we have a fourth position of the placenta in abdominal pregnancy. Strictly speaking this is "tubo-ligamentary-abdominal" and perhaps should be more correctly described under the next division of my subject, but it is more convenient to take its consideration

here. Incidentally, it is worthy of notice what a very marked and unmistakeable ligamentary sac is to be found when the fœtus has really become abdominal, after passing through an intra-ligamentary stage in its development.

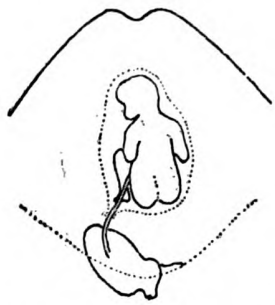

FIG. 22.

The accompanying illustration (Fig. 23), the last of the present series, will bring the preceding case in line with the others I have mentioned.

There are accordingly four different relations of the placenta to the main gestation-sac in abdominal pregnancy which need some differentiation. In the first group of cases the placenta is practically within the main gestation-sac and covered by reflexions of the amnion. In the second it has a fœtal and maternal surface of nearly equal dimensions as in normal pregnancy, the fœtal surface being covered by the amnion and in immediate relation to the sac, while the maternal surface is growing from the spread-out remnants of the tube and from the peri-tubal tissues also, the back of the uterus, the broad ligament and

FIG. 23.

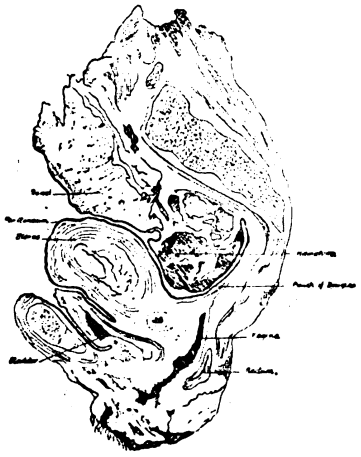
the pelvic wall being favourite sites for such extensions of attachment. In the third, the placenta remains within the tube, the tube is still recognisable and the maternal attachments are confined to the tube itself. In this case there may be a double gestation sac, the one containing the fœtus, the other the placenta. In the fourth the placenta is attached to the upper wall of a broad ligament sac outside the peritoneum and the cord passes to the child through a hole in the ligament.

Before I leave this portion of my subject I want to finally enforce the point that these illustrations showing the different positions of the placenta in tubo-abdominal pregnancy are no mere imaginative figures showing simply possible relations of the pregnancy to surrounding structures. They are records of facts carefully observed and are each and all supported by extant specimens still available more or less for individual inspection and verification.

The sac in abdominal pregnancy evidently varies greatly in appearance and consistency. In many of the recorded cases it can hardly have consisted of anything more than the amniotic membrane. This has become attached to the peritoneum, "its epithelial lining becoming destroyed and its sub-epithelial layer (in some places) becoming dense and fibrous" (Webster). In other situations the sub-epithelial layer has been unaffected and the membrane is directly attached to the intestine or the abdominal viscera, is indistinguishable by sight from the proper peritoneal surface of such viscera, and only visible when reflected from one viscus to another as already described. The membranes are not, however, necessarily adherent in this way; sometimes they have a completely independent existence and probably all degrees are possible of partial peritoneal attachment. Sometimes their consistency and independence are such that they have been described as being extirpated (Tait) or sutured (Rosenmauer) at the operation for removal of the pregnancy. Cases so described are, however, sometimes open to the suspicion that an unrecognised broad ligament pregnancy has been mistaken for abdominal. In true tubo-abdominal pregnancy the sac, consisting at the best of amnion and chorion, and often perhaps of an amniotic layer only, must, if independent, always be extremely thin and easily broken. If completely independent it may admit of removal with the child, but it is extremely doubtful if it could ever possess sufficient independence and consistency to admit of any independent suture. The relations of the placenta to the sac are of chief importance and will need some reconsideration under the heading of Treatment.

The extra-uterine placenta at term is an object of considerable interest. Throughout the whole course of the pregnancy the placenta has marked the site of the original and main attachment of the pregnancy, and in its attachment has held, and still holds throughout, the key to much of its pathology and treatment. When the infant has arrived at term the placenta has also reached its fullest development, and, so far as my experience goes, the extra-uterine placenta at term, though often deformed in shape, keeps close to the normal standard both in size and weight. The method by which it has attained this development outside of the uterus may well demand our attention. Mr. Sutton states: "The fully developed uterine placenta is composed of parts derived from the maternal and fœtal tissues in nearly equal parts; a tubal placenta is mainly if not entirely derived from the fœtal tissues." It is true that there is no clear evidence of a tubal decidua, but the placenta as it increases in size (like a new growth in its progress) absorbs, takes up, and metamorphoses into its own tissue that of the Fallopian tube in which it was originally enclosed, and possibly the ovary of the same side also. In a considerable number of cases it is reported that neither ovary nor tube could be identified on the side of the pregnancy. So completely is this done that all traces of the tube may be lost at term or only the fimbriated end be found, as in the case I have described. When by the reflexion of the amnion this invasion of the placenta is limited to the tube and broad ligament only the matter is solely one of pathological importance; when there is no such limitation the consequences may be serious.

It will doubtless be noticed that what I have said regarding the pathology and operative history of tubo-abdominal pregnancy appears to explain and confirm in some degree the observations of many of the older writers and I am pleased to be able in any way to re-establish their credit and re-affirm in the main the correctness of their records. It is true that they considered that the peritoneum itself might discharge the functions of the fœtal membranes (Parry, p. 135) and that the impregnated ovum might from the outset implant itself on the peritoneum and in both of these guesses after truth they were mistaken. It is true also that in the abdominal or "ventral" pregnancy they thought they saw the child floating freely among the intestines within the peritoneal cavity and did not dream of the almost invisible sheath of the adhering amnion which formed a sac to the pregnancy, but in their observation of the fact that there was an extra-uterine pregnancy in which the child was abdominal or ventral in position and in their opinion that this form of pregnancy deserved to be considered as a distinct and special variety of extra-uterine gestation they were perfectly justified and modern research tends only to confirm their view.



2. *Tubo-ligamentary Pregnancy (syn., Broad Ligament Pregnancy).*

A growing pregnancy situated in the middle of the Fallopian tube as it expands the tube instead of thinning and bursting the upper part of the tube may separate the layers of the mesosalpinx. The space between these layers, which in the normal state is non-existent or

represented by the merest line, becomes under these conditions a space of considerable extent. An increasing amount of the circumference of the tube is accordingly separated from its peritoneal covering and exposed to loose connective tissue only. As the tube expands still further it is only reasonable that it should occasionally give way in this direction and that the fœtus should be extruded into the connective tissue space below the peritoneum. This is, indeed, exactly what happens in "broad ligament pregnancy." The rupture of the tube and extrusion of the pregnancy into the broad ligament is usually accompanied by considerable hæmorrhage, which still further distends the space beneath the peritoneum and between its layers. An extra-peritoneal hæmatocele or broad ligament hæmatoma is the result and in some cases the pressure and disturbance caused by this is sufficient to stop the progress of the misplaced pregnancy. When this is the case the hæmorrhage is slowly absorbed and if the pregnancy be early and abortive it undergoes absorption also.

Broad ligament hæmatoma is of rather frequent occurrence as a sequel to any operation involving ligature of the broad ligament, and the hæmatoma is apt to occur at the first menstrual period subsequently to the operation. Every surgeon who practises operative gynæcology must accordingly be well acquainted with its leading features. It arises suddenly as a tumour or infiltration on one side of the uterus, it roofs the lateral vaginal fornix with a boggy or hard immoveable cement of blood-clot, and gradually extends upwards towards the groin of the affected side at Poupart's ligament. Sometimes its prolongations below are ill-defined and difficult to trace, at other times the tumour is defined and its border is abrupt. When the hæmorrhage is extensive and on the left side it may encircle and block the rectum, as Mr. Tait has shown. At other times, by burrowing in front of the rectum low down in the pouch of Douglas (as shown in the accompanying illustration taken from the work of Dr. Hart and Mr. Carter), it may produce a well-defined tumour behind the uterus that closely simulates the intra-peritoneal swelling of a distended and adherent tube. (Fig. 24). It

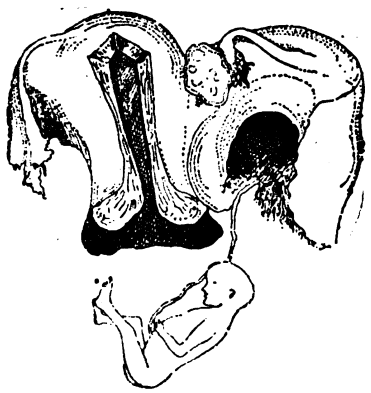


FIG. 24.

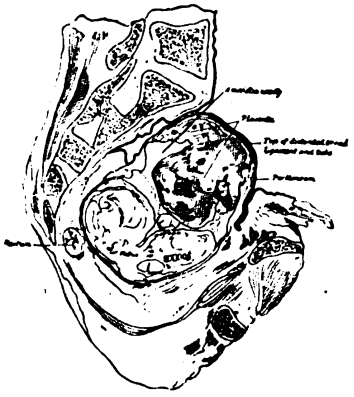
always causes considerable pain (pain preventing sleep) and is frequently accompanied by transient fever. Broad ligament hæmatoma is often confounded with cellulitis and the differential diagnosis is sometimes very difficult. The bare physical signs in both conditions may be identical. Besides being a rather frequent operation sequel, hæmatoma of the broad ligament is occasionally met with after labour and abortion and in connexion with menstrual irregularity and arrest when no pregnancy exists. Other cases are due to the intra-ligamentary rupture of a tubal pregnancy, as already explained, but these are by no means so frequent as some writers would lead us to suppose. In this respect extra-peritoneal hæmatocele (broad ligament hæmatoma) may be said to contrast with intra-peritoneal hæmatocele. Intra-peritoneal hæmatocele in women is almost always due to tubal pregnancy; hæmatoma of the broad ligament, on the other hand, is only in the minority of cases due to this condition. When the pregnant tube ruptures into the broad ligament the hæmorrhage may be limited or small in amount and the placental attachment may be undisturbed. If so, the tube retains its relation and attachment to the placenta while the fœtus (instead of escaping upwards as in abdominal pregnancy) escapes downwards between the layers of the broad ligament and undergoes its further development beneath the peritoneum.

Let us take an actual example of this accident and study it more closely. There is a remarkable specimen in Mason College Museum given by Mr. Hancox which beautifully shows the condition of a broad ligament pregnancy of four months' growth and is well adapted for our purpose. On the right side of the uterus in the illustration (Fig. 25) the

FIG. 25.

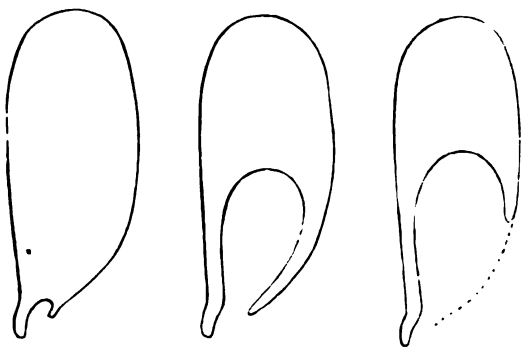


fimbriated end of the Fallopian tube is plainly seen resting upon the roof of a large excavated chamber formed by the upraised layers of the distended broad ligament. If we trace the tube from the fimbriated end towards the uterus we find that it is soon lost in the expanded roof of the broad ligament chamber. The tube as a tube exists no longer. Its middle third is ruptured and spread out and forms the immediate vault of the pregnancy beneath the peritoneum. It is only with difficulty that we can rediscover some trace of its independent existence on the further side of the broad ligament tumour before it enters the uterus. The fœtus has escaped from its cavernous bed by secondary rupture and is now lying outside the broad ligament. It is still, however, connected by the cord, and if we could trace this upward to its termination we should find the placenta attached to the roof and lateral wall of the cavity in the broad ligament, and plainly situated above the original position of the fœtus which has escaped from it. Note that the placenta is uppermost. The course of events has been as follows: the impregnated ovum was arrested in the tube; where it was arrested it adhered and vital attachment took place. At the point of attachment the placenta was formed and no subsequent growth of the pregnancy has separated this attachment. The tube, instead of rupturing upwards into the abdomen, has ruptured downwards into the broad ligament. Into this space the fœtus has been driven and over the buried fœtus the placenta is fixed and blocks any upward progress. What is the inevitable consequence? If the pregnancy continues to develop either secondary rupture must occur or the peritoneum be continually displaced to make room for the growing fœtus. In this instance the case has ended by secondary rupture and the patient has evidently died from hæmorrhage or we should not have such a specimen before us.

Let us now turn to Dr. Berry Hart's and Mr. Carter's sagittal section of a broad ligament pregnancy at nearly the same period of growth. (Fig. 26.) Here we may see an exactly similar condition beautifully portrayed in section. Mark at the highest point the "top of the distended broad ligament and tube"; below this, intimately attached and inseparable from the tube, the mass of the placenta, and again below this, crowded and buried in the lowest part of the pelvis, the unfortunate fœtus. Illustrations intended to show in section the peritoneal reflexions are sometimes confusing and difficult to understand, but this is exceedingly simple and intelligible. The pelvic peritoneum is lifted by the growth of the pregnancy until it is no longer pelvic, or only slightly so. Its reflexions before and behind are shallow depressions only and the arch of it runs across from the promontory of

the sacrum to the pubes. In this instance, too, the case ended by secondary rupture and the patient died from hæmorrhage, though an attempt was made to save her by exploratory incision. Some of the clinical and operative features of a case at this stage may be gathered from the following example.

FIG. 26.



Mrs. G, aged thirty-one years, had been married for three years. She miscarried in April, 1891, and in February, 1892 (at twelve weeks). She menstruated regularly from this date until July, 1892, the last normal period being at the end of this month. Amenorrhœa followed, continued for nearly eight weeks, and was again succeeded by irregular vaginal loss for some two weeks before I saw her on Oct. 10th. The patient gave the history of a sudden attack of pain three weeks before on returning from church in the evening, violent abdominal pain and vomiting being the chief symptoms. This pain was repeated on the following Thursday and Saturday and to a less extent twice during the week that had just passed. On examination I found the abdomen slightly distended and a hard tumour to the right of the middle line above the pubes. The uterus was of normal size, pushed to the left and fixed there. A pelvic mass to the right of the uterus was felt to be one with the suprapubic swelling and only slightly moveable together with the uterus. The pouch of Douglas was moderately distended with fluid. The patient was feeble; the temperature on the evening of the 9th had been 100° F. and the pulse had been 120. The diagnosis was made of intra-peritoneal hæmatocele and free blood in the pouch of Douglas due to the rupture of an extra-uterine pregnancy. Operation was performed on the morning of Oct. 11th, 1892. There were present Dr. Leslie Phillips (who assisted me), Dr. Edge, Dr. De la Chérois, Dr. Williams, and Dr. Addenbrooke. Free fluid blood welled out on opening the abdomen. A ruptured pregnancy was found in the right broad ligament filling up the right side of the pelvis. The hæmorrhage from this (into the abdomen) had been partly confined by adherent, inflamed, and greatly thickened intestine. On separating this the outer coat of the bowel was at one part slightly torn and this was sutured with a continuous Lembert suture. A large mole of pregnancy was removed from the right side of the pelvis and the blood and blood-clot thoroughly washed out with warm water. No pedicle offered itself for ligation as the pregnancy had been subperitoneal. The pelvis was drained. At the close of the operation although very little blood was coming through the drainage tube the patient's condition was very serious. The pulse was 156. Nutrient enemata were ordered to be given every four hours. In the evening the pulse was still 156. On the morning of the 12th the pulse was 148; at 6 P.M. it was again 156. On the morning of the 13th the pulse was 144. At 4 P.M. on this day the bowels were moved and the pulse fell to 129 at night. From this date recovery, although slow, was uninterrupted.

In abdominal disease a persistently high pulse-rate is more than anything else the gauge of the severity of the patient's condition. It is worthy of notice that the severity of this case was as marked as it could possibly be compatible with final recovery. These cases of broad ligament pregnancy with secondary rupture are always serious. Before operation they cannot be differentiated from the cases of later rupture of the tube already considered, but at operation in the more common tubo-abdominal rupture the hæmorrhage can be at once arrested by ligature of the broad ligament and removal of the tube. In the broad ligament pregnancy with secondary rupture the case is different—there is nothing definite to tie unless one ligates special vessels, the operation takes longer, the surgeon has to trust to pressure and drainage and the final result is correspondingly less satisfactory and certain.

The tubo-ligamentary or broad ligament pregnancy may go on to term, and in its full development and during the stages by which it reaches that development it differs very materially from the tubo-abdominal or ventral pregnancy and will need further consideration from almost every standpoint. In tubo-abdominal pregnancy if the patient survive the fourth month and the dangers incidental to the extrusion of the fœtus from the tube she is free from further dangerous complications until the term of pregnancy is near its completion. In the tubo-ligamentary, on the other hand, owing to the higher position of the placenta and its liability to detachment from the growth of the pregnancy, the patient is never free from danger, and although many cases of this kind go on to term secondary rupture and fatal hæmorrhage are by no means uncommon or impossible at almost any stage of the development. In both varieties the period of the third or fourth month is a specially dangerous one because up to this time the pregnancy has received the support and shelter of the pelvis. When the pregnancy rises out of the pelvis into the abdomen the protection afforded by this is lost, and in the broad ligament form the gradual elevation of the placenta brings an additional source of danger.

If we look at the specimens and illustrations already taken as typical of tubo-ligamentary pregnancy in its earlier stages it appears as if the peritoneum had been equally separated in all directions by the growing pregnancy, and certainly in Dr. Hart's and Mr. Carter's case of mid-term pregnancy the perfect arch of peritoneum (seen in section) with a sulcus of equal depth behind and in front marks the case as one in which the pregnancy has been up to this point peculiarly symmetrical in its growth and in its displacement of the peritoneum. But it is not always so. Earlier or later in the history of most tubo-ligamentary pregnancies the tumour tends to invade or displace the layers of the broad ligament and the peritoneum continuous with these unequally. Sometimes it is the anterior fold of peritoneum which suffers the more displacement, and owing to the work of Dr. Berry Hart and Mr. Carter these are the cases which are at present more recognised and better understood. The peritoneum is raised from the back, side, and front of the uterus, it is entirely lifted away from the bladder, it is raised from the anterior and lateral abdominal wall, and in this way a good portion of the pregnancy comes to lie in front of the peritoneum. The pregnancy becomes in some places "sub-peritoneal" according to common anatomical language and may possibly be opened from the outside of the abdomen without the necessity of incising the peritoneum anywhere. The pregnancy is at first "sub-peritoneo-pelvic" and afterwards

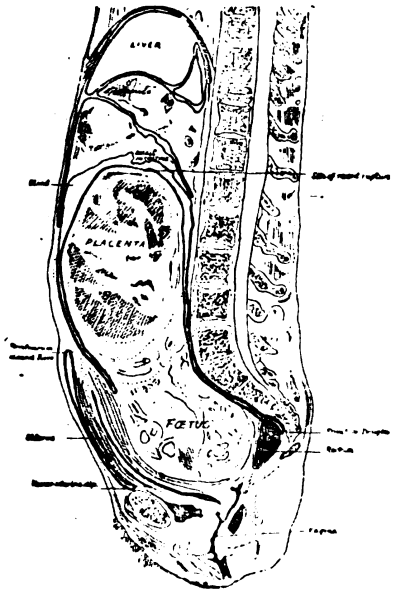


FIG. 27. FIG. 28. FIG. 29.

(if it continues to grow) "sub-peritoneo-abdominal." It cannot be adequately represented by any mere diagrammatic figure, as the tracing of the actual displacement of peritoneum is intricate and must obviously show considerable variations in individual cases. If, however, we take a sagittal section of the normal abdominal peritoneum to be roughly represented by the accompanying illustration (Fig. 27), and if we take the changes produced by a normal

(uterine) pregnancy to be represented by Fig. 28, the main or essential change produced in it by the growth of this form of tubo-ligamentary pregnancy may be approximately depicted by the following alteration (Fig. 29). Now if this diagram be compared with the actual condition found in a case of advanced sub-peritoneo-abdominal gestation, as represented in the frozen section illustration which by the kindness of Dr. Hart I am permitted to reproduce (Fig. 30), it will at once be evident that

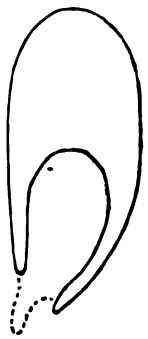

FIG. 30.

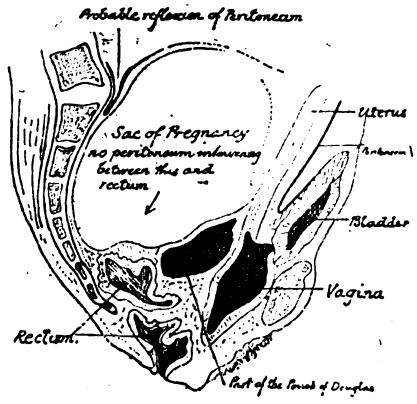
in both the posterior layer of peritoneum is unchanged and that it can be traced uninterruptedly right down to the bottom of the pouch of Douglas. It is altogether anterior to this where the displacement of peritoneum has occurred, and although in the frozen section plate this displacement is seen to be complicated by the retention or "survival" of the vesico-uterine fold (apparently cut off from the rest of the peritoneum), yet the general trend of the displacement or lifting is exactly as shown in the illustration. The anterior part of the pregnancy is that more uncovered by peritoneum and might possibly be reached by the surgeon without its section. It is, of course, this form of pregnancy which since it was first fully described has been very generally accepted as accounting for all cases of advanced extra-uterine pregnancy. It is only right to mention that Dr. Berry Hart himself is in no way responsible for this and that nothing he has written so far as I know affords any foundation for this teaching.

As we have already seen, tubo-abdominal or ventral pregnancy has quite another explanation and is practically distinct from the tubo-ligamentary variety from the moment that the fœtus is extruded from the tube. Now, a considerable body of evidence has formed which tends to show that this sub-peritoneo-abdominal pregnancy which I have been describing is not only quite distinct from ventral pregnancy, but represents only a part, and that perhaps the smaller part, of the cases of true broad ligament pregnancy. For sometimes—and probably in the majority of cases—it is the posterior fold of peritoneum (and not the anterior) which undergoes the greater displacement and then the condition found in advanced gestation is altogether different. The peritoneum is raised from the side and back of the uterus. It is raised from the pouch of Douglas and from the rectum and lifted upwards from the posterior pelvic wall as far as the sacral promontory. This appears to mark the usual limit of displacement and the peritoneum thus raised appears to be sufficient to satisfy the requirements of the growing pregnancy to term. The anterior peritoneum is quite undisturbed and an illustration approximately depicting the change in the peritoneal relations will have this outline (Fig. 31). On opening the abdomen at or beyond the full period of gestation the pregnancy is seen to be everywhere covered by peritoneum much as the uterus is in normal pregnancy, and it is not until the hand is passed behind the sac of pregnancy that one realises that the base of it fills the pelvis on the side from which it is springing and that the peritoneum is reflected from above the pelvis directly on to the body of the pseudo-uterus. The real uterus is found beneath the sac of pregnancy and pushed to the opposite side. This condition has been recognised for some years as occasionally met with by the surgeon when operating for the removal of an extra-uterine pregnancy at term, but the explanation of the method of its production was until quite recently imperfect or wanting. In 1892 I reported a case and described the condition, drawing especial attention to the intra-peritoneal nature of the gestation-sac as viewed from the front after abdominal section. I also drew attention to the breadth of its base and to the position of the uterus and expressed my conviction that the gestation-sac in this variety of ectopic gestation was formed by a "local development of the Fallopian tube and broad ligament."[3]

FIG. 31.

Absolutely true as this opinion was, being practically a rough generalisation of the account I have now presented, there was not at this time sufficient evidence to warrant any detailed history of the local development or displacement of the broad ligament. My own case and others like it had ended favourably and, so far as I am aware, no full or post-mortem investigation as to the exact relations of the sac had then been made. For more certain knowledge we are indebted to Dr. Dunning's[4] case, in which the sac of pregnancy was enucleated from beneath the peritoneum and the relations of the peritoneum to the sac and the amount and character of its displacement admitted of demonstration. From the record of this case there can be but little doubt that Dr. Dunning is right in his contention that this form of pregnancy is produced in the first place by a retro-peritoneal invasion from the broad ligament and that the majority of tubo-ligamentary pregnancies belong to this class or sub-division. My own case (already referred to) was as follows.

Mrs. H was a married woman, aged thirty-six years, the mother of three children, the youngest of whom was two years of age. The youngest was suckled for sixteen or seventeen months, menstruation recurring regularly during the greater part of the time. About one year ago the periods ceased and although some hæmorrhagic discharge occasionally took place this was irregular and scanty. The abdomen soon began to swell and the patient supposed that she was pregnant, but she had never clearly felt any movements of the child. On Feb. 17th, 1891, I saw her in consultation with Dr. H. S. Cook and made the following note: "The patient is very emaciated, sallow, and anæmic. Her tongue is catarrhal and tremulous. Pulse 104 (weak). She is feebly apprehensive, crying out at the thought of any disturbance of position or possible pain from palpation of the abdomen. She has been confined to her bed for more than two months with rigors, occasional fever (temperature 102° F.), frequent vomiting, and marked prostration. Examination (under anæsthesia): the abdomen is enlarged and prominent, the enlargement being more marked upon the left side. The line of greatest girth measures 42½ in. The enlargement is caused by a firm, well-defined swelling, dull on percussion and obscurely fluctuant to touch, which occupies about three-fourths of the superficial abdominal area. It is lateral in position, filling the whole of the left side of the abdomen below the umbilicus and extending over about two-thirds of the right half of the abdomen. The upper limit of the tumour is circular or crescentic in outline, it crosses the middle line half-way between the umbilicus and ensiform cartilage and is continued downwards over the right half of the abdomen until lost to the right of the pubes. The tumour, so far as it can be examined, forms a regular globe and is tense or resistant to touch except over a limited area to the right of the umbilicus. Here a kind of *ballottement* or rather pressure through fluid to a more solid part beneath, can be distinctly made out. *Per vaginam* the uterus can be felt enlarged, distinct from the tumour, and pushed to the left by it. The cervix is not developed as in the pregnant uterus.



[3] British Gynæcological Journal, August, 1892.
[4] American Journal of Obstetrics, July, 1897.

The sound passes to 5 in. A large rounded mass can be felt in the pouch of Douglas; this appears to be one with the abdominal tumour. Auscultation of the abdomen for any evidence of placental souffle or fœtal heart-beat is negative. An alternative diagnosis is made of extra-uterine pregnancy with dead fœtus or ovarian tumour."

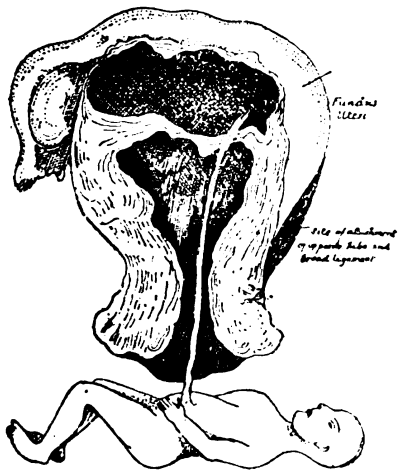
Operation was performed on Feb. 27th, 1891, when there were present Dr. Leslie Phillips (who assisted me) and Dr. Byron Robinson. I opened the abdomen over the area of least resistance already referred to, feeling assured that by so doing I should avoid the placenta. On dividing the parietal peritoneum, which was free from either displacement or adhesion, the wall of the tumour became visible, dark red or almost purple in colour. The hand could be passed in front of the tumour on either side and down into the pelvis. Behind the tumour it was stopped at the sacral promontory and the peritoneum appeared to be reflected from the spinal column upwards over the posterior surface of the tumour. I tapped the cyst with an ovariotomy trocar and evacuated several pints of dirty brown fluid. On opening the cyst a child was seen within it, dead and beginning to decompose. I removed it. The child was of full size and with the exception of some unnatural enlargement of the head was otherwise well formed. It was of female sex and weighed 6¼ lb. During the removal of the child the sac, which although thick was very brittle, tore slightly in a downward direction and I noticed that great care was necessary in dealing with it. The upper part was strictly intra-peritoneal and free from adhesions except some to the great omentum which were easily separated. It appeared to spring from the pelvis, having a very broad base with the uterus underneath it. Its interior was very foul and after washing this out with boric acid solution I finished the operation by sewing the opening in the sac to the abdominal incision. The placenta was not interfered with. The cord was left hanging out of the wound and the sac was drained. The placenta separated and came away about four weeks afterwards; this took place without any constitutional disturbance. The patient made a perfect recovery and has had a subsequent pregnancy perfectly normal in every respect.

Advanced tubo-ligamentary pregnancy must accordingly be divided into two sub-divisions or classes: (1) the anterior ligamentary, sub-peritoneo-pelvic or sub-peritoneo-abdominal pregnancy, and (2) the posterior-ligamentary or retro-peritoneal pregnancy. The first is established by post-mortem proof and frozen sections and does not admit of any doubt or question. The second rests mainly on operative evidence, but that evidence is confirmed by more than one operator, my own experience being exactly similar to that of Dr. Dunning, and I have very little doubt that in time this

FIG. 32.

will be supplemented by the confirmatory evidence of post-mortem dissection. Indeed, I have considerable grounds for believing that such evidence is already to hand and may be recognised in quite an old acquaintance—viz., the frozen section of an extra-uterine pregnancy, which is figured in Dr. Hart's and Dr. Barbour's Manual of Gynæcology (1883, p. 562–3). (Fig. 32.) In a recent visit to Edinburgh, when looking over the preparations belonging to Dr. Hart and Dr. Barbour, I was struck by the fact that in this section no trace of peritoneum could be found between the sac of pregnancy and the sacrum or rectum, and on more closely examining it with Dr. Barbour the condition found appeared to be consistent with the theory that the pregnancy had been tubo-ligamentary and that on the upper side of the section or the part removed the pregnancy had entirely lifted the peritoneum away from the pouch of Douglas and the rectum, while in and beyond the level of the section some remains of the pouch of Douglas still existed in front of the pregnancy. The pregnancy itself was therefore strictly posterior-ligamentary or retro-peritoneal, and we have accordingly anatomical as well as surgical evidence of the existence of this as a special form of pregnancy. If we turn again to Fig. 22 we shall see, I think, that this must also have been an example of the posterior or retro-peritoneal form of broad ligament pregnancy. Although the bony pelvis is not present the position of the sac as regards the uterus and rectum appears to make any other interpretation quite impossible.

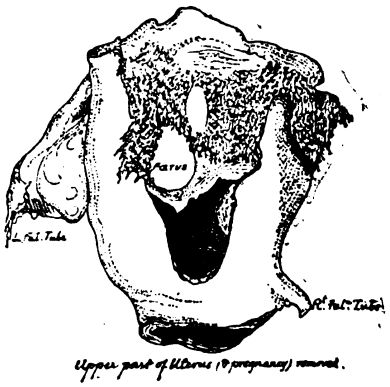
There are two points worthy of further notice in the progress of a tubo-ligamentary pregnancy towards "term." The one relates to the development of the sac, the other to the position and integrity of the child and placenta. In the earlier months space for the growing pregnancy is gained (as we have seen) almost entirely by displacement of the peritoneum and this may be continued more or less throughout the whole period of gestation. In the later months another process of accommodation takes place and further space is obtained rather by development and extension or dilatation of the sac already formed than by further invasion of subperitoneal tissues, so that at term, although the pregnancy is entirely outside the peritoneum, it is not much more so than when *in utero*. For it must be remarked that every normal intra-uterine pregnancy is from the anatomical standpoint entirely subperitoneal throughout and yet the distended uterus forms an intra-peritoneal tumour. Similarly, although the base of the broad ligament pregnancy is entirely below the peritoneum, in most cases the upper part of the sac is intra-peritoneal and forms a tumour of considerable size. This applies to both forms of tubo-ligamentary pregnancy, particularly to the posterior or retro-peritoneal, where the sac of pregnancy forms a pseudo-uterus, which is almost entirely an intra-peritoneal tumour. To a less extent it may be seen in the sub-peritoneo-abdominal form also. If we turn again to the illustration (Fig. 30) of Dr. Berry Hart's and Mr. Carter's case of advanced tubo-ligamentary gestation we find that the fœtus is crowded down into the pelvis and mainly beneath the peritoneum, but the upper pole of the pregnancy containing the placenta reaches high into the abdomen and forms an intra-abdominal tumour covered by unbroken peritoneum and very comparable to the tumour formed by a pregnant uterus at a similar period of gestation.



With regard to the placenta, I have only to draw attention to my belief that its position is inseparably bound up with the position of the Fallopian tube and that its final resting-place is therefore also the final resting-place of the tube. In the large section of advanced pregnancy figured by Dr. Hart and Mr. Carter traces of muscle tissue probably belonging to the tube were found, as Dr. Hart has told me, at the very top of the gestation sac. And this section shows, I believe, the greatest displacement of the placenta on record. In my opinion the original relative positions of the child and placenta are fixed at the time of invasion of the broad ligament or abdomen. In tubo-abdominal or ventral pregnancy the child is uppermost. In tubo-ligamentary or broad ligament pregnancy the child is undermost, its relative position to the placenta being fixed by the relative position of the tube to which the placenta is attached. If the relative position alters during the course of the pregnancy, as it evidently does to a considerable extent in the later stages of the posterior ligamentary or retro-peritoneal form of tubo-ligamentary pregnancy, it is because the sac develops posteriorly to the tube and therefore affords room for the child to pass behind the placenta and so to attain a higher position. Similarly, in the sub-peritoneo-abdominal form it may be quite possible for the child to pass in front of the placenta during the later stages of its growth. If the placenta occupy the highest part of the sac during the later stages of pregnancy it affords evidence of extreme dislocation of the tube, and such a case is liable to hæmorrhage and rupture however far advanced the pregnancy may

be. The placenta will suffer from local hæmorrhage and the pregnancy will be liable to terminate disastrously before the full period of development. In those cases which go to "term" the placenta is usually fully equal to the nutrition of the child, and though much has been written on the faults and lesions of the extra-uterine placenta as responsible for failures and defects of the extra-uterine fœtus I cannot say that the relationship appears to me to be by any means established. So far as my own experience goes the extra-uterine child at term in size and weight and general nutrition is in no way behind the average. But the child is often locally defective or malformed, such defects or malformations almost invariably corresponding to some long-continued pressure exerted by the bony skeleton of the mother on the extra-uterine fœtus. These malformations are most commonly met with in children of abdominal or ventral pregnancies. The children of ligamentary pregnancies, and particularly those of the posterior variety, may be free from any visible defect whatever.

3. *Tubo-Uterine Pregnancy* (*syn.*, *Interstitial Pregnancy*).



Tubo-uterine or interstitial pregnancy is a rare condition and there are only a few specimens which are readily available. Strictly speaking, this pregnancy is not really extra-uterine or only becomes so by rupture into the abdomen, but the pregnancy is "ectopic," outside the uterine cavity, and it is perhaps the most dangerous of all the forms of ectopic gestation. In most of the specimens of this disease or accident it appears to be the tissue on one side of the fundus which is mainly invaded by the growing pregnancy. The obstruction to the passage of the impregnated ovum and its primary attachment is probably exactly at the uterine ostium of the tube. This refuses to admit the passage of the "oosperm," the ostium is pushed before the growing ovum as it increases in size, and a burrow is formed into the uterine tissue (above or to one side of the cavity of the uterus), where the pregnancy finds a temporary resting-place and bed. This naturally raises the height of the uterus on the side affected, and in all the specimens I have seen the asymmetry produced by this has been very noticeable, the Fallopian tube of the non-affected side appearing to enter the uterus at a lower level midway between the (altered) fundus and cervix. In one of the best known specimens (No. 2517[90] of the Guy's Hospital Museum) the uterine appendages of the opposite side appear to have been removed with the unfortunate result that this asymmetry is not readily recognisable. The sac of pregnancy appears to lie across the fundus from right to left, and this is decidedly the impression given of the specimen by the illustration in Mr. Bland Sutton's book.[5] In reality, however, as the following more recent sketch (Fig. 33) will show, the unaltered

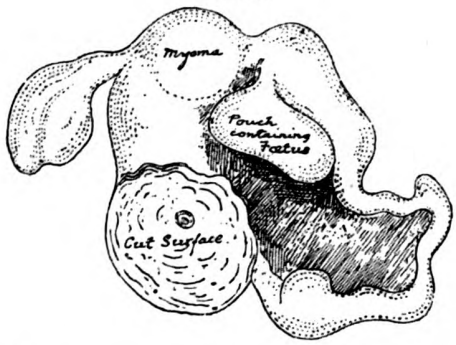
FIG. 33.

part of the fundus lies altogether to one side of this sac of pregnancy and the raw surface where the opposite appendages have been removed shows that there is quite as much distortion in this specimen as in that of the Royal College of Surgeons of England (4691), the other specimen in Guy's Hospital Museum (2517[85]), and in the specimen presented by Mr. Tait now standing in the Mason College Museum (Fig. 34). All show alike that the Fallopian tube and

FIG. 34.

fundus of the side affected are very considerably raised above the level of the fundus and appendages of the opposite side and that the tubes accordingly appear to enter the uterus at different levels. This asymmetry may be simulated by pregnancy in one part of a double uterus or by cornual pregnancy in a bi-corned uterus and, indeed, several supposed specimens of interstitial pregnancy have been found on close examination to be of this nature. In both of these conditions, however, there is always some angle, more or less well-marked, where the double organs join and this is of course absent in a tubo-uterine pregnancy.

A tubo-uterine pregnancy may continue to grow for several weeks to the end of the fourth month or even longer, between uterine peritoneum on the one hand and uterine mucous membrane on the other. Sooner or later rupture takes place, either downward into the cavity of the uterus or upward into the abdomen. The former method of rupture is a highly probable occurrence and if it occurred would presumably be followed by spontaneous healing of the wounded tissue and normal delivery at term, but in spite of the slenderness of the bridge of tissue usually existing between the sac of the pregnancy and the cavity of the uterus we have no positive demonstration that this has ever taken place alone. The only rupture that is known to occur is rupture into the abdomen (or into the abdomen and uterus simultaneously), and the result of this is always appalling. Diffuse hæmorrhage, worse (if possible) than that which takes place with early rupture of the tube, is the main feature of the pregnancy and hitherto this has always proved fatal in a very few hours. The only case approaching or possibly belonging to this class which I have met with in the living subject is the thirty-second of my series.



Mrs. I, aged twenty-seven years, had been married for seven years. She had had three children, the youngest of whom was nineteen months old. She was "regular" until May 6th, 1896, and since this date (until Sept. 10th) has had almost constant discharge of brownish blood. During the latter part of this time she suffered from abdominal pain and tenderness. Early in September this notably increased and the severity of the pain necessitated her confinement to bed. On Sept. 8th I saw her and found the abdomen distended and acutely tender. A fixed hard tumour was felt on the left side, having a crescentic outline and occupying the whole of the left inguinal region. On vaginal examination the mass was felt to be one with the uterus, but on passage of the sound no increase was found in the length of the uterine cavity. The patient stated that the swelling was rapidly increasing in size and the lump in the abdomen had only been noticed for a few days. The patient's lips were pale and her pulse was rather quick and feeble. A diagnosis was made of the left tubal pregnancy with hæmatocele and operation was done on Sept. 10th, 1896. On opening the abdomen a large sac was exposed formed by the expanded left cornu of the uterus, the left tube and the left ovary, and containing placental remains. This was adherent to omentum and intestine, the union with the latter being so intimate that separation had to be made by incision. When the sac was fully freed, opened,

[5] Surgical Diseases of the Ovaries and Fallopian Tubes, 1891, Fig. 103, page 349.

and cleaned it was seen that the inner part of the pregnancy had apparently invaded the uterine tissue of the cornu, and this, together with the base of the sac and broad ligament, was ligatured off from the rest of the uterus in four sections, leaving a long oblique wound on the left side of the fundus. The hæmorrhage was then controlled and the abdomen was closed, a drain being left in the pelvis. The patient made a good recovery.

On examination of the specimen removed it appears, I think, as if the pregnancy had been originally purely tubal and (possibly) a pregnancy of the outer part of the tube, that it had become firmly adherent to the uterus and ovary, and had quite secondarily invaded the side of the uterus in process of growth. If so, it is a special form of tubo-uterine pregnancy, which at present is unrecognised and certainly demands our attention. A specimen recently shown to me by Dr. Cullingworth, and already referred to in my first lecture, appears to me (at all events, so far as I have been able to examine it) to be of the same nature as regards the invasion of the uterus. This specimen is one in which a tubal (or tubo-uterine) pregnancy has been complicated with myoma of the uterus. The fœtus is contained in a curious diverticulum of the tube, while the placenta appears to have invaded the substance of the uterus. The upper part of the uterus (containing both pregnancy and myomata) was removed by hysterectomy and the following is a rough sketch of the parts removed (Fig. 35). In this

FIG. 35.

case there had been no intra-peritoneal bleeding at the time of operation. Whether Dr. Cullingworth would agree with me or not I am unable to say, but it appears to me that this is (like my own) a tubal pregnancy which has quite secondarily invaded the uterus.

In some of the older statistics of extra-uterine pregnancy cases of "interstitial" pregnancy figure largely and in far higher proportion than in any statistics obtained from later experience. Thus in Parry's 500 cases 31 are stated to have been "interstitial," while in Hennig's list of the same date (1876) in 150 cases 42 are reckoned as interstitial. These numbers must almost necessarily be largely mistaken, since any recent specimen is only of rare occurrence, and it is highly probable that some tubo-ligamentary and cornual pregnancies have been included by mistake. When a specimen is difficult to place, the position of the round ligament with regard to the pregnancy is sometimes of service in deciding its true character. This should be on the uterine side of a tubal or tubo-ligamentary pregnancy, while it should be on the other side or in the anterior wall of an interstitial or cornual pregnancy. The position of the round ligament as a guide to the differentiation of cornual pregnancy was first pointed out by Virchow, afterwards utilised by Professor Sir William Turner of Edinburgh, and has proved of very great value. It is not, however, an infallible guide. I have quite lately seen an intra-ligamentary tumour in which a large mass of the tumour was bulging between the round ligament and uterus. The normal relations had been so altered by the growth of the tumour that what should have been the uterine end of the round ligament was lost on the surface of the tumour and no direct connexion could be traced between the round ligament and the uterus. Yet the latter was intact and the tumour was removed without any injury to the uterus. This occurred in the hospital practice of my colleague, Mr. J. Furneaux Jordan (February, 1898).

THE PROGNOSIS AND TREATMENT OF URÆMIC CONVULSIONS AND COMA, WITH SPECIAL REFERENCE TO THE SENILE KIDNEY.[1]

BY ARTHUR T. WILKINSON, B.A., B.SC., M.D. LOND.,
ASSISTANT PHYSICIAN TO THE MANCHESTER ROYAL INFIRMARY.

I WISH to record two cases of acute danger to life from convulsions and coma which seem to me to be worthy of publication. They have the added interest which attaches to recovery and they suggest certain pathological and therapeutical remarks.

The first case was that of a clergyman, aged sixty-nine years, living amongst the Derbyshire hills, a great walker, accustomed to hard work, subject to worry and naturally a large eater. Prior to an attack of influenza with bronchitis early in 1891 he enjoyed excellent health but has since been conscious of some of the infirmities of age. Last autumn he complained of a feeling of pressure on the head which was aggravated by coughing, and coming in one night after a journey his family noticed limited facial paresis with dragging of the feet in walking. This, however, rapidly passed away. Six weeks later he became confused in mind when conducting a service in the church, repeated the same words a dozen times and had to be led down to the vestry. Next day he was quite well again. On March 12th, 1893, from which day the above account is dated, he complained of headache, was very restless, worked feverishly hard in his garden, and the colour of the cheeks and nose became of a deep purplish hue. He refused all treatment. On the 18th he wandered about all day complaining of his head and could not settle down to his books. About 5 P.M., as his son—a Lond. Univ. M.P., to whose careful observation I am indebted for this detailed account—was talking to him he replied confusedly, then absurdly, and soon quite incoherently. He was removed to bed and found to be very drowsy with great congestion of the face and nose. When spoken to very sharply he recognised those around him but immediately relapsed into stupor. There was no paralysis. During the night the drowsiness deepened; he recognised no one, lying on his back with closed eyes and stertorous breathing. He was, however, able to swallow teaspoonfuls of liquid food. Throughout the whole of the 19th and 20th he remained in this condition, having a convulsive seizure during the night of the 19th. I saw him in consultation at 9 P.M. on the 20th, the unconsciousness having then lasted fifty-two hours. Briefly the condition at that time and throughout the day, when he was carefully watched by his son, was as follows. There was intense purplish congestion of the skin of the head and neck and slight swelling of the cheeks with definition of the venules; the conjunctiva and lower lids were suffused and slightly œdematous; the pupils were moderately contracted, equal, and responded sluggishly to light; the skin was moist; reflexes were present; there was no ascites and no anasarca; the temperature was 98·6° and 99° F. on two occasions; respirations 24, deep and snoring; there was no pulmonary abnormality except that the air did not appear to enter the bases freely; the pulse was 88, regular, hard, and incompressible; the cardiac impulse was heaving and laboured, and displaced 1 in. to 1½ in. outwards; the aortic second sound was loud and ringing; the first sounds at the apex were overlapping rather than duplicated; there was no murmur; the abdomen was normal and the bladder was not distended. The patient lay upon his back with his legs at times drawn up, his hands clasped over his head or chest, and his eyes closed. If very sharply spoken to he occasionally responded, the only word uttered being "Yes." There was no rigidity and no paralysis. He resisted feeding, but swallowed whatever liquid passed the teeth. The tongue was thickly coated and dry; there were sordes on the teeth and lips and the breath was foul; there was no loss of control over the sphincters. The bowels were opened by enemas on the 19th and 20th. One curious fact, which I have noticed before in like cases, was the

[1] A paper read before the Manchester Clinical Society on Feb. 19th, 1895, and revised for the Stockport and District Medical Society's meeting of May 13th, 1897.

strength with which the *besoin d'uriner* asserted itself; once during the day he managed to wriggle to the edge of the bed and passed water on the floor. The urine was dark in colour, of specific gravity 1030; it deposited urates freely on cooling and contained the faintest trace of albumin. I was unable to obtain any at that time for further examination. Five grains of calomel were ordered at once, to be followed in the early morning by two-drachm doses of sulphate of magnesium till the bowels were freely opened. I also recommended venesection if matters did not mend. He took the calomel and two doses of salts during the night. About 5 A.M. the coma was so profound and the patient's condition so critical that venesection was contemplated. Between 5 and 6 o'clock, however, he passed three or four large, loose stools, and towards 6 o'clock a comparatively quick change for the better occurred. The cyanosis lessened, the breathing became quieter (26), and the pulse was much more compressible, "running," and it increased in frequency to 102. Between 6 A.M. and 8 A.M. there were gleams of consciousness and apparently natural sleep. At 9 A.M., after sixty-four hours' stupor, the patient woke up, recognised his usual medical attendant, took a glass of milk in his hand, drank it, and asked one or two questions in a perfectly rational manner. Later in the day, of his own accord, he made arrangements for the following Sunday's service. He had no recollection whatever of the events of the past three days. The bowels were kept open, the pulse tension became normal, and shortly afterwards he resumed his work. A year later he had supper at my house and was mentally and physically all one could desire. Two years after the attack he called and reported himself, now in the "seventies," as preaching once every Sunday, able to walk a couple of miles easily, and as having his usual brain power and excellent digestion. I found the pulse to be 76 and regular, tension medium, inclining to high; left cardiac dulness just within the nipple line; the second sound somewhat accentuated at the right second cartilage but not noticeable to the left of the cardiac impulse. The sounds were otherwise normal. He said he usually rose once a night to pass urine, could empty the bladder completely, and had had no sign of cystitis. The prostate was, however, somewhat enlarged. The urine was examined from time to time by his son and by myself. The amount appeared to be about normal and its specific gravity averaged 1018 or 1020; there was no deposit and no casts; standing on nitric acid it gave no reaction; occasionally with the nitric acid and sulphate of magnesium solution a faint haze was seen, but no definite ring of albumin was ever demonstrated. The son informed me that his father habitually neglected the preventive treatment advised; he ate heartily, though his friends limited the *menu* as much as possible, and beyond an occasional aperient eschewed medicine; otherwise the end might have been much longer deferred. To show his activity I may mention that on the day before his death he took two cripples to Manchester to endeavour to find a home for them. On July 16th, 1895, he had a severe apoplectic seizure at 9 A.M. and died the same afternoon from cerebral hæmorrhage. I did not see him and no post-mortem examination was held.

The second case is of quite a different character. The patient was a married man, aged forty-seven years, whose family history was satisfactory. Up to thirty-five years of age he was free in his habits, but since that time he has been very steady and a strict total abstainer; he was always very strong and muscular. On Jan. 19th, 1893, his master, a medical man, noticed that his eyes were puffy and that his face was somewhat swollen, so he ordered him to bed. The patient himself was not aware of the change. There was no other dropsy. On examination the urine was found to contain some albumin. Under the daily administration of drachm doses of compound jalap powder he improved somewhat, but in spite of the purgation suffered from headache. On Jan. 29th at 10 A.M. he was seized with severe uræmic convulsions; the face turned very red, then purplish in colour. He remained in a comatose condition all day, except at noon, when he complained of frontal pain so intense that it made him scream. Very troublesome vomiting set in. At 5 P.M. he had another fit, after which he was very rough, tried to get out of bed, and had to be held down. Elaterium in ¼-gr. doses was administered without result, probably owing to the fact that the stomach rejected everything, even cold water. At 11 P.M. he was again in severe convulsions and remained unconscious till 2 A.M. About midnight ½ gr. of pilocarpin was injected subcutaneously, and the dose was repeated in fifteen minutes. This produced very profuse perspiration. It was the opinion of the practitioner in whose service he was that the injections saved his life, as he was in a most critical condition at the time. In the morning he was described as being calm, conscious, and suffering only slightly from headache. He was then washed, well rubbed, enveloped in warm blankets, and driven down to the Manchester Royal Infirmary to be under my care. It is interesting to note that in spite of the above statements as to apparent consciousness the patient declared that he remembered nothing after the onset of the first fit till he found himself in bed in the infirmary. The condition on admission and further notes taken by my excellent clerk, Mr. E. W. Battle, were in brief outline as follows: "The patient is a strong, well-built man; face red, partly from exposure; lips purplish; no œdema of eyelids or other dropsy. He is drowsy; complains of intense headache and dimness of vision; exhibits marked amblyopia; discs and retinæ normal. Respirations 16. Considerable amount of frothy sputum; physical signs over the lungs normal. The heart's impulse is of medium strength, somewhat diffused, visible in the epigastrium, and, like the dulness, extends outwards to the left nipple line; second sound accentuated at the right base and both sounds at the left apex; no murmur; pulse 68, regular, small, high tension" (see Fig. 1). "Tongue dry, slightly furred; patient thirsty.

FIG. 1.

Tracing shortly after admission, Feb. 1st.

Some pain and flatulence after food; no vomiting; bowels kept freely open—e.g., five times between Feb. 1st and 2nd. Urine: amount, 55 oz.; specific gravity 1020, acid, clear above, heavy deposit of urates; small amount of albumin, too small to 'Esbach'; no blood, epithelium, or casts to be found. Temperature normal throughout." The patient's weight averaged just under 12 st. He remained in the infirmary for three weeks, and was under observation a month longer at the convalescent home. No further symptoms developed. The high arterial tension and headache continued throughout, though varying in degree from day to day and responding markedly to nitro-glycerine tablets (Figs. 2 and 3). The urine, which was

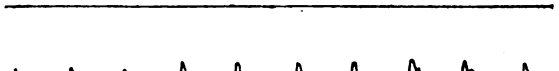


FIG. 2.

Tracing on Feb. 11th. No nitro-glycerine had been given for twenty-four hours.

examined daily, averaged 65 oz., the extremes being 55 and 98 oz. The percentage of urea ranged from 1·3 to 1·6, the amount excreted on the 16th being 480 gr.

FIG. 3.

Tracing on Feb. 12th, taken five hours after the administration of a tablet of nitro-glycerine.

The albumin disappeared by the 17th. No casts were ever discovered. He steadily improved at Cheadle, though the pulse tension remained above normal to the end. He returned to the infirmary for examination in June, 1893, came

to the Manchester Clinical Society two years later, and I have had specimens of his urine up to May, 1898. During the five years which have since elapsed he has had no symptom of uræmia, not even headache. His sight is good, the urine is normal in character and amount, the specific gravity being usually 1022, with 1·85 per cent. or more of urea, and there is no need for nocturnal micturition; indeed, he enjoys good health and is able to follow his employment. Though naturally a hearty eater he has been sparing in his diet ever since the attack and has also paid special attention to the regularity of the bowels.

And now having given my texts I wish to deal with them (1) clinically, (2) pathologically, and (3) therapeutically.

With regard to the first of these heads the marked cyanotic redness of the face seen in both cases might in earlier days have provoked the diagnosis of cerebral congestion. Knowing, however, little or nothing of the real condition of the brain we are now accustomed to point to the prominent cardio-arterial phenomena and to blame the kidneys for failing to purify the blood. Nevertheless, in not a few cases of convulsions and coma the urinary evidence, in my opinion, fails to substantiate any serious structural change in the kidneys and the happy sequel confirms the acquittal. Take the first case already detailed. We have a man whose cells—for physically we are a collection of cells with their cast-off clothing—were sixty-nine years of age and therefore presumably somewhat the worse for wear. The sixty-four hours' coma with convulsions from which he suffered can only be termed "uræmic." The diagnosis of acute Bright's disease was out of the question. In the absence of a post-mortem examination I suppose it is impossible to exclude chronic Bright's disease with absolute certainty. Nevertheless, I must express and defend the opinion that the facts warrant the absence of chronic inflammation of the kidneys. It is true that the patient had slight prostatic enlargement, but none leading to bladder distension or urinary change. It is true also that he showed signs of so-called uræmia for some time before the attack referred to, and that during the attack high arterial tension with definite cardiac enlargement were prominent phenomena. But he lived for two years and four months after the attack under medical observation and was in active work up to the day of his death. So well did he feel that it was impossible to persuade him to adopt, except very casually, the dietetic and medicinal preventive measures which were prescribed. During this period there were no diuresis, no dropsy, no eye phenomena, no discovery of renal casts; albumin, though carefully looked for, was never with certainty detected. Indeed, in no respect did the urine suggest Bright's disease. The pulse tension, however, varied considerably, tending at times to range distinctly high, and his spirits, mental power, and companionability played see-saw with the tension of his pulse. Now, I hold that it is quite unnecessary to invoke an inflammatory change in the kidneys to account for the symptoms. I rather judge that through age his kidneys were physiologically feeble and unable to excrete properly the nitrogenous waste of a hearty eater. With increasing years the vitality of the active protoplasm of the different organs deteriorates. Brain, heart, muscle, and glands become unequal to the tasks of bygone years. The large physiological reserve of earlier life is gradually lost until ordinary effort taxes the tissues' full power. When not built on the "one-hoss-shay" principle some organ takes the lead in the downward path. In this case the patient had begun to outlive his kidneys, a condition by no means rare and of extreme clinical interest. Though most of us have been brought up to regard uræmia, especially in old people, as the outward and visible sign of Bright's disease I venture to question the correctness of the inference and prefer to consider cases such as the above, in as far as they are renal, as coming under the head of the "senile kidney." This is no mere matter of nomenclature, a distinction without a difference, for it materially affects both the gravity of the prognosis and the character of the treatment. Dr. Balfour in his book on the Senile Heart rightly reminds us that in old age we are apt to diagnose "fatty heart" more frequently than we actually find it. It should be called "old muscle" which under adverse conditions may fail, but if relieved of strain will go on again in its quiet way as well as ever. So I hold that the senile kidney is not necessarily an inflamed kidney or even in the strict sense a diseased kidney; it is simply an old kidney, equal to some work, but not to full work. When overtaxed it may give rise to the most alarming and critical uræmic phenomena. The diagnosis of "Bright's disease" and the damper of "old age" take the edge off the treatment. It is assumed that the finale has been reached and that active interference is undesirable. Now it is in just such cases as these that the cerebral disturbance may be quite out of proportion to the renal failure, and old age, instead of a bar to recovery should be our hope and a stimulus to action. If the crisis be tided over and the kidneys be judiciously humoured many years of usefulness and quiet enjoyment may be added. Apart from definite organic disease the body is loth to die. There is an art in growing old with comfort and safety. As Oliver Wendell Holmes hints, old age has to leave many cards on us before we acknowledge ourselves at home to him. We are slow to recognise that the day for records is past, that the play given by functional power in excess of need is no longer ours. A failing heart pulls us up as we hurry to the train or tram and we make good resolutions and limit ourselves to respectable leisurely golf or the mildest of cycling. But a failing kidney, unless it act through the heart, does not worry us much. There may be no consciousness of any departure from robust health. The full pulse, with tension inclining to be high and in course of time arterial thickening, is commonly considered to be "a good strong pulse," and was thus described to me by an elderly gentleman yesterday. There is neither dropsy nor albuminuria, though the lower lids at times may be suspiciously full. The urine is variable in quantity, inclining to deficiency rather than to excess, of full colour, and of average or high specific gravity. There is, indeed, nothing to lead the patient to the medical man, and yet were the possessor of senile kidneys wise and wealthy he would visit his physician daily, and regard him as the purveyor of health rather than the curer of disease. I say "he," for the majority of the cases are men, with whom approaching age curtails outdoor rather than indoor activities. The grey-haired boys are more apt to forget the lapse of years amid the festivities of the dinner-table than in the gymnasium or athletic ground. The knife and fork are wielded as energetically as ever, and the health of friends is drunk to the detriment of the drinker. Literally, in cases recently seen by me, roast beef, plum-pudding, mince-pies, and "good old port" are still the order of the day when impaired excretion calls for abstemiousness. Old habits die hard and obstinacy is not confined to children. When the attack does come it is often quite as much the result of undue stoking as of a blocked funnel. There is no doubt in my mind that habitual over-eating and drinking, or even the continuance in old age of the table habits of adult life, conjoined with senile kidneys, will produce many of the systemic changes usually attributed to chronic Bright's disease. This specially applies to the cardio-arterial and cerebral phenomena. The blood-contamination which is a tolerably fixed factor in true renal disease is, of course, more fitful in its senile "double." Hence the course of the former is more definitely progressive than is that of the latter. Still, I am inclined to think that the arterial thickening found in elderly persons of full habit often arises in this way. The associated cerebral affection may be gradual and cumulative, as in the case of the clergyman, or sudden in its onset. It is characterised by coma and marked congestion of the face and neck with or without convulsions and passing paralytic phenomena. That paralysis may occur in uræmia and in this allied condition, independently of a hæmorrhagic focus, is surely placed beyond doubt. About the year 1880 I saw a man suffering from chronic interstitial nephritis who again and again was brought home from business in uræmic coma. On one occasion he also developed hemiplegia and hemi-anæsthesia and when in that condition was seen by the late Dr. James Ross. The paralysis and coma passed off coincidently and completely and were followed by delusions which lasted several days. He tried to discharge all in attendance because of the clocks carried about in their interiors, the ticking of which greatly annoyed him. Dr. Ross agreed with me in attributing the whole to the uræmic condition. Eighteen months ago I saw a man, in consultation, who, when in the act of drinking healths after dinner, according to his custom, fell down in a state of unconsciousness. Though comatose he strongly resisted all attempts to convey him to bed. When seen later in the day he was found to have an extremely congested face, pupils equal but sluggish in reaction, a pulse of very high tension, and heart-sounds to match. There was definite right hemiplegia, affecting the arm more than the leg, and great

irritability, in spite of complete loss of consciousness, so that it was difficult to keep him in bed. The *besoin d'uriner* asserted itself. The temperature rose to 102° F. We therefore gave him minim doses of tincture of aconite and grain doses of calomel. I confess I was inclined to regard the condition as one of organic lesion, and my friend was the first to suggest that the case was almost on all fours with that of his father. Anyhow, as the arterial tension yielded both coma and paralysis vanished simultaneously. The patient was unconscious for three days, but after the recovery of consciousness he desired to get up and rebelled against the enforced rest. The urine was acid, high-coloured, deposited urates, and did not contain albumin. This patient is still alive and in his average health. The urine is acid, high-coloured, its specific gravity is 1022, and it contains neither albumin nor sugar. It is interesting to note in all such uræmic conditions that many apparently voluntary acts and intelligent responses to questions leave absolutely no impression on the memory, just as in the post-epileptic state. The other day one of my out-patients after an epileptic fit walked several miles in his shirt-sleeves with an axe over his shoulder before he came to himself.

Sir William Broadbent in his very able and interesting book on the pulse lays great stress on the association of convulsions with high arterial tension and suggests that cerebral capillary stasis is the immediate antecedent. Headache and coma are equally the product of vascular tension, and if the intense congestion of the head and neck be any guide to the intracranial condition the explanation just given would certainly apply to all the cases I have seen which were independent of true Bright's disease. It is evident, however, that Sir William Broadbent holds that the high tension producing such convulsions may be quite independent of the kidneys. In other words, the impurity of the blood is due to over-production rather than to imperfect elimination. Whilst acknowledging the possibility of such an origin I am not prepared to exonerate the kidneys so completely in my cases as Sir William Broadbent seems disposed to do in his. Indeed, I believe that just as the cerebral condition is the outcome of the high arterial pressure so the latter indicates the retention within the system of excretory matter which even though in excess physiologically healthy kidneys could easily eliminate. Almost invariably the high tension is of some standing and the gathering storm gives its warning. There is a state which suggests a standing cause, the man having no superfluous kidney power. All the cases are met with in middle or later life and the younger the patient the more certain are you to find either free living—which undoubtedly tells on the kidneys—or actual renal disease which more seriously limits urinary play. This seems to apply to most, if not all, of the cases quoted by Sir William Broadbent. I believe that many men who habitually imbibe wine and spirits and eat largely have at forty or fifty years of age kidneys which for excretory power must be classed as sixty or seventy years old. It is in the middle and later life that alcohol finds a man out. Such persons innocently expect a bottle or two of medicine to set them right, forgetting the number of larger bottles emptied in the past and the length of time devoted to the process. It is this renal defect which gives point and more or less continuity to the contamination of blood due to the otherwise comparatively harmless excesses in diet.

What the exact element is which raises the arterial tension I do not know. It may be a single factor, a varying factor, or a combination of factors, and it is possible that at times its retention may be compatible with the elimination of the other urinary excreta. Anyhow the cerebral phenomena associated with the senile kidney suggest to me a simpler form of blood contamination than that found in the terminal uræmia of true Bright's disease. That the high tension is a recognition of the need for excretion in a body awake to its needs appears to me plain, but the indication at present is general rather than special. I do not believe that uric acid is the key to this secret chamber.

And now let me formally restate the position taken in this paper. In old age and premature old age there may be a curtailment of renal excretory power without any of the urinary signs of Bright's disease. This functional failure is associated with diminished and condensed rather than with abundant pale urine. It is apt, especially under the stress produced by repeated excesses in diet, to give rise to high arterial tension, cardio-arterial changes, and marked cerebral phenomena. The prognosis of uræmia occurring under such conditions is far more favourable than in true Bright's disease. Apart from intercurrent disease cerebral hæmorrhage is the most common terminus. A post-mortem examination is rarely made, the cause of death being evident, and if the body be examined the kidneys, when not definitely sclerosed, are exonerated, and age and arteries alone credited with the final result. Should any structural change, however slight, be found, latent Bright's disease is taken to be a sufficient solution of the problem. To the clinical picture drawn above, which is by no means a rare one, I am accustomed to give as a name the "senile kidney." Since I first read this paper the need for the definite recognition of such a condition, *especially in its relation to uræmia*, has been strongly corroborated by the volunteered experience of medical friends. That uræmic coma and convulsions are not always associated with Bright's disease is frequently illustrated in the puerperal state. During pregnancy, owing to fœtal life and metabolism, there is a call for increased maternal excretion and after birth uterine involution and other changes predispose to undue blood contamination. Should true kidney disease exist one can easily understand how acute disturbances may arise. But in a large number of cases puerperal convulsions do not come under this category. They are purely passing phenomena and leave not a wrack behind. When the blood is surcharged with excreta a comparatively slight renal inadequacy suffices to ensure an explosion. Pressure prior to or at birth may interfere with functional activity, the toxins themselves may produce temporary paralysis of renal cells, &c.—somehow a second factor arises and high tension with coma and convulsions is the result. But it is a case of "*Sublatâ causâ tollitur effectus*": appropriate energetic treatment tides over the crisis and the patient's life prospects are unimpaired. I am inclined to think that such attacks occur apart from pregnancy and in the other sex. The second case which I narrated would undoubtedly be classed as acute Bright's disease. But the only prominent phenomena were those of severe uræmia with prolonged arterial tension, phenomena which indicate not inflammation of the kidneys but simply retention of the urinary excreta. The signs of renal congestion and tubal inflammation were at a minimum. Beyond some puffiness of the eyes at the outset there was no dropsy. After admission to the infirmary there was never more than a trace of albumin in the urine. Blood, renal epithelium, and casts, though carefully looked for, were never found, even when inorganic deposits were present to carry them down. If present at all such elements must have been few and far between. I myself was inclined to regard the case as one of chronic interstitial nephritis, the latency of which is known to all of us. But time appears to be solving the problem adversely to this conclusion. Five years have passed; at no time during that period has the urine been found to be in any way abnormal. No albuminuric retinitis or other register of renal disease has developed and the patient enjoys good health. We have here a hearty eater who, in earlier years, was very free in his habits and who probably thus took the edge off the excretory powers of his renal protoplasm. The kidneys receive a slight check and phenomena altogether out of proportion to the renal change rapidly develop. At present he lives in the regulation of his food and bowels, as knowing himself to possess kidneys equal to ordinary demands but not fit for record excretions.

Let us now turn for a few moments to the pathological side of this subject. At times elderly kidneys are described by the morbid anatomist as "somewhat fibrous." It does not, therefore, follow that we are to call the disease chronic interstitial nephritis. Fibrosis has a wider significance, and it is quite unnecessary to conjure up the spirit of inflammation to account for its presence. Between those who hold that all renal sclerosis is inflammatory in origin and that the associated cardio-arterial change is a dependent sequel and those—like Gull and Sutton and Balfour—who would make the kidney disease a mere degenerative item in a primary arterio-capillary fibrosis there is a reasonable *via media*. That chronic interstitial nephritis is a well-established inflammatory affection due to definite irritation, frequently scarlatinal, and responsible for cardio-arterial, ocular, and other remote phenomena, there can, I think, be no shadow of a doubt. But that all renal sclerosis owns a similar origin I do not believe. Many pathological facts seem to suggest that whenever there is diminution or loss of functional power without coincident loss of blood-supply; whenever, that is, the protoplasm of the master tissue fails in its activities whilst the nutritive

supply is maintained, there is a tendency to overgrowth on the part of the connective tissue. It is reasonable to suppose that vascularity in absence of the usual metabolic and excretory processes may unduly stimulate the connective tissue cells. The blood, accustomed to dispose of its goods to the active protoplasm and being foiled in its efforts, seeks another market, and presses its wares on the interstitial tissue; this having no active function can only show its overfeeding by overgrowth and by the display of its anabolic power in the manufacture of intra-cellular fat or extra-cellular fibres. The best example in a tissue not given to adiposity is seen in the descending lateral sclerosis which follows a lesion of the upper motor arc. We have a tract of living protoplasm cut off from its trophic cortical cells and thus rendered functionless by a lesion which does not interfere with its blood-supply. Certain brain scleroses in early life seem to me to own a similar origin. It is not, of course, suggested that the vascular factor is the only factor in the production of such pathological results. I do not forget that blood-supply is largely a question of nerves and that independent trophic influences are at work; in short, that the problem is complex. In this connexion the periodic nervo-vascular tension associated with functional activity must not be forgotten. We know that the former may occur without the latter, as when the submaxillary branch of the chordatympani is stimulated after the administration of atropine; the vessels dilate, the gland is gorged with blood, but no secretion follows owing to the paralysis of the cells. It may be that the "empty stomach" of a man long past his usual mealtime is due to this tension awaiting cell activity. This unfulfilled expectation when often repeated is undoubtedly a cause of gastric disease, not simply because the organ fails to rise to the occasion when the food does come, because hope deferred maketh the stomach sick, but possibly also because the natural relief to the nervo-vascular erethism given by periodic cell activity and secretion is not experienced, and the unfulfilled desire to provide a functional blood-supply is partly diverted to the connective tissue elements. This question hardly arises in connexion with the kidneys, the cells and glomeruli of which are always in action, but in these organs other factors, even more potent, come into play. Not only have they a blood-supply out of proportion to their size, but also their failure in function produces a general rise of blood pressure with special local vascular stress. Diminished excretion entails increased blood-supply. Should the glomeruli and tubal cells be unable to respond to the stimulus the increase of the interstitial elements is hardly to be wondered at. This hyperplasia may occur, but not necessarily, in senile cell failure. That lead, alcohol, and other poisons may produce renal sclerosis through primary premature loss of vital power in the excretory protoplasm I firmly believe. The gout which accompanies plumbism bears witness to the imperfect excretion. Strong alcohol acts as an irritant and produces small-celled inflammatory exudation, as is well seen round the lobules of the liver when spirit, almost "neat," is frequently poured into an empty stomach on the "hail fellow, well met" principle. Being rapidly absorbed, and only diluted with the blood in the portal vein, the liver experiences its full irritant power; before reaching the other organs of the body the alcohol is mixed with the blood in the superior and inferior cavæ and exposed to excretory areas, so that its power as an irritant is very much lessened. Unfortunately, moderate drinkers measure the effect of alcohol on the system by its action on the muscles and the brain, and so are often able to carry and guide home a drunken and disreputable liver without any compunction. Primary alcoholic irritative interstitial nephritis is therefore not a common occurrence; it is, however, occasionally seen in very heavy whisky drinkers, though commonly overshadowed by the hepatic lesion. Many persons who continuously imbibe more dilute alcohol, as opposed to the "nippers" already referred to, exhibit widespread pathological changes which, in part or at times, are irritative in character, but which may largely be explained in another way. Short of primary interstitial irritation, I believe chronic alcoholism takes the edge off the powers of the more highly specialised protoplasm, notably affecting that of the nervous system and kidneys, which is more staid in character and does not show the rapid reproductive changes seen in the cells of the blood, alimentary tract, &c. As the result of the prolonged influence of alcohol we have curtailed functional activity, diminished vitality, and lessened power of resisting disease. In the nervous system this discounts mental and physical vigour and renders a man of less use to himself and to the community. In the kidneys, where its incidence is possibly greater than on the remaining organs on account of the relatively large blood-supply, it entails the consequences of premature senility. Physiological cell-failure may alone result or, in accordance with the principle already laid down, fibrosis may be superadded. Though it may be difficult in alcoholic peripheral neuritis to prove that diminished axis-cylinder power precedes the interstitial nerve changes, in the parenchymatous paralysis following diphtheria, &c., which are painless from the start and plainly toxic and central, the hyperplasia of the endoneurium is so evidently secondary that it gives countenance to one's views whilst illustrating the general theorem. Anyhow, the relation of diminished functional power with continued blood-supply to fibrosis deserves attention. Should the quality or amount of arterial blood transmitted to an organ be diminished without primary failure of the functional protoplasm, fatty metamorphosis, without fibrous thickening, usually follows.

Where the curtailment of nerve energy, vascularity, and functional activity are coincident simple atrophy is the natural sequel. The marvellous involution of some uterine fibroids at the menopause is a sufficient illustration. A year or two, as I have recently witnessed, may thus render impalpable a large abdominal tumour. But where the blood-supply is retained and function lost the connective elements may revel in the unwonted feast, as in uterine hydatids, where, through failure of the fœtus, the blood-supply is diverted from its main object and the body forgetting to turn off the vascular taps the current is concentrated on the connective tissue, here of the "mucous" variety. This principle seems to have wide applications in pathology and I am glad to see that Professor Adami, in the excellent article on Inflammation contributed to vol. i. of Professor Allbutt's System of Medicine, is disinclined to regard all sclerosis as inflammatory in origin.

Thirdly, dealing with the therapeutics of my text, the prevention and treatment of uræmia in senile kidney and other renal failures may be considered under two heads: (1) attention to diet and (2) measures calculated to aid excretion, to lower arterial tension, and to quiet convulsion. Though of the greatest importance a few passing remarks must suffice for the former. Temperate living in old age would lengthen many a life, warding off apoplexy and uræmia. Indeed, the marked difference in personal comfort and vivacity brought about by a change in table habits has often astonished both the patients and their friends, as the former entirely ceased to discuss whether life was worth living. This need not entail the adoption of liquid or invalid diet, for in advanced life the stomach usually secretes and digests more satisfactorily when stimulated by solid food than when treated to "slops." The sum total of food should be restricted within reasonable limits. This is more important than any specific act of self-denial. If an egg or fish be allowed for breakfast animal food should be permitted at one subsequent meal only, and that not too late in the day. To prevent undue condensation of urine the amount of liquid imbibed should average 40 fluid ounces and be taken chiefly between meals lest it dilute the gastric juice. Intoxicating liquors are better forbidden; if insisted on a small amount of diluted dry spirit during the chief meal and at bedtime may open the tardy stomach arterioles and favour sleep. That vascular tension is thus kept down is matter of observation. Prolonged uræmic coma, just like an attack of gout, is a time of diminished ingestion, and the latter no doubt aids the recovery.

Under the second head I wish to discuss in more detail the value of (*a*) purgatives; (*b*) chloroform, bleeding, and the nitrites; and (*c*) diaphoretics. The importance of attention to the bowels cannot be over-estimated. Not only does regularity greatly lessen the chances of secondary fermentations and toxin formation, but by purgation we can turn out of the body bile and half-digested food and also command the radicles of that vein which carries the crude products of digestion to the great provident dispensary of the body, the liver, where for weal or woe so many mixtures are made. Modern abdominal surgeons, whose one aim in the old days was to keep the intestines quiet, are now beginning to realise their value in elimination and to substitute calomel and salines for opium. They talk of "the race for the bowels" and use the intestine as if it were a drainage-tube. I firmly believe that in commanding the liver and intestines we hold the most important excretory area in the body after

the kidneys. In this respect the views of the late Dr. Mahomed were undoubtedly correct. Indeed, the efficacy of purgation in high arterial tension and uræmia is acknowledged by all, but there is still considerable diversity of opinion as to the relative value of the different drugs. May we employ calomel? Sir William Broadbent places it *facile princeps* amongst the drugs which lower arterial tension and strongly advocates its use in from 2 to 5 gr. doses. Many other writers—e.g., Dr. Whitla in his excellent Dictionary of Treatment—only mention it in order to warn their readers not to prescribe it, and my early training and teaching ran in the same groove. Now I frequently exhibit it when I have reason to regard the uræmic phenomena as out of proportion to the organic renal change. Should the cells of the kidney be much degenerated—that is to say, in parenchymatous disease with dropsy, marked albuminuria, and abundant fatty epithelium and casts—the drug is distinctly dangerous. Quite recently I saw such a case in which 5 gr. of calomel had been given. It stopped the uræmic vomiting, relieved for the time the headache, and lowered the blood tension, but the marked swelling and tenderness of the salivary glands and gums, the furred, foul tongue, &c., gave ample witness that the administration was a mistake. In the terminal uræmia of Bright's disease calomel acts as a poison and the more definitely the cerebral phenomena depend on organic renal failure the more doubtful the use of mercury. The condition of the kidneys *quoad* Bright's disease is in my opinion to be our guide. It is the fact that severe convulsions and coma may be associated with a minimal or passing renal defect that makes calomel admissible. That all such cases have exactly the same pathological substratum I am far from believing, but the use of calomel is not limited to those conditions in which the renal trouble is only transitory. Whenever the blood tension is high, the urine is passed in fair quantity, of average or high specific gravity, deposits urates and contains only a small amount of albumin, I employ calomel without hesitation. Taken alone the amount of albumin present is of little importance. In puerperal convulsions I have seen very highly albuminous urine return to the normal within a few hours. Numerous and varied renal casts must, however, give us pause, more especially if they testify to chronic tubal change.

In senile failure, and in the middle and later stages of chronic interstitial nephritis, we must remember that the system is sensitive to mercury and therefore recall Dr. Ringer's remarks on minimal dosage. In early days I saw 15 gr. and 20 gr. of calomel given as a purge with excellent results. The Cleadle bull-dogs, of local repute, are said to owe their ferocity to this drug. Such treatment in renal failure could only be regarded as tempting Providence. One grain is often an ample dose. Quite recently I saw a gentleman, well in the "teens" of stones, who smiled at the powder in the evening, but assured me that his respect for it was considerably raised on the following morning as it kept him from business. A lady, aged seventy-six years, who was under my observation for several years with gouty cardio-arterial and retinal changes, was severely purged by 1 gr. of calomel, but so greatly relieved thereby that for three or four weeks after each dose she seemed to have taken a new lease of life. The same lady for three years took 5 gr. or more of pulvis ipecacuanhæ compositus every night with great advantage, a method of administering opium in Bright's disease which I consider to be safer than any other. As commonly happens this patient died from an acute and entirely independent affection.

Calomel undoubtedly reduces high arterial tension and relieves the troublesome cardiac, pulmonary, and cerebral phenomena associated with it. It takes several hours to act, but the effect produced is less evanescent than with other drugs. How calomel acts I do not profess to explain. That mercurials will often clear a dense uratic urine is known to all. Elimination of bile by the bowel is probably the principal part of the programme. Anyhow, in dealing with high tension calomel is superior to all other purgatives, including blue pill. It sweeps and drains the intestines as well as the hepatic ducts and in my opinion differs materially from crude mercury in its action. In a case of obstructive jaundice of some weeks' standing, now under my care in the Manchester Royal Infirmary, in which the administration of olive oil, massage, and other treatment have failed to remove the obstruction, both patient and medical man gave independent witness that 1 gr. of blue pill taken three times a day increased the colour of skin and urine, whilst 1-grain doses of calomel caused decided improvement in the digestion and complexion and lessened the urinary excretion of bile, in spite of the continuance of the block in the main duct. Next to calomel, but as its aide-de-camp rather than its substitute, I do not hesitate to place Epsom salts, and in acute cases I am accustomed to follow up the calomel after five or six hours with 2 to 4 drachm doses till free purgation occurs. In chronic high tension an aperient dose of the mistura alba on rising each morning gives very definite relief. I use it extensively in out-patient practice and find, as Dr. Whitla observes, that it can be continued with advantage for long periods. Our mercurial ancestors, with their nightly blue pill and morning black draught, and their by no means delicate attentions to the *primæ viæ*, were perhaps nearer the mark than some of the more scientific moderns. I am told that my friend, the clergyman, was a younger and a better man whenever he had time and grace to attend to his bowels. When calomel is contra-indicated, and especially if dropsy be present, I often employ the compound jalap powder in drachm doses. Some fortify it with elaterium: my experience of the latter drug has not been encouraging. On two occasions the fault may have been in the quality of the drug supplied, in other cases it has been rejected or failed to act. An extra drachm or two of bitartrate of potash may be added, as recommended by Sir William Roberts, with excellent result.

There are, however, cases in which the convulsions are so severe and the whole condition so critical that some method of treatment more rapid than purgation is urgently demanded. If the blood tension be high I believe that both theory and practice uphold blood-letting as a reasonable and efficient remedy. It is true that physiology teaches us that moderate venesection does not lower the arterial blood-pressure and arguments have been based on this statement deriding its utility in disease. But surely a deviation from the normal is a very different thing from a return to the normal. The aim of the automatic regulating mechanism of the body is to secure normality. It may raise the blood-pressure with a view to increased excretion, but it will gladly allow a return to the normal if practicable. I advocate bleeding as a temporary device to tide over a crisis; that it accomplishes its end is undoubted. It must in most cases be backed up by measures more definitely depurative in character, dietetic and excretory. Some obstetric writers, like Dr. Galabin, absolutely set their faces against it. A friend of mine, surgeon to a large hospital, who has had a wide experience in such cases, told me that the only patient he lost in puerperal convulsions was the only one he did not bleed. Its utility in uræmia is maintained by such authorities as Sir William Roberts, Sir William Broadbent, and Dr. Osler. It may be employed with advantage in all cases in which calomel is admissible. Where the patient is already very anæmic and the kidneys are far advanced in organic disease both remedies are worse than useless and the prognosis is not markedly affected by any treatment. In the clergyman first referred to the congested face and full habit of body distinctly warranted the use of the lancet, but the absence of convulsions allowed time for the action of still better remedies. In dealing with severe puerperal eclampsia chloroform by the lungs and chloral and bromide *per rectum* are of unquestionable value. Nevertheless, though they mitigate the convulsions, like morphia they mask the coma, and I am bound to confess that when the pulse tension is high and the patient is plethoric I incline to the older method of treatment. Of the reported value of morphia in uræmia proper I have had no experience and should prefer to commence the trial of it on my enemies rather than my friends. Still, it strikes me as peculiar that the two drugs, mercury and opium, against the use of which in Bright's disease we were formerly warned, should be now both to the front in the treatment of uræmia. This does not prove that the former fears were groundless, but rather supports my present position—namely, that the more pronounced symptoms of uræmia, coma and convulsions, are often associated with comparative renal integrity.

In dealing with the results of chronic high tension I have found the nitrites very useful, but so far have not tried them in actual convulsions. An aching head or a heart struggling irregularly and painfully against an over-full arterial system will at once gratefully acknowledge the receipt of a dose of nitrite of ethyl, as suggested by Dr. Leech, or more slowly respond to tabellæ of nitro-glycerine. The latter preparation, because of its stability and ease of administration, I frequently employ in chronic high tension. It

gave great relief in the second case and may be used to diminish the intense headache which often accompanies the development of albuminuric retinitis. The sphygmograph readily reveals the action of the drug and may be employed to indicate the amount and frequency of the dose required to mitigate the tension. I say "mitigate" advisedly, for to relieve the symptoms it is not necessary, nor, indeed, is it an easy matter, to establish a normal tension. A tabella every six or eight hours is usually sufficient to accomplish the desired end. In one case of cardiac asthma with very irregular high-tension pulse the relief given by the nitrites was so great that the patient was immediately transferred from his bed to the local races, and the latter end of that man was worse than the first. As his medical attendant observed, the treatment both cured and killed him. Sometimes the nitrites produce definite diuresis, but even this should not lead us to set aside other eliminatory measures. When the kidneys fail the skin presents a large and active secretory area second only in importance to the mucous membrane and glands of the alimentary tract. The fact that in Bright's disease urea is excreted by the skin is a definite indication to the therapeutist. Of every-day drugs the sweet spirit of nitre and the acetate of ammonia are the most popular and valuable diaphoretics, but in uræmia we are compelled to adopt more active measures, such as the external application of heat, wet or dry, and the hypodermic injection of pilocarpine. The hot pack is one of our most valuable remedies and available in almost all cases. It is, however, to be specially selected when calomel and venesection are out of the question, when the system generally, and the connective tissues in particular, are drowned in ureated liquid and when the brain disturbance is more dependent on direct intoxication than irregularities of arterial pressure; in other words, in the dropsical uræmias of blocked or bankrupt kidneys.

The employment of pilocarpine hypodermically is not without its dangers. Nevertheless, if other remedies fail, it may be tried, provided the patient possesses full power of deglutition and the thoracic organs are in good conditon. Its action should be assisted by the use of hot blankets, ot bottles, and warm drinks. Usually the response of the skin is rapid, a few minutes sufficing to start the perspiration, but the response of the system is somewhat more uncertain in time and degree. The effect produced, however, in some cases, as in the second already referred to, is very striking. Personally I avoid the use of the drug if possible, but confess that I have not tried the method of inunction recommended in milder cases by some writers with the object of reducing the risk of cardiac collapse and pulmonary œdema to a minimum. As pilocarpine is recommended in some forms of insanity it may be interesting to add that my friend Dr. Wansbrough Jones after the hypodermic injection of ½ gr. for ocular disease witnessed the immediate development of acute melancholia with attempted suicide, and the repetition of the dose some time later at the recommendation of the oculist led to a similar disturbance followed by several months' detention in an asylum. As there was no family history to suggest such a complication the drug was naturally suspected. At any rate the dangers of pilocarpine are sufficiently real to render its use a matter for deliberation. Many other interesting points in the treatment of uræmia press for discussion but time forbids. My object is accomplished if I have left on your minds the impression that so-called uræmic convulsions and coma have not necessarily the serious prognosis usually accorded them; that they may occur apart from evident organic disease; that even in Bright's disease they may prove to be mere accidents by the way; and, lastly, that the value of treatment is often greatest in old age, when the physician is in danger of standing by to watch the curtain fall before the drama has really reached the *finale*.

Manchester.

ON Wednesday evening, May 25th, a conversazione of the St. Andrews Graduates' Association was held at 11, Chandos-street, Cavendish-square. The company was received by the President, Dr. William F. Cleveland, and Miss Cleveland, assisted by the Vice-president, Sir Charles Gage Brown, and others. There was a large gathering of members and their friends, and an excellent selection of vocal and instrumental music was given under the direction of Dr. Cooper Key, of Wilton-place, a member of the council of the association.

MALARIAL FEVER: SOME SUGGESTIONS IN ITS PATHOLOGY AND TREATMENT.

BY WILLIAM FORBES-LESLIE, M.B., C.M. ABERD.

DURING the last few months malaria has appeared as a plague at Batum and in other districts of Asiatic Russia, causing a dreadful mortality, and the losses of the Spanish army in Cuba from the same cause, which I have reason to believe may be placed at nearly 100,000 men, with the death of Sir William Maxwell and others, make this, so it seems to me, an opportune moment for its discussion. My experience of the disease, extending as it does over a period of nearly twenty years, may, I hope, give me a certain authority for the statements I am about to make and lend weight to the observations which have led me to conceive a new pathology and treatment for it. Malaria for centuries has been recognised as the fever which infected marshy and tropical districts. It has during this long period received many names according to the type in which it manifested itself. There are certain parts of the world where it is more common than in others and where it is most deadly; such a part is the west coast of Africa, East Africa, and Madagascar, and it is the malarias of these countries, especially of the latter two, which I wish to discuss. Malaria is endemic, that is, it is confined to certain districts, and has no power to spread beyond its natural zone of production. Some observers are inclined to grant it an epidemic power, and this I believe it has in certain of its independent forms, such as influenza, malarial cholera, yellow fever, and dengue in all forms arising from and particularised from the parent disease. It has the tendency to widely extend itself beyond its seat of origin by winds, rivers, and sea-currents, to be deflected by forests, perpendicular cliffs, and to be impelled obliquely along slopes from the earth to the upper air-currents. It has a great attraction for the earth, which prevents it rising perpendicularly as do the more volatile matters of evaporation. I have noticed that according to its methods of transmission so it differs in the symptoms it produces. Thus if drunk in water or taken in food it gives rise to algid forms. If inhaled in the district itself it gives rise to a continued type frequently terminating in hyperpyrexia, but if inhaled at sea to an irregular type, characterised by intermittent fever, ague, or enteritis. I cannot see that Dr. Manson has proved that the mosquito is the intermediary between the malarial germ in the soil and that found in the human blood. The poison itself is said to be an organism, and this can hardly be doubted, but its form and method of development are not yet understood. Italian observers lay claim to its discovery. Their experiments have been made on Roman fever. It is not singular, therefore, if other observers contest this organism and lay claim to have discovered another which they say is always found in the blood in malaria. The difference in the fever of the Roman marshes from the Chinese and Indian fevers is most marked and my experience in Africa alone has taught me that the fever of no district resembles another, but they differ in some instances as widely as typhoid fever from cholera. Indeed, one could make a fever map of the African continent as uniform in its areas as the counties of England appear on a school atlas. Observers have tabulated such a number of bizarre forms of the organism in the blood that one gets confused and doubtful as to their identity and rather inclines to the belief that they are abnormal elements of the blood changed by some chemical action of the poison than individual organisms. My opinion is that the true germ of malaria has not yet been discovered and will not be till we can obtain a higher power of the microscope. As every district has a fever differing clinically, so must every fever be produced by a different and modified organism. How can we say definitely, then, Here is the organism of malaria? Rather say, Here are a score of organisms which produce malaria. We are only on the threshold of our knowledge of its life-history. Another fact I have observed is its power to produce other diseases. In this it somewhat resembles syphilis; but I cannot help thinking there may be some relationship between the two. In all malarial districts we find syphilis in its worst form, and in Madagascar it is so

common that but one adult native out of ten has not had it or is not suffering from it. Then we know that syphilis came from the east. The poison of malaria is an elastic poison. It is not only changed by difference of district and atmosphere, but by constitutional idiosyncrasies. We must read a malarial origin in pneumonia, typhoid fever, cholera, dysentery, enteritis, yellow fever, malignant endocarditis, multiple neuritis, locomotor ataxy, myelitis, meningitis, lunacy, hepatic troubles, kidney disease, blood diseases, skin diseases, and a host of others, not forgetting the bleeding diathesis. We must be prepared to recognise and treat these, not by the ordinary routine, but by that which applies to malaria, the initial disease and origin of them. It is wonderful to think that a poison can be so mobile as to be capable of change to such an extent. It naturally leads one to a belief that disease can only be impelled along certain planes and that under certain stimulation the tissues react in a certain manner. Another interesting fact in African fevers is that the sequelæ are far less in extent and severity in the algid than in the low forms. Thus we get serious impairment of motor or sensory paths, such as multiple neuritis, locomotor ataxy, migrating neuritis, sclerosis of the cord, paraplegia, hemiplegia, meningitis, meningeal and cerebral hæmorrhage, epilepsy, and diseases of the heart, liver, spleen, and kidneys. There is a great similarity between forms of malaria and influenza. It is natural, as it were, for one to telescope into the other. An attack of influenza will terminate in malaria or the reverse. And I have often noticed that malaria may infect with influenza, so that in this way malaria may originate an epidemic energy. It is quite in line with present opinion that influenza is a hybrid of malaria, for it is conceivable when we consider the mobility of the poison, its proneness to change with a change in its environment, and the fact that as disease is now undoubtedly proved to be the product of organic life that this life should be dominated by the law subserving life in the other departments of nature, and that the law of ascent is as applicable to the organisms of disease as to the organism of man.

We have now arrived at a stage when it is possible to determine the laboratory of the poison. It is necessary in every specific disease that it should have a nidus suitable to its development. Most observers in malaria have placed this in the blood. They say that once having gained entrance to the blood-stream it finds the necessary material for development and sets up a train of symptoms which are the clinical parallel of that development. Klebs was the first to demonstrate this theory by the discovery in the blood of an organism which he believed to be that of malaria. But it is obvious that there must be many organisms in the blood which from our imperfect microscopical powers have escaped notice; and also with a poison so powerful as malaria there must be a corresponding change in the elements of the blood with the production of bizarre forms, the difference between which and the latter is so slight in some cases, if any, as to render a decision difficult if not impossible.

It has been a matter of considerable dispute in what manner the poison obtains entrance into the system. Laveran and older authorities held that it did so through the drinking water, others again believe that it is inhaled, and lately Dr. Manson has come forward with a theory that it enters the blood directly through the agency of mosquitoes. I believe it is possible for it to enter in all these ways. But its introduction by water through the *primæ viæ* is undoubtedly the most frequent method and the most fatal. In almost all the severe cases of algid malarias I have treated the poison has been, as far as I could ascertain, introduced in this manner. So long as the water is boiled, the fruit fresh, and the other natural conditions of health fulfilled, there will be no algid malarias. Dr. Manson's observations have been principally taken from Chinese and Indian malarias. He hypothecates a parasitic cycle such as one finds in certain other diseases. He then goes on to prove this hypothesis by demonstrating similar organisms in the mosquito and malarial blood. The mosquito may in many cases become an accidental medium, but that it is a necessary intermediary is not borne out by facts. It is highly probable that mosquitoes absorb the malarial germ during their aquatic life and that it is possible to introduce such into the human blood, but whether the organism so introduced can set up the disease in healthy blood is not proved. It is not certain that infected blood from one person can produce the disease in another. If there is, as Dr. Manson believes, a parasitic cycle, such introduction must necessarily break that cycle, because it is not only necessary for the organism to change as the development proceeds, but a change must take place in the blood to fulfil a further development in the organism. Further, to look at it practically, how can Dr. Manson explain the reason why persons are attacked at sea by fever who have never been bitten by mosquitoes and who have never been before to a tropical country? I have seen hundreds of such cases. How is it that all the passengers on that side of the vessel nearest the coast have been seized by fever and the remainder on the other side escape. Surely it is not possible to believe that only these were bitten by mosquitoes and the rest were not. Is it not more conceivable and in line with its diffusion to believe that trade winds blowing off the coast carried the poison against that side of the vessel and that it was inhaled by the passengers whose cabin windows were open, but following a law of its diffusion which prevents its rising perpendicularly, was repelled by the side of the ship and obliged to ascend obliquely over it? We can divide most diseases into those arising from organisms in the blood and those arising from the introduction into the blood of the developmental products of organisms outside the blood. Under which class does malaria enter? It is generally believed that it is under the first that we must place it. I entered the field of practical observation equipped with this theory, but my experience after a time led me to modify my belief and I have now altogether changed it. I cannot bring myself to consider malaria other than the result of the products of the developmental energy of the organism outside the blood-stream, and some of the facts which have led me to this belief are that preceding the fever there is invariably a stage of hepatic congestion and signs of bile in the blood; the proneness of the disease to attack the *primæ viæ*, as evidenced by gastric derangement, enteritis, dysentery, and typhoid fever; the peculiar liability of the liver to acute inflammation with abscess as an extension from the *primæ viæ;* the induction of the algid malarias through the *primæ viæ;* the success of a treatment which aims at sweeping out the intestinal tract and disinfecting it; chills and rigors preceding the rise of temperature, with alternating falls and sweating; and the periodic type of the disease with alternations of health and disease. We know that constipation and other bowel derangements will cause stagnation of bile with increased absorption into the blood and that in this condition the constitution is more liable to disease than at any other time. We know also that by an energetic action by purgatives we can cleanse the *primæ viæ*, promote the natural passage of bile, and filter that already in the blood partly through the intestinal walls and by the kidneys. Now we know of no organism which fulfils part of its life history in the human blood which gives rise to such symptoms as are invariably found as a part of this disease except perhaps dengue—but dengue is only malaria under another name—and relapsing fever, which bears a close relationship to it. Idiopathic cases of pyæmia are so like malaria that it is often impossible to distinguish them. But this only bears out the fact that malaria, like pyæmia, is an extraneous disease. If we grant the extraneous life of the parasite then where is its place of development? Like pyæmia it must have a laboratory. I have no doubt that the laboratory is in the intestines, and that from here the poison dispenses its products either as spores, such as those bodies in the form of spheres, crescents, &c., which have already been discovered in malarial blood, or intercellular elements, or as a ferment to the blood-stream just as diphtheria finds a suitable nidus in the tonsil and distributes its poison from thence. It is also certain that the liver has an influence upon its development. Derangement of the biliary functions is always present before an attack. But such a condition can be observed before all diseases of the intestinal tract, showing the intimate relation between the liver and the *primæ viæ* and the tendency to inflammation spreading upwards to the liver. It is interesting to observe that Lauder Brunton attributes some importance to the liver in connexion with the arrest of certain substances absorbed from the alimentary tract whereby they are either destroyed, stored up, or it may be prevented from entering the general circulation in too large amount and that ptomaines may be arrested in this way. To understand the functions of the liver we must remember its unique relation to the vascular

and digestive systems, whereby many of the products of gastric and intestinal digestion have to traverse it before reaching the blood. The process of intestinal digestion is largely due to organisms and it is possible that many of these reach the liver with the material they have acted upon. But there are also organisms of disease which as accidental guests in the intestines also reach the liver. If the liver had no function of this sort the blood must be invaded by hordes of organisms or their products. It is necessary that a filter should exist between the alimentary canal and the circulation and it is natural to look for it in the liver. If this be true, infectious diseases must be preceded by hepatic derangement. Is this the case? It is invariably the case that disturbance of the hepatic functions ushers in infectious or endemic diseases. It is generally believed that at such times the blood is less powerfully phagocytic, but it seems rather that the destructive function of the liver towards organisms and ptomaines is lost. It is difficult to understand how ptomaines are destroyed in the liver. H. Rogers, as quoted by Landois and Stirling, says that it only possesses this property so long as it retains glycogen. Animal starch or glycogen is a true carbohydrate. It is stored up in the liver cells as amorphous crystals; its mother substance is the carbohydrates of the food; it is increased by large quantities of starchy matters, milk, fruit, and cane sugar; it is diminished enormously by a purely albuminous or fatty diet, by forced muscular movements or fatigue, exposure to cold, by hunger or by anything which disorders the biliary functions.

Now let us look at the conditions which induce malarial fever. They are identical with those which diminish glycogen—e.g., purely albuminous or fatty diet, fatigue, exposure to cold, hunger, or anything which tends to the formation of acid, a derangement of the biliary functions, while on the other hand those whose diet consists largely of carbohydrates are usually the persons who escape fever. Let us turn for a moment to the subject of glycosuria. This is a condition characterised by the presence of grape sugar in the urine, which Dr. Pavy holds is due to the liver being deficient in glycogen from a fault in its glycogenic functions. If this be so, then a person suffering from diabetes is unduly susceptible to malaria, which is the case. The exciting causes of glycosuria are, broadly speaking, the exciting causes of malaria, and the fatal effects of opium in malaria may have something to do with its action on the hepatic vaso-motor nerves, whereby it diminishes the formation of glycogen. These facts, I think, go far towards proving that the liver has a peculiar function with regard to ptomaines, retaining, destroying, or utilising them in its metabolism, and that this power depends upon the amount of glycogen in the liver. The latency of malaria may depend upon the retention of the ptomaines in the liver till such time as functional derangement permits their access to the circulation. In every disease with the absorption of poisons there comes a time when the phagocytic action of the blood is neutralised, and even, though the absorption is stopped, the system fails to recover itself. But before this point is reached malaria will exhaust itself by the natural channels. The fact that irritation of the urinary tract is a common feature in fever goes far to prove this. That the poison remains in the blood is highly improbable. The keenest observers have failed to discover it therein. But directly there is an imprudence in the diet whereby the glycogen is diminished then the fever manifests itself. The effect of chills inducing an attack strengthens the hypothesis, for we know that in hot climates the glycogenic functions are profoundly affected by changes of temperature. If we have come to this conception of the pathology of malaria by observing its clinical features, we shall be further strengthened in it by the favourable effect of a treatment based upon this conception. Heretofore physicians have been satisfied in trying to destroy the organism in the blood, but it is difficult to reach the blood with drugs; they have first to pass through the various chemical processes in the laboratory of the body which have power almost invariably to split them into their radicals. The present treatment of malaria may be conveniently divided into the specific and non-specific. The former is held by the mass of the profession, the latter by only a few. The doctrine of specifics is present in the traditions of medicine from the earliest times and it is natural to believe that in the great economy of nature there is a remedy for every disease. Consequently when quinine was discovered to have a favourable effect on malaria it was at once conceived to have a specific action. That it has a favourable effect is beyond doubt, but a specific action would intimate that it cures the disease—which it certainly does not. I have come to this conclusion from a study of both the Indian and African fevers. The method of giving quinine in large and frequent doses is sometimes a source of danger; it may in strong constitutions cut short an attack of ague, but in the deadlier forms of malaria it is most pernicious. I have seen better results attend the administration of simple remedies aiming at alleviating the symptoms. The great Dr. Livingstone came nearer the true treatment of malaria than any other observer. He discovered that a combination of jalap and calomel had the effect of cutting short or preventing an attack. He had it made up into pills which his followers called "Livingstone rousers," duly appreciating their drastic purgation. But Livingstone was unable to explain their action. After several years' study on African fevers I began to suspect that it was not in the blood we must look for the chief source of the poison but in the intestine. I was led to this belief partly by the facts I have already stated in considering its pathology and by the inefficacy of quinine, partly by observing the benefit arising from "Livingstone rousers" and by my experiments on gastric malarias.

Experimenting with the drugs in "Livingstone rousers" I found that jalap had no effect on fever; with calomel I had a different result. I had already administered it as an antiseptic in malarial enteritis with marked success. At the time I did not base it on the theory I now hold, but for some time I had been convinced that mercurial compounds exerted a beneficial action on malaria. Calomel by combining both the properties of a stimulant of the intestinal glands and an antiseptic of the intestinal tract appealed to me as being peculiarly adapted to the objects of its treatment. It was therefore with considerable interest that I read in THE LANCET[1] Surgeon-Lieutenant-Colonel Duke's article on the Treatment of Asiatic Cholera by Calomel. There is a form of malaria which closely resembles Asiatic cholera; indeed, it appears to me that there is a relationship between them. I found that calomel exerted the same beneficial action here as Surgeon-Lieutenant-Colonel Duke ascribed to it in Asiatic cholera. In that form of malaria where uncontrollable vomiting is the prominent symptom—"the white vomit"—its action was instantaneous. In the comatose form its effect was equally rapid, in the continued fevers it cut short the attack. In hyperpyrexia it immediately reduced the temperature. In agues it had the effect of at first confining the stages and then preventing them. In malarial pneumonia it had an extraordinary effect in controlling the spread of the inflammatory process in the lung and also reduced the temperature. Of course each case requires modification in its treatment, but usually I gave 3 gr. at first in cases in which there was constipation and 5 gr. in those in which laxity of the bowels was a prominent symptom. Twenty-four hours after I administered a smaller dose and if there was no severe purging in thirty-six hours a still smaller one. I always use calomel in powder as I find its action is more certain than in pills or tabloids. On no account is opium to be used. Dr. Webster Jones in an article in THE LANCET some years ago on the Value of Calomel in Asiatic Cholera pointed out the fatality following the administration of opium and I am convinced that the same is the case in malaria. Large saline draughts should not be given with calomel to hasten its action, but soda- and potash-waters in small quantities to quench the thirst and alkalise the plasma are necessary. In cases where paralysis of muscles is present or failure of heart threatened hot soup with large doses of pepper will be found of great advantage. I cannot recommend pepper too highly as a stimulant in malaria. I now turned my attention to those drugs which stimulate biliary secretion, such as podophyllin, rhubarb, colchicum, and euonymin. I was not long in discovering that they were injurious, showing that increased secretion of bile without proportional oxidation reacts unfavourably. This went far to prove my theory of intestinal absorption. But I went still further, for I have found fever to be induced by a full diet of meat and fats, which we know increases in a marked degree the secretion of bile and diminishes glycogen. In both ordinary attacks and those induced by diet the administration of calomel has the same beneficial effect. But, as I have

[1] THE LANCET, Feb 4th, 1893, p. 244.

said, it is not only necessary to destroy the laboratory of the poison in the intestine: we must also destroy it in the blood. It is not enough to stand by and wait till the poison is exhausted through the natural channels of excretion. It clings to the blood with a strange obstinacy and seemingly has the power after passing from the blood into the intestine to develop and reconstitute its laboratory. We might by the administration of calomel again cleanse the *primæ viæ*, but we do not prevent a fresh infection. No, we must attack it in the blood. In a *method* of treatment we find the true adaptation of the term specific. It is not enough to use such drugs as iron and carbonate of potash as we do in the anæmia of chlorosis. We have here no vital poison like malaria. Dr. Eustace Smith, in his work on the Diseases of Children, says that in malaria where there is much acute enlargement of the liver and spleen quinine seems to be useless and advocates a treatment with grey powder. I find that quinine has a more favourable action on the poison after the administration of calomel than without it, because probably calomel obviates the biliary derangements which are a feature of quinine. Here we find, I believe, the true and proper application of quinine. I experimented still further on several drugs said to have antiseptic properties on the blood, such as salicylic acid, arsenic, potassium iodide, and carbolic acid. I got the best results from carbolic acid, but better results still by a combination of carbolic acid and quinine. I gave it in the form of a solution in the proportion of 1 gr. of carbolic acid to 3 gr. of quinine in sulphuric acid and water to 1 oz. every four hours till the temperature fell, then less frequently for several days, till the symptoms had disappeared. Almost every case reacted favourably to this treatment. In my hands it has been practically specific. Arsenic is largely used in the French army, partly, I believe, from economical reasons, but the mortality among their troops in Madagascar is a sad proof of its inefficacy. Arsenic diminishes the glycogen of the liver and is thus another plank in favour of the glycogenic theory. In the after treatment the principal object is to nourish the patient, at the same time keeping close watch on the liver, regulating any derangement at once, keeping the paths of excretion open, and giving a diet largely consisting of carbohydrates. Alcohol must be sparingly indulged in; excess is fatal. Another point which is not generally known is that a sea voyage is unfavourable unless the patient is fully convalescent. H.R.H. Prince Henry of Battenberg died at sea; so did Sir William Maxwell. It is a common thing for men to come on board at Beira incompletely convalescent and die before they reach Natal. In many cases men completely convalescent succumb to the terrible black-water fever after being a few hours at sea. What the cause is it is difficult to say. Possibly the motion of the vessel acting through the nerve centres on the vaso-motor nerves of the liver may disturb its glycogenic functions, or a chill may be the cause or it may be in the atmosphere itself. Whatever it may be, however, it is a law of malaria which it is well to bear in mind when advising a patient to take the voyage to Europe. It is too frequently the voyage from which none return.

Banchory, Kincardineshire, N.B.

EXTRAORDINARY CASE OF HORSE-BITE; THE EXTERNAL EAR COMPLETELY BITTEN OFF AND SUCCESSFULLY REPLACED.

BY WILLIAM J. BROWN, B.A., M.B. DUB., L.R.C.S. IREL.,
CERTIFYING FACTORY SURGEON.

ON March 2nd, 1898, at about 4.30 P.M., when present at an auction, I was asked to attend to a boy, aged fourteen years, whose ear had been bitten off by a vicious horse. He presented a hideous appearance, the greater portion of the pinna, together with a semi-circular flap of an inch radius from behind the ear, having been bitten off, leaving only the tragus with a quarter of an inch each of the helix and lobule. (See Fig. 1.) Although the case looked so hopeless (as regards disfigurement) I determined to make an attempt to save the ear, as the patient could be no worse off than he was then if the attempt failed. I asked for the ear and after about ten minutes' search it was brought to me, having been found near the horse in the stable yard. It was of a dirty drab colour and the posterior flap was curled up in a roll. I had no instruments or dressings with me, and it would have taken half an hour or more to procure them, which delay would have

FIG. 1.

The dotted line indicates the portion of the pinna and tissues behind the ear which were bitten off. A notch in the lobe indicates the spot where sloughing took place.

FIG. 2.

R. J——, aged fourteen years, as he now appears.

rendered the attempt to preserve the ear useless. I therefore procured some common needles and thread and after washing the ear in warm water I proceeded to sew it on by inserting a suture above and another below, followed by three behind and three before. The posterior flap had to be unrolled before I could stitch it and owing to the needles being straight there was great difficulty in placing the sutures in the concha and the fossa of the antihelix. I then placed a roll of cotton wool behind the ear to support it, and having wrapped it in cotton wool and covered it with a silk handkerchief sent the boy home. As soon after as possible I removed as much of the wool as I could without disturbing the wound, and after dusting the surface with iodoform wrapped the ear in cotton-wool and Gamgee tissue. On March 7th I removed the dressings, washed the ear with a warm solution of bichloride of mercury (1 in 1000), dusted the surface with iodoform, wrapped the ear in iodoform gauze, and packed it round and covered it with cotton wool. On the 10th I renewed the dressings and removed the sutures. On the 14th a small portion of the lobe sloughed away. On the 16th the patient looked rather anæmic and felt weak, so he was given a mixture containing sulphate of quinine and tincture of perchloride of iron. The same treatment was adopted throughout, the dressings being renewed every second or third day until April 7th, when they were allowed to remain on until the 12th, when the ear was completely healed and presented the appearance shown in Fig. 2. The patient's diet consisted of plain food, together with bovril, beef-tea, and eggs. He is a healthy, intelligent lad, who has survived several accidents, his body being covered with scars from burns. On one occasion it was necessary to transplant six skin-grafts from the calf of his leg to his thigh to replace skin which had been destroyed by burns.

This case, I consider, shows what valuable results may be brought about by antiseptic treatment and making prompt use of whatever comes handy when the proper instruments, &c., are not available.

Chester-le-Street.

A CASE IN WHICH A STONE WAS DETECTED IN THE KIDNEY BY MEANS OF THE X RAYS AFTER SUBSIDENCE OF ALL SYMPTOMS AND SUCCESSFULLY REMOVED.

BY CHARLES A. MORTON, F.R.C.S. ENG.,
PROFESSOR OF SURGERY IN UNIVERSITY COLLEGE, BRISTOL, AND SURGEON TO THE BRISTOL GENERAL HOSPITAL.

THE report of the case of Dr. Taylor and Mr. Fripp at a recent meeting of the Clinical Society of London [1] and the interesting discussion on the detection of stones in the kidney by the x rays which followed have induced me to publish the following case.

The patient, a boy, was admitted into the Bristol General Hospital under my care with well-marked symptoms of renal calculus, but these completely subsided with rest in bed and the boy could run about and jump downstairs without any pain and there was no tenderness in the loin on firm pressure or sharp percussion, so that he would certainly have been sent home without operation had the skiagram failed to detect the calculus, as I should have concluded that the stone might have passed down the ureter into his bladder or have passed *per urethram* without recognition. It is interesting to note that this complete subsidence of symptoms had occurred on a previous occasion, when he had been discharged from hospital apparently "cured." Probably when symptoms came on the calculus got out of its pouch in a calyx and moved about in the pelvis of the kidney and the subsidence of these symptoms was due to its falling back into this pouch again. This complete subsidence of symptoms has been observed in other cases when a stone has remained in the kidney, but without the detection of a calculus by x rays a surgeon would hardly like to do nephrotomy after the symptoms had passed off. That the stone in my case was of the oxalate variety made its detection more easy. The skiagram showing it was exhibited (together with the stone) by me at a meeting of the Bristol Medico-Chirurgical Society last autumn. It was taken by Mr. L. Tyack, lecturer on physics at University College, Bristol.

This patient, aged twelve years, came under my care at the General Hospital on June 28th, 1897, with a history of attacks of severe pain in the left loin. During these attacks he passed urine very frequently. The pain did not shoot into the groin or testes. From the description given by his mother there is very little doubt that he had hæmaturia after an attack. Strong percussion of the left loin seemed to cause some pain, but there was no tenderness on deep and firm pressure on the kidney or in the course of the ureter nor could any stone be felt in the lower end of the ureter *per rectum*. His bladder had been sounded by the assistant house surgeon before I saw him with negative result. In the previous September he had been a medical in-patient with attacks of lumbar pain. This was the first time he had suffered from the pain and it had not recurred in the interval. He was admitted on June 30th with a severe attack of pain which lasted twenty-four hours and was accompanied by vomiting but there was no hæmaturia. The pain was felt through the left loin. These attacks recurred for three days and required morphia injections. The muscles over the kidney became rigid and there was much tenderness over the whole of that side of the abdomen and in the loin behind. The urine was carefully watched but no hæmaturia was detected. The note on July 5th says that he had been free from pain for forty-eight hours, but that there was tenderness on pressure in the region of the kidney behind. A skiagram taken on the 8th showed a shadow lying over the twelfth rib, 1¼ in. from the spine. After this skiagram was taken he could run, and jump down several steps, without pain and there was no tenderness on sharp percussion of the loin and firm pressure there. He said the only pain he had was along the urethra after micturition and this had been present since the passage of the bladder sound before admission. However, another skiagram taken on the 14th showed the same shadow as the one taken on the 8th. I operated on July 23rd. Directly I passed my finger round to the anterior surface of the kidney I felt the stone covered by only a thin layer of renal tissue. It lay just where the skiagram seemed to indicate—in front of the last rib and therefore in the upper part of the kidney. After its extraction I could pass my finger into the dilated calyx in which it had been lying and then on into the pelvis of the kidney, so that I could recognise the apices of the pyramids; I thoroughly sounded the pelvis with a very small bladder sound, but failed to discover any other calculus. The boy made an uneventful recovery and when I saw him a few months ago he was still quite well. The stone was a typical oxalate calculus. It measured ¾ in. by ½ in. and on it was a process about ¼ in. long, covered with rare and beautiful crystalline oxalates.

Clifton, Bristol.

THE ADMINISTRATION OF CHLOROFORM, WITH SPECIAL REFERENCE TO AN ADMIXTURE OF ETHER.

BY WILLIAM E. BURTON, L.R.C.S. IREL., LIC. MED. T.C.D.,
SURGEON TO THE ROYAL MATERNITY CHARITY AND LATE RESIDENT SURGEON, RICHMOND HOSPITAL, DUBLIN.

IN the controversy which has been carried on concerning the methods and the dangers of chloroformisation it seems a pity that the attention of one set of writers should have been so exclusively directed to the influence of the drug on respiration and of the others, equally exclusively, to its effect on the circulation, the fact being that these functions are so mutually interdependent that serious and continued interference with the one cannot fail to quickly affect the other; and when, as in $CHCl_3$ narcosis, such interference is due to primary and simultaneous inhibitive action on the nerve centres of both it would seem that neither of these functions can be neglected with safety to the patient. In other words, to watch the pulse and the pulse alone is to neglect the breathing which may and usually does give warning of an impending catastrophe the approach of which may not have been appreciable in

the pulse and *vice versâ*. Therefore the well-trained and experienced chloroformist will from the first keep watch upon both the pulse and the respiration and he will also note the colour of the skin as influenced by the state of the circulation. This last is a point the importance of which can hardly be over-estimated, and for these reasons: (1) pallor of the skin due to the physiological action of $CHCl_3$ means emptying of the capillaries, not only of the skin, but probably also of the whole organism; (2) empty capillaries argue plethora of the larger blood-vessels, especially the veins and consequent tendency to stasis, which reaches its final depth in "chloroform syncope"; and (3) in this condition (of approaching stasis) the brain and bulb are not merely deprived of sufficient blood-supply owing to inadequate heart action, but the blood which reaches them is itself more or less laden with $CHCl_3$ vapour and is therefore emphasising the inhibitory effect of the drug upon, among others, the centres of the respiration and vaso-motor system. So that at the moment when the heart and the respiratory muscles are in greatest need of normal stimulation only enfeebled currents reach them from a chloroformised brain through chloroformised nerves. Moreover, the muscular tissue itself is more or less immobilised by the direct action of the drug.

Here precisely it is important for the anæsthetist to bear in mind that the physiological phenomena produced by an overdose of $CHCl_3$ are in some important respects paralleled by those of fright[1] (and the patient is usually more or less alarmed and anxious)—e.g., there is (*a*) the proverbial skin pallor of fright; (*b*) syncope; (*c*) cessation of respiration; (*d*) absence of wrist pulse; and (*e*) death. Nor must it be thought that "pushing the chloroform" helps to abolish immediately these phenomena or to lessen their importance. On the contrary, during the first few minutes of chloroformisation the devitalising conditions arising from fright not only continue but become intensified, especially if the drug be "pushed" too rapidly. Herein, as I believe, lies the key to the occurrence of sudden death at the commencement of $CHCl_3$ anæsthesia; and also the explanation of the fact that patients who have no fear of either drug or operation almost invariably take the former well. But if, on the one hand, paleness of the skin implying an empty condition of the capillaries is an adverse sign, then, on the other hand, the safety of the patient is greater when the capillary circulation is well maintained throughout by reason of any one or more of the following factors—viz., (*a*) vigour of the whole circulatory system, (*b*) careful administration of $CHCl_3$, (*c*) a warm atmosphere (which also diminishes, perhaps, the amount of vapour inhaled), and (*d*) the simultaneous administration of any drug (ether) which causes dilatation of the capillaries while stimulating the vaso-motor and respiratory centres as well as the myocardium. (Possibly the heat of the atmosphere was a not unimportant cause of the greater success of the Hyderabad experiments, presuming, i.e., that the experiments were made during the hotter part of the day.)

Bearing in mind the foregoing considerations the statement of Leonard Hill and Harold Barnard that "chloroform acts upon three parts of the economy—(1) the heart, (2) the respiration, and (3) the arterioles"—is seen to be incomplete for two reasons: (1) it is evident that chloroform acts probably on all parts of the economy and interferes profoundly with tissue metabolism generally—especially, perhaps, with both that of the blood itself and of the nervous system; and (2) upon the heart, respiration, and arterioles chloroform does act directly, it is true, but such direct action is negligible if compared with the indirect effect due to the inhibitory influence of the reagent upon the nerve centres supplying these parts. In saying this I must not be understood as making the least attempt to minimise the value of the lessons to be learned from the brilliantly successful experiments of these authors, especially perhaps their demonstration that "chloroform syncope" can be (and has been) produced by an overdose of that drug. Nevertheless, it is surely of the utmost importance in the treatment of this subject that words which do not clearly or not quite inclusively represent the views of the authors should not pass uncriticised or at the least unchallenged. Waller's experiments (which were undertaken with a view to ascertaining "the relative efficacy of various anæsthetics," and for this purpose alone) contribute, however, some very reliable, because extremely accurate and demonstrable, data concerning the behaviour of the tissues—represented by nerve—under the direct influence of $CHCl_3$. Of these it seems to me the most important, placed in the order of their value for practical purposes, are the following: (1) the slowness with which tissue (nerve) recovers from the immobilising effect of $CHCl_3$; (2) the greater strength of chloroform as compared with ether; and (3) the narrowness of the safety margin which lies between sufficient $CHCl_3$ anæsthesia and a lethal dose. Inferentially—although Waller does not specifically state this—there is the corollary that a narrow limit also lies between sufficient and insufficient $CHCl_3$ anæsthesia. Consequently it is manifest that $CHCl_3$, however pure—and to use this reagent for surgical purposes in any other than the purest condition would be inexcusable—needs at all times the utmost care in its administration even in the hands of the experienced anæsthetist. Also quite as much care, deliberation, and patience are required in its use for the most trifling as are demanded for the most serious operation.

Without entering further into details, which are necessarily excluded from this paper, enough has been said to emphasise the dangers and the difficulties of chloroformisation. It was only after much careful and anxious thought about these subjects that I at length resolved to use for the purposes of general anæsthesia a mixture of ether with $CHCl_3$ in which the ether should be in much smaller proportion than in the mixture generally employed—e.g., either A.C.E. or Billroth's mixtures. In A.C.E. I had reached the conclusion that the alcohol served no other purpose than that of a diluent. On the other hand, the ether while present in far too large proportion to act as a stimulating counter-agent to the depressing influences of the $CHCl_3$ was when—as generally—used on an open mask too small in amount to make its anæsthetic effect available to an appreciable extent. Moreover, I found that the large percentage of ether in A.C.E. was calculated to blind the administrator to the cumulative deadening influence of the $CHCl_3$ on the tissues (especially of the nerve centres). I had also noticed that when A.C.E. had been used, however carefully, through a lengthy operation that the vomiting following the withdrawal of the anæsthetic was sometimes more severe and always more prolonged than where ether or $CHCl_3$ alone had been used. Bearing these facts in mind I employed (in the next four cases) instead of A.C.E. a mixture composed of four volumes of $CHCl_3$ with one of ether. The result was highly satisfactory in every instance. Nevertheless, it was evident that the proportion of ether was still too large as shown by the deeper breathing and the skin congestion. Accordingly I steadily diminished the percentage of ether in my subsequent cases until I arrived at the mixture which I am using with excellent results at the present time. This consists of one volume of ether mixed with sixteen volumes of $CHCl_3$. With this mixture I have had up to the present time invariably better results than I have ever previously had with $CHCl_3$ either alone or in the form of A.C.E.

It must be borne in mind throughout the anæsthesia that the presence of ether even in this small proportion causes not only deeper breathing than occurs with pure $CHCl_3$, but in many instances deeper than normal. Consequently, the intake of $CHCl_3$ vapour at each inspiration is (in such cases) larger than when pure chloroform is given. The following are, in my judgment, the chief advantages of producing surgical anæsthesia by using the 1 in 17 C.E. mixture: (1) the ether causes and maintains dilatation of the arterioles and capillaries, thus securing throughout a properly conducted anæsthesia (*a*) the needful blood-supply for the nerve centres including those of the heart and circulation and respiration, and (*b*) immunity from the central plethora produced by the immobilising effect of $CHCl_3$ on the vaso-motor centres; (2) deeper breathing throughout the entire period of anæsthesia however prolonged; (3) more powerful heart-contractions; (4) a wider zone of safety between full surgical anæsthesia and the "fourth stage"; (5) the rapid passing off of the narcosis on withdrawal of the anæsthetic; and (6) the slight sickness resulting from even a prolonged administration.

In giving this 1 in 17 mixture of ether and $CHCl_3$ I find it more advantageous to begin with a simple mask

[1] It must not be forgotten that in estimating the influence of the psychic centres upon any part or function full allowance must be made for the immeasurably greater results of such interference in the human than in other animals, nor that in this paper human organisms only are referred to in considering the action of $CHCl_3$.

designed by me, which permits at all times a free air-supply. Still, there is no doubt that in the great majority of cases the improved Junker remains the best apparatus for the administration of $CHCl_3$. As a precautionary measure I am in the habit of giving in certain cases a hypodermic injection of either of the following: (1) from 5 minims to 10 minims of a 10 per cent. solution of strychnine-sulphate (this stimulates the heart and respiratory centres and is, I think, necessary in all cases where the patient is frightened and distressed); or (2) from 2½ minims to 5 minims of 1 per cent. solution of atropine sulphate (this acts by paralysing the inhibitory fibres of the vagus and should be given in cases of weak dilated heart). Small doses of either of these drugs are useless owing to the antagonising effect of the $CHCl_3$. Whether drugs be given or not it would be well in all cases to secure, in the patient's interest, a warm room and sufficiently warm clothing.

Finally, I will state the following conclusions as the result of my experience. 1. In threatened death from $CHCl_3$ the first and, in my judgment, the most successful step is immediate inversion *in all cases*, the tongue being drawn forward at the same time. If this measure fail—and I have never known it to fail if it has been done in time—I believe that nothing else will succeed, not even artificial respiration, and for the following reasons: (*a*) when central stasis is approaching the feebly-beating heart is being rapidly overburdened with a surplus of blood which, leaving the capillaries depleted, has been pouring into the large veins; (*b*) this capillary depletion implies acute anæmia of, among others, the vagus centre and consequent cardiac inhibition; (*c*) if, in these circumstances, artificial respiration be done by (say) Silvester's method the inspiratory movement tends to drive still more blood into the already distended heart, thus limiting its already enfeebled power of contraction; and (*d*) the inspiratory movements aspirate the cerebral vessels and so further deplete the vaso-motor and respiratory centres while, *æquo pede*, they also help to deepen the cardiac dilatation and inaction. 2. Next to inversion in order of importance I should place the hypodermic injection of ether (30 minims) and 10 per cent. strychnine-sulphate solution (from 5 to 10 minims), which may be given during inversion. 3. Heat applied to the trunk and extremities. 4. When returning power of the heart is evident artificial respiration should be commenced at first, if necessary, in the inverted position for a few moments and afterwards in the horizontal position with the head below the level of the trunk.

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

A CASE OF TRUE SUBCLAVICULAR DISLOCATION OF THE HUMERUS.

BY T. WILSON PARRY, M.A., M.B., B.C. CANTAB.

MR. HOLMES, in his "Principles and Practice of Surgery," in contrasting subcoracoid with subclavicular displacement of the head of the humerus in dislocations of the shoulder-joint, states that "the true subclavicular dislocation, in which the whole head of the bone lies internal to the coracoid process, is very rare." The following case, therefore may prove of interest and be worthy of record.

A woman, thirty-four years of age, came to me on May 19th, 1898, with the request that I should as soon as possible reduce a dislocation of the right shoulder which she was suffering from. The history of the case was as follows. On March 2nd, 1898—that is, about eleven weeks previously—she dislocated the same shoulder by falling and striking her elbow as she fell. She kept the arm in a sling for over a week after the dislocation had been reduced and then allowed herself to bring it into ordinary use. She was away from home at the time when this occurred, so I did not attend her on that occasion. The present injury was brought about on the day mentioned above when she was making some beds. She was shaking a blanket when she suddenly felt the humerus spring out of its place. On examination I found the head of the bone to be completely internal to the coracoid process, immediately under the centre of the clavicle. There was just room enough for me to insert my index-finger between the inferior surface of the clavicle and the head of the humerus. The shaft of the humerus, I need hardly say, was directed some distance from the side. I made three or four attempts to reduce it by extension in the ordinary way without an anæsthetic, but the muscular resistance was too great for me to be successful. I accordingly put the patient under ether and was enabled when she was properly anæsthetised to put the bone in its right place in a moment. The woman, who is very intelligent, volunteered the remark that she knew at once that this second dislocation was worse than the former one, for she felt that the bone was more out of place this second time, and "what's more," she added, "it has given me a great deal more pain."

Youlgreave.

NOTE OF A CASE OF HÆMORRHAGE FROM THE EAR.

BY WALTER H. BROWN, F.R.C.S. IREL.,
HONORARY SURGEON TO THE LEEDS GENERAL INFIRMARY.

A CHILD, aged five years, a patient under the care of Mr. Eustace Carter, had been suffering from a follicular tonsillitis; this was apparently clearing up when, without any warning, hæmorrhage took place from the right ear, the amount of blood lost being very great. When I saw the child with Mr. Carter an hour later she was blanched, deeply collapsed, and the nightdress, pillow, and bedclothes were widely stained with blood. On examining the ear after washing out the clot I failed to detect the source of the bleeding; the examination of the throat gave no information. The meatus was then packed with iodoform gauze, a pad and bandage being put on; this was left in position for four days, during which time there was no sign of any bleeding and the child appeared to recover in a measure. On the packing being taken out a small quantity of pus escaped from the meatus; it had no smell. Four hours after the plug was removed another hæmorrhage took place, more copious than the first one and when I saw the child her condition appeared to be hopeless. The radial pulse could hardly be felt, the surface was cold, the mucous membranes were pale, and the child was restless and partially delirious. There was now present on the right side of the pharynx a swelling pushing the right tonsil over towards the middle line; this swelling did not pulsate. As it seemed most likely that the source of the bleeding was the internal carotid, and as it was quite clear that the child must die if another bleeding took place, I decided to tie the common carotid then and there. The child was put under ether and I ligatured the common carotid at the point of election. The subsequent progress does not call for special comment, the child made a good but somewhat tardy recovery, and is now quite well.

Hæmorrhage from the external ear is not a common occurrence—at any rate not in such formidable quantities as now related. Fortunately for the child we have had no opportunity of making a careful dissection of the parts involved to ascertain the exact cause of the bleeding. I venture to suggest that there had been some inflammatory change in the bone surrounding the internal carotid artery causing erosion of the walls of that vessel. I think now that it would have been better to have ligatured the vessel after the first bleeding rather than to have waited for a second attack and in any future case I shall adopt that plan.

Leeds.

ACUTE PHTHISIS IN A CHILD; RECOVERY.

BY F. G. A. ROGERS, M.R.C.S. ENG., L.R.C.P. EDIN.

THE following case presents several points which will probably be of interest to some readers of THE LANCET. The patient was a male child, four years of age, suffering from acute broncho-pneumonia. The mother had died from pulmonary phthisis and another child had died from tuberculous meningitis some two or three years before. The patient appeared to have recovered from the attack of

broncho-pneumonia and his temperature was normal; there were, however, numerous râles all over the lungs though not loud; the temperature again rose to 102° F. and then dropped, and so alternately rose and fell, the breathing being quickened, the face becoming flushed, and a troublesome cough coming on. There was evidently trouble at the right apex; bronchophony appeared and cough was almost croupous at times. Gradually the right side of the chest seemed to be contracting and falling in, the expansion of the right lung being imperceptible. From the history I judged there was tuberculosis rapidly setting in—in fact, the appearance was one of phthisis in a most acute stage. I told the friends that it was a hopeless case; however, as soon as it was evident to my mind that it was phthisis, I tried the following: dilute phosphoric acid, 40 minims; tincture of hamamelis, 40 minims; tincture of cinchona, 5 minims; syrup of lemon, ½ oz.; water, to 6 oz.; dose, ½ oz. every three hours. I persisted with this till the temperature again became normal and remained so and then ordered it every four hours. I ordered a teaspoonful of cod-liver oil in half a wineglassful of port wine morning and evening, beef tea, raw eggs, milk, &c. The child lost his cough; the right side is distinctly narrower than the other, and the wall over the apex is apparently flattened, but he plays about and is as well as he can be, and may we not hope that he may live as long as the average life? The child lives in the neighbourhood and may be seen. If this treatment is tried and found successful by others it will be a satisfaction to me.

GENERAL HOSPITAL, BIRMINGHAM.

TWO CASES OF ACUTE INTUSSUSCEPTION SUCCESSFULLY TREATED BY IMMEDIATE ABDOMINAL SECTION AND REDUCTION.

(Under the care of Mr. GEORGE HEATON.)

THE question of the treatment to be adopted in cases of intussusception is both interesting and important. It is important because the condition is decidedly frequent and Leichtenstein's statistics showed that in about 40 per cent. of all cases of intestinal obstruction the cause was intussusception. Moreover, in a large proportion of these cases the patient is very young and, according to Leichtenstein's figures, more than 22 per cent. were under one year old. At this tender age any abdominal lesion is of especial importance, as the mortality from intussusception shows. Till within the last few years the plan of inflation or injection was alone employed for the treatment of this condition, but the results were very unsatisfactory, and the trend of surgical opinion has been distinctly in the direction of early laparotomy, not preceded by any attempt at inflation or injection. In the first place injection is not harmless, for a fair number of cases have been reported in which rupture of the bowel has followed injection,[1] even though the injection has been most cautiously administered; and it is generally admitted that neither of these methods, injection or inflation, should be employed after forty-eight or even twenty-four hours from the commencement of the illness. For adhesions will probably have formed; and Marsh,[2] indeed, found firm adhesions fifteen hours after the onset of the symptoms. If, then, the condition has lasted twenty-four or forty-eight hours most surgeons are agreed that inflation, if used at all, should be employed for a very short time only and if unsuccessful laparotomy should immediately follow; but evidence is accumulating that a "primary" laparotomy (that is, one not preceded by inflation or injection) offers a still better chance of success. We have recorded several such cases in THE LANCET in the last two or three years and in February, 1895, we published a case operated on by E. W. Roughton in which recovery followed a primary laparotomy in a child aged only four months. A still earlier success occurred in an infant two months old who was operated on by Carpenter.[3] A valuable paper by F. H. Wiggin of New York appeared in THE LANCET last year[4] in which he forcibly advocated primary laparotomy, basing his opinion on carefully collected records of 103 cases. The two cases which Mr. Heaton has recorded below are valuable as showing the harmlessness of a laparotomy in this condition. It is not improbable that in a few years' time surgical opinion will be very adverse to any attempt at reduction by inflation or injection and that immediate laparotomy will be the rule rather than the exception in the treatment of intussusception.

CASE 1.—A boy, aged four years, was admitted into the General Hospital, Birmingham, on March 28th, 1898, with the history that at 9 A.M. that day he had been suddenly seized with violent abdominal pain. He became very collapsed and vomited almost continuously for an hour. He was then violently purged and passed a considerable quantity of blood *per anum*. This was repeated at 12 noon and again at 12 30 P.M. The vomiting continued up till admission into the hospital at 3.30 P.M., but the collapse had gradually passed off. His bowels had previously been regular, but he had always been subject to "bilious" attacks. He was a delicate boy and had been frequently laid up with bronchitis. On admission the temperature was 97° F., and the pulse was 112, small and regular. The symptoms of collapse had passed off, and he complained of but little abdominal pain across the umbilicus. He vomited some bilious fluid soon after admission. The abdomen was lax and there was but little tenderness. To the right of the umbilicus a freely moveable tumour could be easily felt. It was tender on pressure and could be felt to harden when it was pressed. The rectum contained a little blood and mucus. An anæsthetic was administered and laparotomy was performed seven and a half hours after the onset of the symptoms. The opening was made in the right linea semilunaris immediately over the tumour. The intussusception, which was 5 in. long, was brought outside the abdomen. It was reduced without difficulty except as regarded the last ½ in., the reduction of which required considerable care. The ileo-cæcal valve formed the apex of the intussuscepted bowel. The abdomen was then closed in the usual manner, the whole operation only lasting nineteen minutes. The patient's recovery was rapid and complete. For a few days after the operation he had a good deal of bronchitis, aggravated by his getting out of bed within a few hours of the operation. The bowels were opened naturally on the fourth day after the operation and he passed a hard fæcal mass which was covered with blood. The stitches were removed on the eighth day and he was discharged from the hospital early in May wearing a small abdominal belt to support the operation scar.

CASE 2.—A boy, aged three years, was admitted into the General Hospital, Birmingham, on March 29th (just twenty-four hours after admission of the patient in the previous case) suffering from abdominal pain and vomiting. At 1 P.M. on the day of admission, shortly after going to the closet without any action of the bowels, he was suddenly seized with violent pain in the right side of the abdomen. He vomited several times during the afternoon and had repeated attacks of abdominal colic. About an hour before admission he suddenly became profoundly collapsed and convulsed; he then again vomited and the collapse passed off. He had previously been in good health, though the action of the bowels had been somewhat irregular. On admission the pulse was 96 and the temperature was 100° F. At times the patient lay apparently quite comfortable and would allow deep palpation of the abdomen. But at frequent intervals he was seized with attacks of colic which produced a good deal of collapse. The abdominal walls were blistered and inflamed as the result of hot turpentine fomentations. In the intervals between the attacks of colic a small sausage-shaped mass could be distinctly felt to the right of and below the umbilicus; the mass was not tender and was freely moveable. The rectum was empty.

[1] Parkes: Transactions of the Clinical Society of London, 1892, p. 244.
[2] THE LANCET, Feb. 14th, 1891, p. 368.
[3] Philadelphia Medical Record, June 6th, 1896.
[4] THE LANCET, August 23th, 1897, p. 525.

The bowels were opened once after the beginning of the attack. The diagnosis of acute intussusception being fairly clear the patient was anæsthetised and laparotomy was performed seven hours after the commencement of the symptoms. A 3½ in. incision was made in the right linea semilunaris and the tumour was exposed. The tumour was with some difficulty brought outside the abdomen. The tension on its mesentery in order to do this produced a good deal of shock, which quickly passed off when it was relieved. It proved to be, as in Case 1, an ileo-cæcal intussusception and measured 3½ in. The invaginated bowel was reduced easily except for its last ½ in. This was swollen and œdematous and after reduction appeared as a raised œdematous ring on the surface of the intestine. The intestine was then returned into the abdomen and the abdominal wound was closed. The inflamed and vesicated skin of the abdomen was freely dusted with boric acid powder and the wound was dressed with iodoform gauze. The after-history was uneventful. Notwithstanding the raw state of the abdomen the wound healed by first intention and the stitches were removed on the eighth day after the operation. The patient was kept in bed for a month in order to consolidate the operation scar. The bowels were opened on the third day after the operation and a hard blood-stained fæcal mass was found. They were afterwards kept open regularly with small doses of cascara sagrada.

Both the patients in the above cases were shown at a meeting of the Pathological and Clinical Section of the Birmingham branch of the British Medical Association at the end of April and were then in perfect health.

Remarks by Mr. HEATON.—The two cases related above have a special clinical interest at the present time, when the whole question of the treatment of intussusception is under discussion. In each case the diagnosis was clear, the symptoms, though urgent, had only been in existence for a few hours, and the patient was in fairly good condition. Abdominal section was at once performed without any attempt being made by means of manipulation or inflation to reduce the intussuscepted bowel. Manipulation of the bowel through the abdominal walls has now been abandoned by most surgeons as a method of treatment in such cases, but inflation of the bowel *per rectum* is still as a rule tried before resorting to laparotomy. There is no doubt that a certain number of cases of intussusception can be reduced completely and the patients cured by such careful inflation, particularly when the intussusception is a very recent one; but it is at best a most uncertain method and at the same time by no means devoid of risk, for the bowel may easily be ruptured if too great pressure be employed. When operating upon such cases we generally find that the major portion of the intussuscepted bowel can be reduced without much difficulty. It is the last inch or half-inch which presents the chief difficulty; and it is quite impossible save by actual inspection to be sure whether complete reduction has been effected. It is for this reason that after apparent reduction by inflation the patients' symptoms frequently continue unrelieved and the tumour reappears. Reduction has in reality been incomplete and abdominal section later offers only a remote chance to a patient already exhausted by delay. Surgeons at the present day have practically abandoned the operation of relieving strangulated hernias without actual opening of the hernial sac and inspection of the condition of the bowel; and I venture to think that the same principle should apply to the treatment of intussusception. A rapid opening of the abdomen carried out aseptically adds practically no extra risk to the patient in the early cases, and in cases where reduction is found to be impossible affords the patient his only chance of recovery. Treatment by inflation should only be resorted to where from the patient's surroundings asepsis is impossible or where for other reasons active surgical measures are forbidden.

MEDICO-PSYCHOLOGICAL ASSOCIATION OF GREAT BRITAIN AND IRELAND.—Examinations for the certificate in psychological medicine of this association will be held in London, Edinburgh, Glasgow, and Aberdeen, on Thursday, July 7th, 1898. The examination for the Gaskell prize will be held in London at Bethlem Hospital on Friday and Saturday, July 8th and 9th, 1898. Candidates intending to present themselves for either of these examinations should give seven days' notice to the registrar (Dr. Spence, Burntwood Asylum, Lichfield), from whom any further information may be obtained.

Medical Societies.

CLINICAL SOCIETY OF LONDON.

Acute Dilatation of the Stomach.—Cirrhosis of the Liver.—Election of Officers.—Report of the Diphtheria Antitoxin Committee.

A MEETING of this society was held on May 27th, the President, Mr. LANGTON, being in the chair.

Dr. C. R. BOX and Mr. CUTHBERT S. WALLACE described a case of Acute Dilatation of the Stomach occurring in a youth, sixteen years of age, previously in good health, who came under observation on account of vomiting and collapse attributed to a blow on the epigastrium. The abdomen was rigid, distended, and almost motionless; its right lower quadrant was dull on percussion and tender in the region of McBurney's point. Peritonitis being suspected the abdomen was explored. An enormously distended stomach filled the whole of the abdomen, displacing the intestines towards the pelvis. The viscus was incised and emptied. Death followed in a few hours. Post mortem no cause was found for the gastric distension. Post-mortem digestion of the walls was rapidly advancing. The whole intestinal tube below the stomach was collapsed and empty.—Dr. PARKES WEBER recalled a case under his observation a few months since in which acute dilatation of the stomach was associated with acute febrile disease and pneumonia. The patient was a man fifty years of age. He died in collapse and no post-mortem examination was allowed.

Dr. HUGH R. SMITH read a paper on Seven Cases of Cirrhosis of the Liver occurring in Children and Young Adults. The clinical history and post-mortem appearance of each case was given in some detail. The ages of the patients varied from nine to twenty-four years at the time of their death. The cases fell into two distinct groups, corresponding fairly accurately with the so-called atrophic and hypertrophic cirrhosis of adults. Thus in the first four there were ascites, absence of jaundice, and small hob-nailed livers, which showed microscopically a well-marked multilobular arrangement of the new-formed connective tissue, and the course of the disease was short. Thus one case died eight days after the first appearance of definite symptoms and the most protracted only lived four and a half months. In the last three there was marked jaundice from the first, absence of ascites until the close of the disease, and a large liver, which showed a definite unilobular arrangement of connective tissue and very numerous new bile canaliculi.

The annual meeting was then held, the report presented at which showed the society to be financially in a flourishing position, and the following candidates for offices were duly elected:—President: Mr. John Langton. Vice-presidents: Dr. Sidney Coupland, Dr. James Frederic Goodhart, Dr. Leonard William Sedgwick, Mr. A. Pearce Gould, Mr. John Hammond Morgan, and Mr. William J. Walsham. Treasurer: Dr. William Miller Ord. Council: Dr. Arthur T. Davies, Dr. Archibald E. Garrod, Dr. Sidney Martin, Dr. W. Julius Mickle, Dr. J. F. Payne, Dr. F. G. Penrose, Dr. J. J. Pringle, Dr. Harrington Sainsbury, Dr. R. Percy Smith, Dr. J. C. Uhthoff, Dr. W. Hale White, Mr. James Berry, Mr. C. B. Lockwood, Mr. Stephen Paget, Mr. G. H. Makins, Mr. Rushton Parker, Mr. A. Q. Silcock, Mr. W. G. Spencer, Mr. T. P. Teale, and Mr. G. R. Turner. Honorary secretaries: Dr. J. Kingston Fowler and Mr. Charters J. Symonds.

Dr. CHURCH then read the report of the committee appointed in January, 1895, to inquire into the Clinical Value of Diphtheria Antitoxin. The committee was composed as follows: Dr. W. S Church (chairman), Dr. Stephen Mackenzie, Dr. Sidney Coupland, Dr. W. Hale White, Dr. Sidney Martin, Dr. W. Pasteur (honorary secretary), Dr. J. W. Washbourn, Dr. H. P. Hawkins, and Dr. E. Goodall. For the purpose of the inquiry 832 reports of cases were collected, but upon examination 199 of them had to be rejected, either because the committee were not satisfied as to the evidence of diphtheria or because the amount of antitoxin administered was not stated in normal units, leaving 633 available for further analysis. Of the cases which presented symptoms more or less severe of laryngeal affection nearly one half escaped the operation of tracheotomy, a very much larger proportion than is usually the case in laryngeal diphtheria treated in other

ways. The tracheotomies performed may be divided into two groups: (*a*) tracheotomy within twenty-four hours of the first injection and (*b*) tracheotomy at a later period. Only 2 out of the 75 belong to group *b*. The committee drew especial attention to these facts and also to the results of the operation of tracheotomy, in which the mortality amounted to 36·0 per cent., as opposed to 71·6 per cent. in the control series compiled from the records of the general hospitals before the introduction of antitoxin. The mortality fell as age increased, but it was in the first five years of life that the lessened mortality in the antitoxin series was most marked. It was to the lesser frequency with which membrane extended to the larynx and trachea in cases treated by antitoxin and to the effect of the antitoxin on them when membrane was present that the lessened mortality in the antitoxin series was mainly due. The total mortality in the 633 cases amounted to 124, or 19 5 per cent., as opposed to 29 6 per cent. in the non-antitoxin control series. Not only was the mortality in the antitoxin series much less than in the other, but the duration of life in the fatal cases was longer, a fact which has considerable bearing on the frequency with which paralytic symptoms occurred. The closest investigation failed to discover any connexion between the occurrence of paralysis and the amount of antitoxin injected, nor did the period of the disease at which it was first used appear to exert any influence on the occurrence of paralytic symptoms. Some form or other of rash followed the injection of antitoxic serum in very nearly a third of the cases. The rashes could be divided into two main types, those which were of an erythematous and those of an urticarial character; the former largely predominated. In no instance did the presence of a rash appear to have any bearing on the ultimate result of the case. Joint pains which were not met with in the non-antitoxin series and were apparently due to the antitoxic serum were observed in a small number of cases. The percentage of deaths with suppression of urine was found to be practically the same in the antitoxin and the non-antitoxin series. The general result of the inquiry showed that in the cases treated with antitoxin not only was the mortality notably lessened, but the duration of life in fatal cases was also prolonged. The injection of antitoxin may produce rashes, joint pains, and fever; with these exceptions no prejudicial action has been observed in the series of cases investigated to follow even in cases in which a very large amount of antitoxin serum has been used.

BRADFORD MEDICO-CHIRURGICAL SOCIETY.

Exhibition of Specimens.—History of Syphilis.—Henoch's Disease.—Peliosis Rheumatica.

A MEETING of this society was held on May 3rd, the President, Dr. ARNOLD EVANS, being in the chair.

Dr. S. LODGE showed specimens of (1) Sarcoma of the Eyeball; and (2) Foreign Body in the Eyeball, together with several microscopic specimens.

Dr. GLADSTONE showed a Stomach affected with Diffuse Cancer of the Pyloric Extremity.

Mr. MIALL read a paper on the History of Syphilis. He mentioned that though contagion in general was recognised from the earliest times, yet it was not till the end of the fifteenth century that contagion from sexual connexion was distinguished. It is probable that much of the "leprosy" spoken of by writers was really syphilis. The study of contagion threw much light on disease in general and was probably instrumental in fostering habits of cleanliness. The use of mercury in the treatment of syphilis had been in vogue from very early times and the effects of mercurialisation were also recognised. Reactions in favour of other drugs had from time to time occurred, and guaiacum, China root, sarsaparilla, juniper, mezereon, sassafras, and many others had been vaunted as specifics in the treatment of syphilis. Iodine was discovered early in the present century and was used in the treatment of venereal ulcers of the throat as a substitute for burnt sponge.—Remarks were made by Dr. GOYDER, Dr. HOBROCKS, and Dr. CAMPBELL, and Mr. MIALL replied.

Dr. H. ANGUS read a paper on Henoch's Disease. Alluding to the confusion existing in the classification of purpuric diseases Dr. Angus justified, on the ground of this confusion, the use of the physician's name who first described cases in which there was a definite group of symptoms associated with a purpuric eruption. The symptoms were colic, abdominal tenderness, vomiting often of green material, bloody stools, pain and usually swelling of the joints. A further characteristic of the disease was the recurrence of the symptoms at intervals of eight days or more. Dr. Angus then read notes of three cases which had come under his care. The first case was that of a boy, aged nine years, who had always been strong and healthy and was the son of well-to-do working people who lived on the edge of the moor. There was a family history of rheumatism on the father's side. The case conformed closely to Henoch's type. There was at first slight pain in the limbs, then severe hæmorrhage from the bowels and abdominal pain; the next day the purpuric rash appeared, chiefly on the limbs. The abdominal pain was very severe, resembling lead colic. There was no fever. In four or five days there was improvement, but this was followed by a relapse with recrudescence of all the symptoms; the temperature rose to 101° F. One of the extravasations near the knee-joint formed a superficial abscess which was opened and healed readily. Several relapses occurred and convalescence was not established for three months and there was then some pain in one foot and one wrist. There was ultimately complete recovery. The second case was of a similar nature to the first, except that there was hæmaturia. After three months' treatment in bed the patient was convalescent and was able to walk about, but the urine remained albuminous. He died three months later from nephritis. The third case was that of a boy, aged twelve years, in comfortable circumstances, with a good family history. The illness began with epistaxis and abdominal pain. There were tenderness of the abdomen and vomiting and there was a purpuric rash about the elbows and the knees. There was no rise of temperature or hæmorrhage from the stomach or bowels. After about a month's treatment in bed he recovered, but for some time was nervous and irritable. In none of the cases was there any heart murmur. Dr. Angus mentioned that Dr. Dreschfeld of Manchester had described a number of cases of Henoch's purpura and that he did not consider it a very rare disease. Dr. Angus stated that nothing was known as to the pathology of the disease and that examinations of the blood had given negative results. Fatty degeneration of the cutaneous vessels has been described. Bacilli had been obtained from patients dying with symptoms resembling those described, but these might have been cases of septicæmia. Henoch suggested the presence of a vaso-motor neurosis, leading to paralytic dilatation of the smallest blood-vessels, stasis of the blood, and rupture of the vessel wall or diapedesis of the corpuscles. The abdominal pain might be due to sympathetic irritation. Treatment had been confined to rest in bed with morphia to relieve pain. Hæmostatics appeared to have had no effect.—The paper was discussed by Dr. GOYDER, Dr. BERRY, Dr. MAJOR, and Dr. CAMPBELL, and Dr. ANGUS replied.

Dr. METCALFE read a paper on Peliosis Rheumatica and showed sketches illustrating the nature of the eruption. He described the course of the affection and recommended salicylate of soda followed by iron and arsenic in the treatment.

Reviews and Notices of Books.

William Stokes: His Life and Work (1804–1878). By his Son, WILLIAM STOKES, Surgeon-in-Ordinary to the Queen in Ireland. London: T. Fisher Unwin. 1898. Pp. 256. Vol. IV. of "Masters of Medicine." Edited by the late ERNEST HART, D.C.L. Price 3*s.* 6*d.*

OF the admirable series of Masters of Medicine already published we have read none with deeper interest than the Life of the great Irish physician, William Stokes, and although his son (Sir William Stokes), who writes his father's memoir, very modestly says that owing to his relationship he is to a great extent at a disadvantage, we think no one could have done such a work so well, for he thoroughly understood his father's aims, his patriotic love of his country, his desire to elevate the dignity and honour of his profession, and above all he knew how his father by "precept and example strove to teach the duties of a true and God-fearing physician."

William Stokes belonged to a family members of which have for five generations occupied prominent positions in the

public life of Ireland. Born in Dublin in 1804, William Stokes was the second son of Whitley Stokes, a man who was scholar of, senior fellow of, and regius professor of medicine in, Trinity College, Dublin. His influence on his son was very great, not merely owing to his varied gifts and his remarkable learning, but also because, as Theobald Wolfe Tone wrote, he looked upon him "as the very best man he had ever known." After a careful preliminary education at home, although, as he afterwards very much regretted, he was not allowed to enter college, young Stokes went to Glasgow, where he studied chemistry under Professor Thompson. He subsequently proceeded to Edinburgh, where he had the good fortune to come under the influence of Professor Alison. Under him he developed that love for clinical medicine and original research which ever afterwards so characterised him. It was at this time that Laennec startled the profession by the discovery of the stethoscope, and young Stokes in 1825 (when he was only twenty-one years of age and before he had obtained any medical qualification) published in Edinburgh a small treatise on the use of this instrument for which he received the sum of £70. In 1828 he wrote two lectures on the Application of the Stethoscope to the Diagnosis and Treatment of Thoracic Disease. Graduating in Edinburgh in 1825, Stokes returned to Dublin. In the next year we find him beginning his work at the Meath Hospital (at the early age of twenty-two years), where for forty-nine years, as one of the greatest clinical physicians who ever lived, he attracted students not only from all parts of the United Kingdom, but from the Continent and America. It was here that, associated with his beloved friend and colleague Graves (the great authority on fevers who inspired Trousseau and to whom we owe our earliest knowledge of "Graves's" disease), he completely reformed the system of clinical teaching, the principle being "to teach the individual pupil, to encourage him to learn, to show him how to teach himself, to bring him into the true relation in which he ought to stand with his instructor, to make him familar with bedside medicine, to show him the value of every new fact and observation in medicine, and to make him know the duty as well as make him taste the pleasure of original investigation." His hospital appointment gave him full scope for his powers of observation, of which he fully availed himself; and as a result in 1837 he gave the profession his great Treatise on Diseases of the Chest, a book characterised by Sibson as a "series of living pictures of disease," and one of the most valuable and far-reaching works which ever emanated from the Irish School of Medicine. In 1854 his Diseases of the Heart and Aorta appeared. It was subsequently translated into German, Italian, and French, and in this book, in connexion with fatty heart, the now well-known "Cheyne-Stokes respiration" was graphically described; while the mode of treatment known as "the Schott Method" is here anticipated by Stokes. This work gave him the same pre-eminence as an authority on heart affections that his first book had done on the other diseases of the chest. In 1874 his Lectures on Fever were published, and he also contributed to the *Dublin Journal of Medical Science*, to the "Cyclopædia of Medicine," and to the *London Medical and Surgical Journal*. It was owing to Stokes mainly that in 1838 the Dublin Pathological Society was founded, and he was one of the first secretaries. We have said enough to show that Stokes's original contributions to medicine entitle him to be placed in the very first rank of the "Masters of Medicine," but like other great men of the healing art, and notably his friend, Sir James Y. Simpson, he was gifted with a many-sided nature, his specialities being a love for the fine arts and antiquities. At a very early age he exhibited a liking for poetry and romance and this passion was intensified by reading the Waverley Novels. There is no country richer in archæological remains than Ireland, and this circumstance, coupled with Stokes's close association with such men as Petrie (his life-long friend, whose memoir was his final literary effort), Burton, Sir Samuel Ferguson, Thomas Davis, Mangan, and Anster, developed and intensified his remarkable taste for poetry and art. As an evidence of his recognised pre-eminence in such subjects he was elected in 1874 President of the Royal Irish Academy. It is interesting to know that he has transmitted these high tastes to his descendants—indeed, this "Life" of him is dedicated to his daughter, Margaret McNair Stokes, his "constant companion," who is everywhere acknowledged to be one of the best living authorities on antiquarian subjects.

Want of space prevents our referring to Stokes's views on medical education and on medical ethics (his admirable address on this latter subject to the students of the Meath Hospital should be republished and ought to be read by all young medical men), to his thoroughly Irish humour, to his great desire to raise the status of his profession, and to the many honours (professional and otherwise) which were heaped upon him; but we have said enough to show that this "Life and Work" of William Stokes, written with such literary finish by his highly-gifted son, should find a place in the library not only of every medical man who loves his profession, but also of those who admire true ability and who feel a kinship in what is most pleasing, helpful, and stimulating in the work and writings of their fellow-men.

Inflammation of the Bladder and Urinary Fever. By C. MANSELL MOULLIN, M.D. Oxon., F.R.C.S. Eng., Surgeon to, and Lecturer on Surgery at, the London Hospital; Examiner in Surgery at the University of Oxford, &c. London: H. K. Lewis. Pp. vi. and 156. 1898. Price 5*s*.

WE extend a cordial welcome to this book, for it is the first in the English language in which has been fully set forth the modern theory of cystitis and urinary fever. The influence of mechanical injury, as by a calculus, and of irritation, such as cantharides excreted with the urine, in giving rise to inflammation has long been recognised, but until very recently the fact was not appreciated that a cystitis evoked by either of these forms of irritation had no tendency to persist when the cause was removed and never in itself went on to the formation of pus. For a cystitis to be suppurative the presence of micro-organisms is absolutely essential. When it had been discovered that in all cases of suppurative inflammation of the bladder micro-organisms were present it was too hastily assumed that the presence of these bacteria was all that was necessary to set up a cystitis, but it has been clearly shown that injections of the very same microbes or their products into a healthy uninjured bladder were not necessarily followed by the appearance of any lasting inflammation; in one or two days they generally entirely disappeared. If, however, some injury had been inflicted previously on the bladder, if its walls had been rubbed or bruised, then a very different result followed. The septic injection was the starting point of a severe and protracted inflammation, the vessels of the vesical mucous membrane became dilated, much exudation occurred, and large quantities of pus were found in the urine. Thus it was shown that two sets of conditions are necessary for the occurrence of a septic cystitis — firstly, the presence of special micro-organisms, and, secondly, an increased vulnerability of the bladder wall. In a few cases, indeed, injections of virulent culture did produce a cystitis with suppuration, but these exceptional results are doubtless to be explained by the necrotic action which the toxins of these bacteria have on the vesical mucous membrane, so that the

toxins damaged the epithelium of the mucous membrane sufficiently to allow the bacteria themselves to set up a purulent cystitis. The most common conditions which act as predisposing causes of cystitis are congestion of the vesical mucous membrane and retention of urine. The congestion probably leads to impaired nutrition of the protective epithelium, with the result that it is less able to withstand the attacks of the micro-organisms; retention of urine never by itself causes cystitis, even though it may last for years, but retained urine forms a most admirable medium for the growth of very many forms of bacteria, and a further source of irritation is found in the decomposition of urea. Mr. Mansell Moullin considers it proved that only two micro-organisms can be credited with the power of breaking up urea so as to set free ammonia. These are the urobacillus liquefaciens septicus and the bacillus coli, though the latter is much less effective in this respect than the former. Ammonia, however formed, is an intense irritant to the mucous membrane and so materially assists in starting and keeping up the cystitis. Another point of great importance is the question as to the method by which these bacteria find their way into the bladder. The answer must unhesitatingly be that in the vast majority of the cases they are carried in by catheters. It is no easy matter to make perfectly aseptic the meatus urinarius, but even more difficult is it to prevent a catheter from carrying into the bladder the germs which are already in the urethra. A still more fruitful source of infection is the catheter itself; though its surface may be smooth and polished the interior is nearly always rough and irregular, so that even if at first it should be aseptic after it has been used a time or two it will be almost impossible to render it free from germs. If it be metallic it may be boiled, but the ordinary gum-elastic catheter cannot be cleansed by heat; many of its faults are innate and Mr. Mansell Moullin has had some catheters made in which these faults have been obviated. The catheter is quite solid beyond the eye and its interior is as smoothly polished as the outer surface. Sterilisation is almost impossible if any greasy lubricant is used, as the fat protects the germs from the action of the antiseptic. The author advises boroglyceride or lanolin which has been sterilised and which is kept aseptic by the addition of carbolic or boric acid, and further we are told that boric acid in a saturated solution is the most satisfactory antiseptic to employ.

Though in most cases the germs setting up the cystitis have been introduced from without by the use of a catheter, yet in a few cases it is extremely probable that they have been carried by the lymphatics from the neighbouring rectum, and this is especially likely to be the case when the cystitis is due to the bacillus coli.

The treatment to be adopted for suppurative cystitis follows naturally from a due appreciation of its pathology, and by no means the least important part is the prophylaxis which we have indicated above in speaking of the sterilisation of the catheter. When cystitis is already present emptying and draining the bladder or washing it out are necessary according to the severity of the case. For washing out the bladder Mr. Mansell Moullin prefers sodium chloride and boric acid dissolved in a solution of sodium borate if a mere cleansing action is required, but if a germicide is needed he advises a 1 per cent. solution of nitrate of silver.

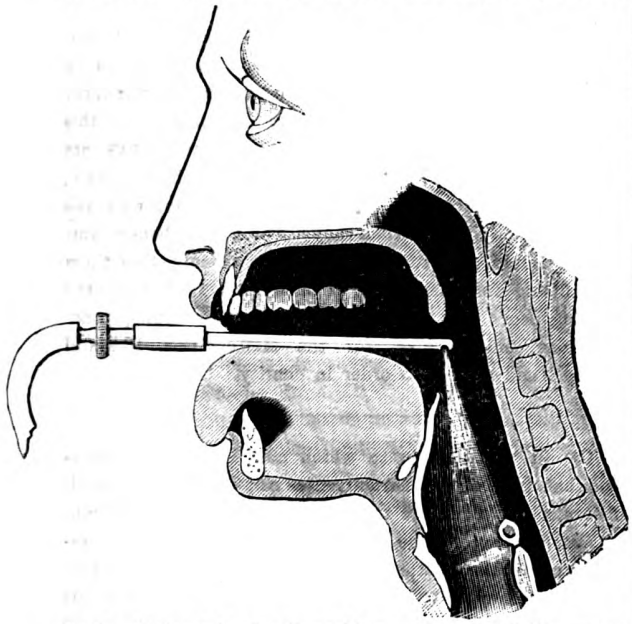
We have thus far omitted to speak of the chapter devoted to Urinary Fever and we fear that lack of space will not enable us to deal with it as it deserves, but we must at least summarise this very clear exposition of a most important subject. There are certain very striking phenomena which only occur after an operation on the urinary organs. A patient has a catheter passed, and severe rigors follow with perhaps death in a few hours or days; such strange results from so simple a procedure demand an explanation. The explanations which have been offered of them can hardly be called satisfactory and yet the results are often so serious that surgeons have made great endeavours to understand their pathology in order to be better able to prevent their occurrence. Mr. Mansell Moullin classifies the cases in four divisions; in the first he puts those in which only a single rigor occurs, in the second profound collapse results, often followed by death in thirty-six hours. Both these forms the author attributes to septic absorption, the difference depending on the dose and the rapidity with which it enters the circulation. In the third form the symptoms do ot follow the operation for three or four days; in these cases a feeble pulse and dry tongue with increasing wandering delirium soon lead to a fatal issue. These symptoms are to be attributed, we are told, to a septic cystitis with an ascending invasion of the kidneys themselves. In the fourth variety there is continued fever with recurring rigors, the fever being due to invasion of the circulation by the organisms. There are certainly many things to be said in favour of this classification and on behalf of the author's contention that disease of the kidneys is no essential factor in urinary fever. We must confess that we think it probable that the nervous theory, which is often advanced to explain urinary fever, will be found inadequate to account for more than a very small minority of cases.

We have said sufficient to show that in Mr. Mansell Moullin's work these important problems are discussed thoroughly and in a manner which is fully abreast of the knowledge of the present day and the consideration of the principles of treatment is as thorough as the pathology. We can recommend a perusal of this interesting volume to all surgeons.

The Diseases of the Lungs. By JAMES KINGSTON FOWLER, M.A., M.D. Cantab., F.R.C.P. Lond., and RICKMAN JOHN GODLEE, M.S. Lond., F.R.C.S. Eng. With 160 illustrations. London: Longmans, Green and Co. 1898. Price 25*s*.

THIS work constitutes a most important addition to the literature of scientific and practical medicine. It is, moreover, a sign of the times, for it brings home to us the truth that even in a subject which might be thought to rest wholly within the physician's province it is needful for its complete exposition to call in the aid of the surgeon. It was a happy thought, marking thus a new departure, which led to the coöperation of such distinguished representatives of the two great branches of our profession in the production of a work of this class. The result has been no less fortunate, for not only is the work more complete in its survey than any similar book with which we are acquainted, but it shows how advantageous it is to have the subject viewed from the two sides. Naturally the chief share falls to Dr. Kingston Fowler, whilst to Mr. Godlee are assigned chapters dealing with injuries of the lungs and pleura, the surgical treatment of pulmonary cavities and of tumours and hydatids, of pleural effusions and empyemata, together with a description of actinomycosis, and a valuable introductory chapter on the Anatomy of the Chest. We may first turn to the main bulk of the volume which is the work of Dr. Fowler.

In the first place the reader cannot fail to be struck by the orderliness with which the contents of the volume are arranged. There is not any condition of the lungs and pleura known which does not in its due place receive attention. The various affections are dealt with in a manner proportionate to their extent and importance, whilst a pleasing innovation is the introduction at the head of each chapter of a summary list of contents, with page references, which has not,



happily, prevented the addition at the end of the volume of a very complete index. These indications of an orderly system are further borne out in the individual chapters, where each branch of the subject is discussed in a regular rotation which applies to all the diseases. The description of the diseases is preceded by a chapter on Physical Diagnosis, which is thoroughly practical and not overweighted by theoretical speculations. We join with Dr. Fowler in the regret that the nomenclature of physical signs is still so equivocal, and we are glad to note that he adheres to the terminology proposed by the Committee of the International Medical Congress. Diseases of the Trachea are first described, and here, as elsewhere in the volume, details are given of actual cases, a practice which adds much to the value of the book. We may specially cite the notice of a remarkable case of chronic tracheitis, in which the posterior wall was so thickened as to be mistaken for growth, so that tracheotomy was performed. The thickened membrane was cauterised and the patient made a good recovery after a severe illness from broncho-pneumonia and pericarditis. Stenosis of the trachea from organic stricture and from compression is discussed, as well as perforation of the trachea by enlarged glands or aneurysms. The chapters on Bronchitis are excellent, but we may pass them by in order to draw especial attention to that on Bronchiectasis, which is most thoroughly considered. The varied etiology of this condition, the importance of its accurate recognition, and the difficulties in its successful treatment render it a matter for thoughtful and accurate analysis and this it has certainly received at Dr. Fowler's hands. The encouraging account he gives of the value of treatment by the "creasote vapour bath" introduced by Dr. Arnold Chaplin and the full details given of its application will certainly be welcomed by the practitioner, who has few more distressing and disappointing cases to treat. A separate chapter is devoted to Bronchiectasis in Children. This is followed by chapters on Bronchial Stenosis and Diseases of the Bronchial Glands. In the chapter on Emphysema the pathogeny of the condition is adequately discussed and the great service rendered to medicine by Sir W. Jenner on this subject is fully recognised. It may be mentioned that the treatment of emphysema by the compressed air bath is spoken of with approval. The chapter on Asthma opens with a striking description of the asthmatic paroxysm and in speaking of its pathology Dr. Fowler enumerates no fewer than eight alternative hypotheses which have been propounded. At the same time he points out that there is now little dispute as to the nervous factor in the affection, the point still *sub judice* being mainly as to whether the bronchial narrowing is due to temporary swelling of the mucosa by vaso-motor influence or the more classical view of spasmodic contraction of the bronchial muscles. To us it has always seemed that the efficacy of anti-spasmodics, and especially of vaso-dilators—such as the nitrites—tells far more strongly in favour of the latter than of the former view. Dr. Fowler has some judicious remarks on treatment, and his warning to the young practitioner not to prescribe until he has heard the experiences of the patient is sensible, for the asthmatic is a law unto himself; there is no affection in which idiosyncrasy plays so large a part, for, as the author pithily puts it, "asthma is a disease of 'exceptions.'" Many chapters are devoted to Pneumonia, its varieties, and its sequels, but we must content ourselves here with drawing attention to the excellent discussion upon the bacteriology of acute pneumonia, the description of chronic and subacute pneumonia, and on pulmonary fibrosis. Next in order come the diseases due to inhalation of dust, the destructive changes which are responsible for so large a premature mortality amongst workers in dusty trades being, as Dr. Fowler shows, due to tuberculosis, which is favoured as much by the unhygienic conditions of the workshops as by the inhalation of dust. Chapters on Congestion, Brown Induration, and Collapse follow, and then comes what is undoubtedly the *pièce de résistance* of the book, the ever-pressing subject of Pulmonary Tuberculosis. It needs many chapters for its exposition, and this is in all respects so thorough and comprehensive, so fully abreast of the knowledge of the day in etiology, pathology, and treatment, that it will be studied with profit even by those who have had most experience in this common disease of our country. Dr. Fowler recognises four types, to the characteristics of which he gives separate consideration. They are: (*a*) miliary tuberculosis; (*b*) caseous tuberculosis; (*c*) fibroid tuberculosis; and (*d*) chronic or fibro-caseous tuberculosis. He discusses the subject of Pyrexia in a separate chapter, whilst in his account of the chronic disease he introduces the very instructive diagrams showing the usual progress of invasion of the lungs which he first brought into notice some years ago. Upon Treatment, he deals with many topics in turn, gives full approbation as well as description of the open-air treatment, considers that "tuberculin" is a remedy which cannot be justifiably used as it induces pyrexia and may disseminate tubercle in the body, treats of antiseptic remedies, of the treatment of local conditions, of climatic treatment, and conveys much wise and practical counsel. There is a fuller study of the subject of Pulmonary Syphilis than is ordinarily met with in such works; Actinomycosis is described by Mr. Godlee, whilst Dr. Fowler writes on Pulmonary Mycosis and on Hydatids. Embolism, Thrombosis, Aneurysm of the Pulmonary Artery, Hæmoptysis, each in turn receive attention, the Pulmonary Complications of some Acute Specific Diseases closing the portion of the work devoted to the lungs.

After a chapter on Injuries of the Pleura by Mr. Godlee, the subject of Pleurisy is treated by Dr. Fowler. Here we have an ample account of the bacteriology of pleural inflammations, and it is interesting to note that in the author's opinion tuberculosis is responsible for very many cases of sero-fibrinous effusion, although it is not always possible to detect the bacillus in the exudation. Mr. Godlee's contribution of the Surgical Treatment of Diseases of the Pleura is, as is to be expected, full of information and of practical suggestion. He also contributes an article on Peripleuritis, Caries, and Necrosis of Ribs and Mediastinitis. Pneumothorax, Hydrothorax, Hæmothorax, and Chylothorax are next taken, the last-named rare condition being illustrated by the clinical and pathological details of a very instructive case. Tumours of the Pleura, Diseases of the Diaphragm, Tumours of the Mediastinum, and Pulmonary Osteo-arthropathy—these are some of the subjects which receive attention and render the work so very complete. Nor must we close this notice without a word of praise for the admirable anatomical chapter by Mr. Godlee with which the book opens. It is sufficiently detailed to render it of much value in the after consideration of pleural and pulmonary diseases, but what is particularly to be noticed is the abundance of excellent illustrations which here find a place. These alone are worth careful study and by the light of Mr. Godlee's text they teach most important facts which are of real practical value. Speaking of illustrations, it must be said that the whole volume is most fully furnished in this respect, a large proportion of the figures being original. These together with the general style of production of the work add to its attractiveness and enhance its value. It only remains for us to express the pleasure with which we have perused a book which bids fair to rank as a standard authority on a subject of high importance, and we may well congratulate the authors on the successful accomplishment of their task. The work will be widely welcomed.

New Inventions.

LARYNGEAL AUTO-INSUFFLATOR.

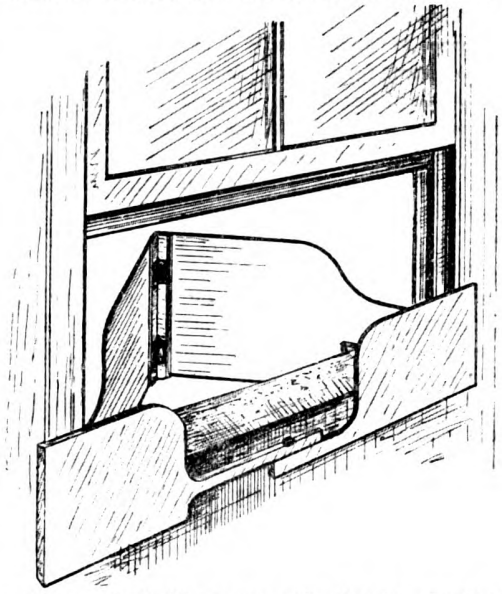
THE superiority in laryngeal conditions of medication by powders, on account of the more lasting effects of such substances as compared with solutions, coupled with the difficulty of accurately insufflating pulverised bodies into the larynx by individuals unaccustomed to throat work, has led me to devise an instrument (made for me by Messrs. Wood and Son, Manchester) by which powders can be readily blown into the organ by the patient or his friends. The apparatus consists of a straight tube with a receptacle for powder at one extremity and a small hole somewhat like the eye of a catheter at the other. This aperture is to be kept downwards when the tube is introduced and a tiny ivory knob on

the insufflator indicates its position. A tube and bellows complete the instrument, which should be passed into the mouth, resting on the tongue, until the soft palate is touched, the tongue being protruded. A deep inspiration is then taken and simultaneously the bellows are forcibly compressed, when the powder is partly aspirated and partly blown into the larynx. The advantages of the insufflator appear to be that (1) it can be used by the patient or his friends owing to the abolition of the usual terminal curve, thus obviating irritation of the sensitive parts about the pharynx by the inexperienced manipulator; (2) the end is not liable to be jerked when the powder is insufflated, as occasionally happens in the instrument ordinarily employed; (3) the powder is evenly distributed; and (4) the price is comparatively small (5*s*. 6*d*.).

St. Ann's-arcade, Manchester. E. S. YONGE, M.D. Edin.

NEW ASEPTIC OPERATION AND DRESSING TRAYS.

HAVING given an extensive trial to the various dressing trays usually sold and to several of my own design, I have now arrived at the most convenient and useful shape which has been made for me by Messrs. Arnold and Sons, West Smithfield, London. The trays are made in sets of three and all fit into one another to economise space and to keep out dust. They are made of tinned copper and can be boiled, scrubbed, and generally made aseptic. They serve for boiling instruments in before or after an operation, while they are adapted for carrying the dressings and sponges in a moist condition to an operation. They are equally adapted for private and hospital work. They fit almost every part of the body. To catch liquid at an ordinary laparotomy or operation about the inguinal canals one tray is put between the thighs and jammed well up against the perineum, while the other two are placed close up against the loin and thigh on either side of the patient. Any amount of washing out and sluicing the skin or operation area may be freely indulged in without wetting the tables and blankets. For all operations the trays serve as instrument holders half filled with antiseptic lotion. It will be found very convenient to keep a pair with, say, the usual instruments for curettement



of the uterus always stowed in them—enema, uterine tube, Hegar's dilators up to 15, curettes, volsellum, &c. Two form a dust-proof box and can be kept on a shelf ready for instant use.

T. HOPE LEWIS,
Surgeon, Auckland Hospital, New Zealand.

A SAFETY WINDOW-CLEANERS' "CHAIR."

WE give below an illustration of a device for the prevention of accidents from window-cleaning. In our opinion there should be no necessity for such an invention, inasmuch as in the interests of humanity local authorities should have the power, if they do not already possess it, of making it illegal for a person either to sit or stand on a window-sill above the ground floor of a building for the purpose of cleaning a window. Until such necessary laws are made, however, we welcome any device which will prevent or minimise danger to life or limb from this cause. As will be seen from the illustration, two strong pieces of board rest against the frame and brickwork enclosing the frame of the window. These boards are connected together by two

arms of wood which slide one upon the other in order that the boards may be regulated to the width of the window. These arms are fixed together by means of a screw. Hinged to the side of each board facing the street are two other pieces of board which meet at an angle formed by means of a strong hinge. An immoveable back rest is thus formed for the person cleaning the window, who is consequently enabled with safety to use both hands in the task of cleaning the window, instead of being forced to hold on to the bottom of the frame with one hand. The price of the article is only 4*s*. 6*d*., and communications concerning it should be made to the inventor, Mr. H. Gold, 21, Great Eastern-street, E.C.

THE LANCET.

LONDON: SATURDAY, JUNE 4, 1898.

WE publish to-day our twelfth supplement in support of the Metropolitan Hospital Sunday Fund and in so doing, for this particular occasion only during the year, address ourselves to a body wholly outside the circle of those to whom as a rule we submit our weekly issues. But by this time it is well understood by our readers that we make this departure from our custom in the interests of a cause common to all alike—in the interests of work which is, on the one hand, dependent upon medical efforts for its due carrying out, but which is, upon the other, the result of the charitable contributions and foresight of the public. Hospital work forms a neutral ground upon which all men, medical and lay alike, can meet and unite to help those of their brethren who have the strongest possible claims on their humanity—the sick poor.

The supplement which we issue to-day, while it deals with the work and growth of the Hospital Sunday Fund from its inception, is written in two parts: the first being a statistical statement illustrated by a few easy and obvious morals drawn from the figures, and the second a short story describing a situation which would be an exceedingly frequent one in the unimaginable case of London being deprived of the services of its hospitals. We have resorted to fiction because it has seemed to us that the short story would form a convenient medium through which to impress the claims of the Hospital Sunday Fund on the general public, but we should like to point out that our story does not avail itself of the usual privileges of romance; for whereas fiction generally selects terrible examples and portrays them as common events, so that a situation set out by the pen of an adept novelist is apt to be much embellished by the art of the writer and by his feeling for chiaroscuro, our author, on the contrary, has chosen a commonplace incident, one of daily occurrence, and has shown how an annoying accident would be transformed at once into a very real tragedy were it not for the intervention of the hospitals. He has not sought to unfold a harrowing tale; he has not designed to shock or frighten persons out of large subscriptions in self-defence: he has simply wished to furnish small subscribers with a practical reason why they should subscribe in their numbers. If the masses will spare their 5*s.* we may be certain that the classes will subscribe their £5. For the Metropolitan Hospital Sunday Fund affords a peculiarly fit opportunity to persons of restricted means of tendering support to the medical charities of London. A small subscription given in this way possesses both actually and sentimentally a value which it could not otherwise have. It is no small thing that the poor man contributing his mite upon this occasion should be able to feel that it goes to swell a Fund large enough to form an indispensable part of the charitable revenues of the world's greatest city and yet to be drawn mainly from sources such as his own benevolence has opened up. Thousands of persons in London are so situated. The subscription list with its regulation guinea is not for them, and were it not for the recurrence of the Fund collections they would stand quite aloof, wishing well to their suffering neighbours but being powerless to promote their well-being in any way.

We need not labour the arguments of our supplement, the whole teaching of which is that the right-thinking inhabitant of London should levy an annual rate upon himself according to his means. It remains for us only to say, in words which we have employed almost identically before, that to all orders of mind, and all social grades, and all creeds alike the Metropolitan Hospital Sunday Fund must appear as a noble charity, splendidly directed, economically managed, justly administered, practical, and humane. To this Fund the rich should give, not only because they are rich but because they are directly benefited by the hospitals; the poor should give and they need no reminding what the hospital means to them when they are sick; the benevolent-minded should give, for no scheme can come before them more fitting for their alms than a fund to benefit the suffering poor; and, lastly, men of business habits, practical men, should give, for the Metropolitan Hospital Sunday Fund represents order in charity.

"OF all the diseases to which man is liable there is none that in point of destructiveness can be compared with tuberculosis." Such are the opening words of an article in the *Practitioner* for June, the whole of the number in question being devoted to the subject of tuberculosis, more particularly pulmonary tuberculosis, and containing numerous papers on the subject from all points of view by some of our most eminent authorities. The editor is to be congratulated on the success which has met his endeavours, for seldom has a better collection of papers been published in any single issue of a medical magazine.

The first article, on the Treatment of Consumption, is written in characteristic style by Sir SAMUEL WILKS. After a short historical *résumé* of some of the methods which have been employed the writer is forced to the conclusion that "the remedy for consumption is not medicine but fresh air. ..... Air and sunshine are the needs of the consumptive; without them no other remedies will succeed." This is the cry which rings throughout all the succeeding papers. It is an opinion which is rapidly gaining ground with all physicians, and without doubt will form the basis in all future treatment of the "national complaint" of all countries. Another of Sir SAMUEL WILKS'S remarks is worth quoting. It is expressed rather quaintly, but contains a great principle: "When reading at school of DIOGENES in his tub and the visit of ALEXANDER the Great to him, I thought he was a man of very bad manners in telling the monarch to get out of his sunshine, and it was not until late years that I took a different estimate of the philosopher. After an attack of influenza I went to Worthing to convalesce, requiring air and sunshine. Everything else in the

world was put aside for these; they were my only wants. When, therefore, I sat looking on the sea and basking in the sun a friend stopped in front of me to talk, he was stripping me of my only shred of comfort and I exclaimed, 'Get out of my sunshine!' I then discovered the greatness of DIOGENES, who evidently knew that the sun was the source of all power."

The second paper is by Dr. ARTHUR RANSOME on the Susceptibility to Tuberculosis under Different Conditions. The conditions include race, climate and locality, toil, sex, age, and heredity. Dr. RANSOME draws attention to the fact that in Dr. LOMBARD'S maps of the distribution of phthisis, the only portions of the earth's surface from which the colour is entirely absent are the arctic and subarctic regions, deserts, and high ranges of mountains, and it is precisely in those parts that human beings are fewest and most sparsely scattered over the ground. Dr. RANSOME speaks doubtfully of the influence of heredity, and comes to the conclusion that "it is highly probable that heredity has much less to do with consumption than is popularly supposed, and that it ranks very far behind many other predisposing causes. This view is gradually forcing its way into the insurance offices, the medical advisers of many of them being far less disposed to "load" applicants with a family history of phthisis than was formerly the case. After discussing the conditions named above the writer concludes "that, with the exception of soil, none of the influences that have been now passed in review have much to do with the spread of tubercular disease."

Dr. SIMS WOODHEAD'S contribution to the Bacteriology of Tuberculosis is excellent, telling all that is known about tuberculosis from a bacteriologist's point of view. The manufacture of KOCH'S new tuberculin is fully considered, but the expression of any definite opinion as to its therapeutical value is wisely refrained from. The important subject of the Relation of Tuberculosis of Animals to Man is dealt with by Dr. ALLAN MACFADYEN, who, after enlarging upon the results obtained by the Royal Commission upon Tuberculosis (1895), comments on several points which should receive the attention of those authorities whose duty it is to regulate and supervise the meat-supply and the milk-supply. His remarks are strongly and concisely expressed. He urges "an adequate inspection of cattle by veterinary surgeons; and the removal of suspected animals from the dairy sheds is required in the first instance. The use of tuberculin as a diagnostic agent is of the greatest value in this respect and the neglect of its aid is inexcusable ..... An early diagnosis of this infectious disease, whether in man or animals, is essential if we are to combat its stealthy spread and so limit the dangers that exist from the two great channels of infection—the sputum of phthisical patients and the milk of diseased animals." With this all must agree. The matter is still further dealt with by Dr. A. K. CHALMERS in a paper on the Causation of Tuberculosis and its Prevention by Legislation, and also by Dr. HERMANN M. BIGGS in an article on the Prevention and Restriction of Pulmonary Tuberculosis in the City in New York. Both these papers form most interesting reading and contain many valuable suggestions.

The Climatic Treatment of Tuberculosis is considered by several authors. Dr. C. T. WILLIAMS writes on the Treatment of Pulmonary Tuberculosis by Residence at High Altitudes; Dr. MICHAEL G. FOSTER on the Mediterranean Littoral as a Health Resort for Phthisis; Dr. F. M. SANDWITH on Desert Climate for Lung Tuberculosis; Dr. ALFRED P. HILLIER on the Climate of South Africa; and Dr. F. PARKES WEBER on Ocean Voyages in Phthisis—a series of papers which will prove most valuable for reference. Much interest will attach also to the papers on the Open-air Treatment of Consumption by Dr. HERMANN WEBER, Dr. RUFFNACHT WALTERS, and Dr. F. W. BURTON-FANNING. As we have said in our columns, when publishing communications on this subject from the same pens, we believe that this method of treatment will be largely adopted in the near future. The question naturally arises as to the most desirable methods of carrying it out. Experience alone can decide as to which course promises the better results—the treatment of phthisical patients in sanatoria under the care of an "expert" or the careful supervision of such patients in private houses by independent medical men.

Two other papers require to be mentioned—the Hospital Treatment of Consumption, by Dr. J. E. POLLOCK, and the Medicinal Treatment of Tuberculosis, by Dr. HECTOR MACKENZIE. They complete a really valuable little collection of monographs which we have pleasure in recommending to the perusal of all our readers.

THE facilities which are afforded to medical men for continuing their education, either in the general curriculum or in special courses, are very limited in Great Britain when compared with those which exist on the continent and in America. The centralisation of medical teaching and the treatment of an enormous number of cases under one roof and one State or charitable dispensation, as we find them in many foreign universities and hospitals, cannot be imitated in London. We have no central university and the hospitals are scattered, so that each appeals to its own supporters and considers primarily and rightly the comfort of the patients rather than the efficiency of the teaching. The systematic examination of the sick by a large class of students has not been introduced here as it has been in many Continental hospitals. Post-graduate teaching has, therefore, in London never been organised on a centralised system, although lectures and demonstrations have been given, generally on special subjects, at our hospitals and in our laboratories to medical men on payment of a small fee. Also, as stated in THE LANCET of May 28th, a combination of the London general hospitals has lately been formed by which a post-graduate student can attend any special part of the medical course at any hospital which he may choose instead of being limited as hitherto to one hospital. Now our experience leads us to believe that the post-graduate student wishes to attend one or more special departments or special hospitals rather than go through an extended curriculum, and in this matter he has a large choice in London already both of hospitals and teachers, although his clinical material cannot be brought to one institution. In fact, we think that under existing circumstances—circumstances, however, of very recent origin, the London post-graduate student can now obtain much of what he wants. But that others think differently is proved by

a scheme which has been submitted to us for the foundation of a Medical Graduates' College and Hospital on the American rather than the continental plan — that is to say, a college and hospital where qualified men alone are to be taught. We recognise the difficulties which must attend any attempt to combine teaching for students with post-graduate instruction. Of course, a college and hospital for post-graduates alone would be a more desirable method for giving the special instruction they desire, but in order to do this with efficiency provision must be made on a large scale. Lecture theatres, class-rooms, laboratories, a museum, and a library must have places in such a college, and such a hospital must attract by the wealth of its general and special clinical material and by the reputation of its teachers. Public consultations and advice to medical men on the diagnosis and treatment of their cases will require very careful management or they may possibly come to be regarded in a false light. It is hardly likely therefore that the scheme will receive much support from the teachers and governors of our general and principal special hospitals and in many instances an active opposition may be excited. The medical profession may subscribe liberally to the foundation and endowment of such an institution, but as the patients will not be admitted into the hospital for prolonged treatment, but rather for the purposes of teaching, it is questionable whether it will derive much support from the general public. If another JOHNS HOPKINS can be found to provide the necessary funds the scheme will be carried out easily, but unless some munificent benefactor arises we are doubtful whether the project, which has much to recommend it, can be brought to a successful issue.

THE Society of Medical Officers of Health for Scotland has issued a very useful "Memorandum with respect to the duties and sphere of the medical officer of health under the Infectious Disease (Notification) Act." By the new Scottish Public Health Act the Notification Act is made applicable throughout the whole of Scotland, and it seems that several instances of friction between the health officer and the medical attendant have recently occurred. The Memorandum points out that a good mutual understanding is essential for the efficient control of infectious disease; that as a general rule it is not the duty of the medical officer to review the practitioner's diagnosis; that the medical officer must start from the belief that certificates are given in good faith; that in respect of diagnosis the private practitioner has, as a rule, an advantage over the health officer in having had the case under observation and in knowing its history; that there are circumstances which justify the officer in reviewing a diagnosis in the interest of the public or of the patient, but that any such review should be made "with a clear apprehension of the delicacy of the undertaking, with due attention to professional etiquette, and, above all, in remembrance of the golden rule." When removal to hospital is in question the private practitioner may cordially concur in the procedure but may object to be an active party and the medical officer may have to step in. Small-pox and typhus fever are diseases which demand drastic suppression, but they occur so seldom nowadays that few practitioners have the opportunity of becoming familiar with them. Small-pox involves removal to hospital, revaccination of exposed persons, a report to the Local Government Board, and perhaps interference with employment. When all this routine has been discharged it is awkward for the private practitioner if it turns out next day that the case is not small-pox, and in his own interests a preliminary consultation would have been advisable. Even where gross carelessness or *mala fides* is suspected the patient should not be visited without prior intimation to the medical attendant. This is the statement of the Memorandum and is most clearly our opinion also. A local authority insisting on its officer making a practice of inquiring into diagnoses should be resisted. Where a different opinion is formed by the medical officer to that which has been expressed by the general practitioner, the information of the varying opinions should reach the patient or relatives through the practitioner, showing that neither medical man has lost confidence in the other because their minds do not happen in an individual case to jump alike. Where the original diagnosis is reversed in hospital the medical officer should take steps to secure "that the patient is not discharged in such a way as to suggest any reflection upon the action of the practitioner who certified the case." In issuing this sound Memorandum the Scottish Society of Medical Officers of Health has taken a wise step — a step, indeed, which is likely of itself to do much to attain the purpose of the Memorandum in the avoidance of friction and the promotion of public as well as professional welfare. It should be welcomed in Scotland as showing the anxiety of the Society that the public health medical service should maintain the best possible relationship with the great body of the profession. The hearty support which the profession gave to the health officers in their last year's strenuous and successful fight to obtain proper status and recognition in the new Public Health Act shows on the other side an equal friendliness which is well reciprocated in the document the contents of which we have here briefly indicated.

Annotations.

"Ne quid nimis."

DENTAL SURGERY AND HYGIENE.

DURING the International Congress of Hygiene and Demography recently held at Madrid an effort was made to establish a direct connexion between dental surgery and hygiene. In respect notably to the systematic surveillance and care of the teeth of children at school much is done but much more could be done to save the coming generation from one important cause of ill-health. Then, also, dental surgery is connected with special occupation diseases such as the necrosis prevalent among the match-makers. Speaking generally, the inferiority of the teeth of the present generation as compared with the teeth of previous generations is a very distressing symptom of the effects of modern life and the study of its causes involves at once questions of dental surgery and of hygiene. In view of these considerations it was felt that dentists should participate in the labours of the Congress of Hygiene. Some two years ago the Spanish Odontological

Society was established and this organisation determined to hold its first general assembly at Madrid at the same time as the Congress of Hygiene. But as there are many dental questions which do not come within the scope of hygiene the dentists met separately at the Royal Academy of Medicine. It was originally intended that when papers were to be read establishing a direct connexion between dental surgery and hygiene the dentists, who were all enrolled as members of the Congress of Hygiene, should go over in a body to the latter Congress. But at the last moment this was not found to be practicable, so the papers in question were read at the Academy of Medicine, with the understanding that they will be published in the official record of the Congress of Hygiene. There were altogether 121 members of what might be called the dental section of the Congress, including some foreign guests. Among the latter Dr. G. Cunningham of Cambridge read an interesting paper on the Teeth of School Children, insisting on a more systematic and wide-spread inspection. Dr. Bofill spoke on Antiseptic Dentifrices, demonstrating the inutility of the nostrums offered to the public. Dr. Aguilar read a paper on the measures to be taken to prevent the disease which is but too well known in the east of London under the popular denomination of "phossy jaw." He suggested that match-makers should not be allowed to work more than fifteen days consecutively and that then they should keep away for fifteen days. He likewise insisted that dental inspectors should constantly examine the mouths of such workers and remove all roots and decayed teeth. Dr. Boniquet of Barcelona spoke of the mouth as the unsuspected cause of many illnesses. For instance, he described eight cases of quinsy which he ascribed to bacteria which sometimes were able to work their way from the root of a bad tooth and passing through the connective tissues became the focus of an abscess situated at some distance. Dr. Hohr, a Spanish dental surgeon of German descent, read a paper on a microbe which he claims to have discovered and names the amœba buccalis. According to Dr. Hohr this microbe is in its normal condition when in the human mouth and there it does no harm; but when it reaches the intestines it gives rise to the amœba coli and may excite dysentery. The resisting power of the mucous membrane of the mouth is greater than that of the intestine. If this organism is in the mouth it will be conveyed to the intestine with the food or saliva and should the subject be predisposed dysentery will result. This assertion is based on the similarity of both microbes. Dr. Hohr therefore argued that if the teeth are kept in perfect order the amœba buccalis will not be found in the mouth; consequently it will not be conveyed to the intestines, and even if the subject is predisposed to dysentery he will escape. Thus dysentery may be prevented even where the predisposition exists by the active intervention of dental surgery. Since the conclusion of the Congress of Hygiene the Spanish Odontological Society have met again and have decided to hold another Dental Congress in two years' time at Barcelona. Foreign visitors will be welcomed at this gathering.

ALCOHOLIC STIMULANTS IN WORKHOUSES.

THE consumption of alcohol in workhouses is a subject of discussion as old as the larger question of which it forms a part. It is one which has for many years occupied the attention of local authorities, with the result, on the whole undoubtedly satisfactory, that the administration of stimulants, at one time regulated mainly by the free hand of custom, is now much less liberal. This statement, however, is only generally true and is qualified by notable exceptions. Eminent among the latter stands the county of Kent. From statistics quoted by a contemporary, the *British Temperance Advocate*, it appears that while the total bill for intoxicants used throughout the workhouses of England and Wales has decreased during the last twenty-two years from £82,555 to £32,911, or about £50,000, the sum expended in the workhouses of Kent has not diminished in proportion. On the contrary, it is noted that while only the three parishes of Eastry, Dover, and Medway show a consumption below the general workhouse average the remainder use an amount varying from 39 to as much as 693 per cent. above that average. Thus in the parish of Milton the sum expended in this way is 4*s.* 9½*d.* per head while in that of Cranbrook it rises to £1 7*s.* 4½*d.* Some allowance must naturally be made for divergence of opinion as to the necessity for alcohol in special cases and conditions, but even this concession will not enable us to explain differences in practice so marked as those above referred to. It is significant that the example of Kent is to a greater or less extent characteristic of the whole southern section of England. It would be of interest and no less, we believe, to the public advantage to have fuller information on this subject. In particular it should be profitable to inquire by whom, in what form, and under what conditions, alcohol is consumed in workhouses, and whether it has been found to exercise any influence advantageous or otherwise on its consumers. It certainly would be remarkable that in one parish the sum expended on alcohol should be ten times that in another or even more without producing some proof either favourable to its employment or the contrary. If none such can be found then the case for the free use of alcohol must be but a weak one and the question of its abatement must appeal to the ratepayer. For our own part while fully recognising the value of alcoholic stimulants in certain cases we are no advocates for their routine employment. The differences of opinion which appear to prevail among parish guardians with regard to this subject have not failed to attract the notice of the Local Government Board. We trust they will obtain at the hands of that body yet fuller investigation and such practical direction as they may require.

AN ABUSE OF THE EXAMINATION SYSTEM.

THE absurdity to which the system of examination may be reduced is well illustrated by the following incident. A practitioner thoroughly well qualified and holding also a diploma of public health applied recently for the post of medical officer of health in a northern borough. On appearing before the local council he was desired to answer certain questions bearing exclusively on the causation, development, and treatment of several infectious diseases. Naturally, and we maintain with much propriety, he declined to be thus examined on matters of a purely professional character by a lay committee and referred to his qualifications as affording satisfactory proof of his professional knowledge. It is gratifying to learn that this very rational view commended itself to more than one member of the extemporised "medical" board and that those members openly resented its action as a meddlesome impertinence. But the most singular part of the narrative remains to be told. It appears that the prime agent in this intelligent proceeding was himself a medical man though a member of the town council. We are not informed as to the result of this election. If in keeping with the procedure adopted success in the matter of selection could not be other than accidental. Any examination of candidates in the circumstances was not necessary, since if medical degrees are not sufficient to guarantee the most ordinary technicalities of our profession they have obviously no value. An examination conducted by an ordinary municipal body and under the conditions we have described could not, moreover, constitute a reliable test of knowledge

It is much to be regretted that the sorry part of principal actor in this comedy should have been allotted, as we are led to believe that it has been, to a member of the medical profession.

SIR JOSEPH FAYRER AND FALMOUTH.

WE desire to contradict a statement which appeared in THE LANCET of May 28th that Sir Joseph Fayrer has become a resident of Falmouth. Sir Joseph Fayrer writes: "Falmouth is a charming place and I occasionally spend a few days there, but I am, and intend to be, a resident of London as I have been for many years." We all hope that Sir Joseph Fayrer's residence in London may be still prolonged for many years. Our correspondent did not mean to imply that Sir Joseph Fayrer had left London to take up his permanent abode at Falmouth.

THE DOSAGE OF CHLOROFORM AND INHALERS.

THE early papers of Snow, which appeared in 1848 and which gave the results of a series of careful experiments made with narcotic vapours, have recently been recalled to the minds of those curious in such matters by the address given before the Society of Anæsthetists by Professor Waller. Snow dealt with the whole body, whereas Professor Waller dealt with nerve tissue, and of course Snow possessed neither the physiological training nor the perfected apparatus at the command of the later experimenter. Yet, as Professor Waller readily admitted, it is Snow's work which has suggested most of the later research and it is Snow's teaching which appears to gain fresh weight by modern experimental results. These papers deal with narcotics in general and not with chloroform and ether alone, and it is not too much to say that most of our knowledge of this group of medicines will be found in Snow's papers. It was a favourite illustration of his to place a candle in a bottle and diffuse chloroform in it. As the candle flickered it is recorded of him in Sir Benjamin W. Richardson's memoir that he said: "There, now, is all that occurs in narcotism; but to submit the candle to the action of the narcotic without extinguishing it altogether you must neither expose it to too much vapour all at once nor subject it to the vapour too long, and this is all you provide against in subjecting a man to the same influence." It was the firm belief in this view which induced Snow to proclaim the dangers of the "open method" then prominently before the world and sanctioned by the authority of Simpson and later of Syme. Snow's inhaler, designed to ensure a low percentage vapour of chloroform, valuable in its day, did not survive. To those accustomed to seeing chloroform poured unstintingly on a towel, on lint, or "on a dresser's woollen glove" *more* Professor Miller, Snow's teaching that 18 minims of chloroform absorbed by an individual of average size and weight will induce narcotism of the third or surgical degree, that 24 minims would plunge him into the fourth degree, and that 36 minims must arrest respiration, would receive scant attention. There can be no manner of doubt that Snow was right and that the advocates of the open method, when that is pursued according to Syme's directions by pouring unmeasured quantities of chloroform upon the cloth, are trenching upon dangerous ground. The safeguard to this method has always been the religious adhesion to the rule "watch the breathing." The strength of the vapour may cause holding of the breath; if the rule is kept the cloth is removed and the patient escapes the overdose. The rule is, however, not always kept and death results. But when Snow's principles are carried out this danger is absent, although there remains the peril arising from the gradual accumulation of chloroform in the blood. Clover's inhaler, among many, sought to obey Snow's injunctions, but its unwieldy size foredoomed it to oblivion. No objection of this kind arises in the case of Junker's inhaler. Its principle renders it capable of giving exact doses, but the earlier patterns were open to many practical objections—objections which the ingenuity of many anæsthetists has to a great extent removed. Among instrument-makers much credit is due to Mr. Krohne for his enthusiastic attempts to render Junker's inhaler as nearly as safe an instrument as any piece of mechanism can be made which stands between a human life and a lethal agent manipulated by the fallible hands of man. In another column we give illustrations of his more recent improvements. The instrument as figured is capable in the hands of a careful administrator of delivering a fraction of a minim of chloroform and so of maintaining a vapour of 1 per cent. or even less. The air is driven through the chloroform by means of a specially-contrived ball bellows which is so graduated that dosage of the anæsthetic can readily be effected and from ¼ to 1 minim driven through the delivery tube and presented to the patient. All the most advanced thinkers now recognise the paramount importance of accurate dosage in giving chloroform, and up to the present time no more accurate plan has been devised than that adopted in Krohne's modifications of Junker's inhaler.

A CHINESE HOSPITAL FOR PLAGUE AT HONG-KONG.

ON April 19th a special meeting of the Hong-Kong Sanitary Board was held to consider the advisability of permitting a Chinese Hospital for the reception of plague patients to be opened under the supervision of the sanitary board. The chair was occupied by the President (Dr. J. M. Atkinson, Principal Civil Medical Officer), and there were also present the Hon. R. D. Ormsby (Director of Public Works), Mr. E. W. Brewin (Acting Registrar-General), the Hon. F. H. May (Captain-Superintendent of Police), Mr. N. J. Ede, Dr. F. Clark (Medical Officer of Health), and Mr. C. Vivian Ladds (Colonial Veterinary Surgeon and Acting Secretary). The Captain-Superintendent of Police moved the following resolution: "That this board do appoint a branch hospital to the Tung Wah Hospital to be established on a site to be approved by the board as a place to which patients suffering from plague may be removed, provided always that such hospital be under the control of the Sanitary Board and under the supervision of one or more duly qualified European medical practitioners, and that the patient be allowed the option of being treated according to Western medical science or Chinese medical methods, and that the burial of those who die in the hospital and the removal of patients therefrom be conducted under regulations to be approved by the board and under the supervision of the doctors." Dr. Atkinson and Dr. Clark, the only medical members of the board, naturally opposed the resolution. According to the *Hong-Kong Weekly Press* of April 23rd Dr. Clark said he thought that in the interests of humanity it would be an evil if the Government of a colony such as this were to recognise in any way the so-called Chinese treatment of disease and especially the treatment of infectious disease. Dr. Atkinson said that in 1894 the mortality amongst the Chinese when the native doctors were allowed full scope was 93·4 per cent., and that in 1898 when the treatment was entirely in the hands of the Medical Department, it was 74 per cent. In the result the motion was carried. At a meeting of the board on April 21st it was announced that the Tung Wah Hospital Committee were willing to establish such a branch hospital and recommended that the Government should lend to them one-half of the cattle depôt at Kennedytown for the purpose. Dr. Atkinson said he considered that the sheds in question were most unsuitable and recommended

that mat sheds on the foreshore to the north of Kennedytown should be used instead. He, moreover, took the opportunity of repeating his protest against the establishment of a hospital where so-called Chinese practice is allowed, in which opinion he was supported by Dr. Clark. Dr. Atkinson's proposal as to the mat sheds was accepted and arrangements were forthwith made with a view to rendering them fit for occupation in the course of a week. In justice to Mr. F. H. May and his supporters on the board, it ought to be added that their action seems to be dictated by a desire to humour the prejudices of the Chinese population and not by any preference for Chinese medical methods rather than European ones.

THE MEDICAL, SURGICAL, AND HYGIENIC EXHIBITION.

THE success of this exhibition, which was held for the first time last year, has induced the organising committee to make it an annual event. It was decided this year to hold the exhibition earlier (last year it was in July) and the Queen's Hall, Langham-place, was devoted on Tuesday last to the exhibition of a very interesting assortment of foods, drugs, surgical appliances, &c. The exhibition closes to-day (Friday). We have considerable pressure on our space this week, but we hope next week to give a detailed description of the novelties shown and of other things of general interest to the profession. Suffice it now to say that the impression that this new departure is a useful one is confirmed and it is evidently appreciated by all those who are anxious to keep pace with the advances which are made in pharmacy and dietetics and in the design and construction of various apparatus and medical appliances.

DIVERS' PARALYSIS.

AN interesting case of this rare condition is reported by Dr. Frederick Taylor in a recent number of the *Clinical Journal*. The patient was under treatment in Guy's Hospital. He had already suffered three times from paralysis, the first time being in 1890. The history of the present attack was as follows:—He was working with five other men at a depth of 162 ft. and went down three times, remaining below twenty minutes each time; the ascent occupied six minutes. He felt quite well after these descents, but at the fourth descent a heavy piece of machinery slipped and jammed him up against an iron beam. He did not lose consciousness, but tried to economise the air at his disposal. After about five minutes he felt suffocated, had intense pain and noises in the head, and began to lose consciousness. It had been noticed on the lighter that the air-tube was not working and another diver went down and by following the line reached the patient and freed the air-tube so that he could be drawn up. On this occasion the ascent occupied only one minute. He felt very giddy and sick, but did not notice anything else amiss. On standing he noticed a feeling of numbness in his feet and this was present also in his arms both as to power and sensation. On admission to the hospital nine weeks afterwards there was marked loss of power in both his legs. There was no marked wasting of the muscles of the legs, though they were soft and flabby. The knee-jerks were normal. There was partial anæsthesia over the inner side of both legs from 3 in. above the knees to 3 in. above the ankles, the areas being roughly symmetrical. There was no loss of sensation to pain; the sensations to heat and cold were normal. The patient gave some interesting information as to the difficulties to which people engaged in this occupation are liable. He said that in his experience the paralysis only comes on after working at great depths and seems to be due to too sudden alteration of pressure. The disease is frequently due to divers having to be quickly hauled up owing to the air-tube being foul. Old men, he thought, are more liable to these attacks than younger ones and the character of the water and the duration of the stay are not so important as is the age of the diver. At a depth of 150 ft. there is not much inconvenience, but every two or three feet lower makes a difference. When diving at great depths the men always have a sense of fulness in the head, buzzing in the ears, and flashes of light before the eyes. On coming up there is often bleeding from the mouth, nose, and ears. The patient also referred to the condition known to the men as "bends"—that is, wrist-drop and foot-drop. This usually lasts from two hours to twenty-four hours, when it completely passes off unless it is an exceptionally bad attack. This condition was ascribed by the patient to the bands applied round the ankles and wrists to make the diving-suit watertight. Dr. Taylor's remarks on the case, together with the literature he quotes, form an article well worthy of perusal.

MR. H. K. HUNTER'S CASE.

WE are authorised to state that the draft of the case appealing from the conviction of Mr. Hunter for calling himself "Physician" has been settled by Mr. Haldane, Q.C., M.P. (who will argue it on behalf of the Society of Apothecaries), and is now before Mr. Muir Mackenzie to settle on behalf of the General Medical Council. As soon as he has done this it will be set down for argument before the Queen's Bench Division and an application will probably be made for a day to be fixed for the hearing. Under any circumstances the case is expected to be disposed of before the long vacation. We take this opportunity of explaining that the General Medical Council issued separate summonses against Mr. Hunter, one for calling himself a physician and another for calling himself a surgeon, but did not proceed with the latter. Mr. Hunter called himself "Physician and Surgeon."

PREVENTION OF PHTHISIS BY SANITARY MEASURES.

WE have recently received the "Ninth Report of the Metropolitan Board of Water-supply and Sewage (Sydney, New South Wales)." It comprises the period from July 1st, 1896, to June 30th, 1897, and contains many interesting papers. One that is well worthy of attention is by Dr. T. M. Kendall and is headed "Mortality from Phthisis as affected by the Operations of the Board in the Metropolis of Sydney, N.S.W." The writer gives a short review of the views hitherto held on this subject and also the results arrived at by Dr. Sims Woodhead after his experiments on milk and meat from tuberculous animals. He also emphasises the frequently expressed opinion that phthisis is a preventable disease and that attention to general hygienic improvements such as good ventilation, plenty of fresh air, ample light, dry houses, good drainage, and avoidance of overcrowding tends to check the development of tuberculosis. Tables are then given showing the reduction in the death-rates from phthisis in the various districts before and after the construction of sewers. These are very remarkable. Several places are mentioned; thus, since the construction of the improved main sewers in the city of Sydney the death-rate from phthisis has decreased from 13·5 per 10,000 of the population to 9·8. An examination of the nature of the soils of the city and suburbs of Sydney shows that the greatest mortality from phthisis occurred on the clay shale soils, although in proportion to the density of population it was greatest on the water-logged sandy soils and on the sandy clay soils. Where the land was low-lying and with little slope the mortality was greater than on the high, sloping land notwithstanding the nature of the soil. Upon pervious soils the phthisis death-rate was 30·9 per 10,000 of the population, while upon

retentive or impervious soils it reached 50. The death-rate from this disease was highest upon those soils into the composition of which clay chiefly enters. Dr. Kendall draws the following conclusions from this inquiry: "1. That there is an undoubted relation between the incidence of phthisis and dampness of the soil. 2. That as the phthisis death-rate has been reduced in those districts provided with proper sewerage since the laying of the main sewers, the laying of the main sewers has exercised an influence over the phthisis death-rate through drying of the soil. 3. That in view of this success which has attended the board's operations up to the present time the extension of these operations will prove of great benefit in coping with the disease called phthisis."

THE COMPLIMENTARY DINNER TO DR. W. S. PLAYFAIR: A POSTPONEMENT.

IN consequence of the death of Lord Playfair the complimentary dinner to be given to Dr. W. S. Playfair on Saturday, June 4th, will be postponed.

THE ROYAL COLLEGE OF SURGEONS OF ENGLAND: ELECTION TO THE COUNCIL.

GENTLEMEN who intend to offer themselves as candidates for the Council of the Royal College of Surgeons of England are reminded that they must give formal notice to the Secretary of the College not later than Monday, June 13th. Blank forms upon which this notice may be given can be obtained from the Secretary at the College. The elections will take place on July 7th.

A PUBLIC HEALTH CONGRESS IN IRELAND.

FROM Aug. 18th to 23rd, 1898, the Royal Institute of Public Health (Dublin Branch) will hold a Congress of Public Health in the metropolis of Ireland. It will be under the patronage of H.E. the Lord Lieutenant of Ireland, the Right Hon. the Lord Mayor of Dublin, and Sir Charles Cameron, the last of whom will act as President of the Congress. The list of vice-presidents includes the names of the most distinguished members of the three learned professions in Ireland and the general committee is a powerful one. The Section of Preventive Medicine will be presided over by Dr. Grimshaw, C.B., Registrar-General; Chemistry and Climatology by Dr. John W. Moore; Engineering and Building Construction by Sir Thomas N. Deane; and the Parliamentary and Municipal Section by the Right Hon. Joseph M. Meade, P.C., LL.D. Conferences of army and navy medical officers, veterinarians, medical officers of health, and sanitary inspectors will respectively be presided over by Brigade-Surgeon-Lieutenant-Colonel Corbett, D.S.O.; Matthew Hedley, chief veterinary inspector of the Privy Council; Mr. Thomas J. Stafford, Commissioner, Local Government Board; and Mr. Conway Scott, executive sanitary officer, Belfast. Important as the Congress is likely to prove, the Health Exhibition which is to be held in connexion with it may be of even greater importance. The preliminary list of sections, embracing practically every department of sanitary science, begins with Physiology and ends with Toys. That work may be tempered with pleasure the Lord Mayor of Dublin has arranged to give a ball during the week, the High Sheriff a luncheon, and the Corinthian Club a dramatic entertainment; while Sir Henry Cochrane and Sir Christopher Nixon will be the hosts at garden parties. Various excursions have also been arranged and there is abundant evidence that the leading citizens are anxious to maintain Dublin's reputation as a city of hospitality. The Dublin Horse Show will commence on the closing day of the Congress and the Health Exhibition will be kept open while this is in progress. Full information regarding the Congress can be obtained by applying to the Public Health Office, Dublin.

THE POSSESSION OF DISEASED MEAT.

IN our issue of March 19th, 1898, we made some remarks upon the case of Mr. Albert Rendell, a draper at Bradford, who was convicted and fined by the stipendiary magistrate for having in his private larder the carcass of a sheep or lamb which was said to be unfit for human food. There was no exposure for sale, but the meat was intended for the food of the defendant, his family, and employés. The stipendiary relying on the case of Mallinson *v.* Carr, held that exposure for sale was not necessary for an offence and fined the defendant, but at the same time stated a case for a higher court. On May 26th the appeal was heard in the Court of Queen's Bench before Mr. Justice Wills and Mr. Justice Channell. They reversed the conviction in the court below on the ground that under the circumstances stated the magistrate had no ground for his decision under the Act. It seems to us that this judgment opens a way for very shady practices. Take the case of a butcher, for instance, who was anxious to get rid of unsaleable scraps and offal. As far as we can see he might feed his own family or his servants upon such offal without let or hindrance from the law. As we said before no one would take the trouble to dress a carcass and hang it in his larder unless there was an intention to use it for food, and to feed people upon diseased meat is neither right nor, to put it upon the lowest grounds, politic from a monetary point of view. We would even go further and say that it is more reprehensible to conceal diseased meat intended for human food than to expose the same for sale, since in the latter case it is obviously more likely to be seized and condemned. The heads of houses ought to be answerable at law for the intent to feed others under their roofs or in their employ with diseased or tainted articles of diet.

CHRONIC CONSTIPATION IN CHILDREN.

THE *Journal de Clinique et de Thérapeutique Infantiles* of May 19th, 1898, quotes a paper by Dr. L. Furst on the Treatment of Chronic Constipation in Children. The writer assigns as the causes of this condition defective peristalsis, insufficient secretion by the intestinal glands, in older children a sedentary habit with lack of physical exercise, and also in some others a feebleness in the action of the sympathetic dependent on excessive use of the brain. One important consequence, he maintains, is decomposition of the retained fæces, which in its turn he holds accountable for convulsive attacks, neurasthenia, insomnia, and other nerve disorders probably associated with absorption of the products of decomposition. Passing to treatment he places much faith in massage of the abdomen aided by small doses of a saline water repeated twice or three times daily. He recognises, also, the value of enemata and advises their use three or four times a week, the solution used being in this case also a weak saline one. The employment of enemata presupposes, of course, an absence of inflammation in the bowel and an uninjured mucous surface. By such means persevered in for some weeks or months Dr. Furst maintains that the difficulties both as to secretion and peristaltic action can best be overcome. His views with regard to the value of careful massage, diet, exercise, and enemata will find general acceptance. His advocacy of the repeated use of salines is more open to question, since the ultimate effect of this process must be to deplete and thus to weaken the bowel in a greater or less degree. The substitution of mild cholagogues with such laxatives—senna, cascara, &c.—as influence intestinal secretion and at the same time stimulate peristalsis appears to us a preferable method.

There is a stage in early childhood at which active exercise is not possible and such measures as those just described are then most useful. After that period, however, an active habit and a suitable diet will in the case of most children prove of greater value than the use of more artificial remedies.

THE CORONERS' SOCIETY.

THE annual dinner of the Coroners' Society of England and Wales was held at the Holborn Restaurant, London, on Thursday, May 26th. Some 50 of Her Majesty's coroners and their guests were present, the chair being occupied by the President, Mr. George F. Roumieu, J.P., coroner for West Surrey. After the usual loyal greeting of "The Queen and the Royal Family" the toast of "The Coroners' Society" was gracefully proposed by Mr. H. G. Croly, ex-President of the Royal College of Surgeons in Ireland, and responded to by Mr. Roumieu, the President. The Coroners' Society was founded in 1846 mainly by Mr. Payne, coroner for the City of London, and so has passed its jubilee, whilst the fact mentioned by Mr. Roumieu that of the 341 coroners of England and Wales 253 are members of the society clearly shows that coroners, medical and legal, recognise the value of solidarity and of the common bond of friendship which the society affords. We counsel the odd 88 promptly to add their names to the list of members. The toast of "The Visitors," proposed by the President, was replied to by Dr. Dawson Williams, Mr. Thomas Wakley, Jun., Mr. Arthur Hacker, A.R.A., and Mr. Marks, clerk of the Peace for the county of Bedford. We may be pardoned, we trust, for recording that the presence among the guests of the society of his grandson was the occasion of very pleasant proof (at least to us) that the name of Thomas Wakley, coroner for West Middlesex, and the work which he did to improve the status of the coroner's office and the coroner's court and to secure recognition of, and remuneration for, medical witnesses are by no means forgotten by the gentlemen who now, some sixty years later, discharge the responsible and onerous duties of Her Majesty's coroners. Moreover, we were glad to observe that the coroners are still recognised as "the people's judges." Mr. Roumieu strongly insisted that people, especially those in the lower ranks of life, were remarkably dependent on coroners for protection. Our readers will remember that the Founder of THE LANCET always maintained that coroners were "the people's judges." In the "Life and Times of Thomas Wakley" (p. 382) occurs the passage: "He [Thomas Wakley] pointed out that the coroner was the *people's* judge, the only judge whom the *people* had the power to appoint, while the office had been specially instituted for the protection of the *people*." The toast of "The Officers of the Society," proposed by the President and responded to by the secretary, Mr. A. Braxton Hicks, and the treasurer, Mr. Arthur Langham, brought the proceedings of a very pleasant evening to a close. We may add that the President-elect of the Society is Mr. J. C. Malcolm, coroner for the City of Leeds.

DEPILATION.

As is well known the application of chemical depilatories to the skin for the removal of superfluous hairs is not a very comfortable operation and may be attended with serious injury to the skin, for these compounds usually contain powerfully caustic components. There are a great many proprietary depilatories, consisting for the most part of sulphides of sodium, potassium, calcium, barium, or even arsenic, but they are not, as a rule, satisfactory. There are Oriental depilatories, Chinese depilatories, Turkish depilatories, all more or less of the same composition. Depilation, indeed, is a very ancient practice. Even the removal of superfluous hairs by means of electrolysis is a long and tedious process, and in reality amounts to the production of corrosive alkali in the follicle. We have, therefore, we fear, little consolation to offer to several correspondents who have recently written to us upon this subject. They should consult their medical attendants and beware of widely advertised nostrums. One states that he has an abundant growth of hair on his face and neck which he has attempted to remove in consequence of the representations of his employers, who forbid their employés to grow beards. He has a particularly tender and sensitive skin which quite prevents him from employing the razor with that frequency which the rapid growth of the hair would demand. In such a case the only plan is to allow the beard to grow and to convince the employers of the absurdity of their views and the extreme unreasonableness of their request. Dictation of this sort on the part of employers is pure tyranny, and no right-minded person would make such an idiotic insistence. Nevertheless, it prevails in a great number of respectable houses of business and the employés are threatened with discharge unless they submit.

THE DEATH OF LORD PLAYFAIR.

CHEMISTRY has lost a practical man and the political world an all-round and valuable consultant by the death of Lord Playfair. Hugh Lyon Playfair was the son of a medical man, George Playfair, Inspector-General of Hospitals for the Presidency of Bengal. He was born in the year 1819 at Meerut, whence later he was sent to England to school. His preliminary education finished, after a short stay at St. Andrews he eventually entered Glasgow University, then known as the Andersonian University. He was led, however, by indifferent health to return to India. After a fortunate restoration he came back and joined his old Professor at Glasgow, Dr. Graham, who had been appointed lecturer on Chemistry to University College, London. With the advice of Dr. Graham, Lyon Playfair next studied organic chemistry under the great Liebig and finally turned his chemical knowledge to account in the management of a calico-print works. Playfair did not stop long in a subordinate position, for in 1843 he became Professor of Chemistry to the Royal Institution at Manchester, now the Victoria University. Thirteen years later he was appointed Professor of Chemistry in the University of Edinburgh, where he had for a time the Prince of Wales and Prince Alfred as pupils. In the meantime he was engaged in considerable public work. He served most usefully on the Royal Commission instituted by Sir Robert Peel which was appointed to inquire into the sanitary conditions of the large and populous factory districts of the north. Other inquiries in which he faithfully and fruitfully worked were in connexion with the reorganisation of the Civil Service, the condition of the fisheries on the Scottish coast, the rinderpest inquiry, and the suitability of British coal for naval purposes, while he was also a special commissioner in charge of the Department of Juries in the Great Exhibitions of 1851 and 1862. In 1862 Playfair entered Parliament as the representative for the Universities of Edinburgh and Saint Andrews, and during his retention of this seat for seventeen years he occupied the position at one time of Postmaster-General under Mr. Gladstone and at another that of Chairman of Ways and Means in the "Eighty" Parliament. Despite the demands of such a publicly active life Lord Playfair found time to take up his pen and to write on literary, scientific, and financial topics. He was one of the heartiest supporters of the University Extension Scheme, and, indeed, invariably associated himself

with movements undertaken in the public interest. Lord Playfair died suddenly at his residence in Onslow-gardens on May 29th; the funeral is announced to take place to-day (Saturday).

CAN COMPANIES CARRY ON MEDICAL PRACTICE?

IT would seem incredible to the uninitiated that it should be possible for totally unqualified persons in the exercise of medical practice to be protected by the Companies Act. But such is the case. The subject was brought before the General Medical Council by a member *in camerâ*, who pointed out the valuable opportunity afforded by the occasion of the Companies Act Amendment Bill for providing a remedy for such a scandal. The Council afterwards gave leave for the motion on the subject passed *in camerâ* to be placed on the minutes. It is as follows:—

"That the President, Mr. Tomes, and Mr. Horsley be a committee to take such steps as they deem most effective to induce the Government to insert a clause in the Companies Act Amendment Bill, now before Parliament, with the object of preventing the registration of companies to carry on medical, surgical and dental practice."

The General Medical Council will do good service if it succeeds in this matter.

EXAMINERS OF DEFECTIVE CHILDREN UNDER THE LONDON SCHOOL BOARD.

THE appointments under the London School Board as "medical practitioner to take charge of the work in connexion with the examination of defective children and of children alleged to be defective" have been conferred upon Mr. G. E. Shuttleworth, B.A. Lond., M.D. Heidelb., and Mrs. F. M. Dickinson Berry, M.D. Lond. Dr. Shuttleworth has throughout his professional career been intimately associated with the study of "defective" children, having been assistant medical officer at the Earlswood Asylum and subsequently for twenty-three years resident medical superintendent of the Royal Albert Asylum for Idiots and Imbeciles of the Northern Counties, Lancaster. He has also been connected with various voluntary institutions established for the investigation of the mental and physical condition of school children in connexion with their education, has furnished important evidence on the subject in Government inquiries, and is also the author of several writings well known to the profession. Mrs. Dickinson Berry, the wife of Mr. James Berry, F.R.C.S., has held various appointments at hospitals for children and women and is an M.D. and B.S. (with honours) of London University.

MODERN SANITATION AND THE ANCIENT HINDOO RELIGION.

ON March 25th Surgeon-Lieutenant-Colonel W. G. King delivered at Madras University a long and able address to the newly admitted graduates in law, medicine, engineering, and arts. After appropriate exhortations to the members of each of the several faculties he urged the graduates as a body to remember that it was to them as educated fellow-countrymen that the people looked for guidance in the midst of doubts and perplexities as to whether Western civilisation was not incompatible with native religious opinions and customs. For instance, the advance of sanitary reform is almost entirely dependent upon the ability of the better-informed classes to influence the uneducated populace. "Those of you who have studied the learned shastras of your forefathers," he said, "must have found ample room for opinion that not only is modern sanitation compatible with caste, but that caste itself, although allied with religious observances, is a magnificent and elaborate system of sanitation. ..... But in the absence of the knowledge of Sanskrit in which these rules were conveyed, tradition, which has been the method of transmission from generation to generation, has led to no little distortion of the original dicta." For instance, the laws of Manu teem with minute directions as to the collection, retention, and withdrawal of water in a pure state, but unfortunately the perversion of the sense of the original shastras has led to wholesale pollution of rivers. In seeking to provide a public water-supply free from any form of animal contamination the various local authorities do not introduce any innovation contrary to caste requirements and act in strict accordance with the spirit of the shastras, and the same may be said with respect to the measures of segregation and disinfection during the present prevalence of plague, which, however, have been resisted on the assumption that they were inimical to caste. In fact, if there has been anything taught by caste it is the necessity for segregation as an aid against the spread of disease, the conditions which determine the duration and nature of the segregation being clearly shown by the laws of Manu and the edicts of Vishnu. On this occasion, for the first time in Madras University, an Indian lady obtained a degree in arts.

THE annual general meeting of the St. George's Hospital Graphic Society will be held at the hospital on Tuesday, June 7th, at 2.30 P.M. By permission of the Board of Governors the annual exhibition, which is strictly limited to the work of members, will be held in the board-room of the hospital. The exhibition will be opened immediately after the meeting and will remain open until the end of the week.

THE foundation-stone of the new building of the North London or University College Hospital, now being erected through the generosity of Sir J. Blundell Maple, Bart., M.P., will be laid by H.R.H. the Prince of Wales, K.G., Vice-Patron of the hospital, on Tuesday, June 21st. Visitors are requested to be in their places by 3.15 P.M.

THE German Emperor has conferred the Royal Prussian Order *Pour le Mérite*, for Science and Art, upon Sir William H. Flower, K.C.B., F.R.C.S. Eng., F.R.S., Director of the Natural History Department of the British Museum and President of the Zoological Society of London.

THE Library of the Royal College of Surgeons of England will be closed on Tuesday, Wednesday, and Thursday of next week (June 7th to 9th) as a conversazione of the Metropolitan Branch of the British Medical Association is to be held in the College building.

H.R.H. THE DUCHESS OF YORK has announced her intention to pay a private visit shortly to the Paddington Children's Hospital for the purpose of naming the new wards opened by the late Duchess of Teck.

THE foundation-stone of the new chapel of the City of London Asylum at Stone, near Dartford, is to be laid on June 18th by the Lord Mayor, who will be accompanied by the Sheriffs of London.

THE Freedom of the city of Edinburgh is to be conferred on Lord Lister on June 15th. Viscount Wolseley is to be similarly honoured on the same day.

THE second annual conversazione of the Royal Society will be held on Wednesday next, June 8th, at Burlington House.

THE IRISH LOCAL GOVERNMENT BILL.

III.[1]

A CORRESPONDENT, well acquainted with the facts of the case, writes to us as follows: "The Local Government Bill will seriously affect our brethren in Ireland. The control of the lunatic asylums, Poor-law relief system, sanitary matters, and the county infirmaries will henceforth be dealt with by county and district councils elected on a popular franchise. With the exception of the lunatic asylums no safeguards are provided in the Bill for the protection of the officers connected with the dispensaries and infirmaries. Past experience does not lead us to believe that popularly elected bodies will deal economically with such matters. With a few exceptions superannuation has been either withheld or granted with a niggardly hand. From time to time attempts have been made to place this question on a more satisfactory footing. ..... The 13th Section transfers the election of coroners from the present electorate to the county council. We think this change beneficial, as the turmoil of a coroner's election is neither dignified nor likely to attract suitable candidates. A suggestion has been put forward that the resident magistrate should in future become coroner for the district. Though this suggestion has emanated from a body deserving of all respect we cannot think it worthy of being seriously discussed. Hitherto the Board of Control has been practically autocratic with regard to lunatic asylums. The needs of the country have not been properly attended to and in many counties a deficiency of accommodation has arisen which amounts to a scandal. Idiots and semi-harmless lunatics are huddled together in the workhouses without suitable facilities for treatment or supervision. The press has frequently drawn attention to this lamentable state of affairs. Questions have been asked in the House of Commons and the Local Government Board inspectors have used their limited powers without any salutary change having been effected. If a centralised permanent board with ample powers at its disposal has failed to effect any improvement the future look-out is not a bright one. ..... It remains to be seen how far district councils will meet the necessities of increased expenditure and we fear any amelioration in the condition of Poor-law medical officers is likely to be delayed to the Greek Kalends. The admirable work done by the county infirmaries in Ireland is well known. Some of these institutions possess considerable endowments and all of the buildings were constructed by private donations and subscriptions. Their maintenance and the salaries of their officers are mainly supplied by Grand Jury presentments. In future these presentments will depend upon the will of the county councillors as they are not 'imperative presentments.' The Association of Infirmary Surgeons has drafted a scheme which is at present under the consideration of the Chief Secretary for Ireland. The object of this scheme is to form boards of management for the various infirmaries composed of representatives from the councils and from the general body of subscribers. This would remove the objection of the money-granting body being unrepresented on the spending body. Provision is also being made for extending the privilege of recommending patients for admission to clergymen of all denominations, Poor-law medical officers, and county and district councillors; also for the inspection of the infirmaries and the annual auditing of the accounts." Our correspondent's criticisms and suggestions are worthy of careful consideration and possess elements of real practical value. We need hardly point out, however, that the new councils will have these matters in their own hands and that the results will be good or bad simply in proportion to the wisdom which these bodies may possess and exercise. Under a democratic administration there is no remedy against the abuses of a system except to endeavour to select suitable representatives and to take care that they are kept fully informed of all the facts and necessities of the case.

A rapid survey will now be taken of those provisions of the new Bill which possess a direct bearing on medical and public health questions. Clause 6 of Part I. contains the provision: "The business of the guardians as local authority under the Diseases of Animals Act, 1894, and the Destructive Insects Act, 1877, shall be transferred to the council of each county." This touches a very important point in Irish local government, which has not received the attention to which it is entitled—viz., the organisation of public health and sanitary administration. It cannot be said that at present this is at all satisfactory. The death-rate in Ireland is, in general, much too high, and though poverty, distress, early marriages, and Celtic fecundity are partly accountable for this, there remains something to be attributed to imperfect sanitary administration. The Poor-law dispensary medical officers are also the health officers for their various districts, but in the appointment of these officers no security is taken that candidates shall possess the requisite sanitary knowledge, and further, they are isolated units, scattered over the face of the country, without organisation or capability of conjoint action. What would seem to be required would be, first, that candidates for Poor-law appointments shall possess a diploma in public health, and secondly, that each county council should have an officer of health who would give his entire time to this work and who would exercise supervision and control over dispensary medical officers in their functions as sanitary officers. The Royal College of Surgeons in Ireland in its memorial to the Chief Secretary states that it "considers that it should not be open to guardians or dispensary committees to place in charge of the sick poor persons who may be entirely inexperienced and whose competency for the special duties confided to them may be entirely unguaranteed. The College, therefore, submits that all candidates for such appointments should be subjected to a previous competitive examination in which a knowledge of their special duty as medical officers, as sanitary officers, and as public vaccinators could be verified." There is much to be said in favour of these recommendations and there is little doubt that their adoption would tend to improve the status and efficiency of dispensary medical officers in Ireland. In any case some means should be taken of securing an adequate amount of sanitary knowledge on the part of candidates for these appointments. The simplest means of attaining this end would be to make a diploma in public health obligatory. This would involve no real hardship and would at least tend in the direction of increased efficiency. Not less important is the second point, viz., that sanitary administration in Ireland requires more organisation and cohesion. It is not to be reasonably expected that dispensary medical officers, scattered over a wide area of country and too often overwhelmed with duties other than those pertaining to them as health officers, should pay adequate attention to sanitary matters. What is wanted is some superior officer, with adequate special knowledge and sufficient time, who should exercise a general control over public health questions within the area under his supervision. This system now prevails in the large towns, and machinery will be necessary to secure some similar methods in rural districts. It would not be unreasonable to expect every county council to have its own officer of health, and there can be little doubt that the money thus expended would be fully remunerative.

Clause 9 of Part I. runs as follows: "It shall be the duty of the council of every county to provide and maintain sufficient accommodation for the lunatic poor in that county in accordance with the Lunatic Asylum Acts, and if it appears to the Lord Lieutenant that any council fail to perform that duty, he may order that council to remedy that failure within the time and in the manner (if any) specified in the order. The duties of the council under this section shall be exercised through a committee appointed by them, and, if the Lord Lieutenant fix a number, of the number so fixed; and out of that committee a number not exceeding one-fourth may be persons not members of the council. There shall be transferred to the council, acting through that committee, the business of the governors and directors of the asylum under the Lunatic Asylum Acts; and the committee, subject to the general control of the council as regards finance, may act without their acts being confirmed by the council. ..... The county council through the said committee shall properly manage and maintain every lunatic asylum for their county; and subject to the provisions of this Act, may appoint and remove the officers of the asylum and regulate the expenditure; and the powers, under the Lunatic Asylums Acts, of the Lord Lieutenant or the inspectors of lunatics, as to those matters, and as to land and buildings, and as to the appointment of governors or directors, shall cease, and

[1] Nos. I. and II. were published in THE LANCET of May 14th and 21st, 1898, respectively.

also the Board of Control for lunatic asylums shall be abolished." It is further provided that the Lord Lieutenant must approve of the regulations adopted by these committees with regard to the management of lunatics, and also that where a district for a lunatic asylum comprises two or more counties the committee for the asylum shall be a joint committee of the councils of the counties with a representation of each council proportionate to the respective expenditures. These regulations regarding asylums do not call for any exposition, and on the whole they will be generally approved. As already remarked, the result of asylum management in the future will be a crucial test of the success of the new *régime*. The asylum boards of the past have been nominated by the Lord Lieutenant for the time being, they have been composed of men of rank and high social or professional status, and there can be no doubt that their duties have been in the main fairly well discharged. Clause 56 gives the county councils acting through their asylums committees power to appoint the officers of the asylum, and it is stipulated that "every resident medical superintendent shall be a legally qualified medical practitioner of not less than seven years' standing, and shall have had experience in the treatment of the insane, and every assistant medical officer shall be a legally qualified medical practitioner." Clause 50 provides that "The council for a county may, either by the exercise of their powers under this Act, or by taking over any workhouse for the purpose, provide an auxiliary lunatic asylum for the reception of chronic lunatics who, not being dangerous to themselves or others, are certified by the resident medical superintendent of an asylum of such council not to require special care and treatment in a fully equipped lunatic asylum, and any such auxiliary lunatic asylum shall either be a separate asylum within the meaning of the Lunatic Asylum Acts, or if the Lord Lieutenant so directs a department of such an asylum."

Clause 13 runs as follows: "A coroner for a county shall not be elected as heretofore, and on a vacancy in the office of a coroner for a county, the county council shall within one month after the vacancy, or such further time not exceeding three months after the vacancy as the Lord Chancellor may allow, appoint a qualified person to the office, and if the county is divided into coroners' districts, assign him a district. The county council may alter the coroners' districts and the enactments respecting those districts shall apply as if the county council were the justices assembled in special sessions for that purpose under the direction of the Lord Lieutenant, and the power of the Lord Lieutenant and justices in relation to coroners' districts shall cease. The Lord Chancellor may, if he thinks fit, remove any coroner for a county from his office for inability or misbehaviour in the discharge of his duty. The writ *de coronatore eligendo* shall cease to be issued, but neither the abolition of that writ nor anything else in this section shall alter the jurisdiction of the Lord Chancellor or the High Court or a judge of assize, in relation to the removal of a coroner otherwise than in a manner provided by this Act, or in relation to ordering a new election of a coroner. A person who is a coroner for a county shall not be qualified to be elected or to be a county or district councillor in that county." These provisions are all sufficiently clear and do not call for any special comment. The change involved in the mode of election of coroner will probably be found advantageous.

Clause 18 provides amongst other things that "for every rural sanitary district there shall be a rural district council, whose district shall be called a rural district." Clause 20 enacts that "in a rural district the district councillor for every district electoral division shall be the guardian for that division." Clause 24 provides that "there shall be transferred to the guardians the business of every committee of management of a dispensary district within their union, and these committees shall cease to be appointed." Clause 25 provides that "there shall be transferred to the district council of every rural district the business of the rural sanitary authority in the district. ..... Rural district councils shall also have such powers and duties of urban sanitary authorities under the Public Health Acts, or any other Act, and such provisions of any of those Acts relating to urban districts shall apply to rural districts, as the Local Government Board by general order direct; and every such order shall be forthwith laid before Parliament." These provisions are sufficiently self-explanatory and their importance is evident. As has been already insisted on, the administration of the sanitary laws in Ireland has not been satisfactory. There is much room for greater thoroughness and stringency in this department, but the present Bill only transfers existing powers to the new elective councils and does not provide any additional machinery. It will rest with the county and district councils themselves to effect a more thorough application of the Public Health Acts, under which the local authorities possess such ample and far-reaching powers. Ireland is a country in which the vigorous application of sanitary laws is peculiarly necessary. There is much poverty, and the tendency of the people is not in the direction of thoroughgoing hygiene. The more need, then, why the excellent public health laws which the country possesses shall be patiently and vigorously enforced.

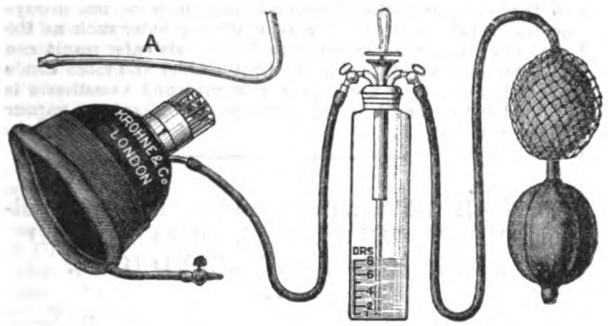
The financial arrangements under the Bill have already been sufficiently dealt with. It remains only to notice some of these provisions which have a special bearing on medical questions. Clause 42 provides that "the Lord Lieutenant shall cause to be paid in respect of every local financial year, out of the Local Taxation (Ireland) Account, at such times and by such payments as he may direct, ... one-half of the salaries of the medical officers of the workhouses and dispensaries, ... one-half of the salary of one trained nurse in each workhouse who is actually employed and possesses the prescribed qualifications, ... and also one-half of the cost of such medicines and medical and surgical appliances as are provided in accordance with the prescribed conditions, ... and to each county council on behalf of every rural district in the county, and to each urban district council, one-half of the salaries approved by the Local Government Board of sanitary officers in respect of their duties under the district council, and t each county council who satisfy the Lord-Lieutenant that they have fulfilled their duty with respect to accommodation and buildings for lunatic poor, and that their lunatic asylum is well managed and in good order and condition, and the lunatics therein properly maintained and cared for, sums at the rate for each lunatic in the asylum for whom the net charge upon the council (after deducting any amount received by them for his maintenance from any source other than poor-rate) is equal to or exceeds 4*s* a week throughout the period of maintenance for which the sum is calculated, of one-half of such net charge, or 4*s*. a week, whichever is least." It is to be noted that these financial concessions, which seem on the whole liberal and well adjusted, are made in consideration of the termination of certain grants hitherto made out of the Exchequer in aid of the rates.

Part IV., dealing with boundaries, contains some provisions which will affect the work of the medical profession. It is provided that the existing boundaries of counties and unions shall be as far as possible preserved, that a union shall not in any case be divided between more than two counties, that a county district shall be situate wholly in one county, and that where a union is divided between two counties each divided part, so far as it is not contained in an urban sanitary district, shall be a separate rural sanitary district.

Clause 51 provides that "where a rural district is coextensive with a union, the district councillors shall, when exercising the duties of guardians, continue to be a board of guardians under their existing name." This is a small matter, but the advantage of calling the same body of men "district councillors" when assembled together for one set of duties and "guardians" when assembled for another is not altogether evident. Clause 55 contains the following important provision: "When any part of the salary of an officer of a county council is paid out of money provided by Parliament, or from the Local Taxation (Ireland) Account, he shall not be appointed or removed, nor shall his salary be fixed or altered without the concurrence of the Local Government Board." Clause 57 provides that "the additional salary granted to the medical officer of a dispensary district by reason of his being medical officer of health of any sanitary district shall be paid by the council of the latter district."

The memorial of the Royal College of Surgeons in Ireland already referred to makes a strong appeal that adequate provision should be made to enable poor-law medical officers to retire upon a pension as of right, if incapacitated from duty by ill-health or upon abolition of their offices, or after completion of the period of service required from Civil servants. The memorial further points out that the discretion at present vested in guardians with regard to this question has led to numerous cases of serious hardship. There can be little question of the reasonableness and justice of this contention.

The dispensary medical officer in Ireland is in general overworked and underpaid. It is nothing short of a scandal that he should be compelled to go on working in many cases when quite broken in health or incapacitated by reason of the infirmities of old age. A suitably adjusted system of superannuation would be not merely an act of justice to a hard-worked class of meritorious public servants, but clearly to the advantage of the public. Work such as that devolving upon dispensary medical officers can only be discharged efficiently by men in good health and not too far advanced in years.



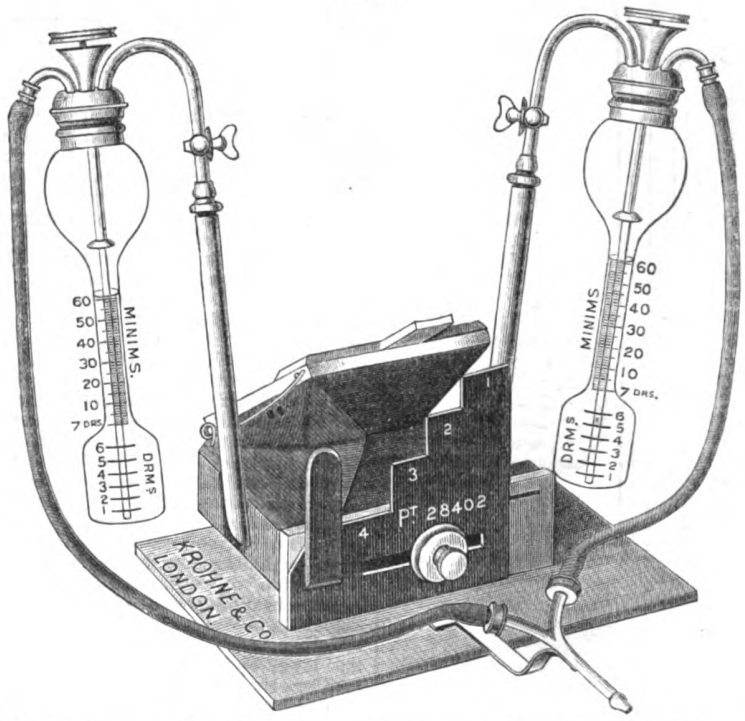
The next and concluding article will complete our examination of the Bill.

RECENT IMPROVEMENTS IN REGULATING CHLOROFORM INHALERS.

Definite Dosage.

BASING all their efforts upon the principles enunciated by Snow, that 18 minims of chloroform contained in the circulation of an average adult sufficed to produce complete anæsthesia, Messrs. Krohne and Sesemann have improved Dr. Junker's inhaler and made various alterations in its construction of which the following is an account. Fig. 1 represents Messrs. Krohne and Sesemann's improved Junker's Inhaler fitted with the feather respiration indicator attached to a vulcanite face-piece, with the Dudley Buxton funnel for filling and tube for blowing chloroform vapour into the mouth or nostril. The vulcanite face-piece can be replaced by a flannel cap or piece of domette stretched across a metal frame. The latter is a safer and more cleanly form of mask and, as it is now supplied with little clips which enable the administrator to readily replace the domette or flannel used in each case, it should commend itself to those who study to eliminate infection through the use of dirty inhalers.

FIG. 1.



Graduated Air.

In Fig. 2 is shown a ball now supplied in place of the former round one, allowing definite quantities of air to be pumped through the chloroform according as the administrator compresses the rings marked 1, 2, 3, and 4. Fig. 3 shows the apparatus made for use in the tropics, the

FIG. 2.

FIG. 3.

use of rubber being confined to the tubes connecting the small bellows with face-piece and mouth-tube. It will be seen that by moving the stop the amount of chloroform is regulated by the air pumped through the liquid, and ¼, ½, ¾, or 1 minim is delivered at each compression of the bellows.

FIG. 4.

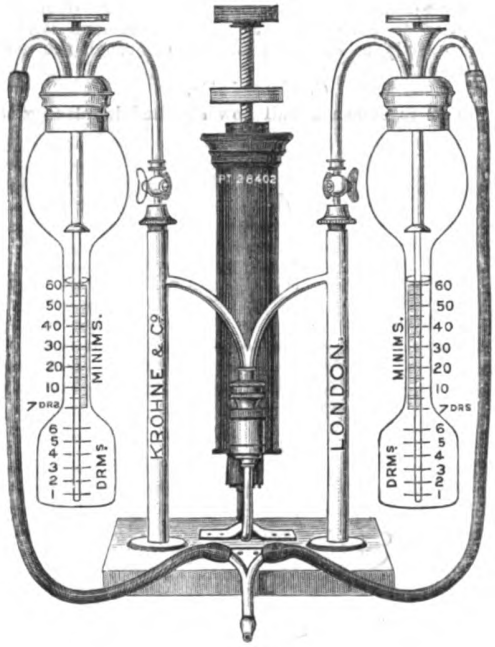


FIG. 5.

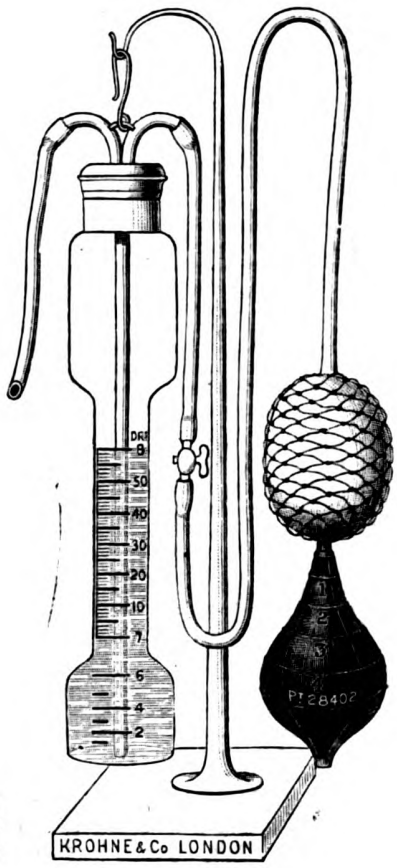

Fig. 4 shows the apparatus with vulcanite or metal air-pump with screw piston rod and nut. This arrangement ensures a rigid precision in the amount of chloroform administered, even, it is claimed, to $\frac{1}{100}$ of a minim. By its use, after commencing the inhalation with a most minute quantity, a gradual and regular increase in definite quantities can be effected. Fig. 5 is to show how accurately the amount of chloroform used can be measured. The eighth drachm is divided up into minims which can readily be read off after each administration.

It is asserted that with this apparatus 18 minims of chloroform will literally produce profound anæsthesia. For this to be the case of course there must be no waste, the quantity must enter the blood of the patient, and to do so in the best possible manner there is no doubt that Messrs. Krohne and Sesemann are correct in advising that it should be given in the most minute doses at a time so that the 18 minims are not absorbed for some minutes. It must be borne in mind that such an ideal result is only attainable in the case of patients who breathe easily and regularly. The data upon which Snow based his figures and those upon which Messrs. Krohne and Sesemann base theirs are derived from auto-inhalation (where the object of the individual is to inspire), whereas in actual practice patients are not always equally well affected towards the anæsthetic and rebel against it if it is not sufficiently diluted. The extreme value of great dilution of the vapour is shown in such cases so that, although the 18 minims limit may be not always achieved, yet by means of a regulating inhaler such as the one under review a far better and infinitely safer result can be obtained than was possible with the older and more crude methods so long in use. As a rule profound anæsthesia is secured with from 1 to 1·5 per cent. of chloroform vapour in the respired air.

ANNUAL REPORT OF THE REGISTRAR-GENERAL ON BIRTHS, DEATHS, AND MARRIAGES IN ENGLAND (1896).

IN THE LANCET of May 21st we reviewed the Registrar-General's annual summary of births, deaths, and causes of death in London and other large English towns for the year 1897, and shortly after going to press we received the report now before us which has reference to the preceding year, 1896. To the uninitiated it does not clearly appear why the report cannot be published until a year later than the summary relating to the same year, we have therefore made inquiries in the proper quarter and have ascertained the following particulars. The annual summary is compiled from the weekly and quarterly returns of the local registrars and relates to the deaths occurring in the 100 principal towns of England and Wales; it can therefore be issued shortly after the close of the year to which it relates and, as a matter of fact, it is generally published about the end of the first quarter of the ensuing year. But the annual report, which is based on the certified copies of the local death registers, cannot even be commenced until these copies have been received at the Central office from every registration district in England and Wales. As the deaths amount to as many as half a million annually and every one of these has to be classified according to age, cause, and locality by experts in the Statistical Department at Somerset House, it will be understood that a vast amount of clerical labour has to be expended before the 380 pages of tables can assume a form suitable for comment and comparison.

In the annual report for 1896 several topics of statistical interest are dealt with, either for the first time or else more fully than in previous annual reports. To one of these topics, which deals with the question of coroner's inquests in relation to uncertified deaths, we referred at length in our leading article of last week. The mortality of England and Wales in 1896 corresponded to a rate of 17·1 per 1000 living. With the exception of the year 1894, when it was lower by 0·5 per 1000, the rate of English mortality in 1896 was the lowest on record. At the several periods of life the death-rates in this year were with very few exceptions the lowest since the commencement of civil registration in 1837. Infantile mortality in 1896 was equal to 148 per 1000 births, and differed scarcely appreciably from the average in the preceeding ten years. In registration counties the mortality

among infants varied enormously, for whilst it was so low as 88 in Wiltshire it rose to 168 in Staffordshire and 175, or nearly double the rate, in Lancashire and Warwickshire.

Examination of the records of past years shows that although the rates of mortality among infants of both sexes vary greatly from year to year, the variations in the proportion of one to the other are comparatively small. Infantile mortality falls much more heavily on males than on females. To 1000 of each sex born in England and Wales during 1896 the proportion of deaths under one year of age were 161 and 134 respectively, showing an excess of 21 per cent. among males as compared with females. At ages under three months the disparity between the two proportions was even greater; the mortality of males at this age was 81 per 1000 births and that of females 64; the deaths of male infants to those of females being in the proportion of 126 to 100 in equal numbers born. Among the diseases which specially affect infants of this tender age bronchitis, pneumonia, and convulsions appear to cause greater excess of mortality, and diarrhœal diseases (with enteritis) appear to occasion less excess of mortality, than do diseases of all kinds without distinction of cause, among males as compared with females. Whooping-cough differs from all other maladies to which infants are specially subject by causing greater mortality among females than among males, and this not in 1896 only but for a long term of previous years. The births of males exceed the births of females in proportions which have ranged between 1033 to 1000 and 1041 to 1000 during the last sixteen years. In every one of these years the relatively excessive mortality among male infants has had the effect of nearly equalising the numbers in each sex who survive to one year of age.

In the year 1896 as many as 78,000 deaths, or 15 per cent. of the total mortality, were caused by zymotic diseases. There was a fall in the aggregate mortality from these diseases in 1896 as compared with the preceding year, and this fall was due to a marked decline in the mortality from influenza and from diarrhœal diseases. In England and Wales the deaths referred to small-pox in 1896 corresponded to a rate of 18 per 1,000,000 living as compared with rates of 49, 27, and 7 per 1,000 000 respectively in the three preceding years. Of the 541 small-pox deaths registered in England and Wales not fewer than 443 occurred in the registration district of Gloucester. Within the first two quarters of the year there were registered in the City of Gloucester from all causes 716 deaths, and of these as many as 421 deaths, or 59 per cent., were ascribed to small-pox. During the first half of the year 1896 therefore the mortality of that city was increased, on account of small-pox alone, by 143 per cent. Of the 541 persons whose deaths were caused by small-pox in 1896 only 8 per cent. were certified to have been vaccinated, whilst 22 per cent were unvaccinated, and with respect to the remainder no sufficient statement as to vaccination appeared in the certificates. In addition to the deaths definitely ascribed to small-pox 151 were attributed to chicken-pox and 42 to "effects of vaccination." These latter include not only the deaths directly referred to vaccination but also those which were stated in the certificates or were found on inquiry to have been caused by the entrance of any noxious material whatever at the site of vaccination. In the year 1894, the last for which the necessary returns are as yet available, the deaths under the heading "Effects of Vaccination" were in the proportion of 1 in every 12,583 children vaccinated. The year 1896 was one of unusually heavy mortality from measles, with one exception the death-rate from measles was higher than in any previous year on record. Scarlet fever was considerably less fatal than the average, although the rate was somewhat higher in 1896 than it had been in the preceding year. Taking England and Wales as a whole the mortality from enteric fever in the year under notice was below the decennial average. If a line be drawn across England from the Wash to the Dee, that part of the country which lies to the north of this irregular line showed in 1896 enteric fever rates which were markedly in excess of the average for England and Wales, whilst that part of the country to the south of the line experienced rates of mortality which were below the average. The deaths referred to diphtheria in 1896 were in the proportion of 292 per 1,000,000 of the population, which exceeded the proportion in any previous year with the exception of 1893–94. London showed the highest death-rate from diphtheria, the other counties with excessive rates in 1896 were Kent, Essex, North and South Wales, Warwick, Worcester, and Cheshire. Whooping-cough was the cause of a mortality in England and Wales during 1896 which was in excess of the average. In London and in 19 of the other English counties the rates were exceptionally heavy, whilst in the rest of the country the rates were below the average. Among constitutional diseases cancer and diabetes were more fatal in 1896 than the average in the preceding ten years, whilst phthisis showed a mortality which was the lowest hitherto recorded. Two important tables are inserted in the present report showing the mortality at different ages among males and females from cancer and from pulmonary consumption. The first of these tables shows that throughout the four quinquennial or decennial periods ending with 1895 the mortality from cancer both among males and among females at every age group from 35 years onwards had steadily increased and that in the year 1896 there had been a still further increase. The table further shows that whereas among males the mortality from cancer has increased in 35 years by 153 per cent. the increase among females within the same interval has been limited to 74 per cent. The second table shows that whereas the mortality from phthisis has decreased since the year 1861 by 40 per cent. among males the decrease among females during the same period has been equal to 54 per cent. The table further shows that at the present time men die from phthisis much more rapidly than women do, although in periods anterior to 1870 the reverse was the case.

THE ROYAL COMMISSION ON THE METROPOLITAN WATER-SUPPLY.

THE twenty-second meeting of the Royal Commissioners was held at the Council Chamber of the Westminster Town-hall on May 16th. With the exception of Mr. Cripps, Q.C., all the Commissioners were present. The first part of the sitting was occupied by taking the evidence of M. Gaston Cadoux, Chief of the Bureau of the Prefecture of the Seine, who gave evidence with regard to the water-supply of Paris. The latter part of the sitting was occupied by the re-examination of Sir A. Binnie whose evidence was not concluded at the end of the sitting.

M. GASTON CADOUX said that in his opinion the present system of administering the water-supply of the city of Paris was preferable to that which previously prevailed when the waterworks were owned and managed by a commercial company. Up to the year 1860 Paris was supplied with water by a single company—the Compagnie Générale des Eaux. The water was at that time derived from the rivers Seine and Marne. The whole of the property of the company was bought and the rate of charges which consumers had to pay was placed under the control of the city authorities. The witness did not know what the original capital of the company was or what amount was paid in dividends. The charges originally fixed by the municipality had been lowered more than once since they had undertaken the supply. The greater part of the water was supplied by meter. In the case of the poor inhabitants a charge of 20 francs a year was made for a supply not exceeding 125 litres a day.

Major-General SCOTT remarked that a water-supply of 125 litres was a small one.

The witness replied that poor people did not require much water and did not take baths. The flow of water was slow, the arrangement being that no more than the arranged quantity could pass to the consumer. The cost of the meter was paid by the consumer. The witness did not know what the cost of the meter was. After the property of the water company had been bought by the municipality a considerable amount was paid in obtaining water from springs. Recently steps had been taken against the pollution of the rivers; the work was now going on but it would not be completed for nearly two years. The question of river pollution was under the control of the Prefecture of the Police, but at present the Seine is polluted by sewage and by refuse from the factories which are situated on its banks. A law has recently been passed to prevent pollution, but the matter of control is found to be difficult. At the present time river water is only supplied for drinking purposes during periods of drought; for the last two years the water of the Seine has been

I.—TABLE SHOWING THE DAILY AVERAGE QUANTITY OF WATER PER MONTH DELIVERED FROM THE THAMES (INCLUDING THE HANWORTH GRAVEL BEDS) BY THE METROPOLITAN COMPANIES DURING THE YEARS 1896–97, AND THE PERCENTAGE OF THE DAILY AVERAGE SUPPLY FOR THE YEAR 1896–97.

(Compiled from the Water Examiner's Monthly Returns and put in evidence before the Commission by Sir Alexander Binnie.)

* Compensation given to river on July 28th of 6·6 million gallons.

filtered before distribution. When river water is distributed for drinking purposes a notice to that effect is placarded in the public places. The parks and gardens are watered by a supply from the Seine and for these places and for the chief streets—as, for example, the Rue de Rivoli and the Boulevards, where a considerable amount of water is used—the supply is conveyed in separate mains. When the river water is used for drinking purposes it is pumped from the river to one of the reservoirs which is usually used for the supply of spring water. The amount of water used per head is about 123 litres per day—that is, roughly, about 27 gallons.

In answer to Sir GEORGE BARCLAY BRUCE the witness said that industrial undertakings were included in this estimation but not the amount used for watering the roads. The spring water is derived from several sources. The first new source was that of Dhuis, from which place there is an aqueduct 131,162 metres in length. Water comes also from the Verdon and Surmelin valleys whence it flows by gravitation to the reservoir at Ménilmontant. The amount of water brought daily from this source is about 20,000 cubic metres. The total cost of obtaining this supply, including the purchase of the springs, compensation to the land-owners and mill-owners, and the amount paid for building the aqueduct, was 18,000,000 fr. The next source used was at Vanne; the work was begun in 1870 and was finished in 1874. The length of aqueduct is 173,000 metres and over a distance of no less than 16,000 metres the aqueduct is supported on arches. The cost was 39,000,000 fr. Between 1880 and 1888 water was derived from springs at Cocheysies. The cost was 3,180,000 fr. and the average amount of water obtained was 120,000 cubic metres. Between the years 1892 and 1894 a new supply of water was derived from the Vigne and the Avre. The cost of the undertaking was 35,000 000 fr. and the quantity of water obtained was 115 cubic metres daily; the length of the aqueduct is 102 000 metres. The work is not yet quite finished. The city has obtained power to bring water from the Loing and the Lunain. It is hoped that from 115,000 to 120,000 cubic metres will be obtained from these sources and that the work will be finished by the year 1900. The estimated cost is 25,000,000 fr. When the works of the water company were bought the company was still entrusted to supply the water for a period of fifty years. This period will end at the close of the year 1909. The city engineers deliver the spring water into the reservoirs and the company have nothing to do with this delivery of water to them, but they distribute it to the consumers. The rates charged depend on agreements made by them with the company, but regulations as to tariffs are passed by the municipal council and approved by the Prefect. The supply to public institutions is not in the hands of the water company; the quantity of these supplies is about one-tenth of the amount of the private supplies.

Sir ALEXANDER BINNIE, engineer-in-chief to the London County Council, put in a series of tables a consideration of which led him to the conclusion that the restricted flow of the Thames would be insufficient to cleanse the lower part of the river from the pollutions caused by the sewage effluents which discharge into the river at Barking and Crossness. The facts given in the accompanying tables are, from Sir A. Binnie's point of view, of the greatest importance and the tables represent the sum of his evidence in the smallest possible space.

THE BRITISH DENTAL ASSOCIATION.

THE annual general meeting of the British Dental Association was held at Bath on May 28th, 30th, and 31st, in the Assembly Rooms. A large gathering of members was present and the experiment of holding the meeting at Whitsuntide may be considered a great success.

General Meeting.

Sir EDWIN SAUNDERS, who took the chair at the general meeting in the enforced absence of the President (Dr. Stack),

referred in sympathetic terms to the illness of Dr. Stack and inducted Mr. W. A. Hunt of Yeovil, the new President, in the chair.

Presidential Address.

Mr. W. A. HUNT, in his presidential address, dealt chiefly with the two questions of the use of anæsthetics in dentistry and the legal protection of the dental profession. Commencing with the historical part of the former of these subjects he said that Horace Wells, a dentist of Hartford, Connecticut, demonstrated in his own person the practicability of nitrous oxide anæsthesia by having a tooth extracted under its influence on Dec. 11th, 1844. Wells then introduced nitrous oxide anæsthesia into general surgery and many surgical operations were performed with its assistance. The next development was that Morton, formerly his pupil and subsequently his partner, a year and nine months afterwards, at the suggestion of Jackson the chemist, used ether for the painless extraction of teeth. Surgical operations were performed under ether in the Massachusetts Hospital in October, 1846, and Dr. Bigelow of that hospital, writing from Boston, sent an account of the proceedings to his friend Dr. Boott in London, who communicated the discovery to Mr. Robinson, a dentist in Gower-street. Mr. Robinson administered ether to a patient and extracted a molar painlessly on Dec. 19th, 1846, which was the first operation of the kind in this country, and he sent a full account of it to Mr. Hunt, sen., of Yeovil, the speaker's father, who immediately had an inhaler made and is believed to have been the first man out of London to make use of ether. The term anæsthesia was suggested by Dr. Oliver Wendell Holmes. The employment of nitrous oxide in Europe was revived by Dr. Evans, the Paris dentist, who brought Mr. Colton with him from Paris to London in March, 1868, with a record of 25,000 cases in America and some in Paris without a death. Mr. Hunt continued as follows: "Thus history points with no uncertain finger to dentists as the originators of anæsthesia. ..... Gentlemen, with these matters of history to guide us, are we to be told that the production of anæsthesia is not within the ability of a duly qualified dentist? The very suggestion to my mind is preposterous. But, on the other hand, the safety, the life of the patient, is in the hands of the anæsthetist, and he should be carefully taught his responsible duty and should satisfy his examiners when seeking his diploma that he has the needful knowledge. Neither in the medical profession nor in our own is this done, and I consider it high time that steps were taken to alter this state of things." With respect to the legal position of the dental profession Mr. Hunt said that more than one-third of the practitioners on the Dental Register held diplomas approved by the General Medical Council, the remainder having no special diploma. While admitting that unregistered persons ought not to be allowed to act as dentists he was not in favour of immediately increasing the stringency of repressive measures, mainly because it seemed to him that the dental requirements of the public were in excess of the practitioners competent to supply them. In the course of his address Mr. Hunt made reference to the abundant Roman remains found in Bath, including a Temple of Minerva, and extensive hot baths 20 ft. below the level of the present city, small portions of which have been explored.

The Reports of the Honorary Secretary and Honorary Treasurer.

In the report of the honorary secretary attention was drawn to the fact that since the last annual meeting no legal proceedings had been undertaken, due in some measure to actions pending on the part of the General Medical Council and the Medical Defence Union. The report also mentioned the formation of a new branch under the name of the "South Wales and Monmouthshire Branch." The report of the honorary treasurer showed that the finances of the association were in a satisfactory condition, the amount invested standing at £1000.

The Meeting of 1899.

It was decided to hold the annual meeting next year at Norwich during Whitsuntide, and Mr. Wentworth White was nominated President-elect.

Papers.

Several interesting papers were read during the meeting. Mr. J. G. Turner gave the results of his investigations into the Pathology of Dental Cysts and showed that the large majority were distinctly epithelial in origin and were closely connected with adherent masses of epithelium met with in the dental ligament. Mr. J. F. Colyer contributed a paper on the Early Treatment of Crowded Mouths and pointed out the value of the removal in many cases of the unerupted first premolar. This paper was illustrated by lantern slides of the cases before and after treatment. Mr. G. Cunningham read a communication on the Immediate Regulation of Teeth and showed the models of various cases before and after treatment. Other papers were contributed by Mr. J. Smith Turner on Matters Connected with the British Dental Association; by Mr. Headridge, on Dental Education and Medical Qualifications; by Mr. Gartrell and Mr. Coxon, on Strengthening for Vulcanite Work; and by Mr. W. B. Ackland, on Cases of Secondary Affections due to Teeth.

The Microscopical Section.

The Microscopical Section was presided over by Mr. F. J. Bennett, who delivered a most interesting inaugural address. Papers were read by Mr. Hopewell Smith on Healing Processes in the Dental Pulp, by Mr. Storer Bennett on Erosion, and by Mr. Leon Williams on Structural Changes in Human Enamel with Special Reference to Clinical Observation on Hard and Soft Enamel. Mr. Arthur Underwood also showed some interesting slides in connexion with enamel. A collection of microscopical slides, specimens, and photomicrographs were exhibited during the meeting.

Entertainments.

The scientific and technical work of the meeting was agreeably diversified by a variety of social entertainments. On May 27th (the evening before the meeting) there was an informal reception of members by the President of the Western Counties Branch and reception committee in the Assembly Rooms; on the 28th there was a reception by the Mayor in the Pump Room and Roman Promenade; on the 29th (Whit-Sunday) the Mayor and Corporation invited the members to meet them at the Municipal Buildings and then to proceed to the Abbey, where Divine service was held; on the 30th the city architect gave an account of the ancient baths and showed the most recent excavations, Mrs. Dudley received ladies at an "At Home," and the annual dinner of the association was held in the Assembly Rooms; on the 31st there was a conversazione by the President at the Assembly Rooms; and June 1st was devoted to excursions to various places of interest.

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

IN thirty-three of the largest English towns 6704 births and 3548 deaths were registered during the week ending May 28th. The annual rate of mortality in these towns, which had declined in the four preceding weeks from 18·4 to 16·4 per 1000, rose again last week to 16·5. In London the rate was 16·0 per 1000, while it averaged 16·8 in the thirty-two provincial towns. The lowest rates in these towns were 8·0 in Croydon, 10·1 in Wolverhampton, 10·4 in West Ham, and 11·1 in Brighton; the highest rates were 22·1 in Gateshead, 22·2 in Newcastle-upon-Tyne, 22·5 in Liverpool, and 23·2 in Sunderland. The 3548 deaths included 400 which were referred to the principal zymotic diseases, against 383 and 380 in the two preceding weeks; of these, 134 resulted from measles, 131 from whooping-cough, 55 from diphtheria, 34 from diarrhœa, 26 from scarlet fever, 19 from "fever" (principally enteric), and 1 from small-pox. No death from any of these diseases was recorded last week in Brighton or in Swansea; in the other towns they caused the lowest death-rates in Nottingham, Blackburn, and Huddersfield, and the highest rates in Birmingham, Hull, Liverpool, Manchester, and Halifax. The greatest mortality from measles occurred in Bradford and in Halifax; from scarlet fever in Halifax; and from whooping-cough in Birmingham, Sheffield, Liverpool, Sunderland, Gateshead, and Newcastle-upon-Tyne. The mortality from "fever" showed no marked excess in any of the large towns. The 55 deaths from diphtheria included 27 in London, 4 in West Ham, 4 in Cardiff, 4 in Liverpool, and 3 in Leeds. One fatal case of small-pox was registered in Newcastle-upon-Tyne, but not one in London or in any other of the thirty-three large towns, and no small-pox patients were under treatment in any of the Metropolitan Asylum Hospitals.

The number of scarlet fever patients in these hospitals and in the London Fever Hospital on Saturday last, May 28th, was 2195, against 2271, 2247, and 2241 at the end of the three preceding weeks; 256 new cases were admitted during the week, against 209, 229, and 223 in the three preceding weeks. The deaths referred to diseases of the respiratory organs in London, which had been 232 and 177 in the two preceding weeks, rose again last week to 216, but were 73 below the corrected average. The causes of 40, or 3·0 per cent., of the deaths in the thirty-three towns were not certified either by a registered medical practitioner or by a coroner. All the deaths were duly certified in Portsmouth, Nottingham, Salford, Newcastle-upon-Tyne, and in eleven other smaller towns; the largest proportions of uncertified deaths were registered in Bristol, Birmingham, Halifax, and Hull.

HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in the eight Scotch towns, which had been 19·8 and 19·9 per 1000 in the two preceding weeks, further rose to 21·4 during the week ending May 28th, and exceeded by 4·9 per 1000 the mean rate during the same period in the thirty-three large English towns. The rates in the eight Scotch towns ranged from 14·8 in Aberdeen and 15·7 in Leith to 23·7 in Dundee and 26·2 in Paisley. The 647 deaths in these towns included 31 which were referred to whooping-cough, 29 to measles, 13 to "fever," 8 to scarlet fever, 6 to diarrhœa, and 4 to diphtheria. In all, 91 deaths resulted from these principal zymotic diseases, against 83 and 104 in the two preceding weeks. These 91 deaths were equal to an annual rate of 3·0 per 1000, which was 1·1 above the mean rate last week from the same diseases in the thirty-three large English towns. The 31 fatal cases of whooping-cough corresponded with the number recorded in the preceding week, and included 18 in Glasgow and 4 in Edinburgh. The deaths from measles, which had been 32 and 27 in the two preceding weeks, rose again to 29 last week, of which 14 occurred in Glasgow, 7 in Edinburgh, and 6 in Dundee. The deaths referred to different forms of "fever," which had been 6 and 4 in the two preceding weeks, rose to 13 last week, of which 9 were recorded in Glasgow. The 8 fatal cases of scarlet fever showed a decline of 6 from the number in the preceding week, and included 3 in Glasgow, 3 in Edinburgh, and 2 in Aberdeen. Of the 4 deaths from diphtheria, 2 occurred in Glasgow and 2 in Edinburgh. The deaths referred to diseases of the respiratory organs in these towns, which had been 109 and 119 in the two preceding weeks, further rose to 125 last week, but were slightly below the number in the corresponding period of last year. The causes of 25 or nearly 4 per cent., of the deaths in these eight towns last week were not certified.

HEALTH OF DUBLIN.

The death-rate in Dublin, which had been 22·5 and 24·0 per 1000 in the two preceding weeks, declined again to 23·1 during the week ending May 28th. During the past four weeks the death-rate in the city has averaged 23·5 per 1000, the rate during the same period being 16·1 in London and 18·7 in Edinburgh. The 155 deaths registered in Dublin during the week under notice showed a decline of 6 from the number in the preceding week, and included 14 which were referred to the principal zymotic diseases, against 7 and 10 in the two preceding weeks; of these, 4 resulted from diphtheria, 3 from whooping-cough, 3 from "fever," 2 from diarrhœa, 1 from measles, 1 from scarlet fever, and not one from small-pox. These 14 deaths were equal to an annual rate of 2·1 per 1000, the zymotic death-rate during the same period being 2·1 in London and 3·2 in Edinburgh. The fatal cases of diphtheria, which had been 1 and 2 in the two preceding weeks, further rose to 4 last week. The deaths referred to different forms of "fever," which had been 2 and 4 in the two preceding weeks, declined again to 3 last week. The mortality from measles, scarlet fever, and whooping-cough exceeded that recorded in the preceding week. The 155 deaths in Dublin last week included 28 of infants under one year of age and 38 of persons aged upwards of sixty years; the deaths of infants showed an increase, while those of elderly persons were below those recorded in the preceding week. 5 inquest cases and 6 deaths from violence were registered; and 49, or nearly a third, of the deaths occurred in public institutions. The causes of 9, or nearly 6 per cent., of the deaths in the city last week were not certified.

THE SERVICES.

NAVAL MEDICAL SERVICE.

STAFF-SURGEON MICHAEL JOSEPH MCCARTHY, M.D. R.U.I., has been promoted to the rank of Fleet-Surgeon in Her Majesty's Fleet.

ARMY MEDICAL STAFF.

Surgeon-Lieutenant-Colonel Naismith has been appointed to the Medical Charge of the Station Hospital, Ayr. Surgeon-Major Clements has arrived for duty in the Home District, and Surgeon-Major Treherne has been posted to the Station Hospital, Western Heights, Dover. Surgeon-Major Hamilton has been posted to Fort George for duty in charge of the Station Hospital. Surgeon-Major Phipps has assumed medical charge at Landguard Fort.

INDIA AND THE INDIAN MEDICAL SERVICES.

The services of Surgeon-Lieutenant-Colonel Cornwall are placed temporarily at the disposal of the Government of Madras. The services of Surgeon-Captain Ricketts are placed temporarily at the disposal of the Foreign Department for employment on plague duty. Surgeon-Lieutenant-Colonel Swaine, Medical Officer, 6th Infantry, Hyderabad Contingent, is appointed to officiate as Sanitary Commissioner, Hyderabad Assigned Districts, during the absence on deputation of Brigade-Surgeon-Lieutenant-Colonel Little.

THE SPANISH-AMERICAN WAR.

According to the reports of Commodore Schley to the War Department at Washington it seems to be now definitely settled that Admiral Cervera's fleet is shut up within the harbour of Santiago with apparently little or no hope of escape without fighting; any advantage consequently which was gained by the Spanish Admiral's adroit manœuvring has been practically lost by his having entrapped himself there. Whilst the Americans were in ignorance of his whereabouts they could not, as we have always contended, attempt the landing of a force in Cuba, for the vessels of the Spanish fleet possessing the greater speed might at any moment inflict a disastrous attack on the transports carrying the United States troops and then steam away, but "bottled up" in Santiago and blockaded by a superior force, Admiral Cervera's fleet is apparently rendered powerless to do anything. If they come out they will probably be defeated or sunk, if they remain in Santiago they run the risk of being starved into surrender. Nor does it seem that the condition of the Spanish reserve fleet at Cadiz is such as to hold out much hope of any Spanish success from that quarter. But there still remain very great difficulties to be encountered by the Americans in their next move if, as is generally believed will be the case, this is to consist of the invasion of Cuba by a big military force, which must largely consist of trained soldiers. Soldiers cannot be made and trained in a day, however good the material, and various other preparations will have to be made on a large scale to secure the success of any such expedition. The United States were from the first, and still are, unprepared. There is a large Spanish force in Cuba, the island is unhealthy, and will become more so as the season advances, and any force which succeeds in effecting a landing and securing a fighting foothold will require to have at its back a large reserve to make up for its losses by sickness and fighting. We may be quite sure that all this is well known to the responsible naval and military authorities and the medical departments of the United States, although it is little heeded by impetuous and irresponsible people. That in determination, promptitude, and enterprising skill, as well as in numerical and financial strength, the United States have the power ultimately to achieve their purpose there can be very little doubt. The war is fast approaching its most critical stage and everything will depend upon the adoption of thoroughly well-considered and organised measures at the present time by the United States Government whether the Spanish-American campaign is soon to bewith in measurable distance of its end or not. Meanwhile there has probably never been a war about which such an amount of false, contradictory, and perplexing news has been published. The reader of the long war columns

spearing from day to day in the newspapers does not know what to believe and is left in a state of utter bewilderment.

SIR ROBERT RAWLINSON, K.C.B.

Army medical officers and all interested in sanitary engineering and practical hygiene will hear with much regret of the death of Sir Robert Rawlinson on May 31st, in his eighty-ninth year. Sir Robert Rawlinson was a distinguished man and did excellent service in his time in the cause of public health. He was one of the Sanitary Commissioners sent out to the Crimean war, where his labours were productive of great practical good and where he was severely wounded by a round shot. He was for twenty-eight years a member of the Army Sanitary Committee. Before that time he had made his mark in surveying and engineering work and in connexion with the Public Health Act, and he subsequently served on several important Commissions and as Chief Engineering Inspector under the Local Government Board. He always manifested a keen interest in sanitary and public health work and did a great deal to advance and apply our knowledge of these subjects in various directions both in civil and military life. He was a man of strong opinions, which he could not readily alter, but the value of his services must close all eyes to his unwillingness to march always with the times.

THE ROYAL NAVAL EXAMINATIONS.

The under-mentioned gentlemen, who competed on May 16th and following days at the Examination Hall, Victoria Embankment, for appointment as surgeons in the Royal Navy, have been granted commissions:—

	Marks.		Marks.

THE PLAGUE IN INDIA.

The most important items of intelligence from India in our opinion continue to be those about the plague in that country. The recent outbreak in Calcutta has proved on bacteriological examination to have been true bubonic plague, but it has, we are glad to add, since disappeared—whether temporarily or not remains to be seen. The disease, chiefly in a sporadic form, nevertheless seems to have been widely disseminated in India, for cases have appeared in many parts of that country and the Punjaub.

THE TIRAH FIELD FORCE.

The following names, omitted in previous despatches, have been mentioned by General Sir William Lockhart as being those of officers specially recommended by the general officers under whom they served:—Surgeon-Major A. E. C. Spence, A.M.S.; Surgeon-Captain J. C. Jameson, A.M.S.; and Surgeon-Lieutenant M. Dick, I.M.S.

INDIAN FURLOUGH.

The Government of India have formally opened leave for the medical service. Local governments have been given power to sanction leave and furlough and are to make their own arrangements.

We are asked to announce that the Volunteer Ambulance School of Instruction has changed its address from 10, St. Benet-place, E.C., to 8, Portman-street, Portman-square, W.

UNIVERSITY OF CAMBRIDGE.—Dr. Alex. Hill, Master of Downing College, has been re-appointed Vice-Chancellor of the University for the ensuing academical year.—Dr. Joseph Griffiths, M.A., F.R.C.S., has been appointed to the new Readership in Surgery. A Lectureship in Chemical Physiology is about to be established in the University.—The honorary degree of D.Sc. is to be conferred on the President of the General Medical Council, Sir William Turner, F.R.S.—The following medical degrees were conferred on May 26th:—M.D. on M. Craig, Caius; A. Eichholz, Emmanuel; and C. E. Hedges, Sidney. M.B. on C. R. Skyrme, Christ's; H. D. O'Sullivan, Emmanuel; and E. M. Corner, Sidney. B.C. on F. A. Mills, Clare; H. D. O'Sullivan and E. M. Corner.

Correspondence.

"Audi alteram partem."

THE GENERAL MEDICAL COUNCIL: THE RIGHT OF MEMBERS TO INSPECT THE COUNCIL'S DOCUMENTS.

To the Editors of THE LANCET.

SIRS,—As in the leading article of your last week's issue on the General Medical Council you made a statement in reference to myself which is contrary to fact, I feel constrained (while deferring discussion of the subject as a whole) to dissipate by an emphatic disclaimer the erroneous impression which that statement is unintentionally calculated to produce. Your sentence in question, which referred to the arbitrary confiscation of the right of the members of the Council to inspect the papers of the Council, runs as follows; "*The question raised was one of great importance* [to which I unreservedly agree] *and later was settled in a sense satisfactory to Mr. Horsley and anyone wishing to make a reasonable use of the documents of the Council.*" From this I dissent in every particular, for (1) the question is *not* settled, it has but just begun; (2) I am not satisfied, as I shall certainly prove; (3) I cannot believe that those who *do* wish to make reasonable use of the documents of the Council can concur in a resolution which would make their power of doing so depend not on their existing rights but on the goodwill of an official. There may be some among the members of the Council who care so little for the rights of their position that the confiscation of the powers entrusted to them by Parliament for the faithful fulfilment of their duties can be acquiesced in by them in silence, but if so it is to be trusted they are but few in number, and I for one must protest against being thus publicly classed among them. I regard the act of the President as an action *ultra vires*, the resolution of the Council as also an action *ultra vires*, and the opinion of Mr. Muir Mackenzie, founded on a case of 70 years ago in which a *liveryman* of a company claimed the right of inspection of documents in the hands of the *Court* of a company, as not only irrelevant to the main issue but positively containing a saving clause which precisely confirms my contention. This will be proved, as your readers will see when you publish the opinion in your report. I may here mention that I took no part in either the discussion or the vote upon the resolution moved by Dr. Glover on this subject because, as I have just stated, it was an action *ultra vires*. I desired to disassociate myself entirely from it in order not to prejudice my legal rights in the matter.

There is one further point to which I would call attention. You state that the vote of confidence in the President, but which was really a vote of confidence in the opinion of Mr. Muir Mackenzie, was passed unanimously. This was not so, for I voted against it. The vote carrying Dr. Glover's resolution was also not unanimous, and on the motion to convert it into a standing order Dr. Glover himself did *not* vote in its favour.

Finally, this important constitutional point was relegated to absolutely the last moment of the session, when nearly half the Council had obtained permission from the President to depart and had left. It is a fitting ending to a session the opening of which was characterised by perhaps the most lamentable event in the annals of the Council.

I am, Sirs, yours faithfully,

Cavendish-square, W., May 31st, 1898. VICTOR HORSLEY.

"TRANSMISSION OF SYPHILIS TO THE THIRD GENERATION."

To the Editors of THE LANCET.

SIRS,—May I, without entering in detail into the numerous misstatements contained in Dr. Shaw-Mackenzie's letter in THE LANCET of April 23rd, point out:

1. That William Fergusson in later years held exactly the same opinion upon his "Observations on the Venereal Disease in Portugal" as was expressed in my letter of March 5th. This fact did not become known to me until after the publication of the letter; it seems to prove the

correctness of my interpretation beyond doubt. Fergusson fully realised and frankly admitted the fallaciousness of the conclusions first drawn by him and still deemed "irresistible" by Dr. Shaw-Mackenzie. He no longer attributed the difference which he had observed between syphilis in the Portuguese and syphilis in the English to attenuation in the Portuguese, but to aggravation in the English, and the cause of this aggravation he recognised in the injudicious mercurial treatment enforced by him in accordance with the "utterly baseless creed" of his time—a treatment worse than Portuguese "apathy" because worse than the disease. Fergusson made the "staggering discovery" that by "murderous and unnecessary courses of mercury" he—to use the words he applies to Brown—had "committed havoc like a man of business."

2. That Thomas Rose's communication, although otherwise an "interesting contribution to the history of fallacies" (Virchow), was not a "corroboration" but a rectification of that of Fergusson. When Fergusson wrote his letter to the Royal Medical and Chirurgical Society he could not bring himself to believe that he had "lived so long in utter error" and he "durst not open his eyes to the whole truth." This was only done by the "bolder" Rose proving that the same "curability of syphilis" also existed in England. Thus Rose converted Fergusson from the fanatic belief in Hunterian heresies to the moderate and sound views of his later days.

3. That Aitken's "testimony" adduced by Dr. Shaw-Mackenzie is unavailable on this point because it is based on historical error. Fergusson as no time advocated non-mercurial treatment as Aitken pretends (although his observations became the starting point of anti-mercurialism). "The error lay in the abuse not in the use of the mineral" was his conviction. Much less did he "practise" non-mercurial treatment "during the Peninsular wars," on the contrary, according to his own statement, he "mercurialised to extremity," "even to death." This may explain why Dr. Shaw-Mackenzie in comparing Aitken's "testimony" with my "statement" found a "striking difference."

4. That apart from Fergusson's recantation all positive evidence we possess tends to show that neither in his time nor since has attenuation of syphilis existed in Portugal.

In his views on the pathology of venereal infection Dr. Shaw-Mackenzie is considerably behind Fergusson, who declared it to be "proved from the earliest records of time" that "gonorrhœa and syphilis are two distinct diseases." Dr. Shaw-Mackenzie, on the other hand, is "perilously perhaps but nevertheless instinctively" brought back "to Hunter's theory of unity of origin." Those not possessed of these "perilous instincts" will not be inclined to follow him in his retrogressive track, but will be reminded of the late Dr. Moxon's humorous saying that "poetic feeling produces no little of the reality as well as the pathology of syphilis."

I am, Sirs, yours faithfully,

Welbeck-street, May 22nd, 1898. GEORGE OGILVIE.

To the Editors of THE LANCET.

SIRS,—I am much obliged to you, with Dr. G. Ogilvie's permission, for an advance proof of his further letter. His original paper in the *British Journal of Dermatology*, November, 1897, seemed to me to discredit Fergusson apparently without acquaintance with his original communication and did not duly credit Rose and Mr. Lee with the principal arguments which Dr. Ogilvie himself relied upon. I in no way, therefore, regret the attention you have permitted me to draw to the original works of these authorities.

I readily admit I was not till now aware of any later published views of Fergusson and I admit in this "fragment intended to fill up a gap in the systematic treatment and history of syphilitic disease"[1] Fergusson fully testifies to the aggravation of syphilis in the British by the abuse of mercury. This admission does not detract from the fact of the curability of syphilis without mercury confirmed by him in the Portuguese and corroborated by him and Rose in the British, facts which appear to show mitigation rather than "idiosyncrasy" when compared with those cases which Fergusson further admits "have occurred and will occur in which the use of that remedy has been and will be found absolutely necessary." Moreover, it is impossible to accept that any ignorance of the uses of mercury will explain the difference between syphilis at the present time and the severity, rapidity of propagation (not always by contact), and fatality which the description of the disease showed at the close of the fifteenth century. Fergusson never denied other causes which might account for the difference in severity. He confirms his previous alternative theory of climate and intemperance, to which he adds mercurial abuse. He does not again refer to transmitted partial immunity, but it seems unreasonable to reject in the case of syphilis that which he himself pointed out in the case of other specific fevers and which is generally accepted. In a publication from which Dr. Ogilvie quotes in his last paragraph I have drawn attention to modified syphilitic symptoms in women. I am inclined to think that such cases throw light on acquisition of syphilis modified by hereditary taint. In any case I am convinced it would often be to the advantage of patient and practitioner if the syphilitic origin, as opposed to the gonorrhœal, and the "use" of mercury in many cases of suppurative and pelvic disease in the female and of chronic urethritis in the male, were more generally recognised.

I am, Sirs, yours faithfully,

JOHN A. SHAW-MACKENZIE.

Grosvenor-street, W., May 24th, 1898.

*** This correspondence must now cease.—ED. L.

[1] Notes and Recollections of a Professional Life, by the late Wm. Fergusson, M.D., Edited by his Son, James Fergusson.

CONSTIPATION IN ADULTS AND INFANTS: AN ANSWER TO A REVIEW.

To the Editors of THE LANCET.

SIRS,—In THE LANCET of March 26th there appeared what purported to be a review of my book on constipation (*Constipation in Adults and Infants, with special reference to the Mechanical Methods of Treatment, &c.* The Macmillan Co. 1897). As this is the age of free thought and everyone has a right to hold to his opinion I have no quarrel with the writer thereof if he objects to the methods of treatment, especially the mechanical, advocated in the book, and he is at liberty to treat his cases with colocynth co., with aloes, &c., and other favourite prescriptions of some ancient disciple of Æsculapius, even though it be contrary to what has been advocated by Englishmen (Wilson, Fox, Bristowe, and especially by S. B. Birch of the Medical School of Manchester in his book "Constipated Bowels," first edition, published about 1859) for the last forty years, even though it be contrary to what that eminent clinician Trousseau taught thirty years ago already, and even though it be contrary to the most advanced medical thought of to-day, (Nothnagel, Boas, Rosenheim, Mathieu, Le Marier).

I shall not attempt to controvert his opinion as to the illustrations—*de gustibus non est disputandum;* and as to the style, if he does not appreciate a clear, lucid exposition, so that he who runs may read, that is his affair, not mine. (If it be the personification of that sprite from Greek mythology that he objects to, more particularly in the sentence excerpted, he must call to account, in this world or the next, the same Dr. Birch already referred to. I found it apt and took it from him.) I would have been content to leave all this to the judgment of the English medical public, who are fully competent to judge for themselves and who may decide between us (here in America it is unanimously in my favour, and the book has been accorded a most flattering reception by the medical journals of all shades of practice), and would have held my peace; but I must defend the Latin, even though it be true that it is not the best of Latin, that I took it from an old writer and am therefore not responsible therefor. The defence thereof is brief. If the reviewer (he has probably become a little rusty in Latin—no disparagement—an old practitioner may become rusty in his Latin and Greek even with credit to himself) will kindly read the sentence thus, "Tollitur causa remotus effectus," he will find that all offence against the shades of the grammarians of ancient Rome had vanished.

In conclusion, allow me to say to the readers of your very valuable and highly esteemed Journal that if they will give the methods of treatment of constipation advocated in my book a thorough trial they will obtain excellent results.

I am, Sirs, yours faithfully,

New York, May 18th, 1898. DR. H. ILLOWAY.

"THE LIMITS OF PROFESSIONAL SECRECY."

To the Editors of THE LANCET.

SIRS,—Permit a lay employer a word on an aspect of this question which has hardly, I think, received its due attention. I am an employer who, I venture to hope, take as high a view as most of my duty towards those in my service, that duty including, as I conceive of it, the obligation of charity and kindliness. I also hold the strongest possible views on the question of professional confidence. But in the case of the medical attendant of a servant, questioned by an employer, it seems to me that a situation arises to which professional ethics can hardly be rightly applied in their strictness, and this not by any means because a servant has any less right to protection than his or her master, but because that protection is more afforded by openness than by reticence.

For a master's duty extends to *all* his servants—not only to the sick one; and not only to them, but to every member of his household. And if the illness of any one of them is of a nature dangerous, or indicative of danger, to the rest or any of them, it is his duty to them to remove the peccant one. On the other hand, if no such danger exist it is equally his duty to consider or overlook the otherwise objectionable nature of the disease. But to do this he must know its nature. And if he is simply told that "the complaint is one which the patient objects to my disclosing," what can he possibly do but assume that it is one which, if known, would entail dismissal—and act accordingly? Of course, I do not for a moment mean that if, after this has been pointed out, the servant-patient still insists on secrecy the medical man would be justified in violating it. But I cannot help thinking that, in his patient's own interests, he should deprecate that insistance to the very uttermost.

I am, Sirs, yours faithfully,

May 25th, 1898. AN EMPLOYER.

*** We print the above letter with pleasure, for it sets out with particular force the layman's side of a difficult question. It is because there are such strong arguments as these which "An Employer" uses that the limits of professional secrecy are so hard to define and the medical man's position often so delicate. We adhere to our expressed opinion.—ED. L.

"THE DIPLOMA OF THE APOTHECARIES' SOCIETY."

To the Editors of THE LANCET.

SIRS,—Your correspondent "G.P. and Physician" asks me to explain my letter. With your kind permission I will therefore do so. I stated that "an intolerable amount of snobbism" was going on in the present day with regard to the abuse of the designation "Physician and Surgeon," at which "G.P. and Physician" retorts: "I cannot for the life of me see why 'superior' persons should call him a snob for so describing himself." Now, Sirs, as a matter of fact I have not called, nor do I intend to call, anybody a snob, and if your correspondent chooses to twist my phraseology so as to apply such an offensive epithet to himself it is no fault of mine, as one would have thought it scarcely necessary to point out to him that there is a vast difference between speaking of any system as one of snobbism and calling a person directly a snob, because it is obvious that many persons of good breeding and culture are guilty of some act of snobbism (in fact, probably everybody is) which would not be sufficient *per se* to identify such person as a snob. All I can add, therefore, is that if any given practitioner chooses to inflate himself before the English public with such a puff and pompous title as "Physician and Surgeon" he is undoubtedly, to my mind, guilty of an act of snobbism, although in all other respects his environment, &c., may redeem him from being a snob. I could take your correspondent a rural stroll if so disposed and point out two graduates with "Physician and Surgeon" embedded or incised in marble after a sepulchral fashion, and I can show him a medicine label—one of many sown broadcast amongst the general public—where the aspirant, evidently preferring a title before his name to one after, has in conspicuous letters "Physician" So-and-so on each mixture. I therefore ask your correspondent whether all this is not snobbism, and, if not, let him say what is.

I am, Sirs, yours faithfully,

London, May 23th, 1898. M.R.C.S., L.R.C.P. EDIN.

HOSPITAL ABUSE.

(BY OUR SPECIAL COMMISSIONER.)

XVI.—BRIGHTON.[1]

Reform at the Maternity Hospital.—Trivial Cases.—The General Dispensary and its Abuse.—The Sussex County Hospital's Investigation.—Great Increase of Hospital Patients.—The Hospitals Refuse to Assist in the Work of Reform.—Numerous Flagrant Cases of Abuse.

THE figures collected by Dr. F. J. A. Waring concerning the distribution of tickets for treatment at the hospitals of Brighton indicate most clearly that abuse prevails in that town as in so many other places. In 1894 no less than 38,113 tickets were given to intending patients and as some of these tickets were renewed they do not represent the full amount of charitable work done. That these charities are largely abused is clearly demonstrated by the experience of the West-street Lying-in Hospital. In 1894 there were at Hove and Brighton 3704 births registered. No less than 1240 of these births were attended by one charity. But other births were attended at the Brighton and Steyning Infirmaries and by the Merciful Society for helping fallen women. Thus more than one-third of the mothers at Hove and Brighton were in receipt of charity. It is obvious that in so prosperous a locality the proportion of mothers who really needed charitable help was not so high. Dr. Waring states that one of the midwives in the service of the Lying-in Hospital expressed her opinion that half the cases which she attended could well afford to pay. Many of these patients were assured in benefit societies which allow 30*s.* at the birth of each child. As a further proof of abuse it is shown that some years ago the number of patients was not so high, but a midwife was appointed who gained great popularity in consequence of her kindly manners and her skill. The number of applicants for admission to the hospital consequently increased rapidly. Now, however, this midwife has left the hospital and established a private practice of her own. The result is that she is at the present time treating, and receiving fees from, the very same persons who formerly were gratuitously delivered at the hospital. The fee charged by the midwife is 15*s.* and this is readily paid by the former patients of the hospital. These facts, it must be explained, are not new; they were brought so prominently forward in 1894 that action was taken and with good results.

Calling at the West-street Lying-in Hospital I was informed that a wage limit had been established. If the husband had no children and was earning £1 or more a week an inquiry was made. On the other hand, if he had several children then no inquiry was made. Patients, on applying, must bring a letter of recommendation from a subscriber. They are given a card in exchange for the letter and told to call again in a week. The details are entered in a book and shown to the medical officer in attendance and if he objects the secretary is informed and an inquiry is instituted. It will be seen that this is a weak system. Its success depends entirely on the accuracy with which the

[1] The previous articles on this subject were published in THE LANCET on the following dates: (1) Sept. 26th, 1896, Plymouth and Devonport; (2) Oct. 10th, 1896, Exeter; (2 *concluded*) Oct. 17th, 1896, Exeter; (3) Oct. 31st, 1896, St. Thomas's Hospital, London; (4) Nov. 14th, 1896, Liverpool; (4 *continued*) Nov. 21st, 1896, Liverpool; (4 *concluded*) Dec. 12th, 1896, Liverpool; (5) Jan. 2nd, 1897, Manchester; (5 *continued*) Jan. 9th, 1897, Manchester; (5 *concluded*) Jan. 23rd, 1897, Manchester; (6) Feb. 6th, 1897, Leeds; (6 *concluded*) Feb. 13th, 1897, Leeds; (7) April 17th, 1897, Coventry; (8) May 1st, 1897, The Royal London Ophthalmic Hospital; (9) May 8th, 1897, France, United Action and Legislative Action; (10) May 15th, 1897, Leicester; (11) June 5th, 1897, Nottingham; (12) July 31st, 1897, Birmingham; (12 *continued*) Aug. 14th, 1897, Birmingham; (12 *continued*) Sept. 4th, 1897, Birmingham; (12 *concluded*) Sept. 18th, 1897, Birmingham; (13) Oct. 30th, 1897, Southampton; (14) March 5th, 1898, Glasgow; 14 (*concluded*) March 19th, 1898, Glasgow; and (15) March 26th, 1898, Bradford.

recommendation form is filled up. Under such circumstances it is not surprising that but few inquiries are instituted. I was informed at the hospital that not more than six or at most eight such inquiries had been made during the last two or three months. The very vagueness of this reply to my questions suggests that check is not very systematically applied. The medical officer in attendance on the day of my visit did not, however, think that there was much abuse. It was his impression that the husbands of the women usually earned only from 15*s.* to 18*s.* a week and that the greater number were cabdrivers or fishermen. Though this state of affairs can scarcely be considered as very satisfactory it is, with regard to the prevention of hospital abuse, the best that Brighton has to show and it has sufficed to bring about favourable results. In consequence of these measures, such as they are, to prevent abuse, and, above all, as a result of the departure of the popular midwife, the number of patients has considerably decreased. They amounted, as already stated, to 1240 in 1894. In 1895 there were 1172 patients; in 1896 only 1024 patients; and I am told that the figures for 1897, when published, will show a further reduction to 955. These figures are rendered more significant by the fact that the population has, at the same time, been steadily increasing.

As an example of the sort of abuse which has been checked a case was mentioned to me of a woman who applied to the Lying-in Hospital though her husband subscribed to the Hearts of Oak, which allows 30*s.* at each accouchement. Many members of this benefit society strive to be admitted to the hospital for nothing and in this they are often encouraged by people who ought to know better. Thus a man employed by a large dairy paid a fee of £20 for the operation of abdominal section performed on his wife. His employer reproached him for having expended so large a sum and told him that he should have sent his wife to the hospital, where the operation would have been done for nothing. Of the cases of abuse which have not been prevented that of a well-to-do shopkeeper was mentioned to me. It was necessary to induce premature labour for his wife and this was done at the hospital. Another case related to a patient who offered his usual medical adviser four guineas to attend his wife during her confinement. As, however, the patient in question lived a long way off the medical man refused to take the case and recommended a local practitioner whose house was close at hand. Subsequently, and on making inquiries, he found that the woman had been taken to the Lying-in Hospital in West-street, and yet her husband had offered to pay four guineas. In a paper read by Dr. Waring at a special meeting of the Brighton Medico-Chirurgical Society in November, 1895, there occurs the following passage: "Dr. A. H. Dodd and I have written to the following large towns for information—viz., Portsmouth and its adjoining towns, Worthing, Hastings, Eastbourne, Tunbridge Wells, Lewes, Maidstone, Ramsgate, Margate, Dover, Rochester, Red Hill, and Folkestone, covering a population of a little over half a million—and we find that they have no lying-in institutions among their charities. The married people in those towns study the principles of thrift. I firmly maintain that it is not right that a woman should be attended gratuitously in her first accouchement. People should certainly not be encouraged to marry who have not saved sufficient to pay for the expenses of the first little stranger's arrival. I am in possession of the names of men employed in large business firms and receiving wages of over £2 a week and adding to their income by letting apartments who have received from the lying-in charity that assistance for their wives which is only intended for the poor." But, as already remarked, the abuse of the Lying-in Hospital has been greatly reduced since these words were spoken; and as such reform can be achieved with regard to the maternity institution it makes it all the more pertinent to inquire why similar measures are not enforced at the other hospitals.

The Lying-in Hospital was not the only institution criticised and publicly denounced. It was pointed out that in 1894 there were at the Throat and Ear Hospital 55 cases of impacted wax and 14 of simple tonsillitis, and at the Sussex County Hospital 33 cases of circumcision. Such cases do not require long or special attention. Two or three visits from a local practitioner would have sufficed and circumcision could in most cases be deferred till the parents were in a position to pay a small fee to their ordinary medical attendant. Looking at the report for 1896 of the Throat and Ear Hospital I find that there were 63 cases of impaction of wax, and during the same year there were 44 cases of circumcision at the Sussex County Hospital. In 1895 Dr. Waring brought to the notice of the profession a certain number of incidents as examples of the sort of abuse which was prevalent. He said that a county cricketer was at that time sending his daughter to be gratuitously treated at the dispensary. A male patient of the same institution was renting a shop of at least £40 a year. He was a foreman at some works and his wife was also earning a livelihood. Another man in constant employment, earning from 35*s.* to £2 a week, with his son assisting in a shop and his wife letting apartments, sent his infant for treatment. A gentleman living in one of the best parts of Brighton subscribes 10*s.* a year to the dispensary; he sent a young lady relative who was living in his house to be treated for varicose veins and she took away with her elastic stockings, and the gentleman had still remaining after this tickets for four months' more attendance. A man who keeps a shop for which he pays £50 rent, and whose wife lets apartments, sent his children to the Sussex County Hospital. One of Dr. Waring's patients was suffering from cataract; he lived on a pension and had some savings. Dr. Waring offered to procure a surgeon to remove the cataract for the reduced fee of five guineas. The patient replied that he could well afford to pay that sum. Nevertheless, he went to the Eye Hospital, where the operation was performed gratuitously by the very same surgeon. The result of this state of things—and several other similar examples were given—was described by Dr. Waring in the following words: "I have seen no end of young medical men, gentlemanly in manner, well skilled and conscientious in the performance of their professional duties, come into the town with the just expectation of earning a living and leave after a few years' struggle utterly ruined. Some years ago a few doctors in Brighton and Hove together with one or two other philanthropists started a Medical and Surgical Home in Ellen-street and they advertised for resident patients and got some from different parts of the country. There was also a dispensary attached to it where the sick and injured could resort and by purchasing a ticket for one penny receive advice and treatment. Of course a large number flocked to it. A little prior to this a medical man came to Hove whom I knew slightly. I met him once in the street, and from what he told me and from my knowledge of him I knew that he was doing well and was able to support his wife and family; but some time afterwards I met him again and he was shabby in appearance and looked depressed. I asked him what was the matter and received the reply that the Medical and Surgical Home in Ellen-street, together with the General Dispensary, had ruined him."

Calling on a member of the honorary staff of this dispensary he informed me that undoubtedly many of the patients appeared to be in a good position. If inquiries were made it would often be found that the husband was an engine-driver; but the patients would argue that they had a right to come because they put a penny a week into one of the boxes which are known at Brighton as the "workmen's boxes." This is an old-standing practice. An employer sends the box round and with the pennies collected from his workmen he buys tickets which he gives to the workmen or their families. Of course the employer does not make any close inquiry into the position of his workmen, whose wives are often lodging-house keepers and thus make a good income. At the railway works there are many labourers and others who receive very low wages and are generally fit persons for a charity. But the skilled artisan whose wife lets lodgings can well afford to pay a few small fees for ordinary illnesses or he can join a provident club; and I am told that there are ten or twelve fully-qualified practitioners in Brighton who will take sixpenny fees. Indeed, the situation of the profession at Brighton is at present so deplorable that I was told that it would be inexpedient to attempt to raise the club fees. There are too many starving medical men ready to take the place of anyone who should complain. Another general practitioner, however, urged that the competition of the provident dispensaries was more disastrous than that of the hospitals. A medical man on the staff of the General Dispensary admitted to me that there certainly was some abuse, but not much. The medical officers had to report cases of abuse; but, of course, they could not do this very often. He

himself had reported a case of gonorrhœa on the ground that if a man could afford dissipation he could afford to pay a medical practitioner's fee. Besides there were medical men who undertook to attend a patient at his house for a whole week for only one shilling. In the face of such competition it was very difficult to act and he felt that if he attempted to prove cases of abuse he would become unpopular. One of his patients, a lady in receipt of an income of £500 a year, said that she was absolutely unable to pay £40 for a very serious operation, therefore she went up to London to get it performed at a cheaper rate. Many persons living in very good houses came to the dispensary, but in spite of appearances they were sometimes in very precarious positions. Lodging-house keeping is very hazardous and it often happened that all the furniture of persons so engaged was seized and sold. He did not think that the well-to-do tradesmen of Brighton were particularly prone to attend the hospitals; but nevertheless there was a widespread feeling that medical men were defrauded, but it was difficult to obtain positive proofs of the fact. Then the medical men had a great amount of gratuitous work to do for curates, governesses, and domestic servants.

The General Dispensary was founded in 1809, therefore it is a very old-established institution, and has so grown in importance that there are now a western branch and a northern branch besides the parent institution. At each of these there is a house surgeon attached who receives a salary of £140 a year but is debarred from private practice. Then there are four district medical officers who receive between them £280 a year. But apart from the paid staff there is an honorary consulting physician, an honorary consulting surgeon, an honorary visiting staff of twelve physicians and surgeons and two dental surgeons. This staff attended during the year 1896 no less than 15,078 patients and this was a decrease of 700 on the previous year. At the western branch there are wards and here 125 in-patients were treated in 1896. The number for the previous year was 113. There are fifteen beds at the western branch so that this constitutes yet another hospital. Patients are accepted at the General Dispensary on presenting a letter of recommendation and on paying a registration fee of 6*d*, but free letters are distributed in return for contributions from friendly societies and to the collectors of workmen's boxes. Subscribers of only half a guinea annually are entitled to recommend six patients, and of course a much larger number of recommendations are given in exchange for larger sums. The government of the institution is vested in benefactors of £10 10*s*. and upwards and in subscribers of £1 1*s*. or more annually, and they are entitled to attend the general annual meeting so as to elect the committee of management and all officers. For these meetings Masonic lodges, friendly societies and other institutions of a similar character which subscribe £3 3*s*. annually may nominate a representative. The house surgeons and the district medical officers have to visit at their homes such patients as are unable to attend at the surgery. Then there is a Samaritan fund for the purpose of providing patients with extra diet, &c. The in-patients are received at the western branch on the recommendation of the house surgeon or one of the branch honorary medical staff. But domestic servants or other workpeople employed by governors living in the district may be received as in-patients on the payment of not less than 12*s*. weekly. The income from all sources during the year amounted to £3800, of which £691 consisted of dividends on investments; the patients' 6*d*. registration fees amounted to £253 and the contents of the workmen's boxes to £309. The annual subscriptions amounted to £820. Then there were donations and life subscriptions to the amount of £495; congregational collections, £206; and legacies, £1022. I have omitted the shillings and pence. These figures show the importance of this institution and the population of Brighton is estimated for the year 1896 at 120,000. As an example of abuse a case was related to me concerning a man who is employed by the town and receives a salary of 30*s*. a week. Two or three of his children are in regular employment and his wife does a good business in letting apartments. Nevertheless she took her child to the dispensary to be treated for a fractured arm and when the surgeon in attendance expressed his surprise she replied: "Is not the dispensary a place for all accidents?" On another occasion a tradesman who pays £35 rent for his house and lets apartments obtained a dispensary ticket and took his child there to be treated for a slight injury to the forehead. Then another case was mentioned to me of a child who was a patient at the dispensary though the father earned as a gardener 27*s*. a week, owned a house worth £25 a year, and did a good business in letting apartments. It is generally felt that far too many letters of recommendation are given in exchange for small subscriptions.

LIVERPOOL.

(FROM OUR OWN CORRESPONDENT.)

Asylum Accommodation in Lancashire for Pauper Lunatics.

AT the recent quarterly meeting of the Lancashire Asylums Board, held in the County Hall, Preston, Mr. Shelmerdine (Liverpool), on behalf of the Lord Mayor of Liverpool, drew the attention of the board to the delay in the completion of the extra wards at Whittingham Asylum. The Lord Mayor had received a letter from Dr. Raw (the medical officer of the Mill-road Infirmary, Everton) complaining of the congested state of the insane wards in that institution, which were so crowded that it was impossible for him to give adequate supervision to dangerous lunatics. Eight lunatic cases were sleeping (at the time Dr. Raw wrote) in the ordinary wards, a state of things to be greatly deplored. The chairman of the Whittingham Asylum Committee said the work had been greatly hampered by strikes and other causes, but they were making every effort to hasten the completion of the necessary wards. The Lord Mayor of Liverpool takes an active interest in the matter, being a member of the West Derby Board of Guardians.

Hospital Saturday Workshops' Collection.

On Saturday, May 21st, the twenty-eighth annual collection in the workshops, warehouses, and other industrial establishments in the city on behalf of the medical charities took place. During the past twenty-seven years the sum of £80,172 has been raised by means of this agency. The collection in the streets called the "ladies' day" are fixed for June 11th, after which date the combined amounts will be advertised.

Hospital for Women, Shaw-street.

Dr. John E. Gemmell, the junior assistant medical officer, has been promoted to the post of acting medical officer, rendered vacant by the resignation of Dr. T. B. Grimsdale. Dr. David Smart has retired from the honorary staff of the hospital after eleven years' of devoted service. Much regret is felt both by the medical staff and committee at the severance of Dr. Smart's connexion with the hospital, for with all of them he was deservedly popular.

The Robert Gee Medical Scholarship.

Mr. Hubert Gordon Thompson, a former student of the Liverpool College, has been the successful candidate in the competition for the Robert Gee Medical Scholarship at University College, Liverpool. Mr. Thompson had previously matriculated at the University of London, having been placed in the first division.

Sir Henry Tate, Bart.

Mr. Henry Tate, formerly resident in Liverpool, who has been the recipient of a baronetcy on the occasion of the Queen's birthday, has been a generous benefactor to the city of Liverpool. He contributed £8000 to the funds of the Liverpool Royal Infirmary and generously assisted other local medical charities, besides contributing largely to the Royal Jubilee Nursing Fund. The spacious library in University College, Liverpool, was also one of Mr. Tate's numerous benefactions. His eldest son and heir to the baronetcy also takes an active interest in hospital work, being a member of several committees, notably of that of the Liverpool Royal Infirmary.

(FROM OUR OWN CORRESPONDENT.)

The Perils of the Medical Profession.

ANOTHER name has been added in Glasgow to the long roll of those who have fallen in the performance of duty. Mr. Thomas Henderson, son of Dr. T. Brown Henderson of that city, a student of medicine of much promise, has at the early age of twenty-two fallen a victim to blood-poisoning contracted in the pursuit of his hospital work as the result

of assisting at an operation (a case of osteomyelitis) in the Royal Infirmary. Seven weeks ago he became affected with blood-poisoning which seemed to have passed off satisfactorily, until Sunday, May 15th, after returning from church, fresh symptoms of blood-poisoning manifested themselves in the form of dark spots on the skin and also on the mucous membrane of the mouth and throat (purpura hæmorrhagica), and in spite of all that medical skill could do the disease proved fatal in seventy-three hours from effusion of blood on the brain. Mr. Henderson was of a singularly amiable disposition and was ardently devoted to his medical studies and much sympathy is felt for his father in the painfully sad circumstances. It is somewhat striking that several members of the profession in Glasgow have recently suffered from blood-poisoning similarly contracted, and we understand that one of these was an eminent surgeon who was infected from the case at which Mr. Henderson assisted when he received the blood infection. Only in Mr. Henderson's case, however, has a fatal result ensued, although in the case of the surgeon referred to the illness assumed for a time a serious character.

IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

The Rotunda Lying-in Hospital, Dublin.

THE Lucina Bazaar and Fête, which was held in aid of the funds of the Rotunda Hospital, came to a conclusion on May 21st and proved most successful both as an entertainment and as a means of earning money for the funds of a great charity. The bazaar was formally opened by her Excellency the Countess Cadogan, who afterwards visited the performances in the gardens of the Rotunda on more than one occasion.

The British Dental Association and Dr. Stack of Dublin.

At the meeting of the British Dental Association, which took place at Bath on May 28th, a resolution was proposed by Sir Edwin Saunders, dentist to the Queen, that the following message, expressing the feeling of the assemblage, should be despatched to Dublin:—

That the members of the British Dental Association, now assembled at Bath for their annual meeting, desire to give expression to their heartfelt sympathy with Dr. Stack, and in doing so they would indulge in the hope that a further turn of rest may enable him to be restored to his family and to resume the duties and pursuits of active professional life.

Dr. Stack, the President of the British Dental Association and Professor of Dentistry at the Royal College of Surgeons in Ireland, occupies the very highest position in his branch of the profession here and is most deservedly popular not only among dentists but also with his colleagues at the College of Surgeons and elsewhere. Wide sympathy is felt with him in consequence of the severe attack of illness from which he now suffers. It is hoped, however, that he will soon be convalescent and able to resume his professional duties.

Hospital Saturday in Belfast.

Hospital Saturday in Belfast was held on May 28th, when about £400 was realised—that is, £80 in excess of 1897, and a larger amount than was obtained at any time during these last five years.

Queen's College, Cork.

The Cork College was very well represented at the recent medical examinations of the Royal University, as may be seen by the following statement:—Second Examination: Honours and exhibitions awarded to two students, one of whom was educated at Queen's College, Cork. Third Examination: Honours and exhibitions awarded to two students, one of whom was educated at Queen's College, Cork. Degree Examination: Honours and exhibitions awarded to two students, both of whom were educated at Queen's College, Cork. It will thus be seen that out of a total of six honours and exhibitions awarded at the various examinations four were won by students of Queen's College, Cork.

Dr. Thomas A. Kelleher has been appointed house surgeon to the Waterford City and County Hospital.

The Local Government Board for Ireland have appointed Mr. Edgar Flinn, F.R.C.S. Irel., D.P.H., of Kingstown, to be a medical inspector under the board.

June 1st.

PARIS.

(FROM OUR OWN CORRESPONDENT.)

Agglutination of Tubercle Bacilli.

M. S. ARLOING made a communication to the Academy of Sciences on May 16th on the subject of the Agglutination of the Bacillus of Tuberculosis. He said that Koch's bacillus, like several other pathogenic microbes, may be made to agglutinate by certain serums. If to some drops of a homogeneous culture or emulsion of the bacilli there is added one-tenth of blood serum of a healthy goat which has never received any inoculation no agglutination is produced. If for this serum there is substituted that of a goat which has been submitted to a long series of subcutaneous injections of more or less virulent samples of either tuberculin or Koch's bacillus phenomena of agglutination soon make their appearance in an intense and complete form. The slight natural agglutinating power of the blood of the ass also increases considerably under the influence of such injections. The agglutinating power of normal serum of different kinds is in inverse ratio to the tendency of the respective animals to contract or to resist tuberculosis. It does not exist in the rabbit and the guinea-pig, which are easily rendered tuberculous; it is very slight in the goat, is more pronounced in the ox and the ass, and is very marked in the horse, which rarely becomes tuberculous. Serum rendered strongly agglutinating by subcutaneous injections of Koch's bacilli or tuberculin produces agglutination either in cultures growing in liquid media or in homogeneous emulsions of fowl tuberculosis, a phenomenon which tends to show a relationship between Koch's bacillus and the bacillus of fowl tuberculosis. The action of the agglutinating serum shows itself equally well in the case of bacilli growing in glycerinated bouillon. The agglutinating power may originate and develop in a very short space of time. Attempts to obtain agglutination in the diagnosis or prognosis of tuberculous disease in the human subject have given the following results: (1) the blood serum of persons affected or supposed to be affected with true pulmonary phthisis caused agglutination 94 times in every 100—complete agglutination 57 times and incomplete 37 times; (2) the blood of patients suffering from surgical tuberculosis caused agglutination 91 times in every 100—complete agglutination 35 times and incomplete 56 times; (3) the serum of various patients caused agglutination 32 times in every 100—very good agglutination 11 times and imperfect 21 times; and (4) the serum of persons supposed to be healthy caused agglutination only 22 times in every 100—very good agglutination 11 times and incomplete 11 times. The proportion of positive results gives reason to hope that the agglutination of Koch's bacilli may prove useful as a clinical method.

The Prophylaxis of Tuberculosis.

In the discussion on M. Grancher's report to the Academy of Medicine on the prophylaxis of tuberculosis, M. Gibert of Havre proposed at the meeting held on May 24th that the academy should represent to the executive the desirability of instructing the prefects to take measures for the disinfection of places occupied by persons who have died from phthisis, whether in town or in country. He remarked that in Havre there are streets inhabited by poor people where phthisis nevertheless does not exist, while, on the other hand, there are streets in which the death-rate from phthisis is 13 per 1000. As for phthisis among soldiers, he has constantly seen army surgeons pass into the service young men affected with tubercle and whom he had certified to be so affected. In order to avoid hurting the feelings of the army surgeons he thought that the medical men in attendance on such cases ought to communicate directly with the prefects and sub-prefects of the departments. M. Laveran said that latent tuberculosis was much more common in the army than was generally supposed. Some soldiers did not venture to go on the sick list and in this way might suffer for a long time from unrecognised tuberculosis; they might also be the means of imparting the disease to their comrades. With regard to such prophylactic measures as the use of spittoons and the damping of whatever has to be swept it has not been found possible to carry out these precautions efficiently, and sweeping is once more done in the ordinary way, raising clouds of dangerous dust. Although paraffin and coal-tar rendered flooring-boards impervious to unwholesome matter, these substances were nevertheless not used in the majority

of barracks. M. Ferrand said that the notification of contagious and infectious disease entails many difficulties. The law of 1892 is too seldom put in force as it is, but what would be the state of affairs if it were extended to tuberculosis? Up to the present time notification of infectious diseases has been made by only a small number of medical men—6 out of 25 in one department and 2 out of 13 in another. The duty of notifying ought not to be laid on the medical men, but on the family and on those who have the care of the patient. A satisfactory way would be for the medical man to have a book with counterfoils, from which book he could detach a page containing a notification and leave it with the family to be sent by them to the authorities. According to M. Collin the precautions taken in the army—namely, the use of spittoons and sprinkling with water before sweeping—are insufficient and ought to be supplemented by additional measures, such as the renewal of floors, the rendering of them non-absorbent, local disinfection, the construction of new mess-rooms, and the providing of infirmaries apart from the living-rooms.

Medical Men in the New Chamber of Deputies.

The last Chamber of Deputies contained 55 medical men. Of this number 7 did not offer themselves for re-election; of the 48 who sought re-election, 14 were not returned, while at the same time 14 new medical members have been elected, so that 48 medical men will have seats in the new Chamber—a reduction of 7 on the number in the preceding one.

The Tarnier Bequest.

The municipal council of Dijon has just received a copy of the will of Dr. Tarnier. He bequeaths sundry articles to the Dijon museum, and 100,000 francs (£4000) to the city, to be employed in some charitable work at the discretion of the city; he, however, expresses the wish, without imposing it as an obligation, that the money should be applied for the benefit of pregnant or lying-in women or newly-born children. The Council has decided to give the name of Tarnier bequest (*legs Tarnier*) to this fund, and one of the streets of the city will be called after the late eminent professor.

BERLIN.

(FROM OUR OWN CORRESPONDENT.)

Ether-Drinking.

IN the *Vierteljahrsschrift für Gerichtliche Medicin* Dr. Cohn, medical officer of health of the district of Heydekrug, draws attention to the fact that the habit of ether-drinking has become prevalent there. This district is situated in East Prussia, near the Russian frontier, and has recently acquired some notoriety in connexion with leprosy imported from the adjacent Russian territory. The population consists principally of Lithuanians, who are of Slav race and whose social and hygienic condition leaves much to be desired. They were formerly much addicted to spirit-drinking, and when spirits became expensive on account of an increase in the duties ether was substituted. It is said that a feeling of pleasurable exhilaration is produced more rapidly by ether than by alcohol, and that the subsequent depression and discomfort are less marked; unfortunately, however, this stage of exhilaration is only too transient. This use of ether causes chronic catarrh, fatty degeneration of the heart, atheroma of the great vessels, cirrhosis of the liver and cerebral troubles which may result in idiocy. The habit of ether-drinking has taken such a hold of the people that, according to Dr. Cohn, on market days when the peasants from the neighbouring villages are in town the smell of ether from their breath is perceptible everywhere. When a vehicle occupied by peasants is met on the high road a cloud of ether seems to float along. Both sexes equally have this failing and when the market is over men and women in nearly equal proportions may be seen intoxicated in the streets. The school-teachers report that mere children often come to school showing signs of having taken ether before leaving home. Mothers also give it to children suffering from abdominal pain. Ether may be easily obtained in the druggists' shops and licensed pharmacies, where it is sold without a medical man's order in the form of "Hofmann's drops" (ether 1 part, alcohol 3 parts). Dr. Cohn is of opinion that the injurious effects of ether warrant its being classed with opiates, arsenic, and other drugs which are only sold for medicinal purposes and on presentation of a prescription by a medical practitioner; he considers, therefore, that the amendment necessary for this purpose ought to be made in the instructions contained in the Pharmacopœia as well as in the regulations of the pharmacies.

The Berlin Accident Service.

An interesting trial of the efficiency of the Berlin ambulance and first-aid service was made on May 19th. At 7 P.M. the chief medical officer of the Berlin police, Dr. Wehmer, without previous notice ordered an urgent telegram to be sent from the central police-station to all the branch police-stations by the special police wires. The telegram was as follows: "Great disaster at Alexander-street. Alarm all the ambulances and surgeons of the accident service (*Unfall-Stationen*). You are strictly forbidden to mention that this is only a false alarm." When the police-stations had received this telegram they telephoned to the *Unfall-Stationen*, which at once sent vehicles to the scene of the alleged disaster. The surgeons were very much astonished when they found no dead or wounded, but only Dr. Wehmer and some other police and municipal officials. It was stated that ten minutes after the alarm was given two surgeons were in attendance with assistants and dressing material; five minutes later two horse ambulances appeared, and before long there were 10 ambulances and 25 surgeons on the spot—surely enough to attend a great many injured. The last ambulance from the most distant quarter of the city arrived about forty-five minutes after the alarm. The sight of so many ambulances driven rapidly through the streets brought a great crowd to the place of the alleged disaster. The excellence of the organisation of the first-aid service was fully proved by this sudden rehearsal.

Hygiene on Railways.

The Imperial Health Office has recently issued instructions with a view to prevent the spread of disease by railway traffic. The regulations are especially intended for the lines leading to and from health resorts which tuberculous patients are in the habit of visiting. It is recommended that the sides of the sleeping-cars of these lines should be as smooth as possible and without corners so that they may be easily cleaned. Velvet should not be used for the cushions, which, moreover, should be capable of being easily removed for the purpose of disinfection. Every compartment ought to be provided with covered spittoons. The floors of the waiting-rooms in the stations ought to be washed every day and the walls at short intervals. The walls are to be painted with oil paint which can be frequently washed. When new premises are to be constructed special attention must be paid to matters of hygiene. The Minister of Public Works, who has the control of the railways, has communicated these recommendations of the Health Office to the railway authorities and has ordered them to be adopted.

(FROM OUR OWN CORRESPONDENT.)

Pilgrimage declared Foul.

THE Quarantine Department in consequence of the existence of plague in the holy places has now declared this year's pilgrimage to be infected. It is difficult to see how they could have taken any other course. The troubles of an International Quarantine Council are, however, interminable, for every nation insists on its own interests being studied and it must be assumed officially that all are equally honest and interested in modern hygiene to the same degree. A case has just occurred which illustrates this official difficulty and also the importance of trying to foresee the possible negligence of any one quarantine inspector. Some members of the board recently desired to put the whole of the west coast of Arabia into quarantine because of plague at Jeddah, and presumably at other ports of the Hedjaz. Moreover, it was felt that a Turkish military cordon round any given place constituted no real safety that disease could not leak through it. The Turkish representative protested and cited as an argument that when plague exists at Bombay or Karachi the whole of the western coast of India is not declared infected. The official number of Egyptian pilgrims this year is 4541.

Case of Imported Plague at Suez.

A vessel belonging to the Khedivial Postal Steamers, which run every fortnight between Suez, Yambo, Jeddah,

and Suakin, is now the centre of some interest. It appears from the official reports that the ss. *Mehallah* left Suez with mails and passengers in the ordinary way on April 19th, left Tor on April 20th, and arrived at the outer harbour of Jeddah on April 23rd, where she stayed for two and three-quarter hours to discharge mails, but did not receive anyone or anything on board from Jeddah and never entered the inner port. The same day, April 23rd, she stopped at Ras el Aswed, the temporary port for Mecca, south of Jeddah and its neighbouring islands, and of course on the west coast of Arabia in Turkish territory. Here she stayed two and a half hours to disembark 67 Egyptian pilgrims from Suez. Their baggage was landed by means of a winch and crane; no person from the shore or boats came on board and no person on board went into the boats or ashore. In fact, it is stated, both here and at Jeddah, that there was no personal communication. I give merely the official story, but I may state here that the captain, doctor, and crew of the vessel are Egyptians. Later the *Mehallah* called at Suakin and returned to Suez on April 30th, where the quarantine officer, Dr. Hodgson, gave her free pratique because there was no illness on board and because she had come from ports which were officially clean. That is to say, the quarantine officials in Alexandria, in spite of plague at Jeddah, had not decreed that the outer harbour of Jeddah and Ras el Aswed were officially infected. For the same reason the crew and passengers of the *Mehallah* were not specially examined for possible plague and they were naturally allowed to land at Suez and disperse to their homes. On May 1st the Egyptian stoker of the steamer suddenly became ill with rigors, fever, headache, vomiting, and swelling and pain in the right groin. The following day the native doctor from the steamer visited him at his house to see why he did not come on board and reported that he was too ill to do so; and this visit was repeated on the 3rd. Fortunately, on the 4th, about noon, the patient invited Dr. Creswell of Suez to see him. Dr. Creswell at once recognised that it was a case of plague, removed the man to the Infectious Hospital in the desert outside the town, disinfected the house, destroyed or sterilised the effects, and placed the patient's household under observation. The whole incident has been the cause of trouble and anxiety, but this has been minimised to a great extent by Dr. Creswell's ready diagnosis and prompt action. The Sanitary Department in Cairo at once despatched Dr. Bitter to Suez to examine the matter bacteriologically and Surgeon-Captain Garner to carry out all necessary hygiene. The crew of the vessel were all reclaimed from their homes in Suez and, though all healthy, were put on board the *Mehallah* in the dry dock and eventually despatched to Moses' Wells, where they remain under the charge of the quarantine officials. The families of the crew are also being kept under observation. The 17 passengers landed at Suez were next traced by the police, some having already reached Upper Egypt. 16 are all healthy and are being kept under police inspection. As they all came from Suakin and not from Jeddah there cannot be any risk of primary plague among them. The remaining passenger died at Suez in the French hospital soon after landing and this naturally excited some comment, but it is now known that he died from phthisis, that he had been ill for four months, and that he made this voyage in order to consult Dr. Zachariades at Tor, who knew him as a former patient in the last stage of tuberculosis. Dr. Creswell on examining the stoker found that he had a small wound outside the right ankle, which may have been the site of the entry of the bacilli; his femoral and inguinal glands were enlarged and he had severe headache, weak and rapid pulse, albuminuria, and fever (102·6° F., rising to 104° that night). On May 5th, when seen with Dr. Bitter, he had a characteristic tongue; his temperature was 102·2°, his pulse was 110, and one of the right femoral glands was red and as large as a pigeon's egg but without fluctuation. Dr. Bitter decided it was a simple bubonic case and at once pricked the gland. Many staphylococci and some degenerated plague bacilli were at once seen under the microscope and later cultures were developed in the ordinary way. Since then Dr. Bitter has kindly shown me in Cairo the plague cultures from this case. The last news of the stoker is that his bubo has discharged a few drops of pus and that he himself is convalescing satisfactorily. Suspicion has now fallen upon a sailor on the *Mehallah*, reported by Dr. Hodgson to have a temperature of 100·4°, a pulse of 100, and a gland in the left axilla as large as a turkey's egg. The diagnosis in this case is not yet made. The health of Suez is now very good, the town is fairly clean, and there is an energetic governor who under English pressure will make it cleaner still. Dr. Ardouin, Dr. Legrand, and Dr. Morrison have also visited Suez, being respectively the Inspector-General, the French doctor, and the British delegate on the Quarantine Board of Alexandria.

Mysterious Importation.

How did this patient get plague? We know that there is no plague at Suez, Tor, or Suakin; we are told there is none at Ras el Aswed; and we know it exists at Jeddah. If we are impolite enough to discredit the official story and assume instead that either at Jeddah or Ras el Aswed, presumably the former, the stoker imported rags, clothes, carpets, or something which contained plague bacilli the case becomes less mysterious. The premonitory symptoms of the illness appeared seven or eight days after the steamer left Jeddah. Now, observers at Hong-Kong and in Bombay have told us that the incubation period is from three to five or even ten days. In cases of direct contagion, such as a nurse catching the disease from a patient, we know (in Bombay) the incubation period may be as short as three days. But it is fair to assume that weakened bacilli lying dormant in clothing may take longer than five days to develop; also we cannot tell whether the unfortunate stoker infected his ankle the same day on which he visited the coast of the Hedjaz or later.

Cairo, May 11th.

NEW YORK.

(FROM OUR OWN CORRESPONDENT.)

A National Society for the Study of Epilepsy and the Care and Treatment of Epileptics.

IT is proposed to establish a national society for the study of epilepsy. It has been roughly estimated that there are 140,000 epileptics in the United States. There is not at the present time any organised body—scientific, professional, lay, or philanthropic—for the study of epilepsy and the care and treatment of the epileptic. It would seem that a national society or association for the study of epilepsy and the care and treatment of epileptics might serve a useful purpose and do the greatest good, but it should be organised along broad and comprehensive lines. A summary of its proposed work may be stated as follows: 1. The scientific study of epilepsy. 2. The rational treatment of the disease. 3. The best methods of caring for dependent epileptics, including (*a*) the construction of proper homes based upon a study of the epileptic's need as to classification and environment; (*b*) the study of the utilisation of the epileptic's labour for economic, scientific, and ethical reasons; and (*c*) the study of the best educational methods to be employed, including manual, industrial, intellectual, and moral forms and forces. In such a society, science, philanthropy, and practical charity may well combine for a common purpose.

Eucaine.

The latest anæsthetic preparation is eucaine, prepared from a South American plant, and in its local action similar to cocaine, but without any of the poisonous effects of the latter, even though employed in much larger doses. The severest test as yet reported was the amputation at the lower third of the leg of a man, sixty-eight years old, without the use of chloroform or ether, followed by rapid and painless healing of the stump. As much of the eucaine was put into two or three tablespoonfuls of water as the water would dissolve and with a hypodermic syringe a few drops of the solution were injected under the skin; about 1 in. from the centre of the injection another was made, then another, until the limb was girdled by them at the place where amputation was intended. After waiting five minutes to allow the superficial tissues to become insensible the needle was thrust deeply into the muscles and injection made; in a few minutes all that portion of the leg, including 3 in. or 4 in. above and below the ring of injections, was found to be destitute of feeling, and the operation of cutting off the limb was proceeded with exactly as with chloroform. When the deeper tissues were cut into a slight smarting sensation was experienced a few times, but immediately relieved by the application of a little more of the solution to the seat of the discomfort.

The National Conference of Charities and Correction.

This conference celebrated its twenty-fifth birthday in New York on Wednesday, May 18th. The conference was organised in 1874 and has met annually since that time. It is composed not only of the representatives of charitable and correctional institutions and societies, but also of men and women who are interested in the broad field of charity in the United States, Canada, and Mexico, and has at the present time nearly 1200 members. The meetings of the conference bring together a large body of people who are earnestly interested in good works and who constitute a congenial fellowship. The conference continues for a week. General meetings are held daily and section meetings are held for the discussion of social subjects, such as charity organisation, dependent children, insanity, juvenile reformation, prison reforms, municipal and county charities and college settlements. The conference has no tests of membership. It offers a free forum to all who are interested in these branches of sociology.

Conditions favouring Tuberculosis.

The Massachusetts Board of Health, in its conclusions relating to the prevalence of tuberculosis in the State, emphasises as one of the chief conditions favouring the production of that disease the continuous and habitual breathing of unrenewed air; consequently in workshops, factories, schoolrooms, public buildings, halls, churches, and the inhabited apartments of dwellings and tenement-houses the absence of adequate means of ventilation must conduce to augment the danger. Of course, dampness of soil on which a house stands and dampness of the immediate neighbourhood tend to the same result, as does, naturally, the occupancy of living- or sleeping-rooms or apartments which are constantly damp or are partly or wholly underground. Another factor inducing the spread of this disease was found to be the presence of dust in the air of apartments, factories, mills and workshops; hence, necessarily, occupations or trades in which men, women and children are exposed to the inhalation of irritating dust must increase the liability to contract phthisical ailments.

May 19th.

Obituary.

JOHN BARRITT MELSON, M.D. CANTAB.

AT the advanced age of eighty-seven years Dr. Melson passed quietly to his rest on May 30th at his country house at Lapworth, near Birmingham. For many years Dr. Melson was widely known in the Midland counties, not only as a physician of high scientific and cultured knowledge, but also as an eminent and powerful preacher in the Wesleyan cause. In this direction he attained a celebrity which overshadowed his professional duties and led him to the pursuit of theology more than that of medicine. The son of a Wesleyan minister, Dr. Melson was born in Forfarshire in 1811. At the age of fourteen years he was apprenticed to a Mr. Harris, a surgeon in Birmingham, where for several years he learned the practical part of his profession. Proceeding thence to Trinity College, Cambridge, he took, after five years' residence, the degrees of Bachelor in Arts and Doctor in Medicine; here, too, he was on account of special merit elected a Fellow of the Cambridge Philosophical Society. At the age of twenty-four years he returned to Birmingham and at once began practice as a physician, and on the founding of the Queen's Hospital he was appointed on the staff. About the same time he became Professor of Natural and Experimental Philosophy and Clinical Medicine at Queen's College. At this period, too, he lectured upon physics and electrodynamics at the Philosophical Institution, having among his pupils the late Archbishop of Canterbury (Dr. Benson) and the present Bishop of Durham (Dr. Westcott). At the first meeting of the British Association in Birmingham Dr. Melson and Dr. Golding Bird were joint secretaries of the chemical section. Faraday was also a friend of his and entrusted him with complicated problems to solve in the way of his scientific knowledge. At an early age he was appointed a justice of the peace for the borough and he discharged these duties with painstaking care for many years, long remaining the senior magistrate on the local bench. A man of conspicuous abilities, of high scientific attainments, and of wide and profound classical and general learning, he devoted his energies to the promotion of good works and to the advancement more particularly of the Wesleyan cause. Tall and commanding in person, dignified in bearing, of genial and kindly manners, his presence will be greatly missed, his death causing the breaking of a link in the long chain of the past. He leaves three sons and three daughters, having married in 1836 Miss Waller, of Luton, Beds, who died in 1879.

HENRY HAYMAN, F.R.C.S. ENG.

BY the death of Mr. Henry Hayman, which occurred on March 21st last, at the age of eighty-six years, there has passed away one of the few remaining representatives of what in its best sense is understood as the old school of general practitioners. Descended from good old Devonshire families through both parents, Henry Hayman was born at Axminster in 1812, where his father conducted an extensive practice for many years. Educated at Blundell's School, Tiverton, he became a student at St. Bartholomew's Hospital, where he was contemporaneous with such men as Paget and Holden. He passed his M.R.C.S. and L.S.A. examinations in 1834 and had the Fellowship of the Royal College of Surgeons of England conferred upon him in 1858. Commencing practice at Chelsea and afterwards at Margaret-street, Cavendish-square, he was for some years consulting-surgeon to Queen Adelaide's Royal Lying-in-Hospital. In 1848 he returned to Ottery St. Mary, where under the strain of a large general practice his health broke down; but after a period of rest he again entered upon active practice in 1868 at Stokenchurch, Oxfordshire, from which he retired and finally relinquished practice in the year 1884. Whilst at Stokenchurch he won the gratitude of the people by securing for them a public water-supply in the face of bitter opposition from some of the owners of property. Here he also founded a lodge of the Oddfellows Society known now as "Court Hayman," the members of which have testified their lasting gratitude to him in a recent letter to the family. A staunch Churchman, he was a man of high culture and genial disposition, of fine physique with a handsome face, rich voice, and possessing a keen sense of humour and an almost inexhaustible store of anecdotes gleaned through a long life of active and varied intercourse with his fellow-men.

THOMAS GIORDANI WRIGHT, M.D. LEYD., M.R.C.P. LOND.

DR. THOMAS GIORDANI WRIGHT, who died in Wakefield on May 27th, had been in practice in that city for the long period of sixty-five years. He was born in February, 1808, at Stockton-on-Tees, where his father and grandfather were organists at the parish church. Dr. Wright received his medical education at University College, London, and also in Edinburgh. He became qualified as L.S.A. in 1830; in the following year he was admitted M.R.C.S. Eng. and graduated as M.D. at the University of Leyden. In 1841 he became a Licentiate of the Royal College of Physicians of London and a Member in 1859. He was present at the opening of the Stockton and Darlington Railway in 1825, and was one of the original members of the British Association for the Advancement of Science.

DEATHS OF EMINENT FOREIGN MEDICAL MEN.—The deaths of the following eminent foreign medical men are announced:—Dr. Johannes Alexander Garten, *privat-docent* of Surgery in Leipsic, and formerly for many years assistant in the Surgical Clinic of the University.—Professor Friederich Jacob Trier, a well-known Copenhagen physician and author. He was one of the editors of two important Scandinavian medical journals. His father, Dr. Seligman Meyer Trier, took an important share in the work of introducing a knowledge of auscultation and percussion into Denmark.—Dr. Dezanneau, Professor in the Medical School of Angers.—Dr. Neudörfer, *privat-docent* of Surgery in Vienna.

THE GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION.

THURSDAY, MAY 26TH.

THE Council met again to-day, the PRESIDENT, Sir WILLIAM TURNER, being in the chair.

The Case of William Masson.

The Council proceeded to the consideration of the case of William Masson of Cottingham, E. Yorks, registered in Scotland Dec. 12th, 1888, as M.B., Mast. Surg. 1888, Univ. Aberd., who was summoned to appear before the Council on Nov. 26th, 1897, to answer the following charge on the complaint of Mr. Edward Ball of Southport, registered as Lic. R. Coll. Phys. Edin. 1886; Lic. R. Coll. Surg. Edin. 1886; Lic. Fac. Phys. Surg. Glasg. 1886:—

That he had acted and acts as cover to an unqualified person named George Watson, who, acting and purporting to act as his unqualified assistant, was and is permitted, authorised, and enabled by him to carry on medical practice and administer treatment to patients as if he (Watson) was a duly qualified and registered practitioner.

It was particularly alleged against him (Masson) that George Watson attended a woman named Higgins in her confinement, using instruments upon her, and that on the death of the woman he (Masson) signed and gave a death certificate purporting to certify that the woman had died from eclampsia. At the conclusion of their deliberations the Council determined: "(1) that the charge made against Dr. William Masson had been proved to the satisfaction of the Council; and (2) that the further consideration of the charge proved against Dr. William Masson be adjourned until the next session."

The PRESIDENT, addressing Dr. Masson, said: I may remind you of your position. The charge which was made against you was fully inquired into in November last and at the conclusion of the Council's deliberations it was determined that the charge had been proved but that the further consideration of it should be adjourned until the present session. So now I have to ask you if the unqualified person, George Watson, is still in your employ.

Dr. MASSON: No, sir; I told you when I was here before that I had already discharged him.

The PRESIDENT: Have you any unqualified assistant in your employ?

Dr. MASSON: I have not.

The PRESIDENT: Will you give the assurance that in the future you will not employ an unqualified assistant?

Dr. MASSON: Certainly I do.

The PRESIDENT: You give the assurance.

Dr. MASSON: Yes.

The Council then deliberated *in camerâ* on the case and when Dr. Masson was recalled

The PRESIDENT addressed him as follows: The Council has further considered your case and the following resolution has been come to:

The Council having further considered the charge against William Masson it does not judge him guilty of infamous conduct in a professional respect.

I may tell you that the Council has come to the decision relying upon your statements that you have ceased to employ an unqualified assistant and that you have no further intention of employing an unqualified assistant. The matter, therefore, is now at an end.

The Case of Julius Mostertz.

The Council next dealt with the case of Julius Mostertz, of 13, Salisbury-road, Noel-park, N., registered in London as Lic. Soc. Apoth. Lond. 1893, who was summoned to appear before the Council on Nov. 27th, 1897, to answer the following charges:—

(1) The complaint related to a dispensary or establishment carried on or conducted at 13, Salisbury-road, Hornsey, under the title of the Noel-park Dispensary.

(2) The complaint was that Mr. Mostertz, being a registered medical practitioner, acted as cover to an unqualified person named George W. Johnson, who, purporting to act as his assistant, carried on at the said Noel-park Dispensary a medical practice and who under cover of Mostertz's name, presence, and assistance was enabled to and did attend on and administer medical treatment to patients and carried on such medical practice as though he were a duly qualified and registered medical practitioner.

(3) The complainants were the Medical Defence Union, Limited.

At the conclusion of their deliberations the Council determined: "(1) That the charge against Mr. Julius Mostertz had been proved to the satisfaction of the Council; and (2) that the further consideration of the charge proved against Mr. Julius Mostertz be adjourned until the next session."

The following letter had been received from Mr. Mostertz:

27, Lordship-lane, Wood-green, N.,
Dec. 13th, 1897.

SIR,—I am in receipt of your letter of Dec. 4th, 1897, and beg to inform you that, in obedience to the order made by the Council on Nov. 27th last, I have dispensed with the services of the unqualified assistant forthwith and have discharged him.

As Mrs. Johnson on her part refused to send him away I have judged it to be the wisest course to sever my connexion with the place altogether.

I beg, therefore, to inform you that from to-day I no longer attend at 13, Salisbury-road, but carry on my practice from 27, Lordship-lane, Wood-green, N.

Yours obediently,
JULIUS MOSTERTZ, L.S.A.

Mr. FARRER, solicitor to the Council, said that the Medical Defence Union, who were the complainants in the case, had been communicated with and they had no further complaint to make. They said they had reason to believe that Mr. Mostertz had severed his connexion with the unqualified person.

Mr. MOSTERTZ appeared before the Council and bore out the statements in his letter. He announced that he had changed his address to 78, Lordship-lane and 1, Salisbury-terrace, which was one house, a corner house. He also gave the assurance that he had no intention of employing an unqualified assistant.

The PRESIDENT, after the Council had deliberated in private, intimated to Mr. Mostertz that, relying on the statement in the letter that he had severed all connexion with the people whose names were mentioned in the original complaint and that he had no intention of undertaking any similar association with unqualified persons, the Council had passed this resolution:—

That the Council, having further considered the charge proved against Julius Mostertz, does not judge him guilty of infamous conduct in a professional respect.

The charge, therefore, against him was at an end.

Unqualified Assistants.

Mr. TEALE moved:—

That the petitions and communications relating to unqualified assistants referred to the General Council by the Executive Committee be now referred to a committee for report thereon to the Council during its present session.

The petitions and communications in question were described as follows:—

(*a*) From 339 registered medical practitioners residing in various districts, desiring that special examinations should be held during the present year for unqualified assistants who have gone through a complete medical curriculum and are over forty years of age.

(*b*) From the Mayor of Wisbech, forwarding a petition, stated to be signed by 3449 persons, praying that Mr. Henry Thorns may be reinstated in his position as an unqualified assistant.

(*c*) From Mr. B. E. Reeves, late an unqualified assistant, seeking permission to continue the practice of midwifery under the supervision of his late principal.

(*d*) From a committee of medical practitioners in Leeds, signed by 138 persons, suggesting that the General Council might modify its recent action in regard to unqualified assistants in view of the fact of the difficulty which is being experienced in obtaining the services of a sufficient number of qualified assistants.

(*e*) T. V. de Denne, who represents that he is unable at the present time to procure the services of a qualified assistant either through friends or agents.

(*f*) From Robert Hugh Wilkin, a registered practitioner, Mem. R. Coll. Surg. Eng. 1893, Lic. R. Coll. Phys. Lond. 1893, on behalf of his father, aged sixty-three years, who all his life has been engaged in medical work, having been apprenticed in 1850, and who was prevented from qualifying by the necessity of immediately assisting his father, whose health had broken down. Latterly the petitioner, who has taken a country practice, has employed his father in a perfectly legitimate manner as an assistant, but now finds himself in the painful position of being no longer able to thus assist his father, and owing to the increased expense of engaging someone else to terminate the career of a brother whom he has been supporting during his course at Edinburgh.

(*g*) From C. Dugdale, who is over sixty years of age, and out of employment in consequence of the resolution of the Council, seeking permission to be allowed to continue his work. He was apprenticed to a medical man in Accrington and went through a regular course of study at University College, London, but owing to family circumstances was unable to go up for the examination. He has assisted in one practice for thirty-five years and can produce testimonials as to his efficiency.

(*h*) From Samuel Whitaker, aged thirty-nine years, son of a late medical practitioner, seeking permission to continue his employment. His hospital course at Guy's was interrupted after two or three years by illness, for which he was sent abroad. On his return he completed his course, but, funds failing him, was unable to go up for examination and since then has been acting as an assistant.

(i) From W. P. Thomas, aged forty years, who has acted as an assistant for twenty-two years to leading practitioners in Wales, desiring permission, in order that he may support a wife and family, to commence business as a chemist or be allowed to pass an easy final examination.

(k) A letter from the secretary of the Committee of Medical Practitioners in Leeds requesting that the committee would receive a deputation.

Mr. TEALE said he thought the Council would agree with him that it was very desirable that these various documents should not be discussed until they had been fully considered by a committee. Evidently this was not a question which the Council could put aside as of no moment; it was a question of very great moment to a large number of practitioners throughout the country.

Mr. BROWN, in seconding the motion, said that the resolutions of the Council on this subject had agitated the mind of the profession to an extent which no resolutions he knew of had done. He could not but think that the Council was to some extent to blame for not having laid down a little more decisively its principles in this matter. A large number of medical assistants had been peremptorily dismissed from employment because it was feared that the attendance of an unqualified assistant even upon an emergency case would bring the principal under the notice of the Council. For himself he thought it must be admitted that now and again an unqualified assistant was necessary in dispensary and ordinary surgery work.

Dr. MACALISTER said that while he was prepared to support the motion he thought it a pity that the report should be prepared and drafted and delivered before their eyes before the committee had met.

A suggestion was made that the words "if possible" should be inserted because it was felt by some members that the committee might not be able to report during the present session. Instead, however, of inserting these words the Council decided to delete "during its present session" and with these words deleted the motion was adopted.

Dr. CHURCH, Dr. MACALISTER, Dr. BRUCE, Mr. BRYANT, Mr. BROWN, and Mr. TEALE were appointed to the committee, Mr. TEALE to be chairman.

The Apothecaries' Hall of Dublin.

On the motion of Dr. GLOVER, seconded by Sir DYCE DUCKWORTH, it was agreed to reappoint Dr. Sidney Coupland as Inspector of the Examinations of the Apothecaries' Hall of Dublin.

The Case of George Hamilton Wyse.

The Council then proceeded to the consideration of the case of George Hamilton Wyse of 51, Talbot-street, Southport, Lancashire, registered in Ireland June 27th, 1871, as Lic. Apoth. Hall, Dubl. 1871; Lic. R. Coll. Phys. Edin. 1871; Lic. R. Coll. Surg. Edin. 1871, who on November 25th, 1897, was summoned to appear before the Council to answer the following charges on the complaints of the Medical Defence Union and the Wigan Medical Guild:—

The complaint related firstly to the medical practice carried on under his name at 88, Adelphi-street, Preston, in the county of Lancaster, and secondly to a medical practice carried on under his name at 95, Wallgate, Wigan, in the same county.

1. The charge against him in respect of the practice at 88, Adelphi-street, Preston, was that he covered an unqualified person named George Wyse, who was, or purported to act as, his assistant, and whom he permitted and enabled, under cover of his presence, name, and qualifications, to attend on and administer medical relief to patients and give medical certificates and generally to carry on at the said place a medical practice as if he (George Wyse) were a duly qualified and registered practitioner.

2. The charge against him in respect of the medical practice at 95, Wallgate, Wigan, was that he covered an unqualified person named Cowan, whom he permitted and enabled, under cover of his name and qualifications, to attend on and administer medical relief and treatment to patients and give medical certificates and generally to carry on at the said place a medical practice as if he (Cowan) were a duly qualified and registered practitioner.

The complainants were, in the matter of the covering of George Wyse, the Medical Defence Union, Limited; and, in the matter of the covering of Cowan, the Wigan Medical Guild.

At the conclusion of their deliberations the Council determined: "(1) That the charge made against Mr. George Hamilton Wyse, in respect of the practice at Preston, had been proved to the satisfaction of the Council; (2) that the charge made against Mr. George Hamilton Wyse, in respect of the practice at Wigan, had been proved to the satisfaction of the Council; and (3) that the further consideration of the charges proved against Mr. George Hamilton Wyse be adjourned until the next session."

The following letter had been received from Mr. Wyse:—

51, Talbot-street, Southport, April 7th, 1898.

DEAR SIR,—I beg to inform you that on the 30th of March I disposed of my practice which I had carried on at 95, Wallgate, Wigan, so that now I have no practice there and have not in my employment any assistant whatever.

I will be glad if necessary to submit proofs that this is the case.

I remain, dear Sir, yours faithfully,
GEO. H. WYSE.

H. E. Allen, Esq.,
Registrar of the General Medical Council.

In this case further complaint is made by the Wigan Medical Guild that Mr. Wyse still employs his unqualified assistant. That he had acted contemptuously towards the General Medical Council in not at once complying with their instructions. It was common knowledge to the members of the Guild that the conduct of Mr. Wyse had not materially improved since he was admonished by the General Medical Council and that the unqualified man Cowan still continued to prescribe for and visit patients as formerly. That owing to the fact that Mr. Wyse still resided at Southport, about sixteen miles from his dispensary at Wigan, he had not or could not exercise that control and supervision over his practice which was required by the General Medical Council.

Mr. Wyse appeared before the Council with Mr. Acland, barrister, as his legal representative.

The PRESIDENT pointed out that the case was not now quite on the footing on which it was left last November, because certain additional documents had been received—certain statutory declarations.

Mr. ACLAND said that copies of these documents had been sent to Mr. Wyse. The answers of Mr. Wyse were sent in the first instance to the Medical Defence Union and afterwards to the Wigan Medical Guild, but the Wigan Medical Guild had made no reply and were not represented on the present occasion.

Mr. FARRER and Mr. MUIR MACKENZIE then read the documents to the Council.

In his declaration Mr. WYSE said that on the same day as he appeared before the General Medical Council—namely, Nov. 25th, 1897—he determined to give up his practice at 95, Wallgate, Wigan, and instructed an agent to sell it. No sale, however, was effected until March 30th, when the practice was transferred to a gentleman named Mr. Hamilton. He also informed Mr. Cowan that he could not retain him and notified to him that his engagement must terminate on March 31st. When he did so he warned him that during the currency of the notice he must simply act as a dispenser and must conform to the requirements of the General Medical Council. At the present moment he had no surgery save that at Southport, where he resided, and since March 31st he had devoted the whole of his attention to the work there.

Mr. WYSE entered the witness box and in reply to questions by members said that his son who was mentioned in the complaint had not been associated with him since February of last year. He admitted that Cowan had given a certificate on one occasion, but it was contrary to his instructions and Cowan had been severely reprimanded for what he had done. He had printed forms for certificates, but whenever he gave a certificate he initialled it and Cowan had instructions from him not to use the forms.

Mr. ACLAND submitted that the person who got the certificate from Cowan had been sent for that purpose and no other, and that something more than this was required to justify the Council in taking action against Mr. Wyse.

The Council sat *in camerâ* for a considerable time.

The PRESIDENT thereafter announced that they had judged Mr. Wyse guilty of infamous conduct in a professional respect and had directed the Registrar to erase his name from the Medical Register.

The Case of J. Hamilton Hart.

The Council next proceeded with the consideration of the case of Joshua Hamilton Hart, of Cliff Cottage, Morley, near Leeds, registered in Scotland, December 31st, 1891, as Lic. R. Coll. Phys. Edin. 1891, Lic. R. Coll. Surg. Edin. 1891, Lic. Fac. Phys. Surg. Glasg. 1891, who had been summoned to appear before the Council to answer the following charge on the complaint of Hugh Woods, of 11, Archway-road, Highgate, registered as M.B., M.D., Bac. Surg. 1886, M.A.O. 1887, Univ. Dubl., President of the Incorporated Medical Practitioners' Association:—

That he as a registered medical practitioner had been guilty of infamous conduct in a professional respect in connexion with certain quack remedies which were styled and extensively advertised as "Munyon's Homœopathic Home Remedies." The particulars of the complaint against him were:—

1. That he associated himself with and was a party to the sale and dissemination and advertisement of these quack remedies.

2. That he acted as consulting physician at the place where such quack remedies were administered and sold and permitted his name and qualifications to be advertised as those of the consulting physician at such place.

On the foregoing being read by the REGISTRAR,

Mr. BROWN intimated that as he was a member of the society whose President made the complaint he would take no part whatever in the proceedings.

The PRESIDENT: Very well; I think that should be minuted.

Dr. MACALISTER: The Incorporated Association is not the body prosecuting in this case.

Mr. BROWN: I believe that is so. At the same time I am a member of the body and I shall take no part in the case.

The PRESIDENT: I think that is very proper.

Dr. Hugh Woods, the president of the association, and Mr. Richard Robert More Madden, its secretary, attended in support of the charge. Mr. Hart appeared in answer to his summons, together with his counsel, Mr. W. H. Clay, and his solicitor, Mr. P. E. Vanderpump.

Mr. CLAY wished at the outset to say that he did not think there was any dispute in regard to the facts. But owing to the late period at which Mr. Hart had received the Council's summons, and his solicitor being resident in Bristol, he had been unable to send to the Council an answer to the charge. That he (Mr. Clay) now held in his hand and if the Council wished it he was now prepared to put it in.

The PRESIDENT: I think that will come later.

Dr. WOODS was then asked to proceed. He mentioned that as lately a large number of commercial bodies had been advertising medical remedies the association of which he was President set themselves to inquire to what extent they were *bonâ-fide*. The association had their attention called to Munyon's Homœopathic Home Remedies, the advertisement of which professed to supply a cure for each separate disease, and they resolved to make an official call at the Munyon business premises at 121 and 123, Shaftesbury-avenue, London, with the view of ascertaining what the so-called remedies were. The secretary of the association, accompanied by another person, went to the Munyon offices. There they met the manager of the company and they put to him several questions. They asked him what the nature of the remedies was. The manager could not tell them. The remedies were sent from America from Professor Munyon or the head-quarters in America. The manager, however, mentioned that *Science Siftings* had declared the remedies consisted simply of sugar. He was unable himself to say whether this was or was not the case, but he thought the representatives of the association ought to see the "doctor" who was a qualified man. They were introduced, but the gentleman—it was not Mr. Hamilton Hart—did not appear very much pleased at being interviewed and only on being pressed did he answer the questions put to him as to the nature of the remedies, though the utmost information that could be obtained from him was that they contained vegetable extracts. He appeared to consider it great impertinence that he should be questioned at all and finally he flatly refused to give his name. As a result of the interview it was concluded by the association that there must be something amiss. Having failed to elicit the name of the "doctor" the association, in order to find out whether it was the case that there really was a whole staff of medical men employed at Munyon's adopted other methods of inquiry. They had been told that one or more registered practitioners were connected with the institute and they took steps to get letters addressed to them by seeming patients. The result was that there came into the hands of the association a letter signed by Mr. Joshua Hamilton Hart. That letter was dated Jan. 22nd last, and was written under the decorative heading of Munyon's establishment. It was addressed to a "Rev. and Dear Sir" and set forth that the writer was consulting physician "here" and would be glad to arrange a personal interview on hearing from the correspondent again. The writer of the letter stated that his residence was some miles away from town, but that he should be prepared to meet his correspondent at any hotel he might name. That letter appeared to afford proof that at least one of the "doctors" associated with Munyon's remedies was Mr. Joshua Hamilton Hart. He (Dr. Woods) thought it was unnecessary to prove that the remedies in question were quack remedies. They were advertised in newspapers all over the kingdom and the fact that they professed to be sufficient to cure each separate disease was sufficient for their condemnation by practical men like the members of the General Medical Council.

Mr. MORE MADDEN then gave evidence which confirmed the statement of the case. Witness added that he had been unable to ascertain of what science Professor Munyon was professor. The manager of the institute had said there was a medical man in attendance. He did not say that that man was a registered medical man, but the "doctor" to whom he was presented said he was a medical man registered in this country.

The PRESIDENT: He was not Mr. Hart.

Dr. WOODS said he wished to show that there was a policy of concealment. The "doctor" seen admitted that he was a registered medical practitioner, but declined to give his name, and he thought that went to show that the establishment was a quack affair which could not be recognised by the General Medical Council.

The PRESIDENT: Confine your questions as to what the remedies are.

Witness, in answer to further queries, said he was informed that the remedies were composed of vegetable extracts. As to the cures they had effected he was referred to the testimonials. The Munyon representatives who were seen knew that he and the person with him represented the Incorporated Medical Practitioners' Association.

Asked by Dr. MACALISTER if the so-called manager of Munyon's stated that he had medical men on the premises, witness answered in the affirmative and said that the gentleman to whom they were introduced as the "doctor" stated twice that he was registered in this country, though he refused to give his name or state what his qualifications were.

The PRESIDENT (to Dr. Woods): Have you advanced all the proofs you wish to submit to the Council?

Dr. WOODS: The chief proof is the letter.

Mr. CLAY: I do not deny that the letter was written by Mr. Hart.

The case for the charge was then closed.

Mr. CLAY, in stating the case for his client, said he was not prepared to discuss what were quack remedies. Those in question were homœopathic remedies and as such were outside the cognisance of the Council by statutory provision. What Professor Munyon's qualifications were he did not know, but the Professor — he would use the American appellation—had been certainly fortunate in hitting upon remedies which, according to his view, had conferred benefits on his fellow creatures, and after being successful in America he appeared to have come over here and established a business. And having done so he was extremely desirous that the persons who applied to him should have the best assistance he could procure. Counsel believed it was the fact that the Professor had obtained the assistance of several persons who were qualified as medical practitioners and he should think that in all probability the gentleman who represented himself as a medical man to the witness who had just given evidence was one of those gentlemen. It was only in October last that Mr. Hart was brought into connexion with the Munyon Company. In that month he saw Professor Munyon himself and entered into an engagement with him, which still subsisted, under which he was to attend daily at the offices in Shaftesbury-avenue and examine the very large correspondence which came in from applicants for the cures. The public might be exceedingly misguided in wanting the cures, but it did seem as if there were a large number of people who were anxious to try any strange or unusual remedy offered to them, and they apparently derived satisfaction from using it. Mr. Hart was employed to see what these applicants said. A large number of persons wrote describing their symptoms and asking for remedies and he (counsel) as a layman should say that it was a very reasonable action on the part of Professor Munyon to try to get a competent person to examine these letters. Mr. Hart's duty was to examine these letters and report. He made an endorsement on each letter as to the kind of cure which it was desirable to send. He did not know if Mr. Hart went on the principle that he should recommend what did the least mischief or that which should do the most good. Mr. Hart had to examine the letters and suggest what answers should be sent and according to his endorsement on the letters the cures were sent. But Mr. Hart had nothing to do with that. Where remedies were not sent and replies to correspondents were sent the latter were

typewritten and signed on behalf of the company. Mr. Hart's name did not appear, and so far as Mr. Hart knew nobody knew that any practitioner was engaged in doing the work which Mr. Hart was doing. Mr. Hart was in no way or degree responsible for the advertisements. As to the specific charge, that of being consulting physician to the Munyon Institute, the term used in the letter produced was an unfortunate term. It would have been better if Mr. Hart had abstained from using it. The letter was written really in his private capacity and was meant to explain how that to which it was an answer had come into his hands. He had no intention of suggesting that the Munyon remedies should be associated with the name of a registered medical practitioner. So far as the particular instance in question went Mr. Hart wished through him to express regret and to give the undertaking that he would not make public his connexion with the Munyon Company.

Mr. HART then submitted himself to examination. In answer to Mr. CLAY he said he was brought into communication with Professor Munyon by advertisement and met the Professor at the Hotel Cecil, where he entered into the engagement with him. He attended at the Munyon Institute daily. His duties consisted of reading the letters that arrived and writing on them what from the symptoms described he assumed to be the organ affected. If the description was insufficient he wrote on the letters words to the effect and advised that a question paper should be forwarded to the writers. His name never appeared in the correspondence. He was paid a weekly salary for the work he did. He had nothing whatever to do in connexion with the advertisements. He could not say that he had ever read one of them and he did not know whether they were drawn up at Shaftesbury-avenue or in America. So far as he knew his name had never been connected with Munyon's remedies except in two cases, one the letter produced, and the other where, writing in his private capacity, he offered to receive a patient into his private residence. The letter, to which that of Jan. 22nd was a reply, professed to come from a curate at Bristol suffering from a disease of a private nature and seeking a night interview after a church meeting he was to attend because he could not get away for a consultation during the daylight. Witness had replied out of sympathy with the writer. He was perfectly willing to undertake that he would not write in the same way again. As in the case of the advertisements he had nothing whatever to do with the remedies.

In cross-examination Mr. HART admitted that he was consulting physician to the institute in so far as that was to be inferred from the duties he discharged. He had practised at Cliff Cottage, Morley, but it was through Munyon's that he received the Council's summons. Asked if he had the degrees Bachelor of Medicine and Master of Arts, as he used the abbreviations for those degrees at the end of the letter produced, he said that the "M.B., M.A." following his signature in the letter stood for "Member of the British Medical Association." Questioned as to whether he was a member of that association he replied that he had been but his subscription had not been paid for this year or last. Asked if it was the fact that there were medical men other than himself associated with the institute he said he did not know.

How do you know that Professor Munyon is not yourself?—Because I profess to be Joshua Hamilton Hart.

In answering a question by the PRESIDENT Mr. HART said he went to Edinburgh in 1878 and he claimed to be an old schoolfellow of Sir William Turner.

The PRESIDENT: I do not recollect you.

Replying to further questions by members of the Council Mr. HART stated that he did not prescribe except where a special prescription, apart from Munyon's remedies, was asked for. He knew nothing about the nature of the remedies. If people were examined in Munyon's Institute that did not take place in his department. He did not know if there was any other qualified man on the premises. The remedies were issued in accordance with what he wrote on the letters. He supposed it was the secretary who despatched them. So far as Mr. Hart knew the secretary was not a qualified man.

Do you regard yourself then as helping an unqualified man in prescribing or advising people as to what remedies they should take for certain diseases?—I never looked at it in that light at all.

You say you are consulting physician?—It was a very stupid expression that.

You take patients into your house?—Yes, medical and surgical.

Questioned as to whether he had any address Mr. Hart explained that letters would reach him if sent to Cliff Cottage. At present he was staying in an hotel. Till Saturday last he had a house at Hampton Wick and was going into one on Saturday, the 28th, in the Regent's Park district.

The Council then deliberated in private for from ten to fifteen minutes and it was resolved:—

(*a*) That the Council do proceed at once to pronounce its judgment on the case. (*b*) That the charge made against Mr. Joshua Hamilton Hart has been proved to the satisfaction of the Council. (*c*) That the Council do now judge Mr. Joshua Hamilton Hart to have been guilty of infamous conduct in a professional respect and do direct the Registrar to erase from the Medical Register the name of Mr. Joshua Hamilton Hart.

Strangers and Mr. Hart having been readmitted the PRESIDENT announced the decision of the Council.

The Council adjourned.

FRIDAY, MAY 27TH.

The Council resumed to-day, Sir WILLIAM TURNER presiding.

The Council and Mr. Gladstone's Funeral.

The PRESIDENT intimated that he had received a letter from the office of the Earl Marshal saying that the limits of space made it impossible to offer admission to the Council to Westminster Abbey on the occasion of the funeral of Mr. Gladstone. Therefore there were no tickets either for the President or any of the members of the Council.

Dr. MCVAIL moved:—

That it be remitted to the Executive Committee to take the steps that may be necessary to secure that the General Medical Council shall receive due recognition and representation in national functions and ceremonies.

There could be little doubt, he said, that this unfortunate refusal to recognise the Council was due simply to the circumstance that the Council had never taken any steps to hold its proper position in national ceremonies in the past and he was quite sure that the matter only required to be brought to the notice of the Government or the departments of the Government which had to do with State ceremony to be put right. It certainly must look to the profession and the public an extremely singular circumstance that the President of this Council, the only person who could be recognised as the official head of the whole profession of the United Kingdom, did not receive, whatever might be the case of the other members of the Council, an invitation without any application whatever, as a matter of right to be present at the great national ceremonial such as this ordered by Her Majesty the Queen.

Dr. HERON WATSON asked whether on the occasion of either of the Jubilee celebrations any recognition of the Council took place.

The PRESIDENT said he believed there was no recognition.

Dr. PHILIPSON seconded Dr. McVail's motion.

Mr. CARTER said he thought the Executive Committee might perfectly well accept the responsibility which this motion proposed to put upon them and suggested that the course for them to pursue would be to make application through the College of Arms and the Earl Marshal that the Council might have proper recognition and a definite precedence.

The motion was then agreed to.

The Bust of the late Sir Richard Quain.

The PRESIDENT said that the bust of Sir Richard Quain, presented by his daughters, was now in the council chamber. He gathered from what he had heard in more than one quarter that the bust was really modelled in order that it might be presented to the Council, that the late President had it in his mind when he sat for the bust that it should have its home with them, and he knew that the daughters of Sir Richard Quain were greatly pleased that it should find its home with the Council. There was no special legacy, but these ladies gave the bust to the Council because it was their father's intention that it should come to them. He proposed:—

That the hearty thanks of the General Medical Council be given to the daughters of Sir Richard Quain, baronet, for their valuable and most acceptable gift of a bust in marble of their father, the late esteemed and respected President.

It would be left to the treasurers, Sir Dyce Duckworth and Mr. Bryant, to arrange where the bust should be placed.

Medical Aid Associations.

Dr. GLOVER presented the following interim report from the Committee on Medical Aid Associations, viz. :—

The Committee have had under their consideration at various meetings memorials to the General Medical Council on the subject of medical aid associations or medical institutes, especially those from Norwich, Yarmouth, and Beckenham. They have endeavoured, by correspondence and conference with the memorialists and with officers of the "institutes," to ascertain the causes of friction and complaint in connexion with these bodies with a view to their removal and they are not without hope of some success. They acknowledge with pleasure the readiness of all parties to help in the elucidation of the subject. They are still engaged in such endeavours and are as yet unable to present more than an *ad interim* report. Their investigations so far confirm the conclusions of the committee of 1893 as to the evils incident to the present system of working such institutions which, when composed of *bonâ fide* members of friendly societies and managed on sound principles, are entitled to, and have always received, the friendly consideration of the medical profession.

Pending their final report the committee would venture to suggest to all concerned—managers, their medical officers, and members of the medical profession generally—a suspension of judgment on questions in dispute and the use of local efforts to adjust differences in a spirit of conciliation.

He asked the Council to receive the report and enter it on the minutes. He might tell the Council that the committee had had a second interview with the committee representing the friendly societies. They met in that chamber and there was a disposition upon both sides very seriously to try to find out some way of meeting the objections of the profession and removing the causes of complaint. The representatives of the friendly societies told them that they would not have an opportunity for a few months of bringing the facts of the case before the bodies, so that necessarily the settlement of the question must stand over for the present. He would, however, ask the Council to be assured that there was a disposition on their part as well as on the part of the committee to set at rest all matters of difficulty and to come to a harmonious settlement with this Council as representing the profession. The questions submitted to the committee were essentially ethical questions and to these questions they had not decided upon a formal answer; they wished to see first whether the thing of which complaint was made could not be mended.

Mr. TEALE seconded the motion.

Mr. BROWN called the attention of Dr. Glover and the committee to a report of the proceedings at the annual meeting of the Coventry Provident Dispensary, where the question of a wage limit was discussed, and appealed to these gentlemen not to allow dust to be thrown in their eyes by any mere verbal alteration of rules.

Dr. BRUCE repudiated the idea of any of the managers of the friendly societies attempting to throw dust in their eyes; they had met them in an open, frank, and gentlemanly manner and were entirely disposed to discuss the question in the most liberal light.

Sir RICHARD THORNE expressed doubt about the last sentence in the report, saying that he thought it required revision.

Mr. HORSLEY said this sentence seemed like a piece of parental advice to many of the practitioners in the country and he was afraid it might be misunderstood. His view was that it was not really required.

Dr. GLOVER said he did not think the sentence could do any harm. Some of the memorialists from Norwich and Yarmouth were disposed to think that they could by local effort settle these matters, and there was surely no reason why they should not try. As to parental advice, he thought there were occasions when this Council might indulge in it. The point really at issue raised by these memorials was the refusal of all professional intercourse with the members of these societies. Was the Council, was Mr. Horsley, prepared to give the sanction of the Council to that blank refusal at this stage of the proceedings?

Mr. HORSLEY replied that he had not the means of deciding that question in the absence of the report of the committee on the subject.

Dr. GLOVER said he had all the means possessed by the committee. Was he prepared at this stage of the negotiations—altogether friendly at present—to recommend that this Council should advise the men of Norwich and Yarmouth to refuse to meet in consultation in any urgent circumstances, in any case, the members of these societies?

Mr. HORSLEY said he was a member of the Council and had certain responsibilities as such. Before he became a member of the Council he held very strong views upon this subject and he did so still. But now that he was here and a committee had been appointed to consider the question he was suspending his final judgment until he saw the report of the committee. Until he received the report he was not prepared to answer any such question as that now addressed to him.

Dr. GLOVER, accepting this view of the situation, said that all the committee asked was that the members of the profession should also suspend judgment.

Dr. MCVAIL took exception to the construction of the last sentence.

The PRESIDENT said that he thought that all those who attended the conference would appreciate the reference to the use of local efforts to adjust differences. He did not think he ever attended a meeting where there were two opposite parties brought into personal contact with each other with a view to the exchange of opinions which produced so strong an impression upon him as this meeting with the five gentlemen representing some of the greatest friendly societies in the country. These gentlemen interchanged their views with the committee with the greatest freedom and he was satisfied; without any pressure they stated plainly what they thought friendly societies could do and what they thought they could not do. He appealed to members of the committee who were present whether they did not show a strong desire that the questions in dispute should be amicably settled and a strong conviction that they could be so settled. He would suggest that a good thing to do might be to leave out the words "a suspension of judgment on questions in dispute and."

This suggestion was at once accepted by Dr. Glover and the words having been deleted the report was received and entered in the minutes.

Dental Education and Examination.

Mr. BRYANT presented the following final report by the Dental Education and Examination Committee :—

In November last, when the third report of the committee "was brought before the Council, it was remitted to the committee to draw up their recommendations in the form of a series of propositions, each dealing with a single subject, in order that the Council might be enabled in May to come to a definite decision on the questions before them."

This has consequently now been done and it is to be hoped that this report in its present shape will be found to be both intelligible and satisfactory to this Council.

The committee have also to report that the dental curriculum, as now brought before you, has received the support of all the dental schools (except Manchester and Dublin, which have not yet spoken), as witnessed by the petitions which are appended to this report, and in which the petitioners express an opinion that it is undesirable to reduce the present scope of the curriculum and examination in general subjects, which they regard as a minimum necessary for the satisfactory qualification of a dental surgeon.

RECOMMENDATIONS OF THE DENTAL EDUCATION AND EXAMINATION COMMITTEE.

The Dental Education and Examination Committee, in accordance with the Council's Resolution of November 30th, 1897 (Minutes, vol. xxxiv., p. 158), beg leave to present their Recommendations to the Council in the following revised form. If these are adopted by the Council they may be at once issued for the guidance of the Licensing Bodies and of Candidates for Licences in Dentistry or Dental Surgery.

RECOMMENDATIONS AS TO THE COURSE OF STUDY AND EXAMINATIONS TO BE REQUIRED OF CANDIDATES FOR LICENCES IN DENTISTRY OR DENTAL SURGERY.

A. Preliminary Examination and Registration.

1. That every dental student shall, at the commencement of his studentship, be registered in the manner and under the conditions prescribed for medical students.

2. That no person shall be registered as a dental student who has not previously passed one of the preliminary examinations in general education recognised by the Council, unless before July 22nd, 1878, he commenced professional study by apprenticeship to a dentist entitled to be registered or by attendance on professional lectures.

B. Professional Study.

3. That every candidate for a licence in dentistry or dental surgery shall be required to produce certificates showing:

(1) That he is at least twenty-one years of age.

(2) That he has been registered as a dental student.

(3) That he has subsequently to the date of registration been engaged in professional study for at least four years.[1]

(4) That he has attended courses of instruction in the following *general subjects* at a recognised medical school: (*a*) [2] Chemistry and physics (with practical laboratory work) for six months; (*b*) Human anatomy for six months; (*c*) dissections (with demonstrations) for twelve months; (*d*) physiology for six months (with practical laboratory work or a separate course of practical physiology); (*e*) principles of surgery (including the elements of surgical pathology) for six

[1] Not more than one year of *bonâ fide* apprenticeship to a registered dentist, if served subsequently to the date of registration, may be reckoned as a portion of the four years of professional study required.

[2] This instruction may be obtained at the science school recognised by the licensing body.

months; (*f*) principles of medicine (including the elements of general pathology) for six months; (*g*) clinical surgery and clinical medicine (at a recognised general hospital) for twelve months.

(5) That he has attended courses of instruction in the following *special subjects* at a recognised dental school: (*a*) dental anatomy and physiology, human and comparative (with practical work and demonstrations in dental histology), for [three] months; (*b*) dental surgery and pathology for [three] months, including materia medica and therapeutics applicable to dental surgery; (*c*) dental metallurgy (with practical work and demonstrations) for [three] months; (*d*) dental mechanics) with practical work and demonstrations) for [three] months.

(6) That he has for two years attended the practice of a recognised dental hospital or of the recognised dental department of a general hospital.

(7) That he has, before or after registration as a dental student, received for three years[3] practical instruction in mechanical dentistry from a registered dentist or in the mechanical department of a recognised dental school and hospital.

C. Professional Examinations.

4. That the examinations for a licence in dentistry or dental surgery shall be partly written, partly oral, and partly practical, and shall include the following subjects: (*a*) chemistry and physics; (*b*) practical examination in dental mechanics and metallurgy; (*c*) dental surgery, pathology, and therapeutics; (*d*) practical examination in dental surgery; (*e*) general anatomy and physiology;[4] and (*f*) general surgery.[4]

5. That the prescribed subjects of examination may be combined or distributed at the discretion of the licensing bodies and may be taken at two or more successive examinations during the course of professional study, provided that no candidate shall be admitted to any final examination in dental surgery and mechanical dentistry until he shall have completed the required four years' course.

Communications from Dental Schools as to the Extent of the Curriculum

22A, Cavendish-square, W., Feb. 1st, 1898.

DEAR MR. ALLEN,—I have the pleasure to send with this note petitions upon the subject of the "general side" of the Dental Curriculum from a very large number of the dental hospitals (with schools) in Great Britain.

I hope that such an expression of opinion may help both the Dental Education and Examination Committee and also the General Medical Council in arriving at a conclusion upon the subject of dental education.

The Victoria Dental Hospital of Manchester will send their petition direct to you.

I also send with this a letter from the Dean of the Newcastle School saying that the staff of that hospital prefer not to sign such a petition.

It is only fair that the Council should know that the Newcastle Dental School have been in existence as a recognised dental school for a short period of time only.

When Manchester has returned its petition all the English Schools will have expressed their opinion. Edinburgh and Dublin have not yet answered my letter sending them the petition to sign; if they are sent to me I will forward them to you at once.

Yours truly,
MORTON SMALE.

(1) *From the Dental Hospital of London.*

To the GENERAL MEDICAL COUNCIL.—We, the undersigned, being, as Deans and Teachers of Dental Schools, fully conversant with the requirements of the Dental Student, in order that he may obtain a range of knowledge sufficient to enable him intelligently to practise his profession, are strongly of opinion that it is undesirable to reduce the present scope of curriculum and examination in general subjects, which we regard as a minimum necessary for the satisfactory qualification of a dental surgeon.

STORER BENNETT,
Chairman of Medical Committee, Dental Hospital of London;
MORTON SMALE,
Dean Dent. Hosp. of London.

Signed also by 26 other members of the staff of the hospital.

Petitions in identical terms were also forwarded from the following dental hospitals:—

(2) From the National Dental Hospital of London.
Signed by 19 members of the staff.
(3) From the Dental School, Guy's Hospital.
Signed by 18 members of the staff.
(4) From the Dental Hospital of Liverpool.
Signed by 12 members of the staff.
(5) From the Dental Hospital of Birmingham.
Signed by 14 members of the staff.
(6) From the Dental School of Edinburgh.
Signed by 7 members of the staff.
(7) From the Dental Hospital of Glasgow.
Signed by 15 members of the staff.

The following is the communication referred to by Mr. Smale as forwarded to him by the staff of the Newcastle Dental School:—

9, Eldon-square, Newcastle-on-Tyne, Jan. 14th, 1898.

DEAR MR. SMALE,—At a meeting of the teaching staff of the Newcastle-on-Tyne Dental Hospital and School held last evening, at which your letter of the 5th with enclosed petition was read, the following resolution was passed: "That having read the petition sent by Mr. Morton Smale, and having discussed the report of the General Medical Council meeting, we are of opinion that the question of the dental curriculum should be left to the Dental Education and Examination Committee as suggested by Dr. MacAlister in his amendment." I am, yours truly,

R. W. MARKHAM,
Dean of the Newcastle-on-Tyne Dental Hospital and School.

[3] No portion of this instruction which is anterior to the date of registration shall be reckoned as a portion of the four years of professional study required.

[4] It is recommended that a synopsis of the scope of the examination in these subjects be issued by the licensing bodies.

Mr. BRYANT reminded the Council that this subject was started on May 26th, 1894, when the Council decided upon the appointment of an inspector who should visit and report upon the examinations of the four bodies granting qualifications in dentistry and when Mr. Tomes was appointed inspector. He should like to take this opportunity of congratulating Mr. Tomes on his appearance among them as a member. It was the first time the Council had included a representative of dental surgery and he thought they would all agree that it was high time such a representative existed and he personally felt grateful that Mr. Tomes was here now, because he would be able to assist the committee very much.

The Council decided to go into committee for the consideration of the recommendations in the report.

Sir RICHARD THORNE said he would like to know what the committee meant by a "dental surgeon." He had always understood that a dental surgeon was a surgeon who was a dentist, but he could not find the term in any Act of Parliament.

Dr. MACALISTER said that a dental surgeon was a person entitle to practise dental surgery under the Dentists Act.

Mr. HORSLEY suggested they should adhere closely to the Act and substitute for "dental surgeon" the word "dentist."

The PRESIDENT pointed out that the Act spoke of a Licentiate in dental surgery or dentistry.

After some further discussion it was agreed that the term used throughout the report should be "dental practitioner."

The first recommendation was adopted without debate.

The second was also adopted, but it was agreed to add a footnote explaining that the examinations in question were those recognised by the Council for admission to the Students' Register.

Coming to the third recommendation the Council approved Sections 1, 2, and 3. To the fourth section they added the words, "for at least the period specified."

The Council then proceeded to deal with Subsection A.

Dr. MCVAIL said that this proposal would occasion difficulty in Scotland because there chemistry and physics were taught in separate classes. In fact, he felt certain that the proposal would be unworkable in Scotland.

Mr. HORSLEY suggested that though the subjects might be taught in separate classes the student might take both classes during the same session.

Dr. REID said that would not be possible in the case of Aberdeen.

Dr. PETTIGREW insisted that the proposed arrangement would handicap very much the Scottish student.

Dr. MACALISTER pointed out that in this matter the Council were only recommending what was to be regarded as the minimum amount of study.

Mr. TICHBORNE, seconded by Dr. PETTIGREW, moved that the sub-section read thus:

Chemistry, theoretical and practical course, six months; physics, three months.

This amendment was lost.

Sir CHRISTOPHER NIXON, seconded by Sir WILLIAM THOMSON, moved that it read:—

Physics, a three months' course; chemistry, a six months' course of theoretical chemistry and a three months' course of practical chemistry.

This amendment was also lost and thereafter the original motion was put and carried.

The further consideration of the recommendations was postponed.

Prosecutions.

The Council sat for the rest of the day *in camerâ*, the business under consideration being a report by the solicitor in regard to the prosecutions directed by the Council last November.

SATURDAY, MAY 28TH.

The Council met again to-day, Sir WILLIAM TURNER presiding.

Sir JOHN BATTY TUKE made his appearance at this sitting, much to the pleasure of his fellow members, nearly all of whom tendered him their congratulations.

The Charge against Mr. H. K. Hunter.

The first item on the programme of business was the following notice of motion in the name of Mr. BROWN:—

(*a*) That a copy of the information laid against Mr. H. K. Hunter, the report of the legal advisers of the Council thereon, and copies of all correspondence with Mr. Hunter relating to the charges made against him be presented to the Council and entered on the minutes.

(b) That all legal expenses connected with any proceedings that may be necessary to obtain the opinion of the superior courts as to the legality of Mr. Hunter's conviction at the Caxton petty sessions in April last for describing himself as a physician and surgeon be defrayed by the Council.

(c) That the Council vote Mr. Hunter a sum sufficient to defray any law costs he may have incurred in defending himself in the proceedings taken against him by the Council.

Mr. BROWN said that in deference to the opinion expressed by Mr. Muir Mackenzie while the Council was sitting *in camerâ* he would ask leave to withdraw these motions at the present time.

Leave being given, the motions were accordingly withdrawn.

Proceedings in camerâ.

For nearly three hours the Council sat *in camerâ* and when the public were readmitted,

The PRESIDENT announced that petitions for admission to the Dentists' Register had been received from A. P. Merrill, T. E. Bush, E. L. Oldfield and W. E. Royce, and the Council had decided not to accede to the petitions; that with regard to a charge made against Isaac Cohen it had been decided that no further proceedings be taken in the case; and that Mr. H. E. Allen had been reappointed General Registrar.

The Council then adjourned until Monday.

MONDAY, MAY 30TH.

The Council met again to-day with Sir WILLIAM TURNER in the chair.

Saturday's Proceedings.

The minutes contained the following references to the proceedings *in camerâ* on Saturday, viz.:—

(a) Certain of the recommendations of the Penal Cases Committee as to prosecutions were adopted; (b) a prosecution which was suggested by a member was agreed to; (c) attention was called by a member to the practice of unqualified persons obtaining registration under the Companies Act, and trading as apothecaries, physicians, and surgeons; and (d) a communication was read from the Apothecaries' Society of London in regard to its powers of restoring names to its list of Licentiates.

The minutes also stated that the following communication had been received from the solicitor of the Apothecaries' Society of London, viz.:—

Society of Apothecaries, London, E.C., May 25th, 1898.

Sir,—The names of the two Licentiates erased by the Society and restored to their list after the Medical Council had restored them to the Register are David Hyman Dyte and Neville Holland: the first restored in June, 1893, and the second in December, 1896. This will enable the Registrar approximately to find the dates when they were restored to the Register.

As permitted by you, I place my views in writing on the subject of erasure by the Society:—

1. The Society cannot cancel or get back a diploma because it has no statutory power to do so.

By its Amendment Act, 1874, it can only erase a name in the case of "infamous conduct in a professional respect" *after* the Medical Council has erased the name from the Medical Register. If a Licentiate has been convicted of a crime the Society can act on its own motion.

2. When a name has been erased because the Medical Council has first struck it off the Medical Register it may be assumed that (a) the Society would not restore it unless under the special direction or advice of the Medical Council, and (b) that it would expect the Council to tell the Society what conditions must be imposed in the matter of examination before the name was restored.

3. Referring to what Mr. Muir Mackenzie says in his opinion as to the statutory right of the Council to restore a name, this would equally apply to the Society. He, however, adds that "the erasure from the list of Licentiates of the Apothecaries' Society involves 'the loss of the qualification entitling' the person to be registered."

If this be so, does not a serious question arise whether the Society, without requiring the person to pass a qualifying examination, can restore a name once erased from its list?

I venture to repeat that in my opinion fresh legislation is required.

Your most obedient servant,
JAMES R. UPTON.

Sir William Turner,
President of the General Medical Council.

Proposed Amendment of the Companies' Act.

Mr. TOMES asked if the Council would allow the resolution arrived at *in camerâ* in respect to a deputation to the Board of Trade to be entered on the minutes. As it stood now the resolution was confidential and therefore there was difficulty in acting upon it.

The Council agreed to the request.

The PRESIDENT intimated that the resolution was to this effect:—

Resolved that the President, Mr. Tomes, and Mr. Horsley be a committee to take such steps as they deem most effective to induce the Government to insert a clause in the Companies' Acts Amendment Bill now before Parliament with the object of procuring the registration of companies to carry on medical, surgical, and dental practice.

That resolution was arrived at on Saturday and it would now appear on the minutes. He might mention that he had written a letter to the Secretary of the Board of Trade intimating to him that a deputation had been appointed and asking that the President of the Board might receive the deputation.

Penal Cases.

Mr. CARTER, seconded by Sir JOHN BATTY TUKE, moved:—

That no case of complaint should be considered by the Penal Cases Committee until a statutory declaration as to the facts of the case has been supplied by the complainant.

Mr. CARTER said that it had been repeatedly the experience of the Penal Cases Committee that charges of a character which probably could not be sustained had been brought by medical practitioners against their neighbours and when inquiries were made the persons making the charges said they did not want their names to appear and were not prepared to give a statutory declaration to the committee. In this way the time of the committee had been taken up with the consideration of letters of a very unsatisfactory character behind which there was nothing to substantiate the charges made.

The motion was agreed to, with the addition of words providing that the Executive Committee give effect to the resolution in the standing orders with reference to penal cases.

Dental Curriculum and Examinations.

The Council then went into Committee to consider further the recommendations of the Dental Education and Examination Committee as to the course of study and examinations to be required of candidates for licences in dentistry or dental surgery.

Mr. BRYANT, the chairman of the committee, expressed the hope that the Council would proceed a little more rapidly than they did on Friday. In none of these recommendations was there any suggestion to interfere with the schemes of education which the four licensing bodies were enforcing. All they did was to lay down general principles for their guidance. He moved the adoption of sub-section *b* of Section 4 of the recommendations—namely, "human anatomy for six months."

Dr. BRUCE moved:—

That the words in Sections 4 and 5 of the report of the Dental Education and Examination Committee fixing particular periods for the courses of instruction specified after line 8, p. 7, Appendix I., be deleted, and that the subjects of professional study and examination be drawn up upon parallel lines to those for professional examination for medical students and become the requirements of the General Medical Council for candidates for licences in dentistry or dental surgery.

In his opinion, he said, it was quite unnecessary to name any particular time for the courses and it seemed to him that the Council would be following a much wiser course if they went upon the same lines as they did with the medical student.

Dr. LEECH seconded this amendment.

Dr. MCVAIL said he had intended to move to remit the report back to the committee that they might consider and report as to how far the medical and surgical examination of dental students should correspond to the education and examination required in the case of medical students. He thought the time had come to consider what was to be the real position of the dentist in the future. Was the dentist still to be a man of inferior medical and surgical training with a few specialisms? or was he to have knowledge such as the members of the medical profession had, with dental knowledge in addition? His own impression was that the time had now come when the dentist ought to be a surgeon, when he ought to have a knowledge of surgery as complete as the person going into the practice of the profession in the ordinary way. He thought the dental profession ought to be elevated and ought no longer to consist of men who had an imperfect education in medicine and surgery. Although they had a separate Register, dentists were, after all, members of their profession and he was glad to think that other members of this Council were beginning to take this position.

Dr. MACALISTER insisted that Dr. McVail's position was one of simple obstruction; he wished to smash the whole scheme.

Dr. MCVAIL objected to this description of his position. He had thought this matter out very carefully and he had seen the difficulties of the committee. They were endeavouring to reconcile two things which were irreconcilable. His hope was to see the dental profession put upon a proper footing and its members become worthy colleagues of their surgical brethren.

The PRESIDENT announced that the latter portion of Dr. Bruce's amendment had been altered to read, "and that the subjects of professional study and examination be specified as in the recommendations for the professional education of medical students and become the recommendations of the General Medical Council for candidates for licences in dentistry or dental surgery."

Sir RICHARD THORNE said he could not agree to this. What he contended was that they ought to draw an absolute line between the surgeon who practised dentistry and the licentiate in dentistry. As for these recommendations of the Dental Committee they were a direct inducement to the dentist to pretend that he had had a medical education. He would give an example of what he meant. A gentleman came over from a distant part of this empire—a gentleman with a good deal of information about diplomas—and he consulted a dentist in one of the west-end squares. One day when he went to him he was not feeling well and he incidentally explained his symptoms. The dentist whom he was addressing referred to the symptoms and added, "You know I am a doctor." The gentlemen said, "I was not aware of that." He replied, "What I mean is that I have had to go through a complete medical education." About these recommendations he would like to point out that they required of these candidates that they should go through a six months' course in the principles of medicine and that they should be occupied in a course of clinical medicine in a recognised general hospital for twelve months, and yet—one would hardly believe it—the committee did not deem it necessary that the candidates should be asked one single question in medicine. A greater anomaly he had never heard of in the course of his life. His idea would have been to eliminate these subjects and devote the time thus saved to purely dental work.

Mr. TOMES said that this was no new subject to the dental profession and it had been decided that a purely dental education would not meet the case. It had been equally recognised that a purely medical training did not make a good dentist. He sympathised with Dr. McVail in his desire to see the dentists of this country fully-qualified medical practitioners who had added to that a dental education. Some day he hoped that might be practicable, but he did not think it was practicable at the present moment. As to what Sir Richard Thorne had said, he could give him many instances of the great desirability of the dentist possessing medical knowledge. The dentist frequently was the person who had the earliest opportunity of recognising malignant and other diseases. As to the existing curriculum, practically speaking, under it some 1600 people had been educated and the net result had been exceedingly good. The dentists of to-day, as a whole, were on a different plane in respect of education and attainments from the dentists of former days, and he did not think the Council would be wise if they put aside the practical results of experience. He did not think that the evil Sir Richard Thorne had in his mind had happened. He did not think that the dental licentiate had poached, or had shown the smallest disposition to poach, upon medical practice. He did not think that he had shown the smallest disposition to pose as a fully-qualified medical man. He had never heard of an instance of the kind. It was not the person who had received an education which taught him the limits of his own knowledge who sought to pose as a fully-qualified medical man; it was the person who had not received that education. It was the educated man who would at once seek the advice of the medical practitioner and it was the uneducated man who would seek to keep the case in his own hands.

In reply to a question addressed to him by Mr. CARTER

Mr. TOMES said that every day in the practice of a dentist the knowledge of general pathology came in. Hardly a day would pass if the dentist was in a large practice without his seeing and having to form an opinion upon a case which was on the borderland where he hardly knew whether the trouble was local or constitutional.

Dr. MACALISTER, speaking to the subject immediately before the Council—namely, the amendment of Dr. Bruce—said that in recommendations as contrasted with requirements it was possible to go into considerable detail, and the detail was much more necessary in the case of the dental than of the medical student. As to the general question, he thought it was all to the advantage of dentists as a profession that they should have the range of their education extended.

After some further debate Dr. Bruce's amendment was negatived.

On the suggestion of Mr. BRYANT sub-sections *b* and *c* were made one sub-section and as such they were approved by the Council.

Sub-section *d* was approved without debate and with the initial words "principles of" deleted. Sub-section *e* was also approved.

On Sub-section *f*

Sir CHRISTOPHER NIXON said that there was nothing in Ireland to fit in with this recommendation.

The PRESIDENT said the chairman of the committee ought to tell the Council whether these courses were to be attended in a dental or a medical school.

Mr. BRYANT: In a medical school.

The PRESIDENT said if that were so then they must be adapted to the courses given in the medical school and it appeared that they were not so adapted.

Mr. BRYANT submitted that they were quite consistent with the present practice. The dental student was asked to attend the ordinary course given to the medical student, but the committee did not wish to emphasise that he was to get up the practice and the treatment of disease; they desired him to learn the principles as embodied in these lectures. If he could get up a little knowledge of practice so much the better for him, but they did not for a moment suggest a special course for his benefit.

Sir RICHARD THORNE moved as an amendment:—

That since the Dental Committee deem it unnecessary to require candidates for the licence in dentistry to undergo any examination whatever in medicine, the requirement that they shall attend a course of at least six months upon medicine and a course of clinical medicine in a general hospital extending over a period of at least twelve months be eliminated from the regulations.

Sir JOHN BATTY TUKE seconded the amendment.

On a vote being taken the amendment was negatived by 15 to 11 votes.

The sub-section with the words "principles of" deleted was then approved.

Mr. BRYANT moved sub-section *g* in this form: "Clinical surgery and medicine at a recognised general hospital for twelve months."

Dr. MCVAIL spoke of this as a sham and a burlesque of medical education and moved to leave out medicine altogether.

Sir CHRISTOPHER NIXON seconded the amendment.

This amendment was negatived, as was also another amendment, moved by Dr. MCVAIL, and thereafter the motion proposed by Mr. Bryant was agreed to.

The Council now reached Section V. and after passing the general statement in this form: "That he has attended courses of instruction in the following special subjects at a recognised dental hospital for at least the period specified," it passed sub-section *a* as proposed in the report.

Sub-section *b* was amended so as to read "dental pathology and surgery with materia medica and therapeutics applicable to dental surgery for three months." Sub-section *c* was passed as proposed in the report.

Sections VI. and VII. were also passed as proposed in the report.

Coming to the Professional Examinations the Council passed sub-sections *a* and *b*, but altered sub-section *c* so as to read "dental anatomy, physiology, pathology, surgery, with materia medica and therapeutics as applicable to dental surgery." Sub-section *d* was passed in its original form; sub-section *e* was made to read "human anatomy and physiology"; and sub-section *f* was made to read "principles of surgery and medicine in their application to dental surgery."

In the last recommendation an alteration was made to make it read "may be taken at two or more successive stages during the course of professional study."

The Council then resumed and Mr. BRYANT moved that the Council confirm the resolutions passed in committee.

This motion was after a short debate agreed to.

The recommendations as finally approved were in the following form, viz.:—

RECOMMENDATIONS AS TO THE COURSE OF STUDY AND EXAMINATIONS TO BE REQUIRED OF CANDIDATES FOR LICENCES IN DENTISTRY OR DENTAL SURGERY.

A. Preliminary Examination and Registration.

1. That every dental student shall at the commencement of his studentship be registered in the manner and under the conditions prescribed for medical students.

2. That no person shall be registered as a dental student who has not previously passed one of the preliminary examinations in general education recognised by the Council unless before July 22nd, 1878,

be commenced professional study by apprenticeship to a Dentist entitled to be registered or by attendance on professional lectures.

*** See Regulations of the General Medical Council in regard to the registration of medical and dental students.

B. Professional Study.

3. That every candidate for a Licence in Dentistry or Dental Surgery shall be required to produce certificates showing—(1) that he is at least twenty-one years of age; (2) that he has been registered as a dental student; (3) that he has subsequently to the date of the registration been engaged in professional study for at least four years[5]; (4) that he has attended courses of instruction in the following general subjects at a recognised medical school for at least the period specified: (*a*)[6] Chemistry and Physics (with practical laboratory work for six months); (*b*) human anatomy for six months and dissections (with demonstrations) for twelve months; (*c*) physiology for six months (with practical laboratory work or a separate course of practical physiology); (*d*) surgery (including the elements of general pathology) for six months; (*e*) medicine (including the elements of genera pathology) for six months; (*f*) clinical surgery and medicine (at a recognised general hospital) for twelve months. (5) That he has attended courses of instruction in the following *special subjects* at a recognised dental school for at least the period specified: (*a*) dental anatomy and physiology, human and comparative (with practical work and demonstrations in dental histology), for three months; (*b*) dental pathology and surgery with materia medica and therapeutics in their application to dental surgery for three months; (*c*) dental metullurgy (with practical work and demonstrations) for three months; (*d*) dental mechanics (with practical work and demonstrations) for three months; (6) that he has for two years attended the practice of a recognised dental hospital or of the recognised dental department of a general hospital; (7) that he has, before or after registration as a dental student, received for three years practical instruction in mechanical dentistry from a registered dentist or in the mechanical department of a recognised dental school and hospital.

*** No portion of this instruction which is anterior to the date of registration shall be reckoned as a portion of the four years of professional study required.

C. Professional Examinations.

4. That the Examinations for a Licence in Dentistry or Dental Surgery shall be partly written, partly oral, and partly practical, and shall include the following subjects: (*a*) chemistry and physics; (*b*) practical examination in dental mechanics and metallurgy; (*c*) dental anatomy, physiology, pathology, surgery, with materia medica and therapeutics in their application to dental surgery; (*d*) practical examination in dental surgery; (*e*) human anatomy and physiology[6]; (*f*) principles of surgery and medicine in their application to dental surgery.[7]

5. That the prescribed subjects of examination may be combined or distributed at the discretion of the licensing bodies and may be taken at two or more successive stages during the course of professional study, provided that no candidate shall be admitted to any final examination in dental surgery and mechanical dentistry until he shall have completed the required four years' course.

The PRESIDENT congratulated the Council on having got through this important and difficult work.

The Council then adjourned.

TUESDAY, MAY 31ST.

The Council resumed work to-day with Sir WILLIAM TURNER again in the chair.

The Dental Committee and the Two Scottish Licensing Bodies.

Mr. BRYANT made an explanation with regard to certain proceedings at the last session in connexion with the suggestion in the report of the Dental Committee that the Royal College of Surgeons of Edinburgh and the Faculty of Physicians and Surgeons of Glasgow should unite and form one Conjoint Board for Scotland.

Dr. HEBON WATSON and Dr. MCVAIL made statements on the same subject.

The PRESIDENT, in closing the incident, said it appeared to him plain that the two bodies in Scotland through their representative men had inquired into the question and had come to the conclusion that there was no power in the Dentists Act to enable them to make the combination.

Disciplinary or Penal Powers of Qualifying Medical Authorities.

Mr. BRYANT, on behalf of the Executive Committee, submitted a fourth report on the disciplinary or penal powers of the qualifying medical authorities. He said that the report contained pretty well all which had taken place on the subject and was thoroughly up to date. The committee's report on the communications they had received contained the following:—

Further communications on this subject have been now received from the Scottish universities and the President having referred them in May, 1898, to the sub-committee for consideration the sub-committee have pleasure in reporting that a considerable advance has been made. The four Scottish universities have been working together by means of a joint committee, and the universities of Edinburgh, Glasgow, Aberdeen, and St. Andrews have informed the Council in almost identical terms that they are of opinion that it is impossible for the Scottish universities to obtain penal and disciplinary powers over graduates from the Privy Council, nor could they ask such powers from Parliament without making them applicable to graduates in all faculties; that they are desirous of assisting the General Medical Council in preventing medical practitioners convicted of crime, or of professional misconduct, from continuing the practice of their profession; but in such cases an inquiry into each case would have to be instituted, for which neither the University Court nor the Senate is, by its constitution, well fitted. Consequently they suggest that Section 40 of the Medical Act of 1858 might be so amended as to prohibit the use of a university degree by a medical graduate whose name had been removed from the Register. The inquiry into the professional misconduct of any accused person would thus be left in the hands of the General Medical Council, and in cases in which names were removed from the Medical Register under Section 29 medical graduates could no longer use the titles of which they were formerly possessed.

The following was the report of the Joint Committee:—

REPORT BY JOINT COMMITTEE OF THE SCOTTISH UNIVERSITIES APPOINTED TO CONSIDER THE QUESTION OF PENAL AND DISCIPLINARY POWERS OVER GRADUATES, OF DATE 5TH MARCH, 1898.

The Joint Committee were of opinion that it is impossible for the Scottish Universities to obtain penal and disciplinary powers over graduates from the Privy Council and that the universities could not ask such powers from Parliament without making them applicable to graduates in all the faculties. The only profession which has suggested that such powers should be obtained is that of medicine, and in cases of professional misconduct on the part of graduates of medicine a kind of inquiry would be rendered necessary, for which neither the University Court nor the Senatus is by its constitution well fitted.

On the other hand, the committee were of opinion that medical degrees in some respects stand in an exceptional position and that it is desirable to aid the General Medical Council in more effectually preventing medical practitioners whose names have been removed by them from the Register, either on account of crime or of professional misconduct, from continuing to practise their profession under cover of the degrees obtained from the Scottish universities.

The committee, therefore, resolved unanimously that their several courts be recommended to intimate to the General Medical Council that they would be prepared to support any proposal made by the Council to obtain from Parliament an amendment of Section 40 of the Medical Act, 1858, so as to prohibit any medical graduate of a university from continuing to take or use the name or title appropriate to his degree after his name had been erased from the Register by the General Medical Council under Section 29 of the Medical Act, 1858, and so long as such erasure continues in force. At present the penalty enacted by Section 40 applies to the false assumption of a medical title, but there seems no good reason why it should not be extended to the case of a man who, although he retains his degree, has, by the erasure of his name from the Medical Register, ceased to be a "duly qualified medical practitioner" in the sense of Section 34 of the Act. The adjudication of professional misconduct and its consequences would thus be left entirely in the hands of the proper authority—that is, the General Medical Council—without the necessity of any further inquiry by bodies largely non-medical and the possibility of a different conclusion being come to by them.

The conclusion of the Executive Committee on the subject was:—

As the disciplinary powers of the twenty qualifying bodies vary vastly and the views of those bodies differ widely as to the expediency of their seeking for more powers than they now possess the conclusion seems to be clear that this Council must take the matter into its own hands either by adopting a suggestion which was embodied in a report of this committee received by the Council in May, 1896, and supported by a carefully considered opinion of Mr. M. Muir Mackenzie, which is appended, or by acting on the suggestion of the Scotch Universities, as set out on page 10 of this report, and so amend Section 40 of the Medical Act as to prohibit the use of a University degree by a medical graduate whose name has been removed from the Register. If the latter measure is thought by the legal advisers of this Council to be expedient it seems to this committee to be the best and soundest one to adopt: for the prohibition of the use of any medical title, whether of a University or otherwise, by anyone who has had his name erased from the Medical Register for infamous conduct, would be a simple and effective action.

He had thought it desirable to take the legal advice referred to and on the Scottish Universities' suggestion Mr. Muir Mackenzie, as legal adviser to the Council, had given the following opinion:—

The facts which have been elicited in prosecutions which have taken place during the last two or three years disclose a very serious mischief arising out of the defective condition of the law. The report recommends that it would be desirable that each qualifying medical authority should in future have power, if it sees fit, to erase from its list or roll of Licentiates or Members the name, and cancel, recall, or suspend the diploma of any Licentiate or Member whose name has been erased from the Medical Register after an inquiry held under Section 29 of the Medical Act, 1858, and should also have power to replace on its lists or roll of Licentiates or Members the names and restore the diploma of any Licentiate or Member whose name after erasure from the Medical Register has been by order of the General Medical Council replaced on that Register. In my opinion the proposal to confer these powers on each of the medical authorities, if carried out by the necessary legislation, would effect a very beneficial change in the law and be very useful in its operation. I would add that the necessary legislation could be effected by a very short and simple Bill to be submitted to Parliament.

In conclusion Mr. BRYANT moved:—

That the President be requested to communicate with the Lord President of the Privy Council as to the practicability of obtaining such an amendment of the law as would more effectually prevent the

---

[5] Not more than one year of *bonâ fide* apprenticeship to a registered dentist, if served subsequently to the registration, may be reckoned as a portion of the four years of professional study required.

[6] This instruction may be obtained at a science school recognised by the licensing body.

[7] It is recommended that a synopsis of the scope of the examination in these subjects be issued by the licensing bodies.

holder of a medical diploma or degree from using the title thereof after his name has been erased from the Medical Register under Section 29 of the Medical Act, 1858, and so long as the erasure continues in force.

Dr. MACALISTER seconded the motion, inserting the words "more effectually" in order to meet an objection by Mr. HORSLEY that the proposal was in contradiction to a resolution of Council to take on a test case in the High Court of Justice.

The PRESIDENT (to Mr. Horsley): Do I understand that you hold that the law does not need amendment?

Mr. HORSLEY: Yes. The test case has not been heard. It certainly has not been withdrawn.

Dr. MACALISTER pointed out that the attitude the Council were now asked to assume was that held at the time he joined the Council some twelve years ago.

Dr. GLOVER wished to emphasise the fact that it had been held it was the respective bodies who ought to get the powers in question, but now it was proposed to relieve these bodies and throw the responsibility on the General Medical Council. He hoped the Council would not commit itself to any such proposal as that now before it.

Sir CHRISTOPHER NIXON regarded the suggestion of the legal adviser as a very happy solution of the difficulty which existed on the subject. But he thought the first step which ought to be taken upon it was to ascertain whether the qualifying bodies would consent to have degrees conferred by them removed by the General Medical Council.

The motion was agreed to.

Direct Representation.

Mr. GEORGE BROWN had given notice of the following motion:—

That in the opinion of the Council, in view of the large increase in the number of registered practitioners residing in the United Kingdom, the time has come when it would be expedient to confer upon them the power of returning an increased number of Direct Representatives to the General Medical Council, as provided for in section 10, sub-section 1, paragraph C of the Medical Act of 1886, and that representations be made to the Privy Council accordingly.

He said that the last time a similar motion was before the Council was in 1891, when 5 members voted for it and 21 against it. But of these 21 only 12 now sat at the Council and owing to the infusion of new blood he thought the time had arrived to revive the proposal. Since he placed it on the notice paper the resolution had been received with a great deal of favour, but it had been represented to him that at such a late period of the session it would be undesirable to bring the proposal forward. In deference to this view he now asked leave to postpone the motion till the November session.

The leave asked for was granted.

A Sweeping Proposal.

Mr. BROWN had also given notice of his intention to move:—

(*a*) That Standing Order 7, relating to the Executive Committee, be and is hereby repealed, and that the duties of the Executive Committee be in future discharged by the branch councils. (*b*) That the Standing Order 9, relating to the appointment of committees on education, examination, public health, dental education and examination, students' registration, and penal cases, be and is hereby repealed. (*c*) That the duties of the committees referred to in Standing Order 9 be in the future discharged by the branch councils.

The PRESIDENT wished to say that if carried these three proposals would practically revolutionise the whole of the proceedings of the Council. He wished to know if Mr. Brown had a seconder.

Mr. BRUDENELL CARTER: The Executive Committee is a statutory committee.

Mr. BROWN was not at all satisfied to delegate the Council's powers to the Executive Committee and the experience of this session and last convinced him that some change in their procedure was necessary. They had sat two days this session at a cost of 300 guineas to correct mistakes made by the Executive Committee, and he thought that the time had come when there ought to be introduced a new mode of conducting their business.

The PRESIDENT: Do you withdraw the proposals?

Mr. BROWN: Yes, meantime.

Dr. MACALISTER: Because there is no seconder.

The Dentists Act and the Duties of the Executive Committee.

Mr. HORSLEY moved that Standing Order No. 15, Chapter VII., which was, "The Executive Committee shall carry out generally the provisions of the Dentists Act in accordance with the Council's resolutions," should be rescinded. He maintained that the Medical Act did not empower the Council to impose upon the Executive Committee the duties they had been undertaking.

Mr. BROWN seconded the proposal.

On a division 9 members voted for the motion and 8 against, 13 declining to vote.

The PRESIDENT: It is a pity that so many members have not voted.

Dr. GLOVER: I declined to vote because Mr. Muir Mackenzie is not here.

Dr. MACALISTER: I voted against it because I did not think a case had been made out.

Dr. MCVAIL: I did not vote because I did not understand the question.

The PRESIDENT: The abstention from voting is most unfortunate.

Eight Notices.

On the motion of Dr. LOMBE ATTHILL, seconded by Mr. TEALE, it was agreed to refer to the Executive Committee for consideration and report the following eight notices of motion standing in the name of Mr. Horsley:—

That the following be added to the Standing Orders, Chapter IX., to follow Standing Order No. 7: "Each committee shall be convened by the chairman of his own motion or by the requisition of any two members of the committee."

That the Penal Cases Committee shall be included among the other committees to be annually appointed in May under Standing Order No. 8, Chapter IX.

That in Standing Order No. 5, Chapter IX., the following shall be a new sub-section: (iv.) The Penal Cases Committee shall meet at least once a month.

That the sentence "as and when approved by the President" in sub-section *a* of Standing Order No. 3, Chapter XIV. (p. 24), be and is hereby rescinded.

That in Standing Order No. 5, Chapter XIV., after the word "offence" the Order shall read, "the matter shall be referred to the Committee of Penal Cases."

That in Standing Order No. 6, Chapter XIV., for the word "solicitor" shall be substituted the words "General Registrar," and that with regard to Appendix A, p. 31, the letter scheduled therein shall be signed by the Registrar to the General Medical Council.

That Standing Order No. 8, Chapter XIV., shall read as follows: "When any answer, evidence, or statement is forwarded or application made by the accused person between the date of the issue of the notice and the day named for the hearing of the charge copies thereof shall be immediately sent by the Registrar to each member of the Penal Cases Committee."

That in Standing Order No. 9, Chapter XIV., for the word "President" shall be substituted the words "Penal Cases Committee."

A Legal Opinion.

On the motion of Mr. HORSLEY, seconded by Dr. BRUCE, it was formally agreed to enter on the minutes the opinion obtained from Mr. Muir Mackenzie about the President's right to prohibit Mr. Horsley's access to Council documents such as Mr. Horsley said he had enjoyed up till April 7th.—Dr. MACALISTER explained that it was not customary to place counsel's opinion on the minutes unless there was a demand to do so.

The Public Health Diploma.

Sir WILLIAM GAIRDNER called attention to diversities of interpretation given at different places to the regulations of the General Medical Council with reference to the course of study for a diploma of public health. He said that since he came to London to attend the meetings of this session of the Council he had received communications from a very excellent man, a high authority on the matter, showing that there was a sad want of uniformity in regard to outdoor sanitary study. The Council's requirement was that every candidate for a diploma must produce evidence of his having during six months studied practically the duties connected with outdoor sanitary work. His correspondent showed that in cases what was demanded was attendance at the sanitary office daily for five days a week, while elsewhere the attendance required was only one hour on Saturday, and only occasional Saturdays came in. What he wanted to know was what was the meaning of "practically." He moved that the consideration of the matter should be remitted to the Public Health Committee.

Mr. TICHBORNE seconded.

Mr. TOMES said it would be a new order of procedure to lay down exactly what a qualifying body was to do. It was for the qualifying bodies themselves to determine. The Council said that such and such an amount of study was requisite, but they left it to the bodies to determine what the amount of attendance should be. The Council were surely not going to say how many hours a man must study. If they once began to attempt it—and he saw a tendency in that direction during the discussion of the dental recommendations—they would be placing themselves in an awkward position, which would be bad for education generally because the qualifying bodies understood the matter better than the General Medical Council did.

The PRESIDENT pointed out that there was a difference

between the relation of the Council to public health and its relation to other subjects. The statement that in one place daily attendance for five days a week was required for outdoor sanitary study, while in other places an occasional Saturday was deemed enough, was a matter to which he really thought the Public Health Committee ought to have their attention drawn.

Sir RICHARD THORNE, chairman of the Public Health Committee, said this matter came before the Council because of a magnanimous Scotch medical officer who was willing to give instruction on five days a week without charging for it. English officers could not do that. He hoped the Council would not order an inquiry because it would not only be difficult to make but would raise other very important questions which the Council would have to deal with as the result.

On a division the motion was carried by 13 votes to 7.

Unqualified Dentist Assistants.

The next business was consideration of the following communication from the British Dental Association, referred by the Executive Committee to the General Council, as to the issue of a notice to dentists in regard to the employment of unqualified assistants:—

British Dental Association, 40, Leicester-square, London, W.C., Feb. 12th, 1898.

DEAR SIR,—Certain members of the dental profession who possess medical qualifications have received an important notice from the Medical Council as to the employment of unqualified persons and assistants. On behalf of the British Dental Association I beg to submit that the time has arrived when a somewhat similar notice as regards "covering" might be sent to all dentists or that the notice issued to the dental profession by the Medical Council in 1893 might be repeated. The notice of 1893 was found to be of much service in helping to check the spread of the practice of "covering," as members of the executive of this association have reason to know; and it is felt that the issue of another notice at the present moment would, as a preventive measure, be most opportune and saving of both time and money to the Council in the investigation and consideration of future cases.

As a minor matter I might remind you that Mr. Miller utilised the opportunity of coupling with the 1893 warning notice a means for further correcting the address entries of dentists in the Register. I shall feel obliged if you will bring this request to the notice of the Executive Committee at the earliest moment.

I am, dear Sir, yours truly,
W. B. PATERSON,
Hon. Secretary of the British Dental Association.

To the Registrar of the General Medical Council.

On the motion of Dr. MACALISTER, seconded by Mr. TOMES, this communication was referred to a committee consisting of the members of the Dental Committee for consideration and report.

Administration of Anæsthetics.

Consideration was next given to the following communication, referred by the Executive Committee to the General Council, from the Dundee and District Branch of the British Medical Association as to the administration of anæsthetics by registered medical practitioners for unregistered dental practitioners—a practice which in the opinion of the Executive Committee is most reprehensible:—

Annfield House, Dundee, March 10th, 1898.

Covering Unregistered Dental Practice:

DEAR SIR,—I have been asked by the Council of this branch to ask you whether the recent notice issued by the General Medical Council will extend to the case of a registered medical practitioner who by administering anæsthetics for dental operations by persons not registered under the Dental Acts gives countenance to this most objectionable form of practice. If the question has not yet been considered you might bring it under the notice of the General Medical Council at its next meeting. I have been corresponding with Mr. Robertson and he has referred me to you.

I am, yours sincerely,
H. E. Allen, Esq. R. C. BUIST, M.D., Hon. Sec.

On the motion of Mr. BROWN, seconded by Dr. BRUCE, this communication was referred to the same committee as that to which the British Dental Association's letter had just been committed.

Mr. TOMES pointed out that the question raised in this case was a much wider one and any decision come to in connexion with it must rule in the case not only of dentists but also medical practitioners.

The PRESIDENT, before calling for the next business on the printed programme, pointed out that in dental matters they were placed now in a difficulty by their adoption of Mr. Horsley's proposal to prevent the Executive Committee from generally administering the Dentists Act. Unless they set up machinery equivalent to that which had existed hitherto all communications on dental matters must come direct to the Council in future.

Dr. MACALISTER thought that communications on dental business relating to matters other than such as pertained directly to the statutory Dental Committee might go to the Executive Committee so as to allow the latter to prepare the business for the Council.

A motion to this effect was thereupon agreed to.

Tropical Diseases.

Sir JOHN BATTY TUKE, as chairman of the Education Committee, submitted the following report on a communication from the Colonial Office regarding special instruction in Tropical Diseases in medical schools:—

The following communication from the Colonial Office has been forwarded by order of the President to the Education Committee for consideration and report:—

Downing-street, March 11th, 1898.

SIR,—In an address (a copy of which is enclosed) delivered at St. George's Hospital at the opening of the Winter Session on Oct. 1st last Dr. Manson, who is now the medical adviser of this Office, urged the necessity for special education in tropical medicine in the medical schools of this country.

2. This is a matter in which Mr. Chamberlain is much interested, as he is anxious to do everything in his power to extend the benefits of medical science to the natives of the tropical colonies and protectorates and to diminish the risk to the lives and health of those Europeans who as Government officers or private employés are called upon to serve in unhealthy climates.

3. He feels confident that if some scheme can be devised by which it can be ensured that all the medical officers selected by the Secretary of State for appointments in the tropics shall enter on their careers with the special knowledge requisite for dealing with those diseases which are especially prevalent in tropical climates, great benefit will result to Europeans and to natives alike.

4. At present there is no arrangement by which officers selected for medical appointments in the Crown colonies and protectorates receive instruction in tropical medicine before taking up their duties, and in consequence the greater number of these officers possess at the commencement of their service only the crudest knowledge of the diagnosis and treatment of tropical disease, though they may by the exigencies of the service be placed at once in responsible positions where such a knowledge would be of the highest importance.

5. Mr. Chamberlain is at the present time endeavouring to make arrangements for giving to colonial medical officers some such clinical instruction in tropical medicine as is given in Netley and Haslar in the case of medical officers of the army, navy, and Indian Medical Services.

6. Even if such an arrangement is eventually arrived at the conditions of the colonial service will scarcely admit of the officers being kept under instruction for more than three or four months; it is therefore desirable that they should have some preliminary knowledge of the subject so that they may derive the greatest possible benefit from their clinical opportunities during this short course.

7. So far, then, as this department is concerned Mr. Chamberlain would be glad if any scheme could be arranged by which an opportunity for special instruction in tropical disease could be offered to the student by the medical schools of this country and would be prepared to support it by selecting preferably for colonial medical appointments those candidates who could show that they had studied this branch of medicine, especially if some certificate or diploma to that effect were forthcoming.

8. Mr. Chamberlain would point to the fact that the War Office, Admiralty, India Office, and Foreign Office are interested in this matter and that, as Dr. Manson states, rather over a fifth part of the medical graduates of Great Britain and Ireland practise in warm climates, or being in the army and navy may be called upon at any time to do so.

9. Mr. Chamberlain has consulted these departments and finds that they share his views as to the desirability of extending the teaching of tropical medicine in the British medical schools and he would ask the General Medical Council to give the matter their earnest and favourable consideration.

10. A similar letter has been addressed to the leading medical schools of this country. I am, Sir, your obedient servant,
C. P. LUCAS.

The President of the General Council of Medical Education and Registration of the United Kingdom.

The Committee have given the foregoing communication their earnest attention at two meetings and beg leave to report to the Council thereon as follows:—

They share the conviction expressed by Mr. Chamberlain that it is highly desirable that medical men who propose to practise in hot climates should have opportunities for the special study, theoretical and practical, of tropical diseases. But they are not of opinion that this desirable end would be attained by means of a recommendation, emanating from the Council, to the effect that such special study should be made obligatory on all candidates for a licence to practise. To be effective it is necessary that every course of instruction in these diseases should include clinical demonstrations and observation of actual cases. In few of the medical schools in the United Kingdom can such clinical instruction be provided; and merely to add a short course of theoretical lectures to those that are already given on the subject in connexion with the usual systematic courses on general medicine would serve no good purpose.

The committee believe, however, that if the resources of such institutions as Haslar or Netley were made available for the instruction, not only in tropical medicine, but also in tropical hygiene and climatology, of qualified practitioners selected for colonial medical appointments, the efficiency of this branch of the public service would be materially increased. At such central institutions the teachers would naturally be selected for their skill and experience in this special branch of practice; the cases for clinical demonstration would be at hand as they cannot be in ordinary general hospitals; and the candidates under instruction, having already obtained their medical qualifications, would be free to give their undivided attention to the special study in question. It would, moreover, be an advantage if the facilities for

genuine and efficient study thus provided were thrown open under proper conditions to other medical practitioners who propose to practise in tropical countries. Certificates or diplomas which might be granted by the authorities of such institutions to medical practitioners who had completed a satisfactory course of study would have a real value as evidence of special qualification. But the committee do not think that this could be said of diplomas granted to medical students possessing only the preliminary and theoretical knowledge contemplated in paragraphs 6 and 7 of the above communication.

The committee accordingly recommend that the Council inform the Secretary of State for the Colonies that, while the Council is not prepared to recommend that tropical medicine should be made an obligatory subject of the ordinary medical curriculum, it deems it highly desirable in the public interest that arrangements should forthwith be made by the Government for the special instruction in tropical medicine, hygiene, and climatology of duly qualified medical practitioners who are selected for the Colonial Medical Service or who otherwise propose to practise in tropical countries.

Sir JOHN BATTY TUKE moved the adoption of this recommendation.

Dr. MACALISTER, deputy chairman of the committee, and who presided at the meeting at which the report was agreed to, seconded the motion.

Mr. CARTER thought the Seamen's Hospital at Greenwich should be mentioned.

Sir WILLIAM THOMSON objected to mention being made of any particular institution and it was only because Netley and Haslar were named in the Secretary of State's letter that they were named in the report. The Council were not asked to name any school and it was not for the Council to suggest what were the schools at which information of the kind in question was to be obtained. In making the recommendation they had made the committee were keeping within their proper limits.

The motion was agreed to.

Recognised Preliminary Examinations.

Sir JOHN BATTY TUKE submitted the following interim report from the Education Committee on the revision of the list of recognised preliminary examinations :—

The Education Committee have been engaged in collecting evidence as to the standard of the various preliminary examinations with a view to the revision of the Council's list, which they propose to report upon at the November session. Much, however, remains to be done and the list cannot be brought into its final form until a date near to the end of the year. Inasmuch, however, as by Resolution 2 of the Council, adopted on November 28th, 1897, the revised list is to come into force on Jan. 1st, 1899, the notice that can be given to the various educational bodies and to intending candidates will of necessity be very short. Representations as to the inconvenience of this have reached the committee from several quarters, and these representations appear entitled to the consideration of the Council. The committee would remind the Council that their original proposal was that the revised list should come into force on Jan. 1st, 1900, and they now accordingly recommend as follows :—

That notwithstanding the Council's resolution of Nov. 29th, 1897, the revised list of preliminary examinations to be submitted by the Education Committee at the November session do not come into force until Jan. 1st, 1900.

He moved the adoption of this recommendation, mentioning that it simply asked for extension of time by a year.

Dr. MACALISTER, in seconding, said that the list would be ready by November; but it was thought that a month was too little to allow after its appearance and therefore the committee reverted to the originally proposed date, 1900.

The motion was agreed to.

Finance.

Mr. BRYANT, chairman of the Finance Committee, submitted the following report :—

The Finance Committee reports that the income of the General and Branch Councils for the year ending December 31st, 1897, was £7942 18s. 4d., but that the expenditure for the same period, having been £10,761 1s., exceeded the receipts by £2818 2s. 8d., as against an excess of £1526 18s. 10d. last year. From Table A it will be seen that the fees received by the Branch Councils were considerably less than last year, as £557 7s. 6d. less was received from that source in England, £254 10s. less in Scotland, while Ireland alone shows a small increase of £32 5s., making a total decrease of £779 12s. 6d.

The items of increased expenditure are shown on Table B, and among these may be specified the following:—(*a*) An increase of £404 8s. 1d. for the British Pharmacopœia, occasioned by the further necessary expenditure in the production of the new book. (*b*) An apparent increase of £451 17s. 11d. in salaries, caused by the vote of £1000 as an honorarium to the late Registrar. (*c*) An increase of £172 18s. 1d. in law expenses, due chiefly to counsel's fees in the appeal by the Apothecaries' Hall of Dublin to the Privy Council. (*d*) An increase of £60 2s. 1d. on account of the interest due on the mortgage entered into by the General Council, the amount having been increased from £20,000 in 1898 to £22,507.

On the other hand decreased expenditure has to be noted: (*a*) in fees paid to the General Council, £343 15s. 2d., the Council having sat for one day less than the previous year; (*b*) in miscellaneous printing, £352 5s. 5d.; (*c*) in inspection and visitation of examinations, £65 2s., owing to the termination of the series of inspections.

Though there are still some payments to be made on account of the Pharmacopœia it may be expected that as the whole of the issue will probably be sold within a short time, seeing that of the Pharmacopœia of 1885 13,500 were sold in the first four months and 22,300 in the first sixteen months, not only will the whole of the expenditure be refunded but a considerable profit will be shown.

The additional expenditure of an exceptional nature (£2507) incurred during the year in the alteration of the Council office is excluded from the total normal expenditure of the year, as otherwise comparison with previous years would be rendered difficult. One of the appended tables shows assets of the three branch councils and the dental fund at the close of the last three years respectively, from which it will be seen that they have decreased owing to the large contributions which have been required by the General Council, the English branch assets having decreased by £1605 7s. 7d., the Scottish by £629 7s. 9d., and the Irish by £687 5s. 8d. The dental fund shows an increase of £823 4s. 9d. It should be remembered, however, that the British Pharmacopœia being now completed and published there will not only be an end to the demand upon the branch funds on account of its expenses, but that the £3683 that has been locked up during the production of that work will be received back by the General Council, removing the necessity for any large demands on the branches for the next few years.

The question of establishing a sinking fund for the repayment of the loan of £20,000 from the English Branch Council should be considered by the Council.

This may be done either by the annual deposit of a sum of money at the Bank of England and the investment of capital with its interest, so that a capital sum would be secured at a fixed period, or by making an annual payment to a sound and established insurance company.

An inquiry at the Bank of England as to the best method to adopt elicited a letter from the manager, in which he informs the committee that it would probably be more advantageous for the Council to arrange the matter with some first-class insurance office than to do so with the Bank of England, both on the grounds of cheapness and simplicity. Under these circumstances it seems best to your committee that this advice should be followed, and your committee have to advise that by making an annual payment of £172 10s. to the Alliance Insurance for fifty years the sum of £20,000 would be realised.

By means of this fund the whole of the debt of the General Medical Council would be wiped out and the Council would have its freehold buildings rent free, and this would be done by the payment of a sum of money every year which would hardly be felt by the Council.

The question of raising the Oxford-street building another storey should also be entertained, for more committee rooms and a room for the President are much wanted.

It was agreed, on the motion of Mr. BRYANT, seconded by Dr. BRUCE, that the suggestion contained in the report as to the sinking fund should be referred to the several branch councils for consideration and report to the General Council and that the President and treasurer should be empowered to obtain plans and estimates for the addition of another storey to the present offices at 299, Oxford-street, they to report to the Council.

The PRESIDENT mentioned that he had brought the matter of want of accommodation before the executive. During the few weeks he had held office he had felt the inconvenience which arose from there being no room for the President, who if he had to meet members had to use the Council chamber itself, the luncheon-room, a committee-room, or it might be the stairs. He did not think it right that the President should be in that position.

Dr. MACALISTER, who pointed out that the resolution committed them to inquiry only, said that owing to their committees having become not only more numerous but more active, more committee rooms, as well as a President's room, had become absolutely urgent.

Mr. HORSLEY urged that the finance report should contain tabular statements of the Council's liabilities and assets and should show the actual legal expenditure more clearly than the account first submitted did.

The Dublin Apothecaries' Hall.

Mr. BRYANT, as chairman of the committee appointed to secure a successor to Mr. Arthur Chance, read the following report :—

The Committee recommend the Council to appoint Mr. H. G. Howse, of 59, Brook-street, Grosvenor-square, London, M.S. London, F.R.C.S. of England, surgeon to Guy's Hospital, and late examiner in surgery at the College of Surgeons and at the University of London, assistant examiner in surgery at the Apothecaries' Hall of Ireland, and inspector on behalf of the Medical Council, "to secure at the examinations of the Apothecaries' Hall the maintenance of such standards of proficiency in medicine, surgery and midwifery (under the provisions of the Medical Act, 1886, Sec. 5, Clause 2) from candidates at such qualifying examinations, and to have such powers and perform such duties in the conduct and inspection of those examinations as this Council may from time to time by order prescribe, and to secure that such examination shall be deemed a qualifying examination within the meaning of the Medical Act, 1886.

He moved :—

That Mr. H. G. Howse, M.S., F.R.C.S., be appointed an assistant examiner in surgery at the examinations of the Apothecaries' Hall, Dublin, in the room of Mr. Arthur Chance, resigned, and that the duties and conditions of his appointment be the same as those relating to the appointment of Mr. Chance.

Dr. HERON WATSON having seconded, the motion was agreed to.

Fines under the Medical Acts.

On the motion of Sir DYCE DUCKWORTH, seconded by

Mr. HORSLEY, the following interim report was received and entered on the minutes:—

The Committee on Fines under the Medical Acts has to report that at a meeting held by them on March 4th, 1898, they directed that a statement, based on the report of the committee that met in 1891, should be forwarded to Sir Edward Bradford and that he should be requested to receive a deputation on the subject. In answer to this communication the Council was informed by the Commissioner of Police on March 24th, 1898, that the matter was receiving his careful consideration and that he was in communication with the Secretary of State for the Home Department on the subject and in answer to a further inquiry made by the Registrar on May 17th he stated that a decision had not yet been arrived at.

The Executive Committee.

A ballot for the election of the Executive Committee, which consists of the President *ex-officio*, four members representing the English Branch Council, two the Scottish, and two the Irish, resulted in the return of Sir Dyce Duckworth, Mr. Bryant, Mr. Brudenell Carter, Dr. Glover, Dr. Heron Watson, Sir William Gairdner, Dr. Lombe Atthill and Sir Philip Smyly. Sir William Gairdner, who takes Sir William Turner's place, is the only new member on the committee.

Mr. HORSLEY thought the Council ought to revert to the old custom of annually delegating powers to this committee. He proposed "That the powers and duties delegated in accordance with the Standing Orders as amended in the present session to the Executive Committee be vested in the committee until the next May meeting of the General Medical Council."

Sir CHRISTOPHER NIXON seconded and Mr. BROWN supported the motion.

The PRESIDENT thought the Council should abide by the resolution of 1887.

Dr. MACALISTER pointed out that no harm had resulted from working under the resolution just referred to.

On a division the motion was rejected by 18 votes to 5.

The Pharmacopœia.

Mr. BRUDENELL CARTER, seconded by Dr. LITTLE, moved that the report of the Pharmacopœia Committee be received and entered on the minutes. This, which was a lengthy one, will be printed in our columns next week, when we shall finish our report of this session.

Medical News.

THE annual dinner of the Members of the Royal College of Veterinary Surgeons took place on June 1st at the Hôtel Cecil under the presidency of Professor Penberthy.

MEDICAL MAGISTRATE.—The Lord Chancellor has appointed Dr. John J. Lynch of Walsall a Justice of the Peace for that borough.

BY the will of Mr. Edward Mackeson, who died in March last, the Royal Asylum of St. Anne's Society, the Surgical Aid Society, and the Association for Promoting the General Welfare of the Blind, will each receive a third share of £100,000.

PRESENTATIONS TO MEDICAL MEN.—Mr. F. M. Blackwood, M.B. Durh., M.R.C.S. Eng., of Summerhill, Sydney, New South Wales, has been the recipient from the Sterling Lodge, No. 18, Independent Order of Oddfellows, of an illuminated address.—Mr. Joseph Park, M.B., Ch.M. Syd., of Helensburgh, New South Wales, has been entertained at a public banquet by the inhabitants of Helensburgh and presented with an illuminated address.—Mr. W. H. O'Neill, M.B., Ch.M. Edin., late of Narrandera, New South Wales, was entertained at a public banquet on leaving the district and was presented with a gold watch and chain. The watch bore a suitable inscription.—On March 25th last Mr. F. J. Drake, M.B., Ch.B. Melb., on his retiring as surgeon superintendent of the General Hospital, Launceston, Tasmania, was presented with several medical works by the medical staff and a spirit lamp by the present and past nurses.—On the occasion of Mr. William A. Rutherford, M.B, C.M. Edin., resigning the post of house surgeon at the Durham County Hospital, which he had held for about three years, he received presentations from the nurses of the institution and other friends as marks of esteem.—On May 27th Mr. C. Thiselton D. Urquhart, M.B., C.M. Aberd., of Aberdeen, was entertained at dinner in the Imperial Hotel by many of his medical brethren on his leaving the city.

DERMATOLOGICAL SOCIETY OF GREAT BRITAIN AND IRELAND.—The annual meeting of this society was held at 20, Hanover-square, on May 26th, when the retiring President, Dr. J. F. Payne, delivered a valedictory address. He then introduced the new President for the session 1898–99, Dr. Radcliffe Crocker, who read a paper dealing mainly with the influence on treatment of a proper knowledge of the bacteriology of the skin.—Dr. J. H. Stowers opened a discussion upon Drug Eruptions. He was followed by the President and by Dr. Payne, Dr. Bowles, Dr. Stopford Taylor, Dr. A. J. Harrison, Dr. Galloway, Mr. Pernet and others.—Dr. Payne showed three cases—(1) Prurigo in a Child; (2) Morphœa in a Little Girl; and (3) a case for Diagnosis in an Old Man.—Mr. Hutchinson exhibited a large collection of drawings illustrating lupus, rodent ulcer, &c.—The annual dinner was held in the evening at the Café Royal, the President being in the chair. About forty members and guests were present.

THE CANDIDATURE OF MR. BENNETT MAY FOR THE COUNCIL OF THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.—A meeting of Fellows of the College residing in the Midlands was held in the Birmingham Medical Institute on June 1st, in support of the candidature of Mr. Bennett May for membership of the College Council. The chair was taken by Dr. Thomas Savage, and there were also present, in addition to the candidate, Mr. Gilbert Barling, Mr. W. E. Bennett, Mr. H. J. Blakesley, Mr. L. Gamgee, Mr. W. F. Haslam, Mr. G. Heaton, Mr. J. Furneaux Jordan, Mr. C. Leedham-Green, Mr. Christopher Martin, Mr. J. W. Taylor, Mr. William Thomas, Mr. T. Wilson, and Mr. J. T. J. Morrison. Apologies for non-attendance had been received by the secretary (Mr. Morrison) from Mr. F. Edge, Mr. G. C. Franklin, Surgeon-Major W. G. Lowe, Mr. C. H. Marriott, Mr. F. H. Marson, Mr. E. J. P. Olive, Mr. Edwin Rickards, Mr. E. S. Savage, Mr. J. Vose Solomon, and Mr. W. D. Spanton. At the request of the chairman Mr. Bennett May stated his views on College affairs and expressed his willingness to accede to the request that he would offer himself for the ensuing election in July. The following resolution, proposed from the chair and seconded by Mr. Barling, was carried unanimously—viz.: "That this meeting of Fellows of the Royal College of Surgeons of England residing in and around Birmingham is of opinion that it is desirable that the Midlands should be represented on the Council of the College, and pledges itself to support the candidature of Mr. Bennett May." It was also resolved that copies of the foregoing resolution should be sent to the medical press, and a sub-committee was appointed to take further steps to promote Mr. Bennett May's election.

BECKENHAM AND PENGE MEDICAL SOCIETY.—The annual dinner of the Beckenham and Penge Medical Society was held at Howard's Assembly Rooms on May 26th, when thirty-five members and guests were present. The company included the Rector of Beckenham and Dr. Walker, honorary members of the society, and the majority of the medical practitioners of the neighbourhood. Among the visitors were Dr. Frederick Roberts, of University College; Mr. Bland Sutton, of Middlesex Hospital (honorary consulting surgeon of the local hospital); Mr. Marmaduke Sheild, of St. George's Hospital; and Mr. Keetley, of the West London Hospital. The dinner was a great success and the pleasure of the evening was in no way decreased by the absence in the speeches of any allusion to the bitter conflict of last year. The medical practitioners remain as they were, but prefer to leave to the healing influence of time and the good sense of the public the settlement of the club question. The toast of "The Queen" was proposed by the President, Mr. Frank Sturges, and he made a feeling reference to the loss which Her Majesty and the nation had sustained in the death of Mr. Gladstone. Mr. Prangley, vice-president, proposed "The Royal College of Physicians of London and the Royal College of Surgeons of England," urging on them a more serious attention to the duties devolving on them as the governing bodies of the profession. This was replied to by Dr. Roberts for the Royal College of Physicians in a very humourous and witty speech and by Mr. Sheild for the Royal College of Surgeons. The Rector of Beckenham, the Rev. H.

Arnott, F.R.C.S., proposed "The Local Medical Society." He spoke of his love and admiration for his old profession in the warmest terms, dwelt on the many advantages of the society in rubbing away rough corners and promoting goodwill and good fellowship among the members, but avoided altogether the "Battle of the Clubs" in either its general or local aspect. This enabled Mr. Sturges, who replied on behalf of the society to avoid it also, and he contented himself with some general remarks on the use of these societies in strengthening and binding together the medical profession throughout the country for its own good and for that of the public. Mr. Wells proposed "The Visitors," regretting the absence of those who were unable to be present. Mr. Keetley replied. The health of the Chairman, proposed by Mr. Bland Sutton, and the Chairman's reply concluded the toast list. During the evening Mr. C. A. Lidgey presided at the piano and Dr. Roberts and Mr. Henley sang. Altogether it was a most excellent dinner, a most enjoyable and harmonious gathering, and a conspicuous success.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

Prisons Bill.

THE consideration of the Prisons Bill by the Grand Committee on Law of the House of Commons is now practically finished and as the measure has been a good deal altered by the Committee it may be useful to explain its present state. Probably the clause in which the most important amendment has been made is the first. The clause provides for the amalgamation of the Directors of Convict Prisons with the Prison Commissioners and against the expressed opinion of the Home Secretary the Committee inserted a stipulation that one of the latter shall be a medical man skilled in mental diseases. In the matter of visitation the Bill in its present state provides that the Secretary of State shall appoint for every convict prison a board of visitors of whom not less than two shall be justices of the peace and whose powers and duties shall be prescribed by the prison rules drawn up by the Secretary of State. With regard to the rules for hard labour it is provided that in making these rules regard shall be had to the sex, age, health, industry, and conduct of the prisoners. Roughly speaking, the arrangements in the original Bill for the division and classification of prisoners stand—that is to say, there are to be three classes. In the interests of persons imprisoned for default in payment of a debt or for default in satisfying an order of the Court there is a proviso that they shall not be placed in association with convicted prisoners or be compelled to wear prison dress unless their own clothing is unfit for use. Clause 6 is now made to read: "1. It shall not be necessary to provide or appropriate punishment cells in any prison for the confinement of prisoners for prison offences, but in every prison special cells shall be provided for the temporary confinement of refractory or violent prisoners. 2. The Secretary of State shall satisfy himself from time to time that in every local and convict prison separate cell accommodation is provided for all prisoners, and a yearly return showing the accommodation of each prison and the daily average and highest number of prisoners confined therein during the year shall be given in the annual report of the Prison Commissioners." The Home Secretary has drafted the rules which he proposes to issue and these he has put before the members of the committee for their consideration. Further than that, by way of concession to prison reformers, he has appointed a committee of experts (the constitution of which was given in our columns last week) to inquire into the important question of the dietary.

Vaccination Bill.

Very soon after the conclusion of the Whitsun Recess the Vaccination Bill will fall to be dealt with by the Grand Committee on Law of the House of Commons, and in view of the proceedings a large number of amendments have been prepared by members of the committee. Many of these amendments aim at the same object though their wording may be somewhat different. For instance, there is a large group which seek to insert in the Bill an arrangement whereby there shall be no prosecution for contravention of the Vaccination Acts unless with the sanction of the board of guardians. Their phraseology and in some cases their methods differ, but they all have this object in view. Mr. Carlile is responsible for a long list of amendments. Among other things he proposes that six instead of twelve months shall be the period from the time of birth within which vaccination shall be required to be performed. He also proposes several new clauses. One of these is in effect that from and after a particular date vaccination by public vaccinators shall with certain exceptions be performed with glycerinated calf or other approved animal lymph, and such lymph shall be obtained either from the national vaccine establishment or from a person or body duly licensed to supply it; that the Local Government Board shall make regulations to secure the provision and supply of glycerinated calf or other approved animal lymph, and may license on such terms as the Board may think fit any person or body to supply such lymph, and that if any parent or person having charge of a child shall signify the desire to have the vaccination performed with humanised lymph the vaccination officer may so perform it on receiving a written statement to that effect signed and witnessed. Mr. Carlile has drafted two other clauses—one providing for vaccination free of charge by public vaccinators and the other providing that parents having conscientious objections to vaccination may make a statutory declaration to that effect and thus free themselves from the possibility of prosecution. Mr. Sydney Gedge proposes that the parent shall get a reward of one shilling for having his child vaccinated, and that in addition to this shilling to the parent the sanitary authority shall pay to the medical practitioner a fee of half a crown for each child whom he vaccinates. Against the name of Mr. Brigg there stand on the notice paper several amendments. One of these limits the penalty on conviction to 5s. "including the costs." In another it is proposed that evidence tendered before a court of summary jurisdiction in cases of prosecution for neglected vaccination shall not be considered complete unless it includes a certificate from a duly qualified medical man that the child whose parent or guardian is being prosecuted is in a fit state of health to undergo the operation. Fitting in with this amendment Mr. Brigg has framed a new clause setting forth that the certificate of the duly qualified medical man shall not cost more than 1s. Colonel Long proposes that in any case where the parent or guardian makes a declaration or affidavit that he objects to the child being vaccinated on the ground that he believes vaccination to be dangerous or wrong and forwards the declaration or affidavit to the local registrar, then the parent shall not be liable to prosecution under the Vaccination Acts. Mr. Logan is responsible for the novel proposal that no local authority or educational authority or institution receiving grants in aid from the Government shall make vaccination a condition of employment or admission. There are many more amendments, but those mentioned will serve to show the drift of the discussion to be anticipated when the committee begins its work.

Appointments.

Successful Applicants for Vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward it to THE LANCET Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week for publication in the next number.

ALFORD, H. T. M., L.R.C.P., M.R.C.S., has been appointed Senior Obstetric House Physician to St. Thomas's Hospital.

ALLFREY, F. H., B.A. Camb., L.R.C.P., M.R.C.S., has been appointed a Clinical Assistant in the Special Department for Diseases of the Ear at St. Thomas's Hospital.

BELFRAGE, S. H., L.R.C.P., M.R.C.S., has been appointed a Clinical Assistant in the Electrical Department at St. Thomas's Hospital.

BELL, R. H., B.A. Camb., L.R.C.P., M.R.C.S., has been re-appointed a House Physician to St. Thomas's Hospital.

BERRY, F. M. D., M.D., B.S. Lond., has been appointed a Medical Officer by the London School Board.

BERTRAM, T. D., M.B., Ch.M. Glasg., has been appointed Visiting Surgeon and Dispenser for the Coonamble Gaol, New South Wales, vice E. O. Newland, resigned.

Births, Marriages, and Deaths.

BIRTHS.

BARTLETT.—On May 23rd, at Saffron Walden, the wife of Hedley Bartlett, M.R.C.S., L.R.C.P., of a daughter.

BENSON.—On May 26th, at Broomhill, Sheffield, the wife of Henry Mitchell Benson, M.B., C.M. Edin., of a daughter.

FLEMING.—On May 26th, at Bruntsfield-place, Edinburgh, the wife of Andrew Milroy Fleming, M.B., C.M., of Salisbury, Mashonaland, of a son.

LITTLE.—On May 26th, at Seymour-street, Portman-square, London, W., the wife of E. Muirhead Little, F.R.C.S. Eng. of a daughter.

MACLEOD.—On May 25th, at Airlie bank, Dundee, the wife of J. M. H. MacLeod, M.B., of a son (stillborn).

OXLEY.—On May 23rd, at 33, Richmond-terrace, Clapham-road, the wife of W. H. F. Oxley, M.R.C.S., L.R.C.P., of a daughter.

STRAND.—On May 25th, at Baker-street, Portman-square, W., the wife of Alick C. Strand, M.R.C.S., of a daughter.

WHITELOCKE.—On May 24th, at Oxford, the wife of H. Anglin Whitelocke, M.B., F.R.C.S., of a daughter.

MARRIAGE.

CONNOLLY—HOPER-DIXON.—On May 24th, at St. Dominic's Priory Church, Haverstock-hill, N.W., Richard Michael Connolly, B.A., L.R.C.S. Edin., District Surgeon, Perak, Federated Malay States, to Flora Hoper-Dixon, second daughter of the late Thomas Nunn Debenham, Regent's-park-road, and widow of the late Surgeon-Captain A. L. Hoper-Dixon.

DEATHS.

BARNARD.—On May 27th, at Broad-walk, Buxton, Arthur Joynson Barnard, M.R.C.S., L.R.C.P., aged 37 years.

HECKSCHER.—On May 29th, at The Elms, Barlow Moor-road, West Didsbury, near Manchester, Martin Bernard Heckscher, M.D., M.R.C.P., aged 74 years.

LOWDELL.—On May 29th, at Charles-road, St. Leonards-on-Sea, Surgeon-Major Charles Lowdell, late 4th Bengal Cavalry (Retired).

SHAW.—On May 26th, at Blackheath, Francis Bentley Shaw, M.R.C.S., L.R.C.P., aged 28 years.

WRIGHT.—On May 27th, at his residence in Wakefield, Thomas Giordan Wright, M.D.

N.B.—A fee of 5s. is charged for the insertion of Notices of Births, Marriages, and Deaths.

Medical Diary for the ensuing Week.

OPERATIONS.

METROPOLITAN HOSPITALS.

MONDAY (6th).—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), St. George's (2 P.M., Ophthalmic 1.15 P.M.), St. Mary's (2.30 P.M.), Middlesex (1.30 P.M.), St. Mark's (2 P.M.), Chelsea (2 P.M.), Samaritan (Gynæcological, by Physicians, 2 P.M.), Soho-square (2 P.M.), Royal Orthopædic (2 P.M.), City Orthopædic (4 P.M.), Gt. Northern Central (2.30 P.M.), West London (2.30 P.M.), Westminster (2 P.M.).

TUESDAY (7th).—London (2 P.M.), St. Bartholomew's (1.30 P.M.), Guy's (1.30 P.M.), St. Thomas's (3.30 P.M.), Middlesex (1.30 P.M.), Westminster (2 P.M.), West London (2.30 P.M.), University College (2 P.M.), St. George's (1 P.M.), St. Mary's (1 P.M.), St. Mark's (2.30 P.M.), Cancer (2 P.M.), Metropolitan (2.30 P.M.).

WEDNESDAY (8th).—St. Bartholomew's (1.30 P.M.), University College (2 P.M.), Royal Free (2 P.M.), Middlesex (1.30 P.M.), Charing-cross (3 P.M.), St. Thomas's (2 P.M.), London (2 P.M.), King's College (2 P.M.), St. Mary's (2 P.M.), National Orthopædic (10 A.M.), St. Peter's (2 P.M.), Samaritan (2.30 P.M.), Gt. Ormond-street (9.30 A.M.), Gt. Northern Central (2.30 P.M.), Westminster (2 P.M.), Metropolitan (2.30 P.M.).

THURSDAY (9th).—St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), University College (2 P.M.), Charing-cross (3 P.M.), St. George's (1 P.M.), London (2 P.M.), King's College (2 P.M.), Middlesex (1.30 P.M.), St. Mary's (2.30 P.M.), Soho-square (2 P.M.), North-West London (2 P.M.), Chelsea (2 P.M.), Gt. Northern Central (Gynæcological, 2.30 P.M.), Metropolitan (2.30 P.M.).

FRIDAY (10th).—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), Guy's (1.30 P.M.), Middlesex (1.30 P.M.), Charing-cross (3 P.M.), St. George's (1 P.M.), King's College (2 P.M.), St. Mary's (2 P.M., Ophthalmic 10 A.M.), Cancer (2 P.M.), Chelsea (2 P.M.), Gt. Northern Central (2.30 P.M.), West London (2.30 P.M.).

SATURDAY (11th).—Royal Free (9 A.M. and 2 P.M.), Middlesex (1.30 P.M.), St. Thomas's (2 P.M.), London (2 P.M.), University College (9.15 A.M.), Charing-cross (3 P.M.), St. George's (1 P.M.), St. Mary's (10 P.M.), Cancer (2 P.M.).

At the Royal Eye Hospital (2 P.M.), the Royal London Ophthalmic (10 A.M.), the Royal Westminster Ophthalmic (1.30 P.M.), and the Central London Ophthalmic Hospitals operations are performed daily.

SOCIETIES.

MONDAY (6th).—ODONTOLOGICAL SOCIETY OF GREAT BRITAIN (40 Leicester-square).—8 P.M. Papers:—Mr. K. D. Goadby: Some further Notes on the Bacteria of the Mouth.—Mr. W. R. Humby: A Communication on Amalgam.

TUESDAY (7th).—ROENTGEN SOCIETY (11, Chandos-st., W.).—7.30 P.M. Council Meeting. 8 P.M. Papers:—Mr. T. C. Porter (Eton): Work on the X-rays.—Mr. A. A. C. Swinton: A Pin-hole Roentgen Ray Camera and its Applications. (Followed by a Discussion.)

WEDNESDAY (8th).—LARYNGOLOGICAL SOCIETY OF LONDON (20, Hanover-square, W.).—4 P.M. Council Meeting. 5 P.M. Cases and Specimens will be shown by Dr. Permewan, Dr. Tilley, Dr. Pegler, Dr. Spicer, Mr. R. Lake, and others.

DERMATOLOGICAL SOCIETY OF LONDON (11, Chandos-street, Cavendish-square, W.).—6.15 P.M. Demonstration of Clinical Cases.

BRITISH BALNEOLOGICAL AND CLIMATOLOGICAL SOCIETY (Limmer's Hotel, Conduit-street, W.).—9 P.M. Conversazione. Dr. G. V. Poore: Circumstances which Influence the Effectiveness of Climatic Treatment. Messrs. Negretti and Zambra: Exhibition of Meteorological Instruments. Dr. W. S. Hedley: Radiant Heat Apparatus.

THURSDAY (9th).—OPHTHALMOLOGICAL SOCIETY OF THE UNITED KINGDOM (11, Chandos-street, Cavendish-sq., W.).—8 P.M. Cases and Card Specimens. 8.30 P.M. Papers: Mr. P. Flemming: A Case of Retinitis Proliferans in which the Eyeball was examined after Death.—Mr. H. Spicer: Œdema of the Conjunctiva.—Mr. T. Collins: The Pathogenesis of Anterior Polar Cataract.

BRITISH GYNÆCOLOGICAL SOCIETY (20, Hanover-square).—8.30 P.M. Specimens will be shown by Mr. S. Keith, Mr. C. Ryall, and others. Dr. F. Edge (Wolverhampton): Note on a Case of Uterus Septus Bilocularis and Vagina Subsepta. Paper:—Dr. G. Bantock: Dysmenorrhœa (followed by a Discussion).

FRIDAY (10th).—OPHTHALMOLOGICAL SOCIETY OF THE UNITED KINGDOM (11, Chandos-street, W.).—Mr. P. Smith: The Etiology and Educative Treatment of Convergent Strabismus. (Bowman Lecture.)

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

MONDAY (6th).—LONDON POST-GRADUATE COURSE.—London Throat Hospital, Gt. Portland-st., W., 8 P.M., Mr. G. C. Wilkin: Anatomy of Ear (illustrated with lantern).

CENTRAL LONDON THROAT, NOSE, AND EAR HOSPITAL (Gray's Inn-road, W.C.).—5 P.M. Mr. Lennox Browne: The Treatment of Lupus and Tubercle of the Upper Air Passages.

TUESDAY (7th).—LONDON POST-GRADUATE COURSE.—Hospital for Skin Diseases, Blackfriars, 4.30 P.M., Dr. Abraham: Neoplasms.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC (Bloomsbury).—3.30 P.M. Dr. Ormerod: Lecture.

WEST-END HOSPITAL FOR DISEASES OF THE NERVOUS SYSTEM (73, Welbeck-street).—4.30 P.M. Dr. T. D. Savill: Cases of Neurasthenia and Acroparæsthesia.

WEDNESDAY (8th).—LONDON POST-GRADUATE COURSE.—Parkes Museum, Margaret-st., W., 4.30 P.M., Prof. A. Wynter Blyth: Air.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST (Brompton).—4 P.M. Dr. Wethered: Incipient Pulmonary Tuberculosis.

WEST LONDON POST-GRADUATE COURSE (West London Hospital, W.).—5 P.M. Dr. D Hood: The Symptoms of Gastric Ulceration.

THURSDAY (9th).—LONDON POST-GRADUATE COURSE.—Central London Sick Asylum, Cleveland-st., W., 5.30 P.M., Dr. Heron: Clinical Lecture.

CHARING-CROSS HOSPITAL.—4 P.M. Dr. Wallis: Demonstration of Surgical Cases (Post-graduate Class.)

THE HOSPITAL FOR SICK CHILDREN (Gt. Ormond-street, W.C.).—4 P.M. Dr. Barlow.

CENTRAL LONDON THROAT, NOSE, AND EAR HOSPITAL (Gray's Inn-road, W.C.)—5 P.M. Dr. D. Grant: Clinical Anatomy and Methods of Examination of the Sinuses of the Nose.

FRIDAY (10th).—LONDON POST-GRADUATE COURSE.—King's College 3 to 5 P.M., Dr. Wilkinson: Typhoid Fever and Diphtheria.

SATURDAY (11th).—ROYAL INSTITUTION.—3 P.M. Dr. R. Caton: The Temples and Ritual of Asklepios at Epidaurus and Athens (with lantern illustrations).

Notes, Short Comments, and Answers to Correspondents.

EDITORIAL NOTICE.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITORS," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.

Lectures, original articles, and reports should be written on one side of the paper only, AND, WHEN ACCOMPANIED BY BLOCKS, IT IS REQUESTED THAT THE NAME OF THE AUTHOR, AND IF POSSIBLE OF THE ARTICLE, SHOULD BE WRITTEN ON THE BLOCKS TO FACILITATE IDENTIFICATION.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers, not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET *should be addressed "To the Manager."*

We cannot undertake to return MSS. not used.

MANAGER'S NOTICE TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, W.C., are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

The rates of subscriptions, post free, either from THE LANCET Offices or from Agents, are:—

FOR THE UNITED KINGDOM.		TO THE COLONIES AND ABROAD.	
One year	£1 12 6	One Year	£1 14 8
Six Months	0 16 3	Six Months	0 17 4
Three Months	0 8 2	Three Months	0 8 8

Subscriptions (which may commence at any time) are payable in advance.

TYPISTS AND HEARING.

IN the May number of the *Phonographic Magazine* of Cincinnati Mr. William Whitford, the official reporter of the American Medical Association, points out that it is essential that the typist should have very acute hearing, otherwise ludicrous mistakes may occur. This is particularly the case in medical work, in which so many words with similar sounds are used. Chemosis and ecchymosis, anæmia and enema, macerate and lacerate, nephritis and metritis may be easily mistaken for each other by one whose hearing is imperfect, while change-stroke bears a close resemblance in sound to Cheyne-Stokes. This is sufficiently obvious, but it may not be so well known that the continual noisy tap, tap of the typewriting machine will impair still more hearing which may be already deficient. We know of a case of chronic middle-ear catarrh in which

the use of the typewriter had a very deleterious and destructive effect on the already deficient hearing. When this was realised the machine was exchanged for one of another make more silent in operation. But the effect of the new machine upon the hearing was nearly as great and now the patient cannot work for a few hours at the typewriter without having to pay the penalty of a diminished degree of hearing. The deafness of boilermakers and artificers who work where there is much loud hammering is well known, and though we do not suppose, as in their case, that the noise of a typewriter would damage the normal healthy ear, the case to which we refer shows that it may accentuate and increase mischief already begun. The man who can devise a silent typewriter will earn the gratitude of a progressive people.

AN IMPROVED TEAPOT.

MANY people prefer, and with good reason, a teapot made of earthenware, but tea-infusers of this kind are not always satisfactory—either the infusion will not pour out freely or else the smaller leaves find their way into the cup. Bailey's patent strainer teapot is designed to overcome this objection, the strainer being formed of a cup-shaped piece of clay perforated with a number of small holes which effectually prevent the tea leaves from getting into the teacup. In the event of the holes becoming filled up with small particles of leaves the teapot can be placed in an oven, when the leaves will shrivel up and they can be removed by blowing down the spout. As the strainer is part of the teapot there is nothing to get out of order and the invention is likely to be appreciated by all lovers of a cup of good tea. The teapot can be obtained at 32, Hatton-garden, E.C., or at the Alloa Pottery, Alloa.

A DANGEROUS PRACTICE.

A CORRESPONDENT of the *Manchester City News* calls attention to the dangerous practice, a very old one in Manchester, of throwing heavy bundles of cloth from the upper stories of warehouses on to lorries standing in the street. It is a wonder that accidents do not happen more frequently. The man on the lorry is generally on the look-out and the one above who throws the dangerous missile acquires, no doubt, some skill in the practice; but accidents do occur, and the writer of the letter gives two instances. In one, occurring the other week, "a little girl just missed death by a few inches, the bundle of cloth falling at her feet," and in the other while a man was loading goods which were being thrown from a warehouse in Hart-street "a bundle fell on him, and he is now in the infirmary, if not dead." The writer is surprised that the trades unions do not take the matter up, but they seem to think more of wages and short hours than of danger to life. No doubt, as he says, "the (calico) printers, dyers, and bleachers save large amounts at the risk of life to the public." It is a matter well worthy the attention of the city council whether or not they should continue tacitly to sanction this dangerous and unnecessary practice.

THE LADY DISPENSER.

To the Editors of THE LANCET.

SIRS,—I should be greatly obliged for any information as to the prospect for a young lady wishing to take up "dispensing." Any particulars as to facilities for instruction and nature and salaries of posts subsequently obtainable will be gratefully received.

I am, Sirs, yours faithfully,

May 31st, 1898. M.D. LOND.

REFUSAL OF MEDICAL MEN TO ATTEND.

IT is a curious delusion that a medical man is public property, bound to be at everybody's beck and call. The most stingy man, who has not paid his medical man's bill for two or three years, is apt to consider as soon as he gets into trouble that he has only to ring the "doctor's" bell to be immediately attended. The medical profession has itself to blame for this popular delusion. It has made itself so cheap that many people assume that its services need not be paid for. It is time that such a notion should be corrected. It was broached a few days ago at an inquest at Elton, where the husband of the deceased complained that the medical man applied to refused to go without an order. The witness admitted that he had not paid for some previous attendance. The coroner refused to believe that a medical man would neglect his duty. So do we. We are not arguing from any inhumanity; but we think that coroners and others do well to vindicate the profession on such occasions and to read the law to the public which expects so much of and gives so little to medical men.

"A QUESTION OF TREATMENT."

To the Editors of THE LANCET.

SIRS,—I have only just observed in your issue of April 16th under the above heading the inquiry of your correspondent "Venule." The dilatation of small veins to which he alludes is, I believe, due to the partial or complete occlusion of their affluent capillaries, such occlusion having been brought about by long-maintained poisoning of the blood stream by the products of depraved digestion and metabolism, including generally uric acid. The heightening of the colour as the result of an attack of indigestion is due to a temporary increase in the contamination of the blood. The treatment for such cases divides itself under two heads: the improvement of the circulation and the opening up of closing arterioles and capillaries, which can be best and most rapidly effected by recourse to the Schott methods of baths and exercises, and, secondly, by careful diet, the limitation of gastric fermentation, intestinal antisepsis, and the free ingestion of warm water from two and a half to three hours after the principal meals, with a view to washing out the stomach and carrying off the products of retrograde metamorphosis through the kidneys.

I am, Sirs, yours faithfully,

June 1st, 1898. W. B. T.

THE DISTRICT MESSENGERS COMPANY.

THE general manager of this company draws our attention to the difficulty often experienced by the public in obtaining the services of a district messenger boy at public places. "In most cases," he says, "this is owing to some prejudice or vested interest on the part of attendants and others." "A messenger call-box," he continues, "is in nearly every first-class hotel, club, theatre, shop, and public building of any kind, and if any difficulty is ever experienced or obstacle thrown in the way of getting a messenger we should be grateful for information given at any of our offices."

"THE LATE ARTHUR JEFFARES BARLOW."

To the Editors of THE LANCET.

SIRS,—Please acknowledge on behalf of the Barlow Fund, per DR. J. W. Moore, £1 from "Postmark" (Waterford).

I am, Sirs, yours truly,

179, Hither-green, Lewisham, S.E., May 31st. R. H. CAPPER.

L.R.C.P., M.R.C.S.—There is no precedent known to the Royal College of Physicians of London for the issue of a second diploma by the College. The request to do so has always been refused. In the great majority of cases the licence has been registered by the General Medical Council, and a certificate of registration answers all the purposes of a diploma. The Royal College of Surgeons of England also declines to issue duplicate diplomas, but a certificate can be obtained from the College that a diploma has been obtained, which certificate would always satisfy the Registrar of the General Medical Council or any other authority. The charge for the certificate is five guineas, unless it can be proved that the original document "has been destroyed or irrevocably lost by fire, shipwreck, or other accident" (Section XIX. of the College Bye-laws and Section VII. of the Standing Rules).

Determination of Sex.—Other journals have already seen the coincidence or we should have been happy to print the note.

J. R.—We do not recommend individual practitioners.

Lambda.—No.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

An original and novel feature of "THE LANCET General Advertiser" is a Special Index to Advertisements on pages 2 and 4, which not only affords a ready means of finding any notice, but is in itself an *additional* advertisement.

Advertisements (to ensure insertion the same week) should be delivered at the Office not later than Wednesday, accompanied by a remittance.

Answers are now received at this Office, by special arrangement, to Advertisements appearing in THE LANCET.

The Manager cannot hold himself responsible for the return of testimonials, &c., sent to the Office in reply to Advertisements; copies only should be forwarded.

Cheques and Post Office Orders (crossed "London and Westminster Bank, Westminster Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Office, 423, Strand, London, to whom all letters relating to Advertisements or Subscriptions should be addressed.

THE LANCET can be obtained at all Messrs. W. H. Smith and Son's and other Railway Bookstalls throughout the United Kingdom. Advertisements are also received by them and all other Advertising Agents.

Agent for the Advertisement Department in France—J. ASTIER, 8, Rue Traversière, Asnières, Paris.

THE LANCET

SPECIAL SUPPLEMENT

IN SUPPORT OF THE

METROPOLITAN HOSPITAL SUNDAY FUND

Published in aid of the Appeal to be made on Sunday, June 12th, 1898.

THE PUBLIC AND THE LONDON HOSPITALS.

THE Metropolitan Hospital Sunday Fund has now been established so long that only those among us who are verging upon middle-age can clearly recall the days when it did not exist, while this is the twelfth representation made by THE LANCET on its behalf to a public wider than the professional circle of our usual readers. Again it falls to our lot to emphasise, if we can, the appeal which will be made on June 12th from almost every pulpit in the metropolis and from very many beyond its boundaries to the generous, whether rich or poor, and to add for the information of those who care to consider the matter in detail statistics which we believe to be eloquent and which we know to be unimpeachable.

THE CONTRIBUTIONS OF THE VERY POOR AND THE VERY RICH.

Very likely to many of those who for the first time glance at figures relating to the Fund, and who see that last year the sum collected amounted to £41,003 13*s.* 1*d.*, the first thought which will occur will be to the effect that something over £40,000 is a very handsome sum and that it shows wonderfully warm-hearted and universal sympathy with a thoroughly deserving object. From that opinion let us offer a respectful but firm dissent and let us proceed to justify our view in detail. It will be conceded upon the briefest reflection that the hospitals which are aided by the Hospital Sunday Fund constitute the one object of subscription, which not only appeals equally to all sects and varieties of religious belief to be found in a city famous for the number and diversity of its creeds (a general appeal on behalf of the poor does that much), but of which also it can be said that its benefits are reaped in various degrees and ways by all sections or ranks of the population, whether rich or poor, whether directly aided or not. In case we may appear to assume too readily that our position on this point is unassailable we will return later to defend it, but for the present we will proceed to point out that leaving aside minuter fractions as of inappreciable importance the yearly contribution per head of the metropolitan population amounts to the inconsiderable sum of 2¼*d.* We published this calculation last year, but it is a picturesque fact which will bear repetition. We took as a sample year 1890, because in that year the individual donations, the large gifts ear-marked with the names of the givers, amounted to only £3991 out of a total of £42,814. This showed the collections by offertory, the anonymous gifts of the general givers, at a little under £39,000, a larger sum than that contributed by them in many years when the total has been a good deal higher. Taking this, then, as the sum given by the general population of London, and the number of that population in 1890 to have been about 4,200,000, it will be found that the sum contributed individually amounted to less than 2¼*d.* Now we are quite aware that it may be said in reply that the 4,200,000 include the poorest of the poor, the women and the children, and that for hundreds of families 2¼*d.* per head would be an impossible annual contribution; but at the same time it is obvious, though not too obvious to be pointed out, that there are thousands of families to whom a much larger sum would mean a small percentage only of money usually spent upon self-indulgence, even though the contributors would justly claim to be among the necessitous of our fellow citizens. Let us leave out of the question the odd 200,000 given in the figures we have quoted as being the number of the population of London, or rather of the conglomerate district to which the objects of the fund appeal, and having thus got rid of one-half of what has recently been known as the "submerged tenth," take the million that comes next above them in the scale of poverty. It would, we may be told, be utterly unpractical to suggest that of this million, which, indeed, includes women and children, one-fourth part should contribute on the average—say—1*s.* per annum to the Metropolitan Hospital Sunday Fund. Unpractical it may be, but we cannot leave the suggestion without pointing out four facts. Firstly, that we are writing of those who contribute voluntarily to no other charitable or philanthropic work or do so to an infinitesimal extent. Secondly, that of the fourth part of the million we have imagined practically all probably earn *something* in the course of the year, while very many of them are in receipt of substantial wages. Thirdly, that the 1*s.* which we have taken as a remotely possible sum may seem preposterously large and may have been chosen by us simply because it was a convenient one to name for the sake of argument, but that at the same time it fairly represents no more than the price of 2 oz. of tobacco added to the cost of a couple of quarts of beer. What proportion 2 quarts of beer and 2 oz. of tobacco bear to the annual *average* consumption of those luxuries by the least poor quarter of the humblest million of the metropolis (omitting the 200,000 as above) we leave to those who care to ascertain the necessary figures and make the necessary calculations. But although we are ready to admit that such a contribution is not likely to be made we must point out that the persons making it would be those who, in themselves, their wives, and their children, benefit most largely and most directly from the hospitals which wealthier citizens have planted in their midst. And this brings us to the fourth fact—namely, that a contribution upon such a scale as we have imagined would exceed in aggregate result that made by the same million persons at an average rate of 2¼*d.* per head by more than £3000.

Turning at this point from the poorest to the wealthiest section of the community—a section which includes only a few thousands or perhaps a few hundreds, whose names are in some instances household words and in some are completely unknown to most of us—we are driven to the conclusion that a large portion of the Metropolitan Hospital Sunday Fund is received from the surplusage of large incomes. We have referred to the special donations to which the names of the givers are attached, and details of which lie before our readers. In 1890, as we have said, these special donations did not bulk largely. How great the value of these noble gifts may be and their importance with relation to the whole Fund can be seen from the figures of 1895, when the total sum subscribed amounted to the unusually high figure of £60,361. Of this total a few pounds less than £22,000 were special donations, and of these £10,000 were given by one financier and the circle immediately associated with him. When therefore we point out that 1895 was the year of what is known as the "South African Boom" it will be seen that the Hospital Sunday Fund may find itself depending to a great extent upon surplus wealth, liable to fluctuation in its amount, and that even in the case of the extremely rich the subscriptions do not constitute a voluntary rate levied upon themselves by those who could do so with least effort and with most conspicuous results; for in the year 1895 the nameless givers contributed a few hundred pounds less than in 1890. The Fund has no reason to complain of the generosity of the wealthy; when the figures are considered the conclusion most naturally arrived at is that the wealthy contribute a liberal share to the support of our hospitals, for it must be borne in mind that over and above their contributions to the Metropolitan Hospital Sunday Fund this is the class from which large sums in gifts and legacies annually accrue to individual hospitals, gifts without the aid of which these hospitals would not be able to carry out their work.

THE CONTRIBUTIONS OF THE GREAT INTERMEDIATE CLASS

When, however, we come to consider the bulk of the population of London, the vast number of persons whose pecuniary position lies between the extremes we have been considering, and whom we can subdivide further indefinitely, we find that while this class contains in its upper and lower divisions a large crowd of subscribers to charity who pay with more or less regularity and remain anonymous it must at the same time be said of these that their contribution to the Metropolitan Hospital Sunday Fund cannot from the figures before us be held worthy of the great body of citizens which is responsible for it. We are writing, be it remembered, for all creeds, on behalf of a Fund mainly collected upon the day held sacred by the Christian religion, but appealing at the same time to all varieties of religious thought and denomination, and on behalf of a Fund the object of which is to aid institutions which not only are of benefit but are actually necessary to the bodily welfare of all members of the community, whether rich or poor, although the boons which they confer immediately upon the poor renders them primarily and more conspicuously charitable. What wonder then that we say that a sum of £40,000, even if it represented the gifts of the "intermediate" citizen only, is inadequate, whether regarded as his contribution to the needs of his poorer brethren or to the aid of the science to which he himself appeals when in sickness. As we have said, £40,000 is not the contribution of the "intermediate" citizen, but even if it were what would it represent? Half-a-crown per head from 320,000 persons, the sum which a clerk on a comparatively small salary spends cheerfully in any week of the year on a seat at a music-hall or the pit of a theatre. We neither urge nor deprecate self-denial in this behalf: we simple wish to indicate that what some would say was a large sum for persons in a comparatively humble rank of life to give is spent by them unquestioned and frequently upon pleasure, while there is another point to which the question of self-denial, even if we do not fully go into it, must of necessity lead. If the hospitals are to be supported only from the surplus which remains to a fortunate few after they have provided liberally for their necessities and equally liberally for their luxuries, what is to happen in years when some unexpected general shrinkage of incomes occurs? Most of the hospitals of London while doing their noble work are living from hand to mouth; more, they are in a pecuniary position which in individuals or trading corporations would be tersely described as bankruptcy. What is to happen to them in years of bad trade? We are living in a time of political uncertainty which is reflected in the dealings of the markets in which we buy and sell and there are very many of all classes who even now are suffering from recently diminished incomes. Does it not behove all who have the means and who, as a rule, do not contribute largely, or perhaps at all, to charitable or religious enterprises, who possibly spend little or nothing in the year upon others, to endeavour to contribute a gift which is substantial and which represents maybe a small pleasure foregone, an inconsiderable fraction of one per cent. upon the yearly income? And does it not behove them to do this for two reasons, firstly, in order that the hospitals may be put in a position of comparative financial soundness as soon as may be, and, secondly, in order that their income may not only be increased but may be more stable than one proceeding largely from funds which are only available in seasons of plenty can ever be?

THE QUESTION OF STATE AID.

But, say many, when the matter is approached from this point of view, if you wish to place the hospitals upon a sound financial basis why not aid them with State or municipal funds? Look at the sum which a fraction of a penny on the income-tax will produce, or, as it is rather a municipal and local matter, consider that under the Public Libraries Act of 1892 a rate of a penny in the pound may be levied in any district which chooses to declare itself in favour of a free library, so that all citizens residing in that district shall contribute their fair proportion to the cost of it. Consider the number of districts in London and its neighbourhood that cheerfully pay this rate and maintain libraries in order that, as the opponents of free libraries cynically put it, a minority of the inhabitants may enjoy all possible facilities for studying the betting and racing news. Can it be for a moment said that these districts, and many more than now avail themselves of the law to obtain free libraries, would not cheerfully see their rates added to by a far greater amount than the penny referred to, if such institutions as the London hospitals, of which Londoners are so justly proud, were to be the recipients of the income thus provided? Again, an alternative or subsidiary plan to State support is to aid the hospitals by taxation levied upon places of amusement, such as theatres and concert halls. We have just instanced the amount spent by a youth of small income upon his seats in the pit as a standard whereby might be judged his subscribing powers to charity; and it was in our mind to suggest that the price of a couple of stalls would not be a large sum to expect from many who fill seats in the best part of the theatres and music-halls perhaps many times during the run of a popular piece as their tribute to the funds of the London hospitals. When, however, it comes to *taxing* anybody or everybody by force of law, for the sake of supporting that which has been originated by voluntary generosity and kept alive by the same agency for so long, a wise man may well pause and consider. We suggest as food for his reflection the following points. They have, of course, been urged before both in our pages and in those of our contemporaries.

In their origin and in their continued existence our hospitals individually have ever represented the liberality of those who have the good things of the world towards those who have not. We have suggested that the poor might reasonably be expected to help, but we are well aware that it is the richer class, the class which is so well endowed that its members would not be admitted either as in-patients or out-patients to the benefits of any hospital, that must always contribute the lion's share. If once the compulsory system were introduced, even to subsidise, it would begin by diminishing and end by destroying the voluntary system altogether. Those who found themselves taxed for the hospitals would gradually cease to subscribe voluntarily, some because they would not care to pay twice over, others because they would think that their subscriptions were not needed for a State-aided institution, others because they would hold that what the State or the township did at all it ought to do thoroughly and bear the whole cost, where it bore a part, and also interfered with the control. This last consideration is the most important one of all. Where the State or the municipality found the funds, there it would necessarily claim to raise its voice in directing the spending of them. And so instead of institutions ruling themselves independently under the

guidance of their own wisest and most experienced members, ever ready to detect and censure any real misfeasance, we should have branches of a Government department aided in their administration by local municipal wisdom. The change from the present system to one of red-tape and schedules no well-wisher of science or of the suffering poor would wish to see. Red-tape is not a ligature employed in our wards and we hope it never will be. What may be the result of permitting the interference of local municipal authorities in scientific institutions has been shown over and over again. Men who are possibly sensible business men and capable as such of sound and economical management where the purchase of necessaries and the keeping of accounts are concerned are not to be expected to prove sound judges of scientific questions and of medical procedure. They are exposed to influences unfelt by professional men which guide them wrongly to the detriment of others besides themselves. But there is another equally grave objection to the proposal of State-aid. What is to be the limit within which State-aided or rate-aided medical and surgical relief is to be afforded? The question has arisen at times locally, and on a small scale, but if the experiment were to be tried in London the consequences would be neither local nor small. We have now a national and State-aided system of education. There is no limit imposed within which its benefits are conferred. It has naturally been thought that it is illogical to compel everyone to help in the maintenance of schools and to reserve to one class only the benefits of the schools themselves. On the contrary, a limited class are so aided that education can be obtained free up to a certain point, while no child who comes and pays all the fees demanded is refused admittance on account of the pecuniary position of the parents. Some of the classes for whom the national education system was not originally designed avail themselves of this. Clergymen and others of small means but good social position are known to pocket their pride and send their children to the village school. They get thereby an excellent education for their offspring, they feel that they are entitled to it, and that by accepting it they are also setting to others a good example; they are, in fact, showing their appreciation of its benefits. On the whole, however, the social standard of the children educated in the public elementary schools of our towns and villages remains pretty much where it was before. The farmer and the small tradesman do not care to send their families to mix with those of their labourers and workpeople. They despise those that do so and feel that they would lose caste by putting themselves on their level as long as they can afford to pay to have their children educated in schools where the fees are higher and the company more select. But no one has ever observed this unwillingness to take advantage of that which was designed for the good of those unable to pay the full price for themselves when it was a case of saving a medical man's bill by having recourse to treatment at a public hospital. Both in the in-patient and out-patient departments constant care has to be exercised to prevent persons from obtaining relief who could well afford to pay for it in the ordinary way in their own homes. The difficulty of dealing with the applications of such persons would be enormously increased if they thought they could claim as a right that to which they were compelled to contribute, while if once it were admitted that the right was theirs the whole character of our hospitals would at once be changed. They would be charitable institutions no longer, but would become huge state or municipal dispensaries for the community at large, while the only check on the increase of their dimensions and of the taxation necessary to maintain them would lie in reducing the comforts supplied and the general scale of their administration to the level now maintained in our workhouses or prisons. What the effect of either of these alternatives would be we need not discuss. It is enough to say that the sufferers would inevitably include the general public, the patients, and the medical profession, an opinion in which medical men are not alone. In 1890 a Special Committee appointed by the House of Lords sat to investigate the whole subject of the administration and accommodation of the metropolitan hospitals and issued an elaborate report as the result of deliberations extending over two years and assisted by a large mass of expert evidence. This report, it is true, recommended improvements of organisation tending to knit the various institutions into one coöperating whole, but the Special Committee which made the recommendation, while dealing with possible improvements in the manner of dealing with the resources of the hospitals spoke no word of criticism upon the manner in which they are obtained —no word of praise of any scheme for throwing the hospitals upon the rates.

THE HOSPITAL AND THE COMMUNITY.

The system we have and which we are proud of is one which has built up for us a system of national hospitals given to and maintained for the nation by the voluntary act of the nation's individual members. If only the funds provided can be in any way made sufficient for the work it is evident that the voluntary method expressing the gratitude and benevolence of the community at large is the right one, the one which does honour both to the giver and the recipient. These two motives, gratitude and benevolence, personal thankfulness towards a system beneficent to the giver himself and goodwill towards that which aids suffering fellow-men, have made the hospitals what they are, and these two motives once thoroughly aroused in the heart of the people of our metropolis should maintain the hospitals without difficulty in the noble position they have won. Each motive should appeal in varying degrees and for various reasons to every class. The cause of gratitude for those who are givers only, though less obvious than in the case of those who have been, or are liable to become, inmates or out-patients themselves, is none the less very real. Take the case of the millionaire who, crushed in a sudden accident to his carriage, lies unexpectedly at the doors of death. Should the catastrophe occur near a hospital and should his condition be such that after his admission for immediate treatment his removal is undesirable he remains an inmate till he is convalescent, with skill as great as any he could summon to his private bedside at his command, and whatever aid is rendered to him is given with no claim for remuneration beyond that which the injured man's sense of gratitude may dictate. If, on the other hand, he is taken to his private residence the medical man summoned to consult beside his pillow may be the same man who would have dealt with his case in the hospital, whose skill has been acquired within hospital walls, and whose name would have been unknown to millionaires had not it been first known favourably to the poor and to his colleagues at his hospital. It is more evident perhaps in surgery than in medicine, but it is none the less true of both, that no body or combination of rich men, however powerful or however wealthy, anxious to retain the highest skill for the use of its members, could do so or would ever think of doing so, to the exclusion of the humble. The medical attendant of the rich man who has been injured in a carriage accident could have gained no experience in dealing with such injuries if he had not for years been in daily contact in his hospital with the mass of sufferers to whom crushing and maiming are among the common risks of their everyday occupations. In like manner in the medical wards of our hospitals opportunities are given for systematic observation, record, and comparison impossible in private practice, on which account it is not too much to say that the higher the degree of knowledge and dexterity exacted by the rich man of his medical attendant the greater reason has he to be grateful to our hospitals which offer such skill to be retained should his needs require it. We urge this point of view upon those rich men who see no other possible motive than benevolence to prompt the gifts of their fellows to the Metropolitan Hospital Sunday Fund and who for themselves claim that they find fields for their own benevolent impulses elsewhere. To the mass of citizens of greater and smaller degrees of wealth, whose medical attendants do not, as a rule, include members of the permanent staff of any hospital, we desire to point out that in their need they turn to those members of the medical profession who may exercise their skill in a circle of private patients, but who must have first acquired it through the medium of hospital appointments or hospital tuition. The mass of citizens do not, save on exceptional occasions, require assistance other than that of the general practitioner who acts as their family adviser. They pay him fees commensurate, as a rule, to their own condition of life rather than to the services which he renders to them, and from the poorest he receives a fee which cannot in any sense represent the time, trouble, and skill which he has bestowed on the case in question. Let us point out that it is only the facilities afforded by our hospital system which enable the general

practitioner to obtain the training that he does during the time and at the price that the average young man can devote to preparation for his profession. The Metropolitan Hospital Sunday Fund is collected mainly in the metropolis and is for the hospitals situated therein, but dwellers in the country would be badly off for medical advice if the schools of the metropolitan hospitals only admitted students pledged to practise within the area immediately surrounding them, while the London hospitals welcome daily patients from all parts of the United Kingdom. Dwellers in country districts have their local hospitals to assist, but in justice to what they owe to London they should not forget London's needs. We have spoken of the gratitude of the richer classes in prompting them to subscribe to hospitals; let us turn to the poorer class—to that class which avails itself of hospital relief and for which hospital relief is primarily intended. To exact a fee from such would be impossible, to demand it would be to rob the hospitals of their charitable character; but at the same time no one who watches from an outside point of view the crowd which waits each morning before the entrance to the out-patient department of a great hospital can fail to see many in it to whom, or to the family of whom, a few pence could hardly be a matter of serious consideration. He is surprised perhaps to see some of them there at all waiting for charitable relief, and he cannot help hoping that when they get it, if the hospital admits them to it, they are duly grateful.

STATISTICS OF HOSPITAL WORK IN LONDON DURING THE YEAR 1897.

TABLE I.—GENERAL HOSPITALS.*

* We reproduce the term "General Hospitals" as employed by the Council of the Metropolitan Hospital Sunday Fund.

SOME CURIOUS CALCULATIONS.

What do the figures say? Let us take a recent year at random; 1896 will do as well as any and the sums look easy to calculate in the table which refers to the work of the special hospitals, and the moneys assigned to them in that year by those who managed the Hospital Sunday Fund. The precise sum distributed to them—and 57 hospitals divided it in the proportions assigned to them—was £13,662, while the number of visits made by out-patients was (as shown by estimates in some cases combined with precise returns in others) 1,310,885. Let us leave out the odd hundreds in the one case and the odd thousands in the other, and we have £13,000 for 1,300,000 visits. One sovereign (or a little over, in point of fact) for every 100 visits represented the gratitude not of the patients treated, but of the whole of London for the boon supplied. £1 per 100 amounts to a little more than 2½*d.* apiece, so that if each patient *had* chosen to contribute that sum for every visit made he who attended once would have given little more than the estimated average gift of a Londoner who has personally received no relief; while the whole amount so raised would have nearly equalled that contributed by the whole of wealthy London to its special hospitals through the Hospital Sunday Fund, 1,300,000 times 2½*d.* amounting to £12,500. Figures such as these help one to realise that great as is the value of the Metropolitan Hospital Sunday Fund to the institutions in whose behalf it is raised and warm as is necessarily their appreciation of it, it really only plays a very small part in providing for their daily expenditure. This we say, of course, not from any wish to depreciate the Fund, but solely on account of our desire that it may play a larger part, a part more worthy of the care with which it is organised and the objects which it benefits. We spoke of the man who glances for the first time at the annual totals and is at once struck with the idea that they are large from the point of view of the givers. Let us point out to him how inadequate they are from the point of view of the receivers. We will not compare them with the amount of the indebtedness of the hospitals or with the income of each institution from other sources, as it is not pretended that the contribution of the Fund is all each hospital has to live upon. Taking two years at random, 1888 and 1896, we find that in the former the amount which the Fund could assign to the hospitals, as distinct from institutions, dispensaries, &c., was £34,135, while the number of general and special hospitals which qualified to receive donations was precisely 100. In the later year, a year when the Fund rose to a higher figure than usual, though not as high as in 1895, the total distributed to hospitals was £39,199, but against this increase the number of the institutions assisted was 116 instead of 100. When we point out that, according to the best obtainable statistics, in 1888 the general and special

hospitals, leaving cottage hospitals out of the calculation, took in 71,000 patients, and in 1896 took in 84,130, it will be seen that the Fund contributes just about 10*s.* per annum towards the board, lodging, and medical attendance of each in-patient relieved, it will be seen from the figures below, which demonstrate the progress of the Fund, that although a glance at the column of totals shows an increase in money subscribed as between 1889 and 1896, it cannot be reckoned as an instance of steady and confirmed progress; whereas there is an increase in the number of those seeking hospital relief, which must be constant both now and in the future, because it principally depends upon the increase of the population of London and its rapid growth at all points towards its suburbs. The increase of 16 in the number of hospitals partaking in the fund may partly be accounted for by the fact that each year more hospitals by care and good management bring themselves within the conditions enforced by those who distribute the grants.

Progress of the Metropolitan Hospital Sunday Fund.

[1] In 1884 £4500 was received from the managers of the International Health Exhibition.

[2] In 1885 a special donation of £1000 was received from Dr. James Wakley, Editor of THE LANCET.

[3] In 1886 a further special donation of £1000 was received from Dr. James Wakley.

[4] In 1887 a legacy of £1000 was paid by the executors of the late Dr. James Wakley.

[5] Including legacy of £1003 14s. from the executors of the late Mr. Thomas Crouch.

[6] In 1891 donations of £5000 from the late Duke of Cleveland, &c., and £1000 from Sir Savile Crossley, Bart., were received.

[7] In 1892 Sir Savile Crossley gave a further £1000; and a legacy of £105 was paid by the executors of the late Dr. H. E. Price of Brighton.

[8] In 1893 Sir Savile Crossley gave a further donation of £1000.

[9] In 1894 a legacy of £5000 (less duty) was paid by the executors of the late Mr. W. J. Whitaker, and Sir Savile Crossley gave a further donation of £1000.

[10] In 1895 Messrs. Barnato and Friends gave a donation of £10,000; £3400 was received from the Stock Exchange through Messrs. Pym, Vaughan, and Co., and Messrs. Burdett and Harris; Lord Iveagh gave a donation of £1000; Sir Savile Crossley gave a further donation of £1000; and Mr. J. B. Robinson gave £1000.

[11] In 1896 Sir Savile Crossley gave his sixth donation of £1000, and legacies were received from Mr. John Smith of £500 and Mrs. May Evans of £172 9s. 4d.

[12] In 1897 Sir Savile Crossley gave his seventh donation, amounting this year to £500.

THE FIGURES FOR 1897.

Let us now examine the figures compiled with reference to the Metropolitan Hospital Sunday Fund and its distribution in the past year (1897) and with reference to the work of the London hospitals during the same period, and we shall be able to see if they continue to bear out the deductions which we have hitherto made from the statistics of previous years taken at random. In the first place with regard to the amount collected. This we find from the balance-sheet of the fund was £41.003, as against £46.035 in 1896, £60,361 in 1895, and £40,379 in 1888. If we take two more dates, also recent ones—1891, £45,330; 1893, £39,290—we shall not add very much to our argument, but we shall possibly make it a little clearer that the Hospital Sunday Fund does not steadily increase with the growth of the population of the metropolis nor does it increase more rapidly in proportion than the population as it becomes better known. On the contrary, it fluctuates with so-called good years and bad, in a manner possibly natural, but none the less calculated to cause anxiety to those who have the welfare of the hospitals at heart. In urging, therefore, its claims upon those who have not contributed before, either because to do so would have been an act of self-denial or because they have not realised its claims, we have endeavoured to suggest the Hospital Sunday Fund as the subject of a small—very small—self-inflicted taxation, in the hope that the act of self-denial may be made annual and may occur even where the superfluity of income ceases. Again, taking the number of hospitals assisted in 1897 and looking to see whether they have increased in number, as from previous experience we had reason to expect they would, we find their number returned as 120, as against 116 and 100 in 1896 and 1889 respectively. This means that after deducting for other institutions there were last year £37,262 to be divided among 120, as against £39,199 in the previous year among 116. We should like to see the incidence of increase and decrease reversed—the Fund larger annually and the number of applicants smaller owing to the increased prosperity of individual foundations. So much with regard to the diminished receipts of last year and to the increased number of hospitals aided; let us turn to the amount of relief dispensed. The general hospitals have had one more added to their list, which naturally does not increase rapidly; let us strike out this one, the Mildmay Mission Hospital, and the figures relating to it. We then find that the general hospitals last year received £21,345 as

against £22,152 in 1896, took in 56,276 in-patients as against 55,514 in 1896, and dealt with 1,893,435 visits of out-patients as against 1,584,735 visits in the preceding year. From this it will be understood that the same group of institutions found their sphere of utility widening last year, as it has widened before and will again, but found a diminished recognition of their needs on the part of the public to which the Metropolitan Hospital Sunday Fund appeals.

GIVE, GIVE, GIVE.

What is that public? The Fund is primarily connected with a collection made in Christian places of worship on the first day of the week. But it excludes no sect or religious denomination of the Christian or any other religion from its appeal any more than the hospitals which it benefits exclude any sect or denomination from their wards. There are many, too, who, not from any motive of sect or denomination, will not hear the claims of the Hospital Fund urged from the pulpit of any place of worship on Hospital Sunday and to this class belong some of whom it least behoves to ignore the appeal, and who are best able to respond to it. To the golfer and the cyclist no one grudges his game or his ride, and parenthetically we may remind each of the support which the medical profession have always given to the national habit of healthy athleticism prevalent in this country. We do not wish to discuss the price of bicycles or to unduly remind the devotees of the one game which appeals to young, middle-aged, and elderly alike of the amount of their club subscriptions, their railway fares, or the expenses incidental to a round of the links, but we do desire to recall to the memory of each that it is for the sick and the maimed that we appeal upon Hospital Sunday and we do ask him as he hurries in pursuit of health not to forget those who are deprived of it and whose only hope of regaining it lies in the generosity of their better-endowed fellow men. A late well-known head-master appealing, not for the first time, for funds for the completion of his school chapel once humorously retranslated "Bis dat qui cito dat" "He who subscribes early gives a second subscription." That is not our point of view here; we do not complain of the generosity of the bulk of those who give annually already, we only urge them to continue their gift and express a very earnest wish that the liberality of Londoners may some day become as universal every time the appeal is made as it is now open-handed where the appeal goes home.

THE PRINCE OF WALES'S HOSPITAL FUND.

We ought not to close this article without reference to H.R.H. the Prince of Wales's Hospital Fund in support of the metropolitan hospitals, to which we made reference at some length last year by way of speculation as to its probable effect upon the Hospital Sunday Fund. The individual donations to the Prince of Wales's Fund during 1897 ranged from 6*d.* to £12,500 and the subscriptions from 1*s.* to £1000 a year. The total sum paid into the credit of the Fund during the eleven months ended Dec. 31st, 1897, was £227,551 12*s.* 5*d.* Of this amount there were contributed in annual subscriptions £21,443 1*s.* 5*d.* After distributing £56,826 among the hospitals there remained a sum of £167,020 for investment. The total expenditure under all heads, including salaries, office and other expenses, and advertisements, amounted to £3704. It is quite possible that the falling off in the receipts of the Hospital Sunday Fund as between 1897 and 1896 may have been, as we expressed a hope that it might not be, due to the rivalry of so important a competitor; it is also possible that the needs of the hospitals and the importance and merits of the organisation which distributes the Hospital Sunday Fund have been brought before the notice of some who have hitherto been indifferent, and that ultimately the Hospital Sunday Fund will be the gainer. Of one thing we are certain. His Royal Highness would deplore the fact that his Fund should interrupt the channels of other charities. He has designed to honour his mother's Diamond Jubilee by establishing his Fund in aid of the metropolitan hospitals. If the Jubilee Fund detaches subscribers from the Hospital Sunday Fund the deserters pay their Prince and their Queen no compliment whatever. The objects of each Fund are the same; there is no rivalry, while the needs of the London hospitals would absorb the contributions of two more Funds as large and still be found thirsty.

SUMMARY OF TABLES.

—	Hospital Sunday Fund award.	In-patients.	Relieved.	Cured.	Convalescent homes.	Remaining under treatment.	Died.	Out-patients' visits.	Accidents and emergencies

Dispensaries	1,723	—	—	—	—	—	—	1,182,838	—
Total	£39,708	114,322	39,120	58,042	8,419	7,092	6,885	4,418,704	325,735

In the following sketch we have tried to picture one situation, and not the most sensational, which would commonly arise were London without these noble institutions, the growth of which and of their usefulness in the memory of living man has been so enormous, and the total absence of which from our midst is not, of course, even with the aid of the most vivid imagination, realisable.

THE MISSING WORD.

AN INCIDENT IN LONDON WITHOUT ——.

Joe Smithson, navvy, came up to London in search of employment. He had had a bout of work on a new light railway in Kent, where, being better educated than his fellows as well as a strong man, he had been made foreman of a gang. Then an old enemy had wrestled with him and overcome him—without any very gallant resistance on his part—and his fall had carried him back to the position of a simple digging workman under a foreman he despised and another bout of liquor had been followed by his discharge. Wherefore he was sitting in a public-house with a man whom he had picked up in the street. The change from a sovereign after paying for drinks for two represented his worldly possessions beyond what were contained within the knotted corners of a blue pocket-handkerchief, and he had not yet found a lodging. The man he had picked up was a decent sort of fellow with a quiet thirst and a somewhat forcible way of expressing himself but speaking seldom withal, and Joe Smithson sat with his legs crossed and his arm hanging over the back of the bench they were on and did the talking himself. He was fond of talking, for he was a man who had read a little, who had attended lectures, and who had once gained a prize in a missing word competition which had kept him and his family in plenty rather than peace for six idle weeks.

"Blow 'orspitals," said Joe Smithson, "it wouldn't make no difference if there weren't no 'orspitals."

A friend of his working as foreman of a gang on the Central London Railway had been removed to St. ——'s Hospital the day before suffering from the kick of a pony which had resented his riding down the tunnel on its back, and Joe Smithson had thereby lost a chance of work; but as the friend was being well cared for without expense to himself it was not very easy to see why his fate should lead to the denunciation of hospitals—except that Joe had been denied admission during the dinner-hour. The stranger from the street made a suggestion to that effect, but Joe Smithson only said "Blow 'orspitals" again with more emphasis than before and declined to stand another drink unless the other agreed with him.

"Where'd we poor chaps be without 'em?" asked the man from the street as a parting shot, declining to be persuaded and rising to go.

"Where we are now!" retorted Joe Smithson to himself, and he continued muttering as he hung half over the back of the seat; "where we are now, if we didn't play the fool; and if we did, what matter?" From which it will be seen that Joe Smithson was not in a condition to reason clearly.

So he ordered something more to drink, and then it seemed to him that he, too, rose, forgot his worldly belongings in the blue pocket-handkerchief, and went out.

* * * * *

Five minutes after leaving the public-house Joe Smithson, lurching across the Edgware-road, collided with a horse which was being driven rapidly northward, and the horse being firmer upon its four legs than he was upon his two went on its way without any important deviation, the wheels of the cart passing after it along the right side of Joe Smithson lying prostrate and over his right hand and right foot. The driver, presumably seeing no advantage to be gained by waiting and many excellent reasons for not doing so, drove off at an increased speed; at all events, Joe Smithson saw him no more. He found himself later sitting on the pavement and leaning against an area railing with a dim recollection of having been helped thither by the policeman who formed part of the crowd in front of him. He fancied that he had somehow hopped there, supporting himself partly on the policeman's shoulder and partly on his left leg. His right foot and hand were useless and in addition hurt him considerably.

"That's right," said the policeman in a tone of pride and possession as Joe Smithson opened his eyes and stared at him; "better now, eh Shall I fetch a doctor"

"Fetch a doctor!" exclaimed Joe, finding his voice—he had only groaned hitherto; "why don't yer bring the College o' Surgeons in a wheelbarrer?"

"Anything you like," said the policeman, who evidently did not understand sarcasm, "only make up your mind."

"Mind!" ejaculated Joe Smithson, "there ain't two minds about it; I'll run to a cab if there's one handy and go to the ——" A twinge of pain in his foot interrupted him as he moved and he ended with a groan.

The policeman blew two toots on his whistle and a hansom pulled up by the kerb. A hansom cab is about as difficult a vehicle as could be devised to get a disabled man into, particularly when he weighs 16 st. and is built correspondingly, but there were willing hands in the crowd.

"Where to?" asked the policeman as the cabman looked down through the trap for orders.

"Why, the nearest ——," said Joe Smithson, "I've forgot the word—you know."

"Doctor," suggested the policeman, sitting down beside him.

"No," said Joe Smithson. "Where Bill Harding's gone, and they won't let you see him 'cos 'e's eatin' 'is beef-tea for dinner; St. ——'s ——"

"Church," suggested the policeman.

"No churches for Bill," answered Joe Smithson, almost laughing at the thought. "I means where they boards and lodges and doctors you for nothin', an' the young women wear white caps, an' ——"

But the policeman did not seem to understand and was taking matters into his own hands. "There's Dr. Zealous round in the next street," he muttered, giving an address to the driver.

When the cab stopped a grey-haired, well-dressed gentleman was coming down the flight of steps from a front door which had a brass plate on it and walking towards a brougham which stood in front of it. He recognised the policeman and stepped up to the cab.

"What have we got here?" he asked briskly.

The policeman explained and the doctor stood on the step of the cab and passed his hand quickly over Joe Smithson's bruised and blood-stained hand.

"There's nothing much in it," he said. "Just some bruising. You must take him somewhere else."

"What, you won't do anything for me, then, governor?" asked Joe, setting his teeth against the pain.

"My good man," said the doctor, "I have a large practice to attend to. You had better go home and send out for somebody."

"Ain't got no home," said Joe Smithson gloomily.

The whole thing puzzled him. He was quite conscious now but could not make matters out.

"Try the workhouse," said the doctor to the policeman.

The policeman shook his head. "They say they'd want room for thousands if they took them in like that," he explained. "The workhouses only look after the people that are taken ill when they are in them."

"But isn't there a place," asked Joe Smithson, "where they take in poor chaps like me that get hurt in the streets or lets them come to be doctored and then go home? a place people subscribes for? What do they call it? A ——"

But the old gentleman was walking rapidly towards his brougham.

"No," he said, turning his head as he did so and speaking in smooth, polite tones, "there is no such institution that I know of; but now you come to mention it I quite admit that there ought to be. Constable, why not take him to Mr. Chiron's Academy for students?"

"Oh," groaned Joe Smithson five minutes later, "where is it that they do it all for nothing and the nurses wear them white caps? Where can it be? I've clean forgot the word."

"They'll do a good deal for you here," said the policeman drily, as the cab drew up before a doorstep on which two young men were standing, "but you'd better stop that about missing words and white nightcaps. I'm going back to my beat." He spoke a few words to the young men by way of introduction to Joe Smithson and the history of his case and then left them.

"If you will come in, my man, we will do what we can for you," said one of them. They helped him out of the cab kindly enough and as they were strong young men it was easier work than getting into it had been. They also paid his fare, saying something about Joe wanting all

his money for board and lodging if he were to be laid up for long.

"There's the foot, too; we must not forget that," said one of them after they had got him inside the house and while they were bending over the hand—but they never arrived at examining his foot; what they did to his hand hurt him so much that he drew it back from them and exclaimed fiercely that he did not believe that they knew their trade.

"My good man," said one of them, "no one could touch a hand in that state without hurting you and we are doing our best to relieve you."

"You both of yer look very young," said Joe Smithson, sullenly. "Ain't you bin to no ——— ?" Again the word failed him and he paused, weakly groping for it in his memory.

"We may be young and we may be jolly green," said the younger of the two cheerfully; "but if you are going to make a favour of letting us look at you you'd better go; you may think yourself and your case interesting but you are not absolutely unique, you know." Joe Smithson stood up. His foot hurt him a good deal, but his huge boot with its inch-thick sole had taken the brunt of the blow, and the cart had not been a heavy one. He could hobble and he did so towards the door.

"I'm off," he said as he did so. "I ain't let out for experimants, I want a place where I can lie down and be comfortable and have a real doctor and a nurse with a white cap on 'er 'ead."

The two young men exchanged glances. "I think," said the elder one quietly, "that you had better have let us do a little for you before you went to look for all that; anyhow, I'll put your arm in a sling and give your hand a support."

As he evidently meant what he said kindly and was apparently doing what he could for Joe Smithson's comfort Joe submitted with a bad grace and left the house with his arm suspended by means of a white bandage and supported on a splint, so that at all events it felt as if it were being kept together a little. He scowled, however, a few moments later and almost climbed the steps again to claim admittance, having overheard, as he leaned against the area railings, something of what the two young men were saying about him. However, not feeling in good trim for fighting, he thought better of it and moved a few houses farther up the street and leaned against other railings.

"Barmy, is it, they call me? lunatic, eh?" he muttered, "I'll loony them when I've 'ad a month in ———" But still the word refused to come back to him, while hitherto no one had seemed to come anywhere near to understanding his explanations. And yet he was a foreman labourer and intelligent and able to express himself—a man who had won a missing word competition.

As he leaned against the railings and wondered dimly what he was to do next someone tapped him on the shoulder. He turned and saw that it was a clergyman, a tall, thin-faced man, with rather sunken eyes and a friendly smile.

"In trouble, eh?" he asked, pointing to the sling.

Joe explained that he had no home, almost no money, and could get no work until he had recovered from his injuries. Therefore he wanted medical attendance and shelter for a little time. Could the reverend gentleman tell him where the—well, the place where that sort of thing was done for poor men. Joe thought that he had found someone at last, perhaps, who would understand what he wanted and where he wished to go. He did not have much "truck," as he expressed it, with the clergy as a rule, but he watched this one intently as he listened with a puzzled look coming into his deep-set eyes.

"You had better come with me, I think; a doctor who is a friend of mine will see you if I ask him and we will arrange the other matter," he said after a pause; "but we must take a cab, it is two miles away."

"Then I'll pay this journey," said Joe Smithson, as his new friend helped him into a four-wheeler, and in the end he did so, after they had driven a long distance and stopped in a quiet square at a quiet house with a church beside it. He found himself a few minutes later on a sofa in a large room chiefly furnished with books, while a doctor who seemed to live somewhere close by was examining his hand and his foot. Joe had looked anxiously at the servant who brought in hot water and other things as they were wanted; her cap had reminded him vaguely of the place he had wished to be taken to. At last the doctor, who appeared to him to have done what he had to do very thoroughly, for he had taken a long time and hurt him a good deal, seemed to have finished his work so that hand and foot lay swathed in bandages, comfortable, but perfectly immoveable and helpless.

"There," said the doctor cheerfully, "you are a lucky chap to be no worse, and now comes the question what is to be done with you."

"A very serious question," said the clergyman gravely, "all the beds I have here for such people are filled, and though my friend the doctor attends to you because he has a kind heart and I ask him to, lodging-house keepers don't quite take the same view of such matters."

"Lodgings for a month at least," ejaculated the doctor, "and he says he has 15*s.* left and no home. What about your parishioners?"

"They do a good deal for the people in the parish," answered the clergyman; "of course I can ask them; the ladies are very kind, and the men, too, for that matter, when a case is brought directly to their notice."

"But," said Joe Smithson interrupting, "ain't there no other place where I'd be taken in an' done for, doctored and fed an' turned out well—a place where there's hundereds and hundereds of poor beggars like me, and women an' kids too, and them that ain't bad enough to have to stay there can come and be seen by the doctors and get their bottles of medicine given them and take them home with them?"

"No," said the clergyman in his deep, thoughtful voice, "there is no such place in all London."

"Then," said Joe Smithson emphatically, "I always thought there was, and if there ain't there ought to be."

"Our injured friend is right," said the doctor, looking a little graver than he had before. "There ought to be. There is the germ of a great idea in what he says. He means an institution for dispensing medical and surgical treatment to the necessitous poor. It would have to be on a big scale—a very big scale—to do good; but then it would do a great deal of good and allay a lot of suffering."

"I suppose doctors could be found to look after it?" asked the clergyman.

"Rather. Put it on no higher ground than self-education. What a grand place it would be for working in or for learning the elements of your work as a pupil; think of the cost of the education and the value of it compared with what we have now. Now our young men have to find out the way for themselves."

"Blow me, but they *'ave*," said Joe.

"Then they would do nothing until they knew how, and would be learning how all day."

"And would the people avail themselves of such a place?" asked the clergyman, "and be grateful for it?"

"Rather; they'd use it right enough," put in Joe Smithson, "and they'd be grateful for it, too," he added, feeling quite sure that he had heard others speak in warm terms of such institutions, others who had used them and been benefited by them. Of himself he did not feel quite sure. He had never thought much upon the subject and had dim recollections of having on one occasion, out of the spirit of perversity, possibly spoken of them disparagingly. It must have been merely out of the spirit of perversity and thoughtlessness, such a spirit attacks every man at times; but the doctor was shrugging his shoulders and shaking his head.

"Where would the money come from?" he asked. "If you are to do such a thing adequately you must have a large sum of money annually which you can count upon as regularly as quarter-day, so that you may make your work fit your income and be covered by it, and it would not be the sort of work you could limit easily. Taxes and rates are high enough already; people would simply rebel against a wholesale measure for raising them, and yet a charge for each institution on the local rates would be the fair, just way."

"But not the best," said the clergyman earnestly. "No; they must be, if ever they are to be at all, the gift of the rich man to the poor man—aye, the gift of all who have not felt the grinding pressure of absolute want to those who do not know where to turn for help in the hour of need. The rich must give of their bounty not only because they are rich; but because to give is good; because, too, that which they are aiding is a national institution for the nation's good and a training ground for those who in the rich man's need will aid the rich man as they have aided the poor. The man who is not rich will give in proportion to his means, because he is

proud to tax himself for a noble object, perhaps because he, too, will some day derive benefit from that which he is establishing or helping to maintain for others. The good to self is there, we cannot afford to despise it as an argument, but the gift that is free from such a motive commends itself to me best. Such a gift in such a nation as ours from the great to the small, from the 'haves' to the 'have-nots,' would be a gift indeed."

The doctor nodded, and smiled at his friend's enthusiasm. "I daresay the 'have-nots' as you call them would help a bit when they had a little; it would be a case of every little helps, I fancy."

"I take it that the poor have no wish to be pauperised," said the clergyman, rather stiffly. "Those benefited, those taken in, that is, and treated, would feel grateful, but they would usually be, from the mere fact of having been ill or injured, the least able to contribute; it would have to be brought home to those in health among them that no gift, however small, would be despised, and then, you see, numbers would tell. Think what the masses of poor number in this city."

"Yes," said the doctor cheerfully, "it is a fine idea, but a bit Utopian; however, give a thing a good name nowadays and it will often go surprisingly. What would you call these institutions that you seem so ready to develop and organise for us?"

"Ah," said the clergyman; "I had not thought of a name for them; we should have to invent one."

Now Joe Smithson felt perfectly certain that he not only could give the name if he only thought hard enough, but could add a good deal of information which would be of service and of interest to his new friends. He had a vague idea that if he was still in London it was London deprived and absolutely ignorant of what should have been to it a household word, and that the word which to him at least was the key to the whole mystery had entirely escaped his memory. Meanwhile they had in their conversation evidently forgotten his existence, and as he lay on the sofa he was getting very drowsy. If only he, the hero of a missing word competition, could recall the word he could help them, and rest quietly, but what was it?

* * * * * *

"If he's drunk he goes to quad, if he's ill and a wandering in his mind he goes to the hospital; anyhow he goes out of here."

They were standing round him in a group, the landlady of the public-house, the man he had picked up in the street, the potman, and one or two others. The landlady had spoken and the potman was shaking him.

"Well?" said some one as he opened his eyes; but his ears had caught the word his mind had been seeking for in vain.

"Horspital!" he shouted; "that's it."

"Bedlam Horspital, I should think, from the way you've been going on," said the potman, shaking him again.

"Here, mind my hand and foot, young man," said Joe Smithson, "they're injured. At least," he added, stretching out his right arm and bending down to pinch the corresponding leg, "I fancy the way I've been sitting 'as made them go to sleep; and I suppose I've been asleep, too, eh? and it was all a dream of mine about London 'aving no 'orspitals and no doctor or pleeceman 'avin ever 'eard of no such thing?"

The friend he had picked up in the street, and who must have returned to see if Joe would change his mind about the drink, interposed.

"Well, what of it?" he asked. "Who said, 'Blow hospitals; it would make no difference if there was no hospitals at all'?"

"Look here," said Joe Smithson solemnly, "I said it, and I've seen I'm wrong. I'm sorry I said it, and what's more I'm going to find out about what they call the Hospital Sunday Fund. If they're all square an' keep their accounts right, an' play the game, they'll have my half-a-crown when the time comes—and yours, too, if I can make yer."

And he went out, looking thoughtful, in search of work and a lodging.

THE METROPOLITAN HOSPITAL SUNDAY FUND.

Amounts received and disbursed in the year 1897.

Dr. RECEIPTS *for the year ending 31st October, 1897.*

1897.	£ s. d.	£ s. d.
To Balance at Bank of England, 1st Nov., 1896	1,664 16 2	
,, Balance in hands of Secretary	7 4 8	
		1,672 0 10
,, Collections made at Sundry Places of Worship	37,373 19 10	
,, Collections at Schools	22 2 4	
,, Donations, including £16 14*s.* 0*d.* for Surgical Appliances	2,360 10 7	
,, Dividend on £45,346 1*s.* 3*d.* 2¾ Consols, per Executors to the Will of W. A. Guesdon, deceased	1,247 0 4	
		41,003 13 1
,, Balance — Excess of Payments over Receipts	830 16 2	
Less in hands of Secretary	21 6 10	
		809 9 4
		£43,485 3 3

Cr. PAYMENTS *for the year ending 31st October, 1897.*

1897.	£ s. d.	£ s. d.
By Awards to 120 Hospitals	37,262 11 1	
,, Awards to 7 Institutions	595 0 0	
,, Awards to 56 Dispensaries	1,719 9 7	
,, Surgical Appliances	2,247 19 1	
		41,824 19 9
,, Rent	170 0 0	
,, Fuel, Gas, and Office Cleaning	22 18 5	
,, Printing and Stationery	250 13 6	
,, Stamps and Postage	88 5 7	
,, Advertisements	268 13 4	
,, Salaries and Wages	818 1 6	
,, Sundries	5 19 9	
		1,624 12 1
,, Special Expenses— Special Church and Chapel Appeals		35 11 5
		£43,485 3 3

Audited and found correct, this 2nd day of December, 1897.

(Signed) W. H. PANNELL & Co., *Chartered Accountants*, 13, Basinghall-street, E.C.

*** In the preparation of the voluminous statistics of hospital work which have been here digested and exhibited in collected form (and which have been specially supplied to us in response to our applications, and are quite independent of any returns made to the Metropolitan Hospital Sunday Fund Committee) we have been greatly indebted to a large number of secretaries and other officers of the various medical charities of the metropolis. To them we desire, as on many previous occasions, to tender our sincere thanks.—ED. L.

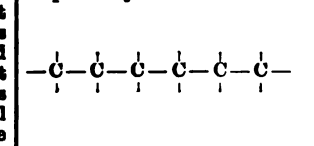
A Public Lecture
ON
PHARMACOLOGY: ITS AIMS AND METHODS.

Delivered at Oxford

BY WILLIAM J. SMITH JEROME,
M.B. LOND.,
LECTURER TO THE UNIVERSITY IN MEDICAL PHARMACOLOGY AND MATERIA MEDICA.

GENTLEMEN,—If we follow the history of science we find that there has been a process of fissiparous division. Scattered facts are brought together, classification and generalisation follow; the facts increase and multiply, and as they do so lines of cleavage show themselves. These lines deepen and widen as the facts go on accumulating and as the groups into which they become separated show more and more clearly the need for different lines of inquiry, till one of such groups becomes at last detached and forms, as far as this is possible, an independent science. There are few sciences in which this process has taken place to a greater extent than in that of medicine, one of whose latest offshoots is the science which I have the honour of introducing to you to-day—viz, pharmacology. In order to show that this, though of relatively recent origin, has not been barren of results, it suffices, while putting aside the names of distinguished pharmacologists of other countries, to mention two only of our own—viz.. Frazer and Lauder Brunton. But what is Pharmacology? The term has been used in a narrow and in a comprehensive sense. I will for the moment employ it in the latter and provisionally define pharmacology as the science which treats of drugs. What, then, is a drug? A drug is any substance which may be used in the treatment of disease. I am aware that exception may be taken to such a definition, which includes, it may be said, even the knife of the surgeon, but it is difficult to frame one which shall be entirely free from objection. The same difficulty is encountered when we try to describe the difference between foods and medicines or between plants and animals; and, again, it is quite impossible to draw a sharp dividing line between the sciences of chemistry and physics.

In using a substance as a drug what is it which we need to know and which it is the province of pharmacology to teach? I have qualified the statement that pharmacology is an independent science. Few sciences, if any, can stand alone, and certainly not pharmacology. Life is attended by the exercise of function and health is dependent on the normal performance of this; in other words, disease is ordinarily manifested by a derangement of function and drugs are given for the purpose of restoring this perverted action to its normal state. The study of the normal functions of the body is therefore essential to the pharmacologist; but this study forms an important branch of physiology, and physiology is the only basis on which pharmacology can surely stand. The same perversion of function, however, may arise from different causes and conditions, hence the necessity for some knowledge of pathology. Function standing thus in intimate relation to physiology, pathology, and pharmacology it is desirable to consider it more closely, especially in connexion with one fundamental fact which underlies it. It is not dependent on form or size, for the monad and the largest mammalian are both functionally perfect. It seems not to be inseparably connected with complexity of structure, for the seemingly simple amœba performs the functions of digestion, respiration, and reproduction as efficiently as the more specialised animals of higher type. Of want of structure it behoves one, however, to speak with caution, for the apparently structureless substance of to-day may—thanks to improvement in our instruments and in the method of preparing specimens—be found to-morrow to possess a delicate and complicated organisation. There is one condition, however, which is present in all living things, and which, though it has a wider range of action than is represented by the exercise of function, is rarely, if ever, wanting where function occurs, and that is chemical activity. Medicine occupied itself at first with the organs of the body, with diseases of the brain, of the heart, of the lungs, &c. The organs, however, are made up of tissues and these, in their turn, become objects of investigation, but to stop here were obviously to stop midway, for the fibre and the cell are compound objects, and it is in the molecules and atoms constituting these that the real secrets respecting function are contained.



Omitting all consideration of the physical properties and changes of the molecules I propose to refer briefly to a few facts connected with their chemical activity. Most molecules under the usual physical conditions contain two or more atoms and chemical action is generally attended by a splitting of the molecules, the liberated atoms or groups of atoms arranging themselves differently and thus forming new and different molecules. This splitting of the individual molecules takes place because the sum of the forces tending to hold their atoms or groups of atoms together is less than that of the forces acting from without the molecules and in an opposite direction. The discussion of the nature of this force or forces is beyond the scope of the present lecture. It suffices with some substances simply to bring them together under the usual physical conditions for a splitting of their molecules to take place, while with others some help is needed—such as is afforded by heat, light, electricity, &c. Thus the molecules of hydrogen contain (under ordinary conditions of temperature and pressure) two atoms of hydrogen and that of chlorine two atoms of chlorine. If these gases are mixed and kept in the dark and at a moderate temperature they remain for the most part unchanged, but if the mixture is exposed to the sunlight or heated the molecules of each kind of gas are ruptured, the two (H) atoms in each (H) molecule and the two (Cl) atoms in each (Cl) molecule are separated and new molecules are formed, every one of which contains one atom of (Cl) and one of (H) (HCl). What in this case takes place with single atoms may occur also with groups. Thus if, instead of hydrogen and chlorine, we take marsh gas and chlorine we find the methyl group CH_3 acting just like the single atom of hydrogen, and instead of two molecules of hydrochloric acid we get one of hydrochloric acid and one of chloride of methyl $HCH_3 + Cl_2 = CH_3Cl + HCl$. In this case, therefore, as before, old molecules split, atoms or groups of atoms change places, and new molecules are formed. Now this process generally, if not always, attends the exercise of function and, as we shall see, the connexion is no accidental one. If the chemical changes going on in a resting muscle are estimated, so far as this is possible, at the ordinary temperature of the room and afterwards within certain limits at higher temperatures, they are found to have been increased by the elevation of temperature. If the power of the muscle to respond to stimuli is tested under the same conditions a corresponding rise in this is likewise to be observed as the temperature is raised. The muscle cells like that of an amœba have other functions to perform than that associated with movement, and it is with the heightened exercise of these that the increase of chemical activity referred to is connected. If what is regarded as the special function of the muscle—viz, that of doing mechanical work—is now called into play a fresh impetus is seen to have been given not only to the functional but also to the chemical activity of the part. And what is true of muscles individually is true of them collectively, is true of other organs, probably even of nerves and of the organism at large. A frog may be made by being warmed to exhibit more, and by cooling less, of both chemical and functional activity; indeed, these two processes seem to proceed *pari passu* within certain limits. The upper limit—that of increased activity—is soon reached. The question of the minimum of function and of chemical action compatible with the continuance of life is a very interesting one, but time forbids me to enter fully into it on the present occasion. In hibernating animals we have a reduction of both functional and chemical action during hibernation. In resting seeds and during the winter sleep of plants the reduction is carried still further, while living substances have been not only frozen but exposed to lower temperatures still without being killed. In some of these cases the diminution of both functional and chemical activity must have reached a point not far removed from complete arrest, and were it possible by means which did not injure the structure of the cells to arrest instantaneously and absolutely all chemical action in our own bodies and to maintain the cessation I see no reason why we should not rest for centuries and take up again the thread of active, busy life at any moment on the removal of the inhibitory influence. Unfortunately for those who might wish in this way to

sacrifice the present to the future such complete arrest is not easily attainable, for absolute chemico-molecular inactivity is not a necessary condition of chemical equilibrium, the requirement for this being not that there shall be no chemico-molecular movements, but that these shall be in opposite directions and equal. In the meantime we should not have died—death, in fact, is far from being a condition of chemical inactivity. As it draws near, except when it occurs suddenly, the breaking up of old and the formation of new molecules on the old lines of health goes on less actively, some of the new ones formed come to differ from those they replace, and when death has actually happened the process does not stop; the molecules still split but the atoms soon group themselves differently and molecules of a totally different kind ultimately take the places of those of which the tissues had been previously composed. Our bodies then are made up of molecules and the normal performance of their function is inseparably bound up with the chemical behaviour of the molecules. These are capable of splitting and rearranging their atoms in a great variety of ways and health is maintained so long only as they do so in a particular manner, which is probably fixed and definite for every cell (including, however, a certain range of variation in connexion with varying conditions such as intermittence of function and change of food). A quantitative deviation from the normal is attended with an increase or diminution of functional activity. The precise effects of a qualitative change are less easily determined. This brings us within the province of disease and the passage from health to disease and *vice versâ* is subtle and may even involve a paradox, for it sometimes seems as if it might be truly said that an apparently healthy organism is rendered more healthy by becoming sick. When two young and to all appearance healthy animals are fed and treated identically except that to one are given minute doses of arsenic and to the other not, the animal taking the arsenic is found to have a better appetite and to become heavier than the other. Known and well-established facts respecting the Styrian arsenic eaters leave no doubt that this animal feels better than the other. What happens, then, in such a case? When a cell contains molecules which are foreign to it, either through the presence of an element which is not usually there or through a special grouping of its ordinary atoms, that cell is certainly abnormal and may fairly and reasonably be considered sick; and it is a fortunate accident if it is able to perform its functions with its usual precision and success. It is still more a matter for congratulation if the results of the functional action of such a cell not only equal but surpass those obtained from the normal ones. And yet this appears to have happened in the case of animals which have taken arsenic in the manner I have mentioned. Arsenic is taken up and retained; this can be proved by analysis, and as arsenic is chemically closely allied to nitrogen it has been suggested that in certain molecules arsenic may take the place of some of the nitrogen and it is conceivable that a proteid molecule containing a small amount of arsenic in place of an equivalent quantity of nitrogen may perform its functions as well as, or even better than, a corresponding proteid molecule constituted in the normal manner. But there is another way in which the arsenic may act in these cases. If larger doses are given the condition of improved health gives place to one in which the reverse obtains. The breaking up of the old and the formation of new molecules now take an abnormal course. The tissues lose their nitrogen and this, nstead of yielding urea, which is a diamide, passes out of the body largely in such forms of combination as leucine and tyrosin which are amido-acids, while the carbon and hydrogen remain combined with oxygen in the form of fat molecules. The cells and fibres of the body are found, in fact, to have undergone fatty degeneration. Fatty degeneration is, however, under certain circumstances at least a natural process; it is the first step of the process by which nature gets rid of the solid exudation products of disease. It is therefore also conceivable that when in the apparently healthy the condition is improved by arsenic certain feeble cells of the organism—and probably the healthiest organism always contains some such—become fattily degenerated and replaced by others which are healthier and more robust.

Having thus indicated the nature of the connexion between chemical and functional activity in respect of both increase, diminution, and perversion of function I will add a word or two respecting the general character of chemical action. The chemist, when synthetically engaged, may be compared to a worker in precious stones, only instead of gems and jewels he has to handle molecules and atoms. The aim of each is by arrangement and rearrangement of his materials to produce ever an object of greater beauty and of greater value. As the diamond is the gem of gems, so carbon, of which the diamond is composed, is the central atom round which organic nature is built up. The chemist has an advantage over the jeweller in that his atoms, though not alive, are mysteriously active, and when he brings them together under certain conditions they need no cement to fix, no clamp to hold them in position, but by virtue of an innate power they bind and fix and clamp themselves. They do this, however, by means which follow fixed and settled laws.

For example, let H– –O– –N– and –C– represent one atom of hydrogen, oxygen, nitrogen, and carbon severally. These have one, two, three, and four clamps or uniting bonds respectively. When such an atom is detached from its connexions its clamp or clamps becoming free it does not remain in this condition but attaches itself, each clamp joining with some other till all are fixed, and the united group thus formed constitutes a molecule. Thus H–H represents a molecule of hydrogen, but H–O– could not exist alone and would at once unite itself with some atom or group of atoms which had one clamp free. Another atom of hydrogen, e.g., would suffice, and we should then have a molecule of water, the two clamps of the oxygen and the one of each of the hydrogen atoms being all satisfied. To the clamps with their tendency to join with those of other atoms the term "affinity" is given and the wondrous energy displayed by some substances *in statu nascendi* is not strange when we bear in mind the necessity inherent in any atom or group of atoms to satisfy the accompanying affinities. An atom of hydrogen *in statu nascendi* (H–) can for this reason break up molecules which resist the fully-formed molecule of hydrogen (H–H).

Organic compounds are divided into two great classes, the fatty and the aromatic, and these are constructed on the type of the bar or open chain and the ring or closed chain respectively—

—and the chemist, like the jeweller, having made a bar can weld the ends together and form a ring if he desires one. He can take some molecules of carbon (charcoal) and of hydrogen and by heating them together under favourable conditions make them break up and change the position of their atoms so that acetylene is formed, $C_2+2H_2=2(H-C\equiv C-H)$. In this molecule he can introduce four atoms of (H) and so get ethane, $C_2H_2+2H_2=(H_3C-CH_3)$, or instead of this he can join together three molecules of acetylene and form a ring of benzol, $3C_2H_2=C_6H_6$. From ethane, by taking out an atom of H, and replacing it by a methyl group, he can produce propane, and by repeating the process butane and other hydro-carbons of the series. In the molecule of these hydrocarbons he can replace an atom of (H) by a hydroxyl group (OH) and so get the series of alcohols of which ordinary ethyl alcohol is the most familiar member $(CH_3CH_2)-H+OH=(CH_3CH_2OH)$. By removing two atoms (H) from this molecule he obtains the aldehyde, $CH_3CH_2OH-H_2=CH_3COH$. And from these aldehydes he gets acids by introducing into the molecule an atom of (O), $CH_3COH+O=CH_3COOH$. The so-called oxides of the alcohol radicals of the type of sulphuric ether are produced when from two molecules of the alcohol one molecule of water is removed. $2C_2H_5OH-H_2O=\frac{C_2H_5}{C_2H_5}>O$. The true or compound ethers are procured in the same way from a molecule of alcohol and of acid. From the saturated hydro-carbons the unsaturated are obtainable and from them again their various derivatives. And what is true of the fatty applies equally to the aromatic bodies. The alcohols of the benzines are formed in the same way as those of the fatty hydro-carbons, the first alcohol of this series being the so-called carbolic acid, a hydroxyl group replacing an atom of (H). If instead of a (OH) group we introduce into a benzine molecule a (COOH) group we get benzoic acid, and if both an (OH) and a

(COOH) group are substituted for two atoms of (H) salicylic acid is the result. Several such groups may be introduced in succession. Thus, if into a benzine ring we insert first a hydroxyl (OH), then an ethyl group (C_2H_5), next to this an amidogen (NH_2), and finally an acetyl one (CH_3CO), we get the valuable drug phenacetine. Then, again, two aromatic rings may be found together in a single molecule; it is in this way that salol is got from salicylic and carbolic acids, a molecule of water being removed. Not only the substances I have mentioned—with the exception of phenacetine, which contains some nitrogen—but an enormously large number of others may be made from charcoal, hydrogen, and oxygen with the aid of reagents, which may be regarded, under the circumstances, as the tools with which the chemist works. Other elements may be introduced into the molecules in the same way.

There is yet another mode of chemical action: $C\equiv N-H$ represents prussic acid; $C\equiv N\text{-}CH_3$ methyliso-nitrile or prussic acid in which an atom of H has been replaced by a methyl group. Both are poisonous. $CH_3-C\equiv N$, on the other hand, is the formula for methyl-nitrile, which is not poisonous. Both the isonitrile and the nitrile contain the same kind of atoms and the same number of them, but they are differently placed within the molecule, and new molecules, having entirely different properties from those they replace, may be formed by a mere intra-molecular change in the position of the constituent atoms. I mentioned that the number of affinities varies with the elements. I may add that some of the elements have sometimes one number of affinities and sometimes another—e.g., nitrogen may have three or five and sulphur two, four, or six. It will be remarked that in the isonitrile the nitrogen has five affinities and in the nitrile three only. This change, however, is not the cause of the difference in properties, for we find carbaminthionic acid, $CO\begin{matrix}SH\\NH_2\end{matrix}$, harmless, and thiocarbaminic acid, $CS\begin{matrix}OH\\NH_2\end{matrix}$, a powerful poison, though the kind and number of the atoms and the number of the affinities are the same in both cases, the only difference being the manner in which the elements are grouped; the (S) and the (O) in fact have changed places, the sulphur being joined to the carbon only in the poisonous compound, and to both the carbon and the hydrogen in the harmless one.

An important question now presents itself: Are the chemical phenomena occurring in living tissues essentially the same as those which take place in the laboratory? I will not go into the theories of the nature of the difference between dead proteid and living protoplasm. These, ingenious though they may be, lack the one thing needful—viz., the fact of being proven. But there are two facts connected with the subject to which I would wish to draw attention. 1. The synthesis of such bodies as urea and sugar has dispelled, probably once for all, the belief that any products of plants or animals are necessarily incapable of being copied by the chemist. 2. Though it is true that the course of chemical action in living things does not run strictly parallel with that observed in the laboratory, and though life and organisation occur in the former while they are wanting in the latter, it must not be forgotten that there is another factor of supreme importance. It may be safely asserted that in living tissues there are not a few only but many substances which have never yet been isolated; and as the results of any reaction depend, not in some slight degree merely, but mainly and principally on the nature of the reagents present, it must needs be that the chemistry of life will present difficulties which the laboratory for the time being is unable to explain. When, on the other hand, this disturbing factor, the presence of unknown bodies, has been eliminated, as in the future we may hope it will be, it is quite possible that many of the difficulties at present connected with the subject will have explained themselves.

Having taken a cursory glance at the kind of chemical changes constantly going on in our bodies we are now in a position to ask what happens when to the seething, restless mass of molecules of which they are made up we add fresh molecules in the form of drugs. We will take in illustration one of the simplest—viz., common table salt; this, though generally a condiment, may sometimes prove a valuable medicine. It may fall to the lot of some of you to find yourselves in charge of a case of poisoning in which, having done your best not only to remove the poison from the system by the ordinary methods, but also to combat special symptoms and support the strength of your patient, you find yourselves confronted by the fact that in the desperate struggle between the poison and the organism the latter will, if no further help be given, inevitably succumb before it can eliminate the poison. One hope remains, and that is afforded by removing some of the blood, and with it the poison it contains. Having done this, you must replace the missing blood by other blood, or, by what is perhaps better, and certainly safer, by a weak solution of chloride of sodium. Let us suppose that you have injected a proper quantity of this. What is likely to happen to it? A certain—or rather an uncertain—time after the injection there will have been eliminated from the body a quantity of chlorine and of sodium larger than would otherwise have been excreted by an amount corresponding to the chloride of sodium in the injection. Chloride of sodium being a normal constituent of the body it seems natural to conclude that the (Na) and the (Cl) simply circulated as (NaCl) in the interval. This is, however, by no means necessarily what has taken place. The chlorine and the sodium may each have had a very chequered and independent career—independent, i.e., of each other. The chloride of sodium coming into contact with water and carbonic acid may give free hydrochloric acid according to the equation $2NaCl + CO_2 + H_2O = Na_2CO_3 + 2HCl$. The HCl, after taking part in digestion and finding itself in relation with several bases—viz., those of (K), (Na), (Ca) and Mg—may combine with two or more of these in succession and be finally eliminated in union with some of them. The sodium carbonate may also be decomposed and its sodium be united to one, or more than one, of the several acids of the body. Even when the (Cl) and the (Na) do leave the body in the form of (NaCl) it may happen that in any given molecule the (Cl), having been introduced in the injection, detached itself from the (Na) with which it was united and afterwards combined with a (Na) atom which was previously in the body; and the same applies, *mutatis mutandis*, to the sodium atom. The more complicated drugs are naturally not more exempt from change than chloride of sodium, and it may happen that the therapeutic action of a medicine is due neither to the substance which enters nor to that which leaves the body, but to an intermediate product. The subject of the changes undergone by drugs in the body is both interesting and important. Interesting is it to see a substance like sulphonal, which, though resisting the action of some very powerful reagents in the laboratory, is slowly but surely changed by the forces which are at work within us. More interesting still, perhaps, to see how a drug seizes on and fixes some intermediate product of tissue change and thus brings it, perhaps for the first time, under our observation. The cystin-forming group has been thus fixed by the halogen derivatives of benzine, the resulting phenyl-mercapturic acid showing that this group, like uric acid, is formed normally during the ordinary processes of nutrition. Interesting again is it to see one drug reduced and another oxidised during its passage through the system, while a third leaves the body partly in an oxidised and partly in a reduced condition. It is also not without interest that a drug may become for the time being an integral part of the living organism.

We are now able to answer a question asked at an earlier period of the lecture—viz., What is the kind of knowledge which pharmacology is expected to supply? It should tell us not only the coarser and more obvious changes in function induced by the introduction of a drug into the system, but also in as precise terms and as fully as possible the chemico-molecular phenomena which accompany these changes. I need not say that the chemico-molecular phenomena accompanying normal function are not fully understood and I do not wish to imply that even if they were we should know all which it would be well for us to know respecting function. We should still probably be unable to say why contractile tissue contracts or why, coincidently with molecular changes in a particular part of the brain, a thought is struck off.

I pass to a consideration of how knowledge of the kind I have indicated is to be obtained. It is needless to inquire if materia medica either teaches or contributes to increase this form of knowledge. The question carries with it its own negative reply and it may probably be safely predicted that at a period which, though future, is, I hope, not far distant, the greater part of materia medica will be relegated to its natural *habitat*—the domain of the druggist. *A priori* reasoning in the present state of our knowledge also avails

nothing. The one, the only, method of inquiry is the experimental. What, then, is an experiment? An experiment consists in altering the conditions connected with a subject and observing the result. What more easy? some may say. But those who speak thus forget the difference between looking at and seeing. An artist looking at an object or a landscape will see much which the untrained eye is sure to overlook and many physicists must have looked at without observing some of those phenomena, the clear and definite seeing of which has made the name of Faraday for ever famous. It is well if we can at once explain what we see, but the important point is that we do see and that we see truly. A fact is an eternal truth; an inference from a fact may be—sometimes is—altogether false. The literature of science teems with hypotheses, some of which, though masterpieces of ingenious theorising, possess one fatal fault, that of having been falsified by subsequent experience. Not that hypotheses are valueless—they serve various purposes, including that of suggesting new lines of work which, even when, as is sometimes the case, they disprove the theory to which they owed their origin, may lead to results of lasting value. The therapeutic use of chloral hydrate is connected with a perfectly reasonable but quite erroneous hypothesis—the belief that the chloral hydrate was decomposed by the alkaline fluids of the body as it is decomposed by alkalies in the laboratory, yielding chloroform. Chloral yields no chloroform in passing through the body, but it is none the less a potent and valuable medicine.

It will be evident from what I have said respecting the nature of an experiment that every prescription carried out is, thanks to the multiplicity and varying nature of the factors involved, necessarily an experiment. Bearing in mind the enormous number of prescriptions written daily by medical men throughout the world, and not forgetting the great and special difficulties connected with this particular form of work, I would still venture to ask, Is the harvest reaped by pharmacology in this field as abundant as might reasonably be hoped for? Though it is true that no inconsiderable part of existing pharmacological knowledge has been acquired by the mode of experimenting to which I have alluded we are compelled to ask, Does this method, unaided and alone, suffice to protect those who entrust not only health but life to our care? In connexion with this subject I will direct your attention for a moment to what is perhaps one of the saddest pages in the history of medicine. Till the researches of Pasteur had indicated the line along which light was to be sought no outlook was more dark, no prospect more dreary than that presented by diphtheria. The helpless physician used this remedy and that, and amongst others he tried chlorate of potassium. It seemed to be of service; at any rate, there were *a priori* grounds on which it might be expected to be useful. It was used extensively, it was used for years. In the course of time, however, and almost at the same period that an American physician sounded a note of warning, a German prosector noticed in the bodies of those who died while taking it appearances which suggested to his mind the fearful question: Can this fancied remedy be helping the disease to kill? It was a question which could be answered only by further experiments on animals. They answered it, and with an almost brutal clearness showed that the lethal dose of a poison had been given. They showed that the physician had pointed the shaft of the disease, nay, more, that he had himself forged a weapon with an edge more keen than that of even diphtheria itself. This happened in 1879. How many victims chlorate of potassium had claimed till then and how many more homes might have been darkened between then and now but for those experiments on animals it is vain to guess. The episode is past and though painful is instructive, and I think we may not only patiently but even confidently await the time when those who are now against us on the subject of experiments on animals will, with fuller knowledge and not less humanity, reverse their present unfavourable judgment, remembering that yielding to the instinct of pity, though more easy, is not always better, wiser, or holier than resistance to it.

Another method by which pharmacological knowledge is to be obtained is that which is generally understood as research. This, I think, is an ideal form of work, and the leisure and acquirements needed for it are, in my opinion, well worth striving after. A laboratory, it is true, may not be an attractive object. It is not usually gratifying to the æsthetic sense; there are apt to be too many and too obvious manifestations of matter apparently in the wrong place, but it possesses, or at least should possess, one of the fundamental attributes of beauty—viz., a fitness for the purpose it is intended to subserve; and if in itself not beautiful it enshrines what is *par excellence* "a thing of beauty and a joy for ever." It enshrines, it is pervaded by, the spirit of truth—truth which serves both as a lamp to illumine and as a beacon to direct, and yet which shines with a pure and steady ray on those alone who seek to follow it in singleness of purpose. The work performed accords most aptly with Matthew Arnold's description of the work of nature. "Toil unsevered from tranquillity ..... Labour that in lasting fruit outgrows far noisier schemes, accomplished in repose, too great for haste, too high for rivalry." And though it must be granted that the methods of the laboratory, like those of nature, are occasionally harsh, it must also be conceded that its results are useful and its aims beneficent. But even into this paradise of toil there enters or may enter one insidious sin—the lust of what is called "priority." This must be fought against and overcome, or else, like a gathering cloud, it will, if left unchecked, roll onwards and most surely darken all. And why should it not be fought against and overcome? Each fact discovered in the pursuit of knowledge, discovered it matters not by whom or when, and even when unimportant in itself, may prove a stepping stone by which that knowledge mounts to other and far higher things. This is the worker's real recompense; it is this pregnant possibility which makes work, honest work, like virtue, its own great reward.

But to proceed, some of you may be inclined to ask how, if what I have said respecting the relation of drugs to the organism and of the organism to drugs be true, there can possibly be different systems of administering medicines. By whatever name you call your method of giving drugs you must be guided in the act by one of two principles, the rational or the empirical; and the difference between these is soon illustrated. Suppose that to a weak anæmic patient with relaxed arteries, unable to sleep because when he lies down the blood pours too freely through the dilated vessels to the brain, you give digitalis and iron, you will probably brace up the arteries, and by removing the condition on which the insomnia depended you will succeed in inducing sleep. You will then have acted rationally. But if in such a case you simply give a hypnotic, chloral hydrate, morphine or some other, you will procure sleep it is true; your patient may be satisfied—nay, even thankful—and perhaps so satisfied that he may repeat the dose, and this not once only, but many times, until he has at last acquired the narcotic habit. I need not tell you that in this case the prescription will have been both empirical and wrong. It is possible, however, that a prescription may be at the same time empirical and right, for so long as the mode of action of a drug is not understood, the drug, if given at all, must be administered empirically. Quinine, e.g., was given advantageously in malarial disease long before either its power of checking protoplasmic movement was understood and even before the protoplasmic parasite of the blood corpuscles in ague had been discovered. Facts such as these, however, afford no excuse for sinning against light, but should, on the contrary, stimulate us to contribute something to the increase of the knowledge which, in proportion as we gain it, tends to raise us from the level of the charlatan to the plane of the philosopher.

To turn to the future of pharmacology: not only is the physiological action of a substance influenced by the nature of the elements it contains, the number and proportion of these, and on the particular manner in which they are grouped within the molecules, but this action may in many cases be modified in a definite direction at will. A convulsing substance like strychnine may, for example, be converted into a paralysing one, and a sedative such as morphine may be changed to one which will tend to excite convulsions by the mere introduction of an alcohol radical. These and many other kindred facts present to the mind of the pharmacologist a definite goal—viz., the point at which a knowledge of the physical properties, of the chemical composition and of the chemical structure of a substance, will enable him to predict the nature and extent of its value as a drug. The goal is distant, perhaps may never be attained, but so long as there is progress towards it the path being followed cannot be a wrong one, and I would now in place of my former definition of pharmacology describe it as physiology, extending its borders in a special direction, and proposing to itself a new problem—viz., the problem of the

relation of chemical structure to physiological action; remembering, however, at the same time, that physiology, deprived of the support which it now obtains from chemistry and physics, would be reduced from the condition of a growth deeply rooted and widely spreading to that of a hollow and decaying trunk.

Finally, I am concerned not only with pharmacology but also with the teaching of it. This suggests a thought in connexion with the subject of instruction in general and I address myself now more particularly to my pupils.

Cowper says of knowledge and wisdom that "far from being one they have ofttimes no connexion," and a similar caution may perhaps be not altogether out of place respecting instruction and education. The one is as devoid of life as the other is instinct with vitality, and it may be asked, What is the vital spark which transforms the dead, dry bones of instruction into that living, radiating something which we recognise as education? It is nothing less than thinking—thinking in the sense of the third and highest mental operation of the logician. You and I may lack the richness of endowment of a Newton or a Darwin, but we possess, though in a less degree, the faculties which made them great. The conceptions of "the divinely-gifted man," grand as they often are, spontaneous though they sometimes seem, like yours and mine are the outcome of previous thought. We read of the soul of things—not of persons only, but of things. This soul embraces much which is beyond our ken; but it includes amongst others this, the relation of things to other things; and without accepting the proposition that "everything is in everything" we must admit that all things have some sort of relation to each other, and in proportion as we can grasp such relations will any knowledge we acquire be valuable to ourselves and potentially useful to others. Now, in order to help you in fitting yourselves to acquire, each within the limits possible to him, an aptitude for perceiving these relations I should like to give you a suggestion. Some men never travel without a Bible, others without a copy of a poet or some other favourite author. I would say to you, not only travel, but live, with some difficulty, some problem, which in your leisure moments you are always seeking to unlock, or rather with two such, one connected with, and one independent of, your special work. You may not solve the problems you propose, but you will solve others by the way. The habit will suggest to you not only subjects for reading but also materials for practical work; it will increase your knowledge; it will enlarge your judgment; it will widen your culture; it will drive *ennui* from your path, and it will be strange if at the end of your threescore years and ten you have not valid ground for feeling that the world is in some degree the better for your life. I will now conclude, and I think I cannot do so better than in altering somewhat a line of a late distinguished professor of this university and saying-Think clear, see deep, and you will bear fruit well.

SOME RESULTS OF OPEN-AIR TREATMENT OF PHTHISIS AT BOURNEMOUTH.[1]

BY ARTHUR RANSOME, M.D. CANTAB., M.R.C.P. LOND., F.R.S.,

CONSULTING PHYSICIAN TO THE MANCHESTER HOSPITAL FOR CONSUMPTION AND DISEASES OF THE THROAT.

Two years ago I had the honour of bringing to notice the systematised treatment of phthisis in the open-air as pursued on the continent and in America. The treatment of phthisis by abundance of fresh air had undoubtedly long been the practice of some medical men, both in Bournemouth and elsewhere, but it seemed desirable to point out how well adapted Bournemouth was for the establishment of properly equipped sanatoria in which the treatment could be carried out in its entirety. Since then several such establishments have been started in this neighbourhood, two of them the houses of medical men, Dr. Pott and Dr. Johns, two of them hotels, and it seemed to me that this would be a good opportunity for bringing together the results of the treatment both in these places and in the various lodging- and boarding-houses in which it has been practised as thoroughly as possible under the circumstances. I have myself some notes of a few cases which I have seen, for the most part in consultation with other medical men, and I have put them together in the hope that others will bring forward similar cases, so that we may have an insight into the mode of working of the method, and thus be in a position to judge as to its efficacy.

Before bringing forward these notes, however, it may be desirable to discuss the question of what circumstances are essential for this mode of treatment. In the first place, neither a particular latitude on the earth's surface nor any great altitude can be considered absolutely necessary. Of the more important sanatoria on the continent some are placed at high altitudes, others almost at the sea level. As Dr. Léon-Petit points out, "1850 mètres and 35 mètres above the sea level are the two extreme limits represented by Arosa and Malchow, and other sanatoria are placed at various intermediate degrees in the scale of altitude." Some of them are installed in the severe climates of Silesia and Saxony, others on the foggy banks of the Rhine, one at least in a valley of the Black Forest, and several on high plateaus, amongst long-enduring snow, but where the atmosphere is pure and sunny. Each of these places has its advantages and disadvantages, but all of them can show a fair proportion of cures. In a recent paper[2] Professor von Ziemssen discusses this question and passes in review the relative merits of high and ordinary altitudes. He concludes that the only advantages in favour of mountain climates are "the pure, dry air, the slight wind in winter." He then points out the disadvantages of treatment at high altitudes. Marked atmospheric changes occur not unfrequently (wind, rain, snow) and are injurious to the patient. They make the acclimatisation of many patients difficult, and patients with high temperatures, especially those who do not reside in the sanatoria, may become decidedly worse. Other objections are the wearisome journey with all its bad effects, the separation from the family, the comfortless conditions in severe illness and in case of death; further, the financial anxiety and the economy necessitated. All these have a bad effect upon the patient. When the advantages and disadvantages are compared, the former are not so clear as to indicate the unconditional recommendation of treatment at high altitude.

I cannot resist the temptation also to quote Dr. Walshe in his excellent work on "Diseases of the Lungs" (p. 385): "No climate will stamp out phthisis, wherever acquired, either in the individual or in the stock. To imagine that there exists a specific power in any combination of atmospheric conditions, to stop the evolution of local mischief and eradicate the tuberculous diathesis, is not a whit less illusory than the people's creed, which ascribes sovereign virtues to 'native air.' But climate may, and does, prolong the existence of the phthisical. It does this, either by modifying nutrition and vitality in the mass, or by lessening the activity, perhaps warding off the occurrence of certain secondary states (say bronchitis, hæmoptysis) which might of themselves have proved the real causes of death. In either fashion climate takes its occasional share in bringing about the nearest approximations to real cure therapeutically obtainable."

The attributes which a climate intended for open-air treatment ought to possess are thus laid down by Dr. Léon-Petit and may be found in certain localities in almost every country. "The best climate is that which restricts the least the daily duration of the stay of the patient in the open air." 1. It is obvious that pure air is indispensable and therefore that we must avoid proximity to large towns or of factories giving forth soot, dust, or deleterious gases. 2. The soil upon which the sanatorium is to be built should be sandy, without damp, and affording the smallest possibility of fog after sunset. Plains well exposed to the south or broad valleys fully open to the sun are particularly favourable on condition that they are sheltered by hills against north and north-west winds. "The immediate neighbourhood of a forest of pines is likewise very desirable both as a purifier of the air and as a shelter in summer against the heat, and in bad weather against the wind." 3. The phthisical patient must not feel himself to be in a barrack or in a prison; he should have before his eyes something better than walls. An extensive view exercises upon both mind and body a reflex action that is most beneficial. An elevated site, and gentle slope from it, is therefore indicated. Well provided

[1] A paper read before the Bournemouth Medical Society on April 20th, 1898.

[2] Münchener Medicinische Wochenschrift, No. 1, 1898.

Table showing Results of Open-air Treatment of Seventeen Phthisical Cases.

No.	Sex.	Age in years.	Duration of treatment.	Periods of fever.	Gain or loss of weight.	Remarks	Result.
1	M.	29	2 years.	None.	+ 28 lb.	Third stage; both sides.	Great improvement; quiescent 18 months.
2	F.	23	2½ years.	3 weeks.	+ 28 lb.	Third stage; both sides.	Great improvement; quiescent 2½ years.
3	F.	21	6 months.	2 weeks.	+ 8½ lb.	Third stage; left apex.	Quiescent for 3 years.
4	M.	22	2 years.	None.	+ 9½ lb.	First stage; left side.	Quiescent 2 years.
5	M.	18	1½ years.	3 weeks and 2 weeks.	+ 19 lb.	Second stage; right side.	Quiescent 15 months.
6	F.	28	4 months.	10 days.	+ 5 lb.	Second stage; right side.	Improvement.
7	M.	45	6 months.	2 or 3 of 1 week.	Gain of 7lb. at first; now varies.	Second stage, advancing to third.	Temporary improvement.
8	M.	27	4 months.	1 week.	+ 10 lb.	Second stage; right apex.	Quiescent 1 year.
9	F.	26	3 months.	—	—	Third stage; right apex.	Temporary improvement; lost sight of.
10	F.	35	—	2 periods of 2 weeks.	—	Third stage.	Quiescent 15 months.
11	F.	30	6 months.	None.	—	First stage; right apex.	Quiescent 5 months.
12	M.	23	6 months.	Several attacks.	—	Third stage; both sides.	Temporary improvement for 3 months; disease progressing afterwards.
13	F.	34	6 months.	1 week; 4 slight attacks.	+6 lb. in 6 weeks.	Third stage; both sides.	Quiescent 4 months.
14	F.	49	4 months.	3 or 4 days.	+9 lb. in 2 months.	Third stage; right side.	Quiescent 4 months.
15	F.	24	6 months.	2 weeks.	+ 11½ lb.	Second stage; right side.	Quiescent 4 months.
16	F.	16	15 months.	Several attacks.	+ 12 lb.	Third stage; both sides.	Quiescent 6 months.
17	M.	4	2 years.	Many months.	—	Doubtful cavity right apex; whole lung consolidated.	Recovered.

Table added by Dr. Francis Pott and showing Results in Four other Cases. The diagnosis was confirmed by bacillary search.

18	M.	28	36 days.	None.	+ 12½ lb.	Old mischief quiet, right apex; second stage, left apex and scapular.	Stay only long enough to teach patient to live.
19	M.	35	85 days.	3 weeks.	+ 21 lb.	Cavity small, right supra-scapular; second stage, left subclavicular.	Cough and expectoration ceased. Immense improvement maintained now 10 months.
20	F.	34	100 days.	Continuous.	+ 6¾ lb.; subsequently lost.	Mixed infection; active cavities both chests.	Sudden death; syncopal; no œdema.
21	M.	31	120 days.	99° F., evening; 9 weeks.	+ 14 lb.	Absolutely fixed chest; scattered active mischief both sides.	Relative improvement maintained 8 months in spite of return to clerical duties.

with fresh water, if possible from a spring, it should be sufficiently extensive to afford a large garden, or better still a park, surrounding the building. 4. The access to a sanatorium for phthisical patients should be as easy as possible, and it should not therefore be far from a railway station, and the roads in the neighbourhood should be in good order. I need scarcely point out how entirely all these conditions are fulfilled at Bournemouth and in its immediate neighbourhood.

Dr. Léon-Petit has also some excellent remarks upon the best form of construction of a sanatorium, with its dormitories, verandahs, kiosks, the best modes of ventilating without draught, heating, cleaning, &c., but we have not now to deal with these subjects. It is of more importance to consider the management of the patient and the attitude towards him of his medical attendant. A few points relating to these subjects may perhaps be discussed with advantage. In the paper already mentioned I ventured to point out that as regards the patients the treatment involves (1) for many of them rest in the recumbent posture for the greater part of the day, generally in open verandahs or shelters, sometimes in the open grounds; (2) careful but full feeding; (3) "massage" in certain cases; (4) in others carefully graduated exercises; (5) the judicious use of baths or cold sponging; (6) the provision of suitable amusements; and (7) appropriate medicinal treatment. In all these things the constant supervision of the medical attendant is absolutely necessary; upon him also depends the gradual education of the patient to the new *régime* and the infusion into him of a cheerful and hopeful state of mind.

I should like again to dwell a little on the importance of the *rôle* of the medical man. The hygienic rules for the treatment of a phthisical patient are simple enough; but their application to each case is often difficult and delicate. In the first place the physician should have full faith in the efficacy of this method for the cure of a large proportion of the cases; without this he can hardly inspire the necessary confidence not only in the patient but also in his attendants. These last are often the most difficult to convince. In the next place he should have sufficient knowledge of the extent of the disease and of the temperament of the phthisical patient to enable him to arrive at something like a just prognosis, so that he may be able to speak hopefully to some and to warn others, or rather their friends, of the gravity of the case. In every case it must be remembered that whilst phthisis is certainly curable, at any moment it may become incapable of anything more than alleviation. There are not a few cases in which the disease runs its course of destruction almost without a break, even when they are placed under the most favourable circumstances. It is important that these cases should be recognised from the outset, if possible, and the friends warned not to expect too much from the treatment. On the other hand, there are not a few cases of advanced disease in which the occurrence of periods of quiescence gives some hope of permanent improvement. We can probably all of us remember persons who have attained advanced ages who had been in their youth condemned to death as "consumptives." In every suitable case the physician should know how to inspire hopefulness. As Voltaire has said, "The hope of cure is already half the cure." Very often under the open-air treatment this hopefulness is encouraged, and to some extent justified, shortly after its commencement. In most cases, after the first few weeks of the treatment, the fever disappears, the night sweats are arrested, the cough ameliorates, and owing to the rest and abundant feeding the weight increases. Instances of cure in apparently hopeless cases judiciously cited by the medical man also serve sometimes to enhearten a despairing patient.

I would again emphasise what I said in my former paper

as to the need of constant supervision of the phthisical patient, by his medical attendant. It is required at every part of the treatment. It is particularly necessary in the early stages of the process, when the patient has to be gradually acclimatised to the open air and when the greatest tact has to be used to overcome his prejudices and to combat the constant fear of catching cold or of taking "a chill." The aim is to have perfectly pure air everywhere about the patient day and night, but the air of an inhabited chamber is seldom absolutely pure, as may be judged from the fact that it so rarely contains free ozone. Even with the windows wide open ozone cannot often be detected within it. In the daytime, therefore, it must be our object to have the invalid either in the open or lying down in an open verandah or kioak for as long a time as possible. In the night-time we have to be satisfied with windows as widely opened as the degree of velocity of the wind will permit. With most patients these objects can only be attained by gentle measures and they have to be led judiciously towards their full attainment, carefully screened from all sensation of draught and thoroughly protected by suitable clothing. When their education in this respect is completed it is remarkable how well they bear exposure to the coldest air and how greedily they seek for it of their own accord. The dread of taking cold soon vanishes when they find how rarely this accident happens in the open air.

The extent to which the patient must assume the recumbent position has also to be carefully regulated. There are some to whom it is only needful for about an hour after each full meal. Others have to lie down most of the time they are in the open, as it is found that they cannot be kept thoroughly warm in any other position. Many of these latter persons have in addition to be submitted to massage in order to keep up muscular tone and to assist nutrition. The amount of exercise and its nature have to be prescribed and its effects watched by the medical attendant, and the amusements permissible have to be rigorously laid down. Whilst the fullest feeding possible has to be aimed at the particular diet each invalid can most readily take and profit by has to be ascertained and the cooking sedulously attended to. Dettweiler's saying, "*Ma cuisine c'est ma pharmacie*," must be taken very seriously. Wonderful results have been obtained by the "stuffing" processes of Debove and Walther, but our aim should be true physiological feeding, an endeavour to nourish the body to the utmost, without overtaxing the eliminatory organs. This object can only be attained by watchful supervision. Baths and bathing also need discrimination in their application, but so applied they are often of great service in carrying out this treatment.

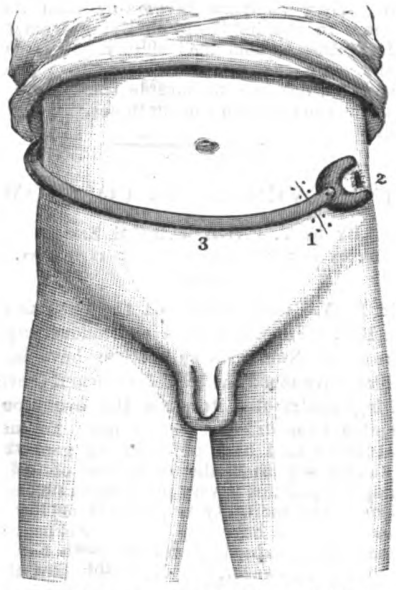
Lastly, without unduly exalting medicinal treatment I am of opinion that it also requires careful study to adapt it to each case. The routine practice of simply ordering a few capsules of creasote or guaiacol, or certain small doses of their carbonates, cannot be said to fulfil all our obligations in this regard. It is for these reasons that I venture to urge upon all general practitioners who have phthisical patients under their charge a very constant attendance upon their invalids and an active interest in their daily management. Without this it cannot be said that the open-air treatment of phthisis, as inaugurated by Dr. Brehmer, has been thoroughly carried out, and not a few failures, such as we have seen returning from Davos and other health resorts, will often be found to have taken place in consequence of shortcomings in the necessary discipline and supervision.

The few patients whom I have been able to induce to try open-air treatment, which I have now to bring before notice, have been, for the most part, under the charge of medical men who have adhered more or less completely to the conditions just formulated. They are only 17 in number, but in all but 2 they were ascertained to be tuberculous by the "bacillus search." In the two cases no sputum was obtainable and one of them was a child, aged four years, with signs of a cavity at the apex of an entirely consolidated lung. This may have been non-tuberculous.[3] The period of time during which they have been under observation is too short to justify any conclusions as to the likelihood of complete cure; it is only possible to point to evidences of improvement in their general condition and of, at any rate temporary, quiescence of the disease. A number (6 or 7) of obviously hopeless cases, in which the disease progressed from bad to worse, but in which from the outset some degree of open-air treatment was tried, have been omitted from the list; but it may be mentioned that even in these cases there was apparent some amelioration in their condition from the use of abundant aeration. It will be found from the Table, in which I have summarised the more complete cases, that 2 of them gained about 28 lb. in weight during the treatment; 1 gained 19 lb.; 9 others gained weights varying from 5 lb. to 12 lb.; 1 was stationary, and of 4 the weight was not taken. In 7 cases the disease is quiescent now and has been for periods of from one year to two and a half years. Most of these may probably be put down as deserving of Dettweiler's designation of "relative cures." 5 others are also now quiescent and have been quiet for periods of from four to six months, and these must still be regarded as under suspicion; 1 is simply noted as having improved, and 3 as having improved for a time and then relapsed, the disease now progressing. The child mentioned as being a doubtful case has now entirely recovered. As I have already remarked these results are still inconclusive, but so far as they go they seem favourable to a more prolonged trial of the system. They compare favourably with the results which we were in the habit of obtaining from the older methods of treatment, combined simply with free ventilation, without such systematic exposure to the open air. They are at least not less favourable than those reported from the various sanatoria on the continent.

Bournemouth.

[3] 10 showed signs of excavation, 5 were in the second stage and 2 were in the first.

AN IMPROVEMENT IN COLOTOMY.[1]



BY F. T. PAUL, F.R.C.S. ENG.,
SURGEON TO THE LIVERPOOL ROYAL INFIRMARY.

SINCE Mr. H. A. Reeves published his first cases of iliac colotomy in 1882 there has been a continuous improvement in general results. Numerous suggestions have been made, some of which have stood the test of time and prevail whilst others, having contributed towards the evolution of the present practice, have dropped out of use. To judge from such opportunities as I have of observing general surgical results I should say that the operation of colotomy in ordinary hospital practice is very much more successful than it used to be. The mortality is probably as low as under present conditions we have any right to expect and the inconvenience of prolapsed bowel is much less frequent. There still remains, however, the drawback that the patient has practically no control over the act of defecation. Even when the motions are well formed and the bowels are moved only once a day that motion must be passed, no matter how inconvenient the occasion, whenever reflex contractions occur in the colon. At various times I have had trusses made for colotomy patients, but whether designed to relieve prolapse or unconscious defecation they have never been a genuine success. In the matter of control the artificial anus resulting from colotomy is not only greatly inferior to the natural orifice but is much less perfect than the artificial anus obtained after excision of the rectum. The most complaisant operator will probably allow that there is room for improvement in this direction.

The suggestion I have to make is the adoption for colotomy of the principle introduced by Hahn into the operation of gastrostomy and now, as slightly modified by Frank, commonly used in that operation. The principle is that a portion of the viscus is withdrawn from the abdomen by a direct wound, attached to the deeper part of this wound, and then passed under the superficial tissues and opened on the surface at a distance. This method of performing gastrostomy is most successful in preventing leakage of the contents of the stomach and it appeared to me that it might prove equally valuable as applied to the colon. The plan adopted is as follows. An incision is made at the usual site in the line of the internal oblique fibres. The sigmoid is withdrawn and attached to the deep part of the wound by one or two sutures only and it is then passed directly backwards for about 2 in. to 2½ in. between the external and internal oblique muscles, where it is brought to the surface, opened and sutured, the original wound being completely closed

[1] Abstract of a paper read before the St. Helen's Medical Society on Feb. 11th, 1893

I have operated on three cases, on two as above, but in the third case by dividing the bowel, the rectal end being brought out at the lower end of the original wound, and the upper end being passed between the tissues and brought out posteriorly. The artificial anus in this case was a very good one, but the other opening emitted a foul discharge from the cancer which did not yield to treatment, and was more unpleasant than when such discharge is passed *per anum*. Division of the bowel considerably increases the severity of the operation, and I think I should only be inclined to practise it where there was a long expectation of life and in a case in which the sigmoid did not accommodate itself, owing to mesentery or bulk, to the other method. This operation appears to me to be a decided improvement on the ordinary colotomy. The artificial anus has a most natural look, but there does not seem to be, as I at first hoped there would have been, any natural control over the act of defecation. Whether the abdominal muscles could be trained to act in this way after a time I cannot say, but at any rate a truss applied as in the figure with a horseshoe

An improved colotomy. 1, The original wound closed. 2, The artficial anus. 3, Salmon and Ody truss with horseshoe pad.

pad seems to act admirably. It compresses the bowel where it runs in the abdominal wall, and quite prevents the escape of fæces until it is removed. This operation takes rather longer than a simple iliac colotomy, but it is not at all severe. Two of the patients were old men with advanced cancer of the rectum and both stood the operation well. The third patient was a woman with incurable syphilitic stricture; she has, I hope, many years to live. It is certainly an advantage that by this method the bowel may be opened at once without any fear of contaminating the peritoneum. The devious track and the ease with which the distant orifice can be perfectly and closely sutured to the skin remove all danger on this score. For some years I have always opened my colotomies at once through a glass tube, but am glad to feel that it is quite safe to return to the old plan of completing the operation outright. At the same time I would not advise the adoption of this method in all cases, and as a matter of fact have not used it in the last two. When the mesentery is very short it would not often be desirable to divide the bowel, as would be necessary under those circumstances, nor could this operation be conveniently performed in any but the sigmoid region. In cases of complete obstruction with distension, also, the glass tube method would generally be preferable; but, after all, the vast majority of colotomies are performed in the sigmoid region and upon patients with sufficient stamina and sufficiently long mesenteries to render the operation, as I have described it above, quite feasible.[2]

Liverpool.

[2] A fourth case recently completed has proved quite successful with the help of the truss.

THE VALUE OF CERTAIN DRUGS IN THE TREATMENT OF GOUT.

BY ARTHUR P. LUFF, M.D., B.Sc., F.R.C.P. LOND.,
PHYSICIAN IN CHARGE OF OUT-PATIENTS IN ST. MARY'S HOSPITAL.

Two methods of treating gout, and especially chronic gout, have for some time past been more or less employed by medical men. They are treatment by means of alkalies and treatment by means of salicylates. As far as I can discover these methods of treatment both originated from the supposition that uric acid is present as such in the fluids and deposits of gouty subjects and that this uric acid was rendered soluble and was therefore removed from the system both by alkalies and by salicylates. It is now well known that uric acid is always present in gouty subjects either in the form of sodium quadriurate or biurate. It is also well known that the chemical and physical properties of both these substances are entirely different from those of uric acid. As it therefore appeared to me that the object of employing alkalies and salicylates in gout originated in a misconception, and as I have for some time believed that both these methods of treatment are wrong in principle and in action, I thought it desirable to submit the matter to experimental investigation.

REASONS FOR BELIEVING THE TREATMENT OF GOUT BY ALKALIES TO BE ERRONEOUS.

The treatment of gout by alkalies is mainly based on the assumptions that uric acid is present as such in the blood and tissues and is rendered soluble by the administration of alkalies, that uratic deposits of sodium biurate are dissolved by alkalies, and that the system of a gouty person is pervaded by a general acidity which is neutralised and removed by alkalies. It will be seen that these assumptions do not stand the test of experimental inquiry. With regard to the first assumption, it is now well known that in gouty subjects uric acid is never present as such in the blood and tissues, but is always combined with sodium as the quadriurate or biurate. The only way in which alkalies could beneficially affect the quadriurate would be to delay its conversion into the biurate. In order to test this point I conducted a series of experiments so as to ascertain the effect of artificial blood serum to which different alkalies had been added on the decomposition of sodium quadriurate. In all the experiments the artificial blood serum employed was Sir W. Roberts's standard solution.[1] This was employed instead of blood serum in order to obviate the objections which have been raised to the use of blood serum in such experiments—viz.,—The tendency to variations in its alkalinity. Moreover, as shown by Sir W. Roberts, this standard solution reacts with uric acid and with the quadriurates and biurates in the same manner as blood serum itself.

OBJECTS OF CONDUCTING THE EXPERIMENTS WITH SODIUM QUADRIURATE.

These experiments were undertaken in order to ascertain whether any of the drugs ordinarily employed in the alkaline treatment of gout possess any power when introduced into the circulation of restraining the precipitation of sodium biurate from the quadriurate contained in the blood. Such experiments would show whether any such drugs would be of use either in delaying or partially arresting an attack of gout or in lessening the formation of gouty deposits. When sodium quadriurate is mixed with water it is decomposed into a uric acid moiety and a sodium biurate moiety, the uric acid appearing immediately it is set free in the form of ovoid or spindle-shaped crystals. These crystals appear in a very short time after the contact of the quadriurate with water—generally in from one to five minutes—whilst the sodium biurate passes into the gelatinous form, which, if sufficient water be present, is dissolved. If instead of water an alkaline medium be employed to decompose the quadriurate, such as blood serum or artificial blood serum at the temperature of the human body, then as long as free alkaline carbonate is present the uric acid moiety of the quadriurate, instead of crystallising out as uric acid,

[1] Croonian Lectures, 1892, p. 76.

unites with the sodium carbonate to form sodium biurate, which first assumes the amorphous form. After a time this amorphous biurate becomes gradually converted into the needles of the crystalline biurate. The time therefore which elapses between the saturation of the blood serum with sodium quadriurate and the first appearance of needle-shaped crystals of sodium biurate represents the inhibitory influence of the medium on the crystalline precipitation of sodium biurate. The experiments were conducted in the following manner.

METHOD OF CONDUCTING THE EXPERIMENTS WITH SODIUM QUADRIURATE.

Ten milligrammes of sodium quadriurate were well rubbed with ten drops of a 0·1 per cent. solution of the drug in artificial blood serum and the mixture was then placed in a small corked tube and kept at 100° F. Every half hour a small quantity of the mixture was removed and examined under a high power of the microscope and the time at which crystals of the sodium biurate first appeared was noted. A similar experiment, for purposes of comparison, was made with the quadriurate and artificial blood serum alone. I experimented separately in this way with potassium bicarbonate, potassium citrate, lithium carbonate, lithium citrate, sodium bicarbonate, sodium phosphate, piperazine, and lysidine. The results are shown in the following table:—

TABLE I.—*Showing the Influence exerted on the Decomposition of Sodium Quadriurate by Artificial Blood Serum alone and by Artificial Blood Serum containing 0·1 per cent. of Various Drugs in Solution.*

Solvent.	Sodium biurate crystals appeared after the lapse of—
Artificial blood serum	Two hours.
Ditto, containing 0·1 per cent. potassium bicarbonate	,,
,, ,, ,, potassium citrate ...	,,
,, ,, ,, lithium carbonate ...	,,
,, ,, ,, lithium citrate	,,
,, ,, ,, sodium bicarbonate ...	,,
,, ,, ,, sodium phosphate ...	,,
,, ,, ,, piperazine	,,
,, ,, ,, lysidine	,,

These results show that none of the drugs mentioned in the table exercise the slightest effect in delaying the conversion of the quadriurate into the biurate even when present in far larger proportions than can possibly be introduced into the blood by the medicinal administration of these drugs.[2] Therefore it appears that the treatment of gout by alkalies and salts of the alkalies does not delay the conversion of the quadriurate into the biurate.

DOES THE TREATMENT OF GOUT BY ALKALIES INCREASE THE SOLUBILITY OF SODIUM BIURATE?

With regard to the second assumption, that the administration of alkalies increases the solubility of the biurate deposited in the joints and tissues, Sir W. Roberts has shown that sodium bicarbonate and sodium phosphate diminish the solubility of sodium biurate, while potassium bicarbonate exercises no influence whatever on its solubility. He fails to find any direct object in the administration of alkalies for gout, and he has seen gouty attacks recur with full severity when the urine has been for a long time maintained persistently alkaline by the administration of bicarbonate and citrate of potassium. That the administration of alkalies might increase the solubility of the biurate appeared at one time to be probable from the results of some experiments performed by Sir A. Garrod. He immersed small pieces of cartilage infiltrated with sodium biurate for forty-eight hours in aqueous solutions of the carbonates of lithium, potassium, and sodium respectively. At the end of that time he found that the cartilage immersed in the lithium solution was restored to its natural condition; that in the potassium solution was much acted upon, while that in the sodium solution appeared to be unaltered. These results are somewhat in opposition to those of Sir W. Roberts and as neither the experiments of Sir A. Garrod nor those of Sir W. Roberts represent the conditions under which alkalies when introduced into the circulation would act on sodium biurate, I thought it desirable to reinvestigate the subject as far as possible under such conditions.

INVESTIGATIONS OF THE EFFECTS OF VARIOUS ALKALINE DRUGS ON THE SOLUBILITY OF SODIUM BIURATE.

These experiments were undertaken in order to compare the solubility at 100° F. of sodium biurate in artificial blood serum and in artificial blood serum containing different proportions of the various drugs. The experiments were carried out in a similar manner to that described in my Goulstonian lectures.[3] I experimented separately with the following drugs: potassium bicarbonate, potassium citrate, lithium carbonate, lithium citrate, sodium bicarbonate, sodium phosphate, piperazine, and lysidine. Much greater proportions of the drugs were employed than could possibly be introduced into the blood by medicinal administration. The results are shown in the following tables:—

TABLE II.—*Showing the Solubility at 100° F. of Sodium Biurate in Artificial Blood Serum alone and in Artificial Blood Serum containing Different Proportions of Potassium Bicarbonate.*

Solvent.	Sodium biurate dissolved.
Artificial blood serum	0·11 per 1000.
Ditto, containing 0·01 per cent. potassium bicarbonate	0·10 ,,
,, ,, 0·10 ,, ,, ,,	0·10 ,,
,, ,, 0·20 ,, ,, ,,	0·11 ,,

These results show that potassium bicarbonate would not in the slightest degree increase the solvent power of the blood for gouty deposits.

TABLE III.—*Showing the Solubility at 100° F. of Sodium Biurate in Artificial Blood Serum alone and in Artificial Blood Serum containing Different Proportions of Potassium Citrate.*

Solvent.	Sodium biurate dissolved.
Artificial blood serum	0·11 per 1000.
Ditto, containing 0·01 per cent. of potassium citrate	0·10 ,,
,, ,, 0·10 ,, ,, ,,	0·10 ,,
,, ,, 0·20 ,, ,, ,,	0·11 ,,

These results show that potassium citrate would not in the slightest degree increase the solvent power of the blood for gouty deposits.

TABLE IV.—*Showing the Solubility at 100° F. of Sodium Biurate in Artificial Blood Serum alone and in Artificial Blood Serum containing Different Proportions of Lithium Carbonate.*

Solvent.	Sodium biurate dissolved.
Artificial blood serum	0·11 per 1000
Ditto, containing 0·005 per cent. of lithium carbonate	0·11 ,,
,, ,, 0·01 ,, ,, ,,	0·11 ,,
,, ,, 0·10 ,, ,, ,,	0·15 ,,

These results show that lithium carbonate would not in the slightest degree increase the solvent power of the blood for gouty deposits even when present in far larger proportions than could be introduced into the blood by medicinal administration. Lithium salts are usually given in doses of 1 gr. to 5 gr. three times a day, whereas to get 0·01 per cent.

[2] In order to have 0·1 per cent. of any drug in the blood it would be necessary to introduce 600 gr. of that drug at once into the circulation of an adult man of average weight.

[3] THE LANCET, April 17th, 1897, p. 1073.

of a lithium salt into the blood it would be necessary to introduce 60 gr. of the salt at once into the circulation of an adult man of average weight.

TABLE V.—*Showing the Solubility at 100° F. of Sodium Biurate in Artificial Blood Serum alone and in Artificial Blood Serum containing Different Proportions of Lithium Citrate.*

Solvent.	Sodium biurate dissolved.
Artificial blood serum	0·11 per 1000
Ditto, containing 0·005 per cent. of lithium citrate ...	0·11 ,,
,, ,, 0·01 ,, ,, ,,	0·11 ,,
,, ,, 0·10 ,, ,, ,,	0·11 ,,

These results show that lithium citrate would not in the slightest degree increase the solvent power of the blood for gouty deposits.

TABLE VI.—*Showing the Solubility at 100° F. of Sodium Biurate in Artificial Blood Serum alone and in Artificial Blood Serum containing Different Proportions of Sodium Bicarbonate.*

Solvent.	Sodium biurate dissolved.
Artificial blood serum	0·11 per 1000
Ditto, containing 0·01 per cent. of sodium bicarbonate.	0·10 ,,
,, ,, 0·10 ,, ,, ,,	0·09 ,,
,, ,, 0·20 ,, ,, ,,	0·08 ,,

These results show that sodium bicarbonate would slightly decrease the solvent power of the blood for gouty deposits.

TABLE VII.—*Showing the Solubility at 100° F. of Sodium Biurate in Artificial Blood Serum alone and in Artificial Blood Serum containing Different Proportions of Sodium Phosphate.*

Solvent.	Sodium biurate dissolved.
Artificial blood serum	0·11 per 1000
Ditto, containing 0·01 per cent. of sodium phosphate	0·11 ,,
,, ,, 0·10 ,, ,, ,,	0·11 ,,
,, ,, 0·20 ,, ,, ,,	0·11 ,,

These results show that sodium phosphate would not in the slightest degree increase the solvent power of the blood for gouty deposits.

TABLE VIII.—*Showing the Solubility at 100° F. of Sodium Biurate in Artificial Blood Serum alone and in Artificial Blood Serum containing Different Proportions of Piperazine.*

Solvent.	Sodium biurate dissolved.
Artificial blood serum	0·11 per 1000
Ditto, containing 0·01 per cent. of piperazine	0·09 ,,
,, ,, 0·10 ,, ,, ...	0·11 ,,
,, ,, 0·20 ,, ,, ...	0·13 ,,

These results show that piperazine would not in the slightest degree increase the solvent power of the blood for gouty deposits even when present in far larger proportions than could be introduced into the blood by medicinal administration. Piperazine is usually given in doses of 5 gr. three times a day, whereas to get 0·10 per cent. of piperazine into the blood it would be necessary to introduce 600 gr. of the drug at once into the circulation of an adult man of average weight.

TABLE IX.—*Showing the Solubility at 100° F. of Sodium Biurate in Artificial Blood Serum alone and in Artificial Blood Serum containing Different Proportions of Lysidine.*

Solvent.	Sodium biurate dissolved.
Artificial blood serum	0·11 per 1000.
Ditto, containing 0 01 per cent. of lysidine	0 09 ,,
,, ,, 0·10 ,, ,, ...	0·10 ,,
,, ,, 0·20 ,, ,, ...	0·10 ,,

These results show that lysidine would not in the slightest degree increase the solvent power of the blood for gouty deposits, even when present in far larger proportions than could be introduced into the blood by medicinal administration. Lysidine is given in doses of from 30 gr. to 120 gr. three times a day, whereas to get 0·20 per cent. of lysidine into the blood it would be necessary to introduce 1200 gr. of the drug at once into the circulation of an adult man of average weight.

FURTHER EXPERIMENTS AS TO THE INFLUENCE OF POTASSIUM AND LITHIUM SALTS ON THE SOLVENCY OF GOUTY DEPOSITS.

As it appeared to me that the experiments of Sir Alfred Garrod, previously referred to, into the solvent effect of potassium bicarbonate and lithium carbonate on gouty deposits were scarcely comparable with what occur. when these drugs are acting *viâ* the blood and other fluids of the body, I thought it desirable to repeat the experiments under different conditions. I therefore investigated the solvent action on gouty deposits of artificial blood serum impregnated with quantities of potassium bicarbonate and lithium carbonate respectively; the quantities of the drugs used were in excess of those which could be present in the fluids of the human body when full doses are being administered. The artificial blood serum impregnated with potassium bicarbonate contained 0·01 per cent. of that drug, which is equivalent to the introduction at once of 60 gr. of the drug into the circulation of an adult and the after maintenance of that amount in the circulation. The artificial blood serum impregnated with lithium carbonate contained 0·0015 per cent. of that drug, which is equivalent to the introduction at once of 10 gr. of the drug into the circulation of an adult and the after maintenance of that amount in the circulation. The experiments were carried out in the following manner.

A piece of cartilage well and uniformly infiltrated with sodium biurate which had been removed from a gouty joint at a post-mortem examination was divided into three equal pieces. One piece was suspended in a bottle containing 100 c.c. of artificial blood serum, the second piece in a bottle containing 100 c.c. of artificial blood serum impregnated with potassium bicarbonate, and the third piece in a bottle containing 100 c.c. of artificial blood serum impregnated with lithium carbonate. The bottles with their contents were kept throughout the experiments at the blood heat and every twenty-four hours fresh supplies of fluid were introduced, so that the first piece of cartilage was constantly bathed in artificial blood serum at the blood heat, the second piece in artificial blood serum impregnated with potassium bicarbonate, and the third piece in artificial blood serum impregnated with lithium carbonate. By this method of procedure it was considered, as regards any solvent effect that the drugs might exert on the gouty deposit, that the results would be fairly comparable with what occurs when potassium or lithium salts are medicinally administered. The pieces of cartilage were removed every twenty-four hours and examined by means of a lens and the experiments were continued until all the sodium biurate was dissolved out of the cartilage. The solution of the sodium biurate from the cartilage proceeded at the same pace in the three pieces and was in no way accelerated by the presence of the potassium bicarbonate or the lithium carbonate. The sodium biurate was completely dissolved from the three pieces of cartilage on the fifteenth day. These experiments indicate that the quantities of potassium bicarbonate and lithium carbonate which could by ordinary dosage be introduced into the fluids of the body can exercise no influence on the solvency of gouty deposits, and the results obtained

support the views of Sir William Roberts that potassium bicarbonate and lithium carbonate exercise no influence on the solubility of sodium biurate.

The net result of all these experiments is that the treatment of gout by alkalies or by piperazine or lysidine does not increase the solubility of the biurate deposited in the joints and tissues. Levison holds very similar opinions with regard to the alkaline treatment of gout. He considers that the administration of the ordinary alkalies, of lithium salts, or of piperazine, with the object of either dissolving sodium biurate or of preventing its deposition, is decidedly useless. He also found that the administration of piperazine exerts no influence upon the amount of uric acid excreted.

A GENERAL ACIDITY OF THE SYSTEM NOT ASSOCIATED WITH GOUT.

The third assumption, that in connexion with gout there is a general acidity of the system which causes a diminished alkalinity of the blood, is opposed to the results of recent investigations on the subject. The experiments of Klemperer and my own experiments[4] show that the alkalinity of the blood of gout is but very little, if at all, diminished and that corresponding variations in the alkalinity of the blood may frequently be met with in healthy individuals. Moreover, the experiments previously published by myself[5] demonstrate that a diminution in the alkalinity of blood serum containing uric acid in solution does not facilitate the deposition of sodium biurate from it nor does a diminution in the alkalinity of blood serum diminish its solvent power for sodium biurate. It appears, therefore, that there is no ground whatever for the assumption that the treatment of gout by alkalies tends to neutralise a so-called general acidity of the system and so renders the blood a better solvent of gouty deposits.

REASONS FOR BELIEVING THE TREATMENT OF GOUT BY SALICYLATES TO BE ERRONEOUS.

Just as the treatment of gout by means of alkalies is based on the entirely erroneous supposition that uric acid is present as such in the fluids and deposits of gouty patients, so the main reason for giving a salicylate in gout is based on the assumption that it unites with uric acid throughout the system and so effects its removal from the system and its elimination in the urine. That sodium salicylate does cause an increased elimination of uric acid in the urine, at all events in the early stages of its administration, is undoubted. This is shown by the following daily determinations which I made of the total uric acid excretion of a healthy man before, during, and after treatment with sodium salicylate. The diet was of the same nature throughout the experiments.

TABLE X.—*Showing the Daily Excretion on Successive Days of Uric Acid by a Healthy Man before, during, and after Treatment with Sodium Salicylate.*

—	Daily excretion of uric acid in grammes.
Before taking salicylate	0·547
	0 589
	0·731
Average	0·622
Fifteen grains of sodium salicylate taken three times a day	0·852
	0·942
	0·826
	0·784
Average	0 851
Salicylate left off	0 340
	0·581
	0 543
	0·677
	0·686
Average	0 565

That this increased elimination of uric acid is due, however, to the removal of ready formed uric acid stored in the system is, in my opinion, incorrect. In the first place it must be remembered that any uric acid deposited in any of the organs or tissues of gouty subjects is deposited in the form of sodium biurate, and the result of the following experiments shows that artificial blood serum, containing sodium salicylate in much greater proportions than could be introduced into the blood by the medicinal administration of the drug, has not the slightest increased solvent effect on the biurate.

TABLE XI.—*Showing the Solubility at 100° F. of Sodium Biurate in Artificial Blood Serum alone and in Artificial Blood Serum containing Different Proportions of Sodium Salicylate.*

Solvent.	Sodium biurate dissolved.
Artificial blood serum	0·11 per 1000
Ditto, containing 0·003 per cent. of sodium salicylate	0·11 ,,
,, ,, 0·006 ,, ,, ,,	0·11 ,,
,, ,, 0 01 ,, ,, ,,	0·11 ,,
,, ,, 0·10 ,, ,, ,,	0·11 ,,

These results show that sodium salicylate would not in the slightest degree increase the solvent power of the blood for gouty deposits even when present in far larger proportions than could be introduced into the blood by medicinal administration. Sodium salicylate is usually given, in the treatment of gout, in doses of 15 gr. to 20 gr. three times a day; whereas to get 0 1 per cent. of sodium salicylate into the blood it would be necessary to introduce 600 gr. of the drug at once into the circulation of an adult man of average weight. Dr. J. Fawcett,[6] who likewise finds that sodium salicylate produces an increased uric acid excretion, considers it improbable that the increase can be explained by a mere clearing out of retained uric acid.

I also find that artificial blood serum containing sodium salicylate in far larger proportions than could be introduced into the blood by medicinal administration has no effect whatever in delaying the conversion of sodium quadriurate into the biurate, as is shown in the following table.

TABLE XII.—*Showing the Influence exerted on the Decomposition of Sodium Quadriurate by Artificial Blood Serum alone and by Artificial Blood Serum containing 0·1 per cent. of Sodium Salicylate in Solution.*

Solvent.	Sodium biurate crystals appeared after the lapse of—
Artificial blood serum	Two hours.
Ditto, containing 0·1 per cent. of sodium salicylate	Two hours.

It therefore appears from the results of the experiments given in Tables XI. and XII. that sodium salicylate has no direct action either in delaying the decomposition of sodium quadriurate or in effecting a solvent action on deposits of sodium biurate. The supposed solvent effect of sodium salicylate for gouty deposits does not therefore exist. What I believe to be the correct explanation of the increased elimination of uric acid in the urine during the administration of sodium salicylate is that salicylic acid unites readily with glycocine and so conveys an increased amount of that body to the kidneys, where by its combination with urea an increased amount of uric acid is necessarily formed. This increased formation of uric acid is directly detrimental to gouty subjects and on that account I consider that salicylates are contra-indicated in gout.

CONCLUSIONS.

1. The ordinary alkalies, the lithium salts, piperazine, and lysidine, do not exercise any special solvent effect on sodium biurate and their administration to gouty subjects with the object of removing uratic deposits in the joints and tissues appears to be useless.

2. Sodium salicylate does not exercise any special solvent effect on sodium biurate. Its administration with the object of removing uratic deposits in the joints and tissues appears to be useless, and, moreover, it is apparently contra-indicated in gout on account of its leading to an increased formation of uric acid in the kidneys.

OBSTRUCTIVE LARYNGEAL AFFECTIONS AND THEIR INFLUENCE UPON CHLOROFORM ANÆSTHESIA.

BY H. BELLAMY GARDNER, M.R.C.S. ENG., L.R.C.P. LOND.,

ASSISTANT ANÆSTHETIST TO CHARING-CROSS HOSPITAL; ANÆSTHETIST TO THE NATIONAL ORTHOPÆDIC AND MALE LOCK HOSPITALS.

THE fears which are so generally entertained as to the danger of giving an anæsthetic to patients suffering from any form of obstructive laryngeal affection lead me to put forward a few observations founded upon several severe cases of this nature which I have lately been called upon to anæsthetise. Not only do the majority of such patients pass through the anæsthesia remarkably well, but, as I shall hope to show, there is reason to believe that the element of asphyxia produced by a partial mechanical obstruction of some weeks' duration in the patient's upper air-passage is responsible for a maintenance of blood-pressure and increased respiratory activity which, so far from causing alarm, may, with due recognition of its limits, be positively of value to the anæsthetist during the narcosis. In ordinary chloroform anæsthesia a very shallow type of respiration is often witnessed which cannot be disregarded by the administrator as a warning of impaired central activity; it requires the most diligent watching, for, being inaudible and hardly palpable, irregularity may without further notice be succeeded by complete cessation. Further, also, under the influence of shallow breathing the pulse is small and slow and the general circulation, as evidenced by pallor of the countenance, shows marked signs of depression. When the breathing is inaudible Dr. Hewitt[1] has found that "the administrator may usually cause a softly snoring sound by pressing the lower jaw backward." I have frequently proved this manœuvre to be an extremely valuable one in producing an artificial stertor, which acts as a good guide, and having marked the *increased depth of respiration* which ensues in nearly every instance when it is resorted to am also convinced that though the increase is compensatory in character it has two important practical results, because (1) it prevents the stagnation of chloroform vapour of increasing strength in the lungs, and (2) adds a considerable impetus to the venous circulation by augmenting the suction action of the thorax. That this latter action is a powerful factor in emptying the large veins I have witnessed in operations exposing the internal jugular vein at the root of the neck, when it can be seen that this vessel partly flattens at each cardiac diastole in expiration, but collapses completely during deep inspiration. Now during partial respiratory obstruction, until compensatory thoracic movements have been established, there is a deficiency of oxygen in the circulation which centrally stimulates the respiratory muscles to further efforts; the same condition also causes a general vaso-motor constriction with consequent rise in blood-pressure and it is therefore to the proximity of incomplete respiratory compensation that I attribute the absence of those symptoms of depression which might be expected in patients with chronic laryngeal obstruction under chloroform.

The administration of chloroform to patients with a partial laryngeal obstruction is clinically a somewhat comparable procedure to the exhibition of nitrous oxide gas with small percentages of oxygen in surgical operations. The valuable experience gained in the gradual onset of symptoms due to reduction of the oxyhæmoglobin in the blood in these latter cases (easily rectified by increasing the supply of oxygen to be inhaled) has shown definitely that not only in theory is it possible to take advantage of these two factors in the respiratory and vaso-motor compensatory mechanism, but in actual practice the administrator can feel and perceive at every breath where the limits of this slight oxygen deprivation lie and can detect by the depth of air-intake and tendency of facial colour the phenomena which will follow during several ensuing minutes. It cannot with certainty be stated that the elimination of carbonic acid gas is retarded in cases with mechanical obstruction in the air passage, but, as it is probable, I would here suggest a reference to the remarkable result obtained by Dr. Augustus Waller during his experiments as to the direct action of anæsthetics upon isolated nerve, which showed that when CO_2 was mixed with chloroform vapour in the gas-chamber the recovery of electromobility in nerve-tissue was more pronounced than after chloroform alone.[2] This bears very directly upon the cases I shall relate and should be carefully investigated in future work. At this point the foregoing remarks should be clearly defined as a dangerous doctrine for any but those who are in constant association with the administration of anæsthetics. The actual fatal result of a more or less *sudden* obstruction to respiration during chloroform narcosis has been so frequently reported and the warning is so thoroughly appreciated by all experienced administrators that this paper cannot, I think, be misunderstood in merely offering an explanation of certain satisfactory symptoms in otherwise desperate cases.

CASE 1. *Double abductor paralysis of the vocal cords.*—A man, aged fifty-seven years, of powerful build, height 5 ft. 11 in., with bulky abdomen, had abductor paralysis of his vocal cords for twenty-six years and suffered with laryngeal stridor and dyspnœa on any slight exertion. His arterial system was not markedly degenerate and his pulse was 96 per minute. His chest expansion was very feeble owing to paralysis of the intercostal muscles in the upper six spaces, but the diaphragm and abdominal muscles were working vigorously. Removal of the malignant glands in the neck and primary growth at the right base of the tongue were decided upon. On April 9th, 1897, chloroform was given on a Skinner's mask. When the stage of surgical narcosis was reached loud inspiratory stridor supervened with extreme abdominal efforts; complete obstruction to air-entry seemed imminent, but by head extension and raising of the chin respiration settled into a very deep and regular rhythm. The lips and ears were a trifle dusky, but the pulse remained full and strong for over an hour and a quarter, the rate being on the average 114 per minute. After this tracheotomy was performed and the pharynx was plugged to prevent inhalation of blood during removal of the tongue; by means of Junker's inhaler chloroform was continued through the tracheal tube; the pulse, however, fell to 72 and became less regular in force and rhythm while the face grew paler and the respiration shallow. Half the tongue was removed and the patient did well subsequently; but it was clear to me that when the partial laryngeal obstruction had been eliminated by tracheotomy the circulation began to fail directly as the respiration became less vigorous.

CASE 2. *Multiple papillomata in the larynx.*—The patient was a boy, aged eight years. He was thin, of dark complexion and nervous temperament, with severe dyspnœa and retraction of the lower intercostal spaces due to obstruction to inspiration by the laryngeal growths. He was chloroformed for the removal of the latter *per vias naturales* without laryngotomy. Before commencing his lips were slightly cyanosed and his pulse was small and rapid. The breathing grew deeper with stridulent inspiration as the narcosis proceeded, the pulse became stronger and fuller under its influence, while the colour remained the same as before. Seated astride the couch I then raised him against my own chest into the sitting position for the use of the laryngoscope while I continued the chloroform administration through Hewitt's tubular mouth-gag from a Junker's inhaler. The respiratory mechanism maintained its deep and regular efforts whilst the forceps were introduced several times into the larynx and portions of growth were removed. Though I have anæsthetised this patient on nine occasions in the above manner at intervals of a week or more his pulse has not flagged under the anæsthetic nor has the breathing shown irregularity from central causes; and this is the more remarkable in the vertical posture, which is apt to favour syncope in cases without respiratory obstruction. In this instance increasing dyspnœa had been present for three months before the first operation.

CASE 3. *Epithelioma of the larynx.*—A woman, aged sixty-five years, fairly well nourished, suffering from a malignant growth at the posterior margin of the upper aperture of the larynx, had several attacks of acute dyspnœa, the last an hour before operation. Chloroform was administered, breathing grew deep and audible (as would be more usual under ether), with marked improvement in the pulse and colour in the

[1] Anæsthetics and their Administration, p. 229.

[2] Dr. A. Waller: Brit. Med. Jour., Nov. 20th, 1897, p. 1473.

third stage of anæsthesia. After a quarter of an hour the trachea was reached and opened, but directly air entered and the obstruction was entirely relieved breathing became shallow and almost ceased, the pulse, which had been full and strong before, became small and slow, and pallor of the face appeared, which only gave place to returning colour and respiration after three or four strong compressions of the chest walls. This remarkable sequence of circulatory phenomena was due, in my opinion, to the sudden loss of stimulation to the respiratory mechanism which had been working vigorously under the influence of partly venous blood and thereby strongly emptying the right heart by ample thoracic movement.

CASE 4. *Epithelioma of the larynx.*—The patient was a man, aged sixty years, thin, wiry, and alcoholic, his voice was almost gone, and he had laryngeal stridor and dyspnœa on exertion. There was deep, diaphragmatic respiration under chloroform; his colour was somewhat dusky, but his pulse was strong and regular at 96. Tracheotomy was performed. No pallor or respiratory cessation occurred here, but the breathing becoming quiet and shallow on insertion of the tube the pulse fell in force and frequency at the same time.

CASE 5. *Tuberculous disease of the right thyroid cartilage.*—The patient was a boy, aged eighteen years. He was very thin and anæmic, with a hard swelling over the right side of the larynx. He was suffering from severe dyspnœa painful to witness. When requested to fill his chest the upper part expanded, but breathing usually was mainly diaphragmatic. He had hoarseness for two years previously and increasing respiratory obstruction for two months, culminating in attacks of acute asphyxia during the three previous nights. Sleep was now impossible, but the patient could lie down flat. His pulse was 84, small and weak, though regular. Chloroform was taken on Skinner's mask with regular hoarse inspirations which passed into a deep rhythm, though air entry was severely obstructed. Operation was begun. The pulse was good. When, however, the head was extended backwards the brawny swelling in the throat almost entirely occluded the passage of air. The face and ears were deeply cyanosed, secondary pallor commencing. The pulse was still regular. The head was flexed, the mouth was opened, and the tongue was drawn forward; the tissues over the swelling were divided and breathing was much freer. Forty minutes from beginning high tracheotomy was performed. After insertion of the tube some obstruction arose from ropy mucous, but allowing the patient to come round a little this, with a little blood, was coughed up, and at the end of one and a half hour's operation he finished well, was warm, of good colour, and with a pulse at 84.

To illustrate the very grave and alarming symptoms which arise under chloroform from *sudden* obstruction to breathing in a previously unobstructed patient the following case may prove of value.

CASE 6. *Accidental division of the right recurrent laryngeal nerve.*—The patient was a male, aged thirty-five years, thick-set and well nourished, suffering from hygroma of the thyroid gland on the right side. Breathing was normal. A.C.E. mixture was administered on Rendle's mask throughout; there was typical anæsthesia during the first half-hour of operation, when the right recurrent laryngeal nerve was accidentally cut by the operator; inspiratory stridor set in and gradually became more marked. There was, however, no real dyspnœa till after operation, when the obstruction from paralysis of the right vocal cord became very severe and despite head extension and drawing forward of the tongue extreme cyanosis and irregularity of the pulse supervened with very deep inspiratory efforts. Secondary pallor accompanied this acute asphyxia and the surgeon was compelled to intubate the larynx with an O'Dwyer's tube to relieve the symptoms. When the breathing became quieter the patient was removed to bed and after complete recovery from the anæsthetic the tube was coughed out and he subsequently did well.

In certain of the foregoing cases, though tracheotomy was performed, it was not undertaken for the purpose of alleviating asphyxia during anæsthesia, but had been designed beforehand as part of the remedial treatment for the disease; in this last case, however, the very grave symptom of cardiac irregularity supervened rapidly upon respiratory obstruction, and it was this secondary circulatory failure which rendered laryngeal intubation or tracheotomy necessary to save the patient's life.

Welbeck-street, W.

CLINICAL REMARKS ON SOME ADVANCED FORMS OF URETHRAL STRICTURE TREATED BY A COMBINED URETHROTOMY AND PERINEAL SECTION.

BY REGINALD HARRISON, F.R.C.S. ENG.,
SURGEON TO ST. PETER'S HOSPITAL.

IN some clinical remarks I recently offered[1] on the commoner forms of urethral stricture I reserved for separate consideration certain instances where the methods of treatment then referred to were unlikely to prove of much benefit for the reasons that either the obstructions were too "burn-scar"-like and contractile to dilate or too tough or extensive to divide from within the urethra. In addition to such characteristics these strictures are not unfrequently complicated with fistulæ or tortuous routes in the perineum and scrotum through which both urine and pus escape. Hence the discomfort of the patient is often greatly added to. Cases answering to this description are generally regarded as being best treated by some form of perineal section or, as it is sometimes called, external urethrotomy and it is to this point I desire now to confine myself. As a contribution to this subject I published a series of cases[2] where the usual operation of perineal section as undertaken for stricture in the deep urethra had been greatly simplified and its safety and efficiency increased by combining with it internal urethrotomy. Strictures of the class now under notice are but rarely impassable to some form of instrument and as by reason of the urinary fistulæ which so often complicate them they are seldom urgent in their nature time is allowed not only for effecting an entrance into the bladder by the natural way, but also for ascertaining what may be the outcome of some kind of dilatation. Assuming that the former is accomplished, though dilatation proves futile, the combined operation probably offers the best solution of the difficulty. In describing it, together with such modifications as I have adopted since the publication of my first paper on this subject, I will take in illustration two typical instances in which it was employed.

CASE 1.—A man, aged fifty-one years, whom I saw and operated upon in 1890 had been the subject of a stricture with a strong tendency to contract for some years and had undergone no less than six operations for it, including a divulsion by Holt's method and five internal urethrotomies at various intervals and places. For some months before I saw him the stricture had been contracting and closing in spite of the patient's well-directed efforts with suitable bougies to keep it open. Straining to urinate was constant and prevented continuous sleep, and there was some cystitis with probably pyelitis. It was clear that a free relief must be afforded as structural kidney complications appeared imminent. I performed an internal urethrotomy with Teevan's modification of Maisonneuve's instrument, as I thought that the latter might not stand the strain put upon it by the cartilaginous character of the tissues which had to be divided. This being done I passed a full-sized grooved staff (No. 12 English) into the bladder. As the latter was evidently gripped in the deep urethra I had the patient placed in the lithotomy position and I divided in the median line from without inwards such contracted tissues as remained. I thus opened the urethra and found by passing my finger first into the bladder and then hooking it forwards along the urethra in the direction of the penile orifice that the walls of the canal had now been rendered free and unresisting. A full-sized gum-elastic drainage-tube (such as I have elsewhere described and figured[3] in connexion with the larger subject of bladder drainage) was passed into the bladder through the wound and retained. The parts were well washed out with a solution of perchloride of mercury (1 in 6000). The drainage-tube was finally withdrawn on the sixth day and the wound soon closed. Eight years have now elapsed since this operation was practised.

[1] THE LANCET, April 23rd, 1898.
[2] Brit. Med. Jour., July 18th, 1885.
[3] Surgical Disorders of the Urinary Organs, 4th edition.

The patient remains in good health and suffers no further inconvenience from his urinary organs than having occasionally to pass a full-sized bougie for himself. I frequently meet him.

CASE 2.—This patient, aged forty-five years, had a tough contractile stricture which had resisted dilatation and was complicated with several urinary fistulæ of two years' standing. I operated upon him in 1892. He was treated in the same way as the preceding patient and in addition the various fistulæ were opened up and scraped. The result was equally satisfactory and is so far permanent.

Perineal section carried out on these lines has been found to present many advantages. In the first place it is easier to effect a division of the hard and condensed tissues of the perineum, such as generally surround strictures of this kind, upon a fairly large staff than upon a small one or even upon the shouldered staff which Syme used for marking the commencement of the contracted portion of the canal. The freedom or otherwise with which the large-sized instruments move in the canal is sufficient to determine the necessity for proceeding at once with the external section, as well as the precise locality and degree of the contraction which remains. It may seem at first sight in combining these two operations that the magnitude of an ordinary perineal section is increased. This, however, is not the case, as the division of more or less of the obstruction from within the canal has not infrequently proved sufficient to completely clear the urethra, whilst it invariably tends to limit considerably the extent of any external section which may still be required. Further, it must be remembered that there is no kind of wound involving the deep urethra which heals so kindly or is so free from those constitutional symptoms which occasionally follow operations on this canal than that where a temporary drain is established for the urine. Again, this point is importantly supported by the results following rupture of the deep urethra from external violence. Cases of this kind where a perineal section is performed and a temporary drain established compare most favourably, both immediately and remotely, with those where the treatment consists in the retention of a catheter, when this can be passed, the points of distinction being in the former class of cases the absence of septic symptoms of a serious nature and the more favourable character of the scar which results. There is no worse kind of stricture to manage than that following an extensive rupture of the deep urethra and its treatment by what may be described as the closed method. It is on grounds such as these that I believe the combined operation proves of much benefit in the treatment of some of the most serious and complicated forms of urethral stricture.

Before concluding these remarks I will briefly refer to a class of strictures which I have only incidentally noticed. This is the structurally impassable stricture—impassable alike to instruments and urine and associated invariably with an extraneous route for the urine, probably through the perineum. The latter condition is the result either of nature's effort to provide escape for the urine by abscess and fistula or of the surgeon's, more promptly and directly, by incision. In endeavouring to restore a urethra of this kind and to close a well-worn fistula the surgeon will fully recognise the mechanical and physiological difficulties before him not only in reproducing a portion of the canal which to all intents and purposes is obliterated, but in subsequently fitting it to take up the functions connected with the process of natural, or even aided, micturition. It requires no great amount of surgical ingenuity to establish the continuity of the urethra so far as instrumentation is concerned, but to secure a reasonable degree of control or influence over the restored portion of the canal is by no means certain. On the other hand, experience and trial have not infrequently shown that a good urinary fistula has proved an excellent substitute for a bad urethra.

Lower Berkeley-street, W.

TORQUAY NATURAL HISTORY SOCIETY.—The report presented at the annual meeting of this society showed that there were 198 members and associates. A special vote of thanks was awarded to Mr. C. H. Wade, M.A. Oxon., M.R.C.S. Eng., L.R.C.P. Lond., for the large amount of time and trouble he had devoted to the society.

A CASE OF RECURRENT CANCER OF THE BREAST TREATED BY OÖPHORECTOMY AND THYROID EXTRACT.

BY G. ERNEST HERMAN, M.B., F.R.C.P. LOND., F.R.C.S. ENG.,
SENIOR OBSTETRIC PHYSICIAN TO THE LONDON HOSPITAL, ETC.

A PATIENT, aged forty years, consulted me as to a lump in the left breast. The patient's weight was then 10 st. 3 lb. She had had two children, the last thirteen years ago. Menstruation was regular. The characters of the lump led to the opinion that it was cancer, and the patient was advised to see a surgeon. The result of this advice was that in October, 1890, Mr. Treves removed the left breast. The whole mamma was removed, but as no glands were discovered in the axilla the axillary space was not evacuated. The breast after removal was cut into, and the tumour was found to present all the characters of cancer so well marked that it was not thought necessary to complete the diagnosis by microscopical examination. The patient recovered well from the operation. In July, 1893, her weight was 11 st. 2 lb. In November, 1895, it was 11 st. 1 lb. In the beginning of 1896 she began to lose flesh. In May, 1896, she weighed 9 st. 12 lb., and in July 8 st. 13 lb. After this she gained a little, reaching 9 st. 6 lb. in October. Towards the end of December she noticed a lump in the armpit, which induced her to again come for examination. As a result of this on Jan. 4th, 1897, Mr. Treves cut down first upon a lump just above the clavicle and then upon the lump in the armpit. The lump above the clavicle was found to be an indurated fixed gland in such close relation to the subclavian vein that its removal was unadvisable. When the axilla was exposed, a mass of new growth was found quite surrounding the axillary vessels. There were also nodules in the pectoralis major. The new growth was so extensive that the complete removal of the axillary growth could have been effected only by amputation of the upper extremity, and if this had been done the supra-clavicular nodule would have remained. The incisions were therefore closed without any attempt to remove the recurrent growths. The wounds healed well.

As there was no prospect of cure by any other treatment, the case in which Dr. Beatson observed disappearance of recurrent cancer of the breast after oöphorectomy and the administration of thyroid extract was put before the patient and her husband, and after consideration they decided to accept this chance of cure. Menstruation had been irregular for about three years, but had not ceased. She had last menstruated on Jan. 3rd, 1897. On March 2nd, 1897, I removed both ovaries. They presented small cysts but were otherwise healthy. As soon as the vomiting caused by the anæsthetic had passed off the patient began to take thyroid extract; at first the glycerine extract made by Allen and Hanburys, then either tabellæ from Allen and Hanburys or tabloids from Burroughs, Wellcome and Co. She has taken this ever since in as full doses as she could, varying from 10 gr. to 15 gr. daily. She has occasionally had to diminish the dose on account of dyspeptic symptoms—vomiting and epigastric pain—thought to be produced by it. On Sept. 27th, 1897, she came up for examination. Mr. Treves and I examined the parts. The supra-clavicular nodule was no longer to be felt. The axillary artery could be felt pulsating, apparently quite free from growth around it. The patient's weight, which on March 27th, 1897, was 8 st. 4½ lb., is now (May, 1898) 8 st. 10½ lb. On May 5th, 1898, the patient was seen by Dr. G. C. Tayler of Trowbridge, who reported as follows: "I examined the operation scars this day and find that they are pale—almost the colour of the neighbouring skin—soft, no adhesion to the subjacent parts, and no deposits of any kind in the surrounding tissues."

In this case, as in one published by Dr. Beatson, recurrent cancerous growths atrophied after removal of the ovaries and the administration of thyroid extract. The length of time since the operation during which the patient has remained well—fourteen months—is enough to justify the assertion that the course of the disease has been modified by the treatment.

Since the publication of Dr. Beatson's case Mr. Stanley Boyd and Mr. Watson Cheyne have reported cases of oöphorectomy for mammary cancer, but it is not stated in their reports that thyroid extract was given. Thyroid extract has very powerful effects upon the body, and I think Dr. Beatson's practice cannot be said to have been followed if thyroid extract has not been given. Cases treated by oöphorectomy without thyroid extract do not justify a conclusion as to the uselessness of oöphorectomy *plus* thyroid extract. My reason for combining oöphorectomy with thyroid extract was simply that Dr. Beatson's successful case was treated in that way. The explanation of the benefit which seems to me the probable one is that based on the protozoon theory of cancer—that the withdrawal of the ovarian secretion, coupled with the presence of an excess of the thyroid secretion, makes the tissues of some persons a less fit food for the cancer protozoon.

I have since treated some cases of uterine and vaginal cancer by oöphorectomy and thyroid extract, but the results are not yet complete enough for publication.

Harley-street, W.

THE LOSS OF SEXUAL POWER IN TABES DORSALIS.

BY R. CUNYNGHAM BROWN, M.D. DURH.,

CLINICAL ASSISTANT TO THE NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, QUEEN-SQUARE; LATE JUNIOR HOUSE SURGEON AND SENIOR ASSISTANT HOUSE SURGEON, HUDDERSFIELD INFIRMARY.

Loss of sexual power is one of the most constant disturbances of function encountered in tabes, being present in at least 70 per cent. of cases of over two years' duration. Leimbach[1] found it present in 58·25 per cent. of all cases of whatever duration, and in 15·54 per cent. it was one of the earliest symptoms of the disease. Before investigating, however, this disturbance of function it may be well to glance at the normal mechanism. Erection is a complex process largely reflex in nature, having for its afferent limb fibres passing from the glans penis and penis to the upper sacral and lower lumbar cord and for its efferent limb fibres passing from the cord to branches supplying the pudic and dorsal arteries of the penis and the transversus perinæi and bulbo-cavernosus muscles. Erection therefore depends partly on the presence of afferent stimuli ascending from the penis, but may also be initiated or inhibited by cerebral impulses. Ejaculation is an act more dependent than erection on the presence of afferent stimuli. The afferent impulses in this case also come mainly from the glans penis. The efferent impulses are spread over a larger area than in the case of erection, effecting peristaltic contraction of the muscles of the epididymis, vas deferens, and prostate, and later rhythmic contractions of the levator ani, sphincter ani, constrictor urethræ, &c.

Tabes being mainly, if not entirely, a disease of the mechanism subserving the production and transmission of afferent impulses, it is to be expected that the loss of sexual power in tabes should be found to be due to the diminution or loss of those afferent impulses concerned in the act. The larger contention, that tabes is entirely a disease of the mechanism subserving the production and transmission of afferent stimuli, is outside the range of this paper, but in this connexion Dr. Warrington's paper[2] on the effect of section of the posterior roots on the cells of the anterior horn and that of Dr. Schaffer[3] on the changes in the cells of the anterior horn in tabes are of great value. Clinical experience, however, shows clearly the part which loss of afferent stimuli plays in the production of loss of sexual power. Of 12 cases of tabes taken at random 2 were women and not examined from this point of view. Of the remaining 10, 8 had suffered from tabes for a period of two years or more, and in these loss of sexual power was present in 6. None of them were old men, only one being over forty years of age. Now in every one of these 6 cases in which there was loss of sexual power there was absolute analgesia of the glans and comparative or absolute analgesia of the rest of the penis. 4 of these had in addition comparative loss of tactile sensibility in the penis and glans, but in the other 2 tactile sensibility was normal. Further, in the 4 cases in which there was no loss of sexual power there was no affection of sensibility of the penis or glans. These figures are very significant and indicate very clearly that the alteration in sexual power is closely related to the diminution or loss of afferent impulses from the skin and possibly deeper structures of the glans and penis.

The loss of sexual power is gradual in onset and exists in proportion to the amount of analgesia of the glans. In the majority of cases examined, also, the condition might be described as belonging to one of two stages: (1) that of loss or diminution of voluntary sexual power with persistence of involuntary erection and emission; and (2) loss of both voluntary sexual power and involuntary emission. In the first stage analgesia of the glans alone or accompanied by diminished tactile sensibility is present, but the testicles are not atrophied and testicular sensation is present. In the second stage there are in addition atrophy of the testicles and loss of testicular sensation. The first stage passes gradually into the second, but a considerable time may elapse before complete loss of sexual power is established. In one case, three years after the loss of voluntary power, erection and emissions of purely cerebral origin occurred with regular frequency. This persistence of emission of cerebral origin shows that the efferent paths may remain capable of function long after the reflex process is impossible and indicates the afferent nature of the lesion. As to the site of the morbid processes at work it is impossible to speak with certainty at this stage. Gumpertz,[4] however, has demonstrated changes very early in tabes in the peripheral nerve structures, and it is, at any rate, possible that this, as well as other symptoms of tabes, is due to disease commencing not in the posterior spinal ganglia or in the posterior root at its junction with the cord, but in the extremely peripheral nerve structures subserving the production and transmission of afferent impulses.

VITALITY: AN APPEAL, AN APOLOGY, AND A CHALLENGE ADDRESSED TO BROTHER PRACTITIONERS.

BY

LIONEL S. BEALE.

(*Continued from page 1050.*)

AMONG the untenable propositions enumerated not the least extravagant is that in which the growth of living things is classed with the process of accretion or aggregation in the non-living world. Only watch the gradual living growth as seen by all in the little child. Can the faintest analogy be pointed out between this vital growth and any inorganic process whatever? Think of the increase of the several complex tissues, for example, in the arm or in a finger. As the member grows in length, do not the nerve plexuses distributed to the peripheral parts become separated by a gradually increasing distance from the nerve centres, and does not this change occur not only without interruption but at the same time that steady improvement in nerve action is taking place? Do not new tissue formations, new growth, and new nerve action all actively proceed and simultaneously? How, then, can such phenomena be caused, directed, and regulated by physics or swayed by chemistry?

If we study but a small particle of the growing tissues in properly prepared microscopical specimens we shall find millions of minute bioplasts among the tissues formed during growth—the vital phenomena and tissue formation and action proceeding with great regularity during the whole period; not only so, but evidence of anticipation of a future condition, of preparation for further growth and arrangement of tissue. Thus the complete development and action of the several tissues and their continued and healthy action are provided for during youth, adolescence, maturity, old age, decrepitude, up to death—one stage so gradually passing

into the next that healthy individuals are scarcely aware of the occurrence of any change at all.

All growth through living nature is effected by living matter (bioplasm) alone. Who can show that any tissue of any living thing in this world is formed by *aggregation*, *precipitation*, *deposition*, *a sort of crystallisation*, or by the "differentiation" of a previously homogeneous exudation-plasma?

Minute anatomical and chemical investigation and biological observation enable us to form in some degree a mental picture of the changes affecting the bioplasts of the tissues and of their action during life, and to form some idea of the phenomena which actually occur and which succeed one another from the time when the speck of living matter began to increase and multiply exceedingly, and some of the resulting bioplasts first began to produce perhaps only soft temporary tissue, to the time when the formation of lasting tissue and the construction of the several organs was complete, and their action became necessary to the well-being of the organism now developed and attaining its normal and permanent characters. The longing on our part to find out exactly how the several parts and organs of a complex organism are formed, and precisely how they act and what work they do is certain to lead to real advance of hygiene, psychical knowledge, and medicine.

Much, indeed, has been and is being gained in this direction, but our knowledge is still far from being accurate, definite, and complete in many important points which will certainly ere long be determined. Nevertheless, I appeal to all to consider whether the results of minute anatomical research and our knowledge of the minute structure and mode of action of various tissues and organs are not at this time really in advance of some of the doctrines still held and taught far and wide upon these matters—nay, upon the question of the nature of the endowments and the mode of increase of the very simplest living particles in nature; and I fear it will yet be some time before a clear and accurate account will be given and generally accepted of what goes on at the moment when a molecule of non-living matter receives its vital endowments. Indeed, I doubt whether any student of any department of living nature can acquire from our best works on physiology a definite notion of the ordinary processes which are necessary to his existence from moment to moment and to that of every living particle in the life world.

The importance of the thorough investigation of the physical and chemical phenomena of the living body is unquestioned, but is it not a fact that during the last forty years or more there has been a persistent and most determined effort on the part of some highly distinguished philosophers as well as physiologists, physicists, and chemists, and even physicians, to persuade mankind that all vital actions are in their nature but physical and chemical, while no one has succeeded in proving his case or even in adducing evidence that his contention is likely to be established in the future? The chemico-physical investigation of living nature has rightly been regarded as a highly important department of scientific work and thought, but is it quite suited for the training of the medical student, or, indeed, for students generally? Nor is it the fact that only undue prominence has been given to the importance of physical and chemical phenomena, for has not the influence of vitality in determining the course and character of the physical and chemical changes in matter during the living state been by some recent as well as by ancient authorities wholly ignored and denied? Unfortunately, too, physico-chemical doctrines of life have been accepted and made popular, and in consequence many thoughtful persons have been persuaded that these views, if not at this time completely established, would certainly be proved to be true some time hence, just as the idea of the evolution of life somehow from the non-living has gained credence, although there is not a fact convincing to the reason to be adduced in its support. Indeed, no one who advocates the physical doctrine of life has even attempted to explain to us the exact difference between a particle of matter in the living state and the same particle when death has occurred. Does not the vast, far-reaching influence of special vital power which is associated with a modicum of matter preclude the possibility of vital actions being only physical and chemical? Has any true analogy been pointed out between this far-reaching vital power over matter which perhaps is not to come under its influence for many years, and any physical or chemical action whatever? But some might say, "chemical action goes on after life has ceased in certain cases, as shown by considerable rise in temperature," to which the reply is that "in the situations where heat is being evolved in the dead body for some time after 'death' has taken place, particles of living matter or bioplasm still exist and continue to live until the temperature has ceased to rise.

Is it not indeed very doubtful whether the wonderful work of highly skilled scientific workers in physiological chemistry and physics in the splendid laboratories rightly provided in many institutions in every part of England will result in establishing the longed-for conclusions with reference to the nature and cause of vital processes, though quite recently another step towards that desired consummation of the universal operation of physical law seems to have been made by the discovery of "living crystals," of which I saw, or thought I saw—or did I dream I saw—the announcement? Almost daily new substances are discovered and bodies of wonderful properties extracted from a compost consisting of many textures, as well as the special secreting cells, vessels, &c., of an organ removed from a dead animal and beaten up into a soft pulp and then subjected to various chemical operations. But what right have we to assume that any of the substances at last obtained in a pure, perhaps in a crystalline, form were actually present when the organism was alive and the several bioplasts were performing their active vital functions? Is it reasonable to conclude that any theory based upon the results of such post-mortem operations ought to be accepted by us as even a probable solution of the facts, or that anything is likely to be gained by such methods of investigation concerning the nature of life? The conditions present in the laboratory are absolutely different from those in and around every particle of matter which is alive.

Is it not wonderful, therefore, that a few authorities still advocate a physiology consisting of chemical and physical phenomena, a physiology which would seem to be but a department of physics and chemistry—a physiology without vitality? No explanation whatever has been offered by the advocates of this abiotic physiology of the manner in which according to their view the chemical and physical actions are determined, governed, or regulated, or of the means by which the never-ceasing analytical and synthetical operations are carried on, or why the atoms—if atoms there be—change their places and relations to one another, or what governs their constant movements, or how their behaviour during life differs from their behaviour when life has ceased. But men are getting dissatisfied with a physiology and philosophy which postulates a living nature without vitality. Some of us rebel at being called mechanisms built by the sun, or laboratories of a kind, or machines for the conversion of energy. Nor can we any longer find comfort in the comprehensive words "protoplasm," "metabolism," "differentiation." We want to learn in what particulars Life differs from Non-life, or to be compelled by fact and reason to admit that there is but a difference of degree—the one state passing gradually into the other state.

Every attempt to account for the formation, construction, and action of tissues and organs of anything living without the recognition of vital agency has signally failed. Deposition from fluid, the gradual concentration of a solution, conversion, condensation, and processes allied to crystallisation have been proposed and found wanting. Much conjuring is still done by that learned word "differentiation," which seems to have satisfied many and silenced or soothed appeals for information. Can anyone point to one instance in all living nature in which tissue or structure has appeared in the absence of living matter or bioplasm? Each little morsel of tissue is formed by a particle or a portion of a particle of living matter passing into the *formed state*, while the rest of the particle may continue to grow and furnish more bioplasm for subsequent conversion into formed material or tissue. The process of formation really depends upon changes determined by and prepared for during the life of the bioplasm, and must, as it seems to me, be referred to vital power, which ceases at the *moment of formation*. So slowly, so gradually, does tissue formation proceed that it is impossible at present to see and follow the change from *living* to *formed* in any one spot of a specimen placed for examination under high magnifying powers; but by careful comparison of different parts of the same specimen in which tissue formation is going on a correct idea of the operation may be formed.

The particular characters and composition of the tissue

must then, as it seems to me, be referred to the vital power of the bioplasm which was concerned in its production. As I have shown long ago, no tissue can add one particle of new tissue to that which is already formed, and I venture to think this fact has been proved by the evidence that was advanced some years ago and illustrated by my drawings. The formation of the various special compounds which characterise different secretions, as bile, saliva, &c., as well as the so-called products of disintegration, are also results of the conversion of matter that *was living* into these substances. *Formation* therefore is absolutely different from all forms of precipitation, deposition, crystallisation and the like, and is one of the wonderful changes due to *Vitality*. All crystals are non-living and nothing that lives is crystalline.

I challenge opponents to advance evidence against the view that *formation*, *nutrition*, *disintegration*, *oxidation* as they occur in the living world, are dependent upon *Vitality*; that structureless living matter, *bioplasm*, is the only substance capable of building up and breaking down, of forming tissue and removing it, of taking up matters resulting from disintegration and of conversion. So far from it being correct to say that these processes are results of physical and chemical change, are they not just as much dependent upon *Vitality* as the chemical operations in the laboratory are dependent upon *the chemist?* So in the production of tissues and chemical compounds characteristic of particular and higher forms of life, between the constituents of the *food* on the one hand and these *formed matters* on the other, several kinds of bioplasm live and multiply, form and die, before the results which have been foreseen as it were from the first are accomplished—all through the complex processes, *living matter* being the sole metabolic substance and *Vitality* the sole metabolic *agent*.

Biology, though the most recent, is by no means the least important of the "'ologies." The course of physiology of man which used to be so useful to the student training for the practice of medicine has of late years, under the influence of purely scientific professors devoted to their subject, many of whom have been engaged in original research as well as in teaching medical students the general principles of physiology, grown to such an extent, both in length and in elaborate complexity, that a division of the teaching labours of this department has been rendered necessary, and the course has been divided into physiology proper, histology, and elementary biology. The last has been regarded as a course preparatory to that of pure physiology and has usually been in the hands of a separate scientific teacher who has not yet advanced to special professorial dignity. In this elementary course is taught something of the use of the microscope and the best methods of preparing tissues for examination. The professor of physiology is now relieved of a difficulty resulting from the pupil not having been grounded in general knowledge of living nature before he entered upon the study of physiology proper.

In this biological course every student can gain some insight into the phenomena of life as observed under simple conditions in living organisms including plants. He sees and may contemplate the wonderful vital movements of living matter or bioplasm as exhibited in the amœba, living leucocytes, mucus, and pus corpuscles of man, also in the "cells" of Vallisneria and in the hair-like bodies of the flower of Tradescantia, a plant which will grow in the heart of London and other large cities. The student also gains some information about the general structure of some of the invertebrata and the general anatomy of the lower vertebrata as shown in the respiratory, circulatory, and digestive organs, and perhaps the nervous system of the fish, the frog, the bird, and the mammal. Under the new regulations this course of elementary biology may be taken at one of the several schools, colleges, or institutions now established in many parts of the country for teaching certain branches of elementary science and some technical subjects connected with secondary education for the people. By this arrangement the student of the future will be better prepared than his predecessors for entering upon the study of certain departments of science absolutely necessary for those who are training for our profession, and indeed fit subjects of general education. In these days ought not everyone to be acquainted with the broad facts of life and death by which these very different states of matter are, and have ever been, sharply separated in nature? And is it not true that living matter should have an appropriate name by which it would be for once and for all marked off from matter in any other state—a name indicating its unique position in the material universe and its exceptional endowments—so distinct from all known material characters and properties? In *bioplasm* we have a word which is well defined, and unlike *protoplasm*—that may be living or dead or even cooked and yet be protoplasm. The instant bioplasm dies it ceases to be bioplasm and resumes the state of ordinary non-living matter. I have for many years considered bioplasm to be the most suitable word for the matter which is alive, and for some time it has been inserted in most of our modern dictionaries. It may be well to note that in the New Sydenham Society's "Lexicon of Medicine and the Allied Sciences," by Mr. Henry Power and Dr. Leonard Sedgwick, among the words having the root *βίος* we find the following:—"biological," "biologist," "bioplasm," "bioplast," "biosis," "biotic," "biotomy," "bioscopy," "biolysis," "biogenesis," and "abiogenesis."

Physical and chemical physiology has advanced so much of late years that for its profitable study a good knowledge of chemistry and physics and a course of practical work in the laboratories is necessary. This for the general student of medicine would not be possible even though the medical course were extended to ten years. An advanced knowledge of physical physiology and familiarity with the numerous delicate and complex instruments required in the pursuit of this department would be of little service to the medical student in the future practice of his profession.

The case, however, is very different with regard to biology, for we are dealing with vital actions and deranged vital phenomena during our whole life, and it is certain that a knowledge of the minute anatomy of tissues and of the mode of their production and action must be of great assistance to us when we are trying to form a correct idea of what is actually wrong in the tissues of the person whose sufferings we are endeavouring to relieve and whom we are hoping soon to restore to the normal condition of health.

Of all the progressive changes carried out in medical education of late years I believe the recognition of biology as an essential subject to be one of the most important additions to our curriculum—not only because for the first time our students early in their medical training are enabled to gain some general knowledge of living nature of interest to every intelligent person and absolutely necessary for a knowledge of man's structure, but also because what the student learns in this course may suggest to him certain new lines of investigation which may assist in advancing medical learning and the good management of the sick and injured.

In elementary biology the student learns how to prepare tissues for microscopical examination and the best means of clearly displaying structure and the colourless structureless bioplasts concerned in tissue formation and in promoting the circulation of fluid in the interstices of the tissues by which their healthy state and normal action are preserved.

As time goes on the new biology will become one of the most important subjects of early medical education, and there is every probability of its taking its place as a necessary subject in the general education of everyone, and I have no doubt that elementary biology will soon be taught in all national and board schools. Indeed, already a few school teachers are attending courses of biology in order that they may undertake the teaching of this very important subject.

(To be continued.)

THE LATE MR. C. W. PRICE.—An inquest was held in Cardiff on May 25th upon the body of Mr. Charles Williams Price, M.R.C.S. Eng., L.R.C.P. Edin., L.S.A., formerly of Court House, Caerphilly, who had died from the effects of opium poisoning. The jury returned a verdict that the deceased had died through opium poisoning and that there was no evidence to show in what state of mind he was at the time.

A GRAND festival concert will be held at the Crystal Palace on Saturday, June 25th, in commemoration of the sixtieth anniversary of the Queen's coronation. Madame Adelina Patti will make her first appearance at the Crystal Palace since the Handel Festival of 1880 and will be supported by Miss Clara Butt, Mr. Edward Lloyd, Mr. Santley, and the London contingent, numbering some 3000 voices, of the Handel Festival Choir. A varied programme of first-class music will be provided.

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

RUPTURE OF THE LIVER; FORMATION OF CYSTIC SWELLING CONTAINING BILE-STAINED FLUID.

BY ARTHUR RUSSELL ALDRIDGE, M.B., C.M. EDIN.,
SURGEON-CAPTAIN, ARMY MEDICAL STAFF.

THE case related in THE LANCET of March 21st, 1898 (p. 719), by Mr. C. Whipple under the above heading, and about which it is remarked that probably no similar one has been recorded, induces me to send the following notes of a case in which the symptoms were very similar, though there was no history of injury except muscular violence.

The case occurred a few years ago, and was under my care during the early stage only, so I am unable to give very complete notes. An officer, aged twenty-four years, who had been in India about a year, enjoying good health during that time, while training a raw and hard-mouthed pony with polo stick and ball suddenly felt pain in the right hypochondrium. After a few hours this became very severe, and on examining him it was found that there was severe pain and tenderness, most marked at a point just below the costal margin, a little to the right of the middle line. A slight puffy swelling could also be detected over the costal cartilages near this spot. The symptoms were attributed to rupture of some fibres of the rectus muscle and the patient was treated accordingly, but after a few days, the pain continuing, a swelling began to appear just below the costal margin. As fluctuation could be felt in this it was aspirated and one and a half pints of slightly blood-stained clear fluid were withdrawn. On examination, besides showing the presence of blood, the fluid gave the reactions for bile acids and pigment, but though carefully searched for no hydatid hooklets or membrane could be found. During this time the patient's temperature remained slightly above normal. From this time the case came under the care of another medical officer and the history was briefly as follows:—After about a week, the fluid having reaccumulated, the cyst was again aspirated and similar fluid removed. On a third tapping a short time later the fluid proved to be slightly purulent. The cavity was now opened by incision, about a pint of pus was removed, and a drainage-tube was inserted, but in spite of daily antiseptic irrigations of the cavity symptoms of septic infection appeared and the patient died from this. No post-mortem examination was made. The exact nature of this case has always remained a matter of uncertainty to me.

GENU RECURVATUM.

BY ARTHUR S. TAYLOR, M.D. CANTAB., F.R.C.S. ENG.

THE condition known as genu recurvatum, described by Mr. Sheild in THE LANCET of May 28th, is sufficiently rare to make it desirable that all cases should be carefully noted, whether the deformity be severe or slight, in order that some rules should be arrived at for treatment. I think that the following case, though of a decidedly milder type, is very instructive.

The patient had had four children previously. The labour in each case had been tedious but straightforward. When she was in about the fourth month of her pregnancy she had a bad fall over a rope and injured her knee. This fact was, of course, made much of later, but the real interest of the accident lay in the question as to how far it may have been responsible for any malposition of the child's legs or for the course of after-events. It is curious how often there is a history of injury in these cases. The confinement was expected some time in February, 1898, and indeed about this time the liquor amnii escaped and feeble labour pains came on. The child, however, was not born until March 17th—i.e., one month later. The labour was difficult owing to the size of the child and forceps had to be used. The head was born in the first vertex position. The condition noticed at birth was the following. The legs appeared to be rather short but otherwise the whole body was well developed. The right leg was hyper-extended on the thigh about 10° beyond the straight and could only be flexed through 45°. There were two transverse furrows in front of the knee-joint. I thought I detected a rudimentary patella, but could not be positive. The left leg was hyper-extended about 30° and could not be flexed at all. The same transverse furrows were present, but there was no trace of a patella. I expected that the child would have to wear some kind of support for the rest of her life and ordered gentle massage and flexion. The condition on June 1st was as follows. Neither leg could be hyper-extended. Both legs could be flexed until the heel touched the buttock. There was a well-marked patella to be felt in the tendon of the right quadriceps extensor and a less well-marked one in the left tendon. The transverse furrows more or less remained.

This case appears to me to be rather one of faulty or arrested development than of malformation. The sequence of events seems to be this. The mother had a fall about one month later than the date at which the patella cartilage first appeared. Possibly the result of this was to extend the legs on the abdomen, the hip-joints being completely flexed. The quadriceps extensor being relaxed the stimulus necessary to the proper development of the sesamoid bone was removed. This condition would be accentuated in my case during the last month owing to the escape of the liquor amnii. The posterior crucial ligaments would also develop somewhat too short and limit flexion. The interesting point is that after birth and under normal conditions development has proceeded on the proper lines. In Mr. Sheild's case there was definite malformation and at the end of eight weeks no improvement had taken place. At the same time great injury is likely to follow forcible manipulations in such young subjects and no good will be done if the quadriceps extensor tendon is bound down to the shaft of the femur. If such a condition could be ascertained I would recommend subcutaneous section of any opposing bands. But in any case it seems worth while to wait a few months. Ossification commences in the patella in the third year and it will be easier to ascertain the exact condition when the child has developed somewhat, and the more simple cases like my own will escape operation.

Surbiton-hill.

TWO CASES OF THE EXTERNAL EAR COMPLETELY CUT OFF AND SUCCESSFULLY REPLACED.

BY F. A. PURCELL, M.D., M.CH. R.U.I.,
SURGEON TO THE CANCER HOSPITAL.

IN THE LANCET of June 4th Dr. William J. Brown reports an "Extraordinary Case of Horse-bite; the External Ear completely Bitten Off and Successfully Replaced." This paper recalls two cases which occurred some years ago in my own practice in which the external ear was completely cut off and which I successfully grafted on.

The first was that of a groom who came to fisticuffs with his horse in his loose box; he got knocked down and the horse trod on his head and completely cut off the man's external ear. The man secured his ear and came to me without delay.

The second case was that of a lad. While at play he rolled down the stone steps of an area. In his fall his external ear was cleanly cut off. His mother brought him at once to me, bringing the ear with her.

I adopted the same method in replacing the ears in both cases. As I had been successful in the first I hoped to be so in the second, as the result proved. The moment I got the ear I placed it in warm water nearly blood-heat, washed it and cleaned it; then I washed and prepared the patient. I applied the ear and noted all landmarks to make sure of its accurate adaptation. I passed interrupted horsehair sutures all round, without tying them until the last was passed; by this means the needle was able to be inserted through both edges, having noted the corresponding spots by jagged skin or otherwise. When the sutures were tied taut the ear fell into its exact position. I had no trouble with the curled-up edges. The ear was then covered with gauze and wool and bandaged. I ordered the application of a small flannel bag loosely filled with table salt; this to be heated in a saucepan over the

fire until made hot and renewed when cool. This bag was then laid over the ear outside the dressings and bandage. My object was to keep the ear warm and restore the circulation. In both cases the ear became united. I saw the patients many times after; the ears were of good colour, but became numb when they were pinched.

Manchester-square, W.

A Mirror OF HOSPITAL PRACTICE, BRITISH AND FOREIGN.

Nulla autem est alia pro certo noscendi via, nisi quamplurimas et morborum et dissectionum historias, tum aliorum tum proprias collectas habere, et inter se comparare.—MORGAGNI *De Sed. et Caus. Morb.*, lib. iv. Proœmium.

MIDDLESEX HOSPITAL.

A CASE OF VESICO-UTERINE FISTULA; CLOSURE BY TURNING CERVICAL CANAL INTO BLADDER; SUBSEQUENT OÖPHORECTOMY.

(Under the care of Dr. WILLIAM DUNCAN.)

WE cannot but agree with Dr. Duncan that the case he has recorded below is probably unique. As to the mode of formation of the fistula it is not unlikely that the explanation suggested is correct, but it may possibly have followed a coincident tertiary syphilitic ulceration of the vagina and therefore be not necessarily traumatic. The method employed to close the gap was exceedingly ingenious, and its suitability was fully demonstrated by its success. It would be of interest to know whether, in cases such as this where the only outlet from the uterus is through the bladder, the urine makes its way into the cavity of the uterus, and if so, whether the mucous membrane of that organ tolerates the urine.

A single woman, aged thirty-three years, was admitted into Prudhoe Ward, Middlesex Hospital, on Jan. 1st, 1898, complaining of constant discharge of urine from the vagina. There is nothing of note in her family or personal history. She had one child nine years ago. The patient was sent to Dr. Duncan by the house surgeon of a provincial infirmary, who gave the following account of her case: "The patient first came under our notice two years ago suffering from acute iritis; this was very persistent. We believed it to be of a syphilitic nature and eventually did an iridectomy. Ten months ago she was admitted with a large tumour on the right side of the abdomen; it had apparently no connexion with the pelvis and was situated immediately beneath the liver. Abdominal section was performed on July 2nd, 1897, and proved the swelling to be an enormously distended uterus with walls like an ether bag. The incision was closed and the os uteri was dilated with Hegar's dilators; the membranes were then punctured, allowing the escape of a very large quantity of fluid. The patient was sent back to the ward and eighteen hours later a four or five months' fœtus arrived without any artificial aid. It was putrid and stinking. I gave a uterine douche after delivery and then handed the douching on to an experienced nurse to do night and morning. A week after delivery the bed was saturated with urine. On examination the vagina was found to be intact, but on inserting the finger about an inch into the cervical canal a communication with the bladder was felt. About a month later I was deputed to close it. After about two hours' work and having cut away the whole of the anterior lip of the cervix I managed to close it with a dozen sutures. It held for a week and then broke down."

On admission to Middlesex Hospital the patient was somewhat anæmic-looking. The heart and lungs were normal. There was a central cicatrix extending from the umbilicus to the pubes. The vulva and vaginal outlet were marked by syphilitic scars. *Per vaginam* urine was dribbling away. High up in the roof of the vagina there could be felt an opening into the bladder larger than a shilling. The margins felt thickened and indurated. On Jan. 23rd, under anæsthesia a careful examination was made with the patient in the lithotomy position. The anterior lip of the cervix was completely absent, the posterior lip was 2 in. long, and to its upper third the margins of the fistulous opening were firmly adherent. The opening into the cervical canal could not be seen, even when the posterior lip was pulled down by means of a volsellum forceps. On passing the finger into the bladder a phosphatic calculus of the size of a filbert was detected and removed. It was evident that it would be impossible to dissect off the bladder from the cervix in order to free completely the margins of the fistulous opening and bring them together, so Dr. Duncan decided that the only course lay in an attempt to fix the vaginal portion of the posterior lip of the cervix into the opening and thus close the fistula, but at the expense of diverting the uterine canal into the bladder.

On Feb. 3rd, gas and ether having been administered and the patient placed in the lithotomy position, the vaginal mucous membrane was removed from the margins of the fistula, leaving a raw surface about ¼ in. wide; next the anterior surface of the posterior cervical lip was completely converted into a raw surface. With a very curved Hagedorn needle the raw surfaces on the vaginal wall were brought into intimate contact with the raw surface on the cervix by means of seven silkworm-gut sutures fastened with coils and shot. A winged indiarubber catheter was placed in the bladder so that the urine could run off into a bottle as quickly as it entered the bladder. The subsequent progress of the case was uneventful; the stitches were removed a fortnight later. There was no trace of leakage into the vagina. On the 16th as the urine was slightly alkaline it was decided that the bladder should be gently washed out twice daily with a warm boric acid solution. On the 23rd the urine was normal and the irrigation of the bladder was discontinued. On the 25th blood appeared in the urine, but there were no clots or shreds. The urine was of specific gravity 1017 and was acid. The patient felt some little pain in the abdomen. On March 3rd it was noted that blood continued to pass with the urine for four days and then ceased. Dr. Duncan advised the patient to let him remove her ovaries and tubes so as to prevent bladder troubles at her menstrual periods; to this she consented.

On March 9th, gas and ether having been administered, a 4 in. incision was made through the scar of the operation which was performed nine months previously. The omentum was found to be intimately adherent to the abdominal wall down to within 2 in. of the pubic crest. Into this space, where the omentum was non-adherent, the ovaries and tubes were drawn up and removed completely in the usual way. The abdominal wound was then closed with continuous silk sutures in two layers (fine silk for the peritoneum and thick silk for the remaining structures). Convalescence was uninterrupted. On the 16th the bowels were relieved by an enema, the continuous sutures were removed, the wound had perfectly healed, and there was no moisture in the vagina. The patient could hold her urine for eight or nine hours. On April 6th the patient was very well and left the hospital to go home.

Remarks by Dr. DUNCAN.—This case—which is, I imagine, unique, not only in the manner in which the fistula was produced, but also in the subsequent treatment—presents several points of much interest. It was evidently in the beginning one of hydramnion, which condition sometimes renders diagnosis of pregnancy difficult. The deflection of the uterus to the right side probably made the medical men put aside the question of pregnancy, but it should not have done so, as it is by no means uncommon to find the gravid uterus deflected to one or other side of the middle line, especially to the right. Then as regards the formation of the fistulous opening it is impossible to say definitely whether it was caused by Hegar's dilators or by the nozzle of the syringe which was used twice daily by a nurse to give an intra-uterine douche. If, however, the injury had been caused by Hegar's dilators one would have expected the urine to commence to dribble through the vagina on the third or fourth day instead of on the eighth. The tissues of a gravid uterus are easily torn through, besides which this woman was syphilitic and any damaged structures would be more likely to break down than in a healthy patient. At all events the case well illustrates the necessity for using great gentleness and care in dilating a gravid uterus and in the use of an intra-uterine douche, which latter, in my opinion, ought never to be relegated to a nurse however experienced she may be. Having detected a fistulous opening into the cervical canal the usual course is to draw down

the cervix with volsellum forceps and then to separate the bladder wall from the uterus until the fistula is freely exposed, when it should be closed with sutures as in a vesico-vaginal fistula, leaving the opening into the cervical canal to close up of itself. In this case probably the house surgeon was unable to reach the opening in the way just mentioned, so he had to cut away the whole of the anterior lip of the cervix and one sympathises with him for having to exercise his 'prentice hand on such a difficult case. When the patient was admitted under my care I reluctantly came to the conclusion, after a careful examination, that the only way to close the fistula was by bringing the posterior lip of the cervix forwards and uniting it with the bladder wall; this of course necessitated deflecting the uterine canal into the bladder and making the woman sterile. Lastly, although cases have been recorded in which women have menstruated through the bladder without ill result it seemed to me best to avoid subsequent risks by performing cöphorectomy.

MADRAS GENERAL HOSPITAL.

TWO CASES OF FILARIAL DISEASE.

(Under the care of Surgeon-Captain F. J. CRAWFORD.)

CASE 1.—A man went to the Madras General Hospital on March 14th, 1897, suffering from filarial disease, the trouble for which he sought relief being periodical attacks of pain and swelling in both groins, with swelling of the "testicles" and fever. From his own account it was evident that the attacks, which were becoming more severe and frequent, were making life a burden to him. The sense of heaviness and uneasiness, the irritation of the pelvic and genital organs, the consequent fits of nervous depression and the melancholy state of mind caused by inability to carry out his marital duties were graphically described in a letter written by him while he was waiting his turn for operation in the hospital. He said that if he could not obtain relief he would end his life and his appearance and general demeanour tallied well with this statement. He was troubled with nocturnal emissions and though quite a young married man the well-known mental depression which characterises such cases was well marked in him. On examination there was discovered on the right side a hydrocele which was not of the ordinary kind, but quite soft and flabby, the skin as well being slightly thickened. Both groins were the seats of swellings which consisted of several distinct glandular enlargements and enlarged lymphatic vessels, giving to the touch the characteristic boggy feeling, gradually subsiding to some extent on firm pressure. The affection had lasted for some years and the swellings had gradually become more marked. Exacerbations occurred every month or so, at which times the local trouble increased, and on these occasions the patient's mental condition, according to his own account, was one of great despondency and anxiety about himself. He made no secret of the almost uncontrollable impulse which he had during the attacks to put an end to his life. The hydrocele was first operated on and after letting out the pinkish milky fluid the tunica vaginalis was freely removed. The affection, in fact, was treated in exactly the same manner as an ordinary hydrocele. Healing readily took place and the patient remained in hospital because subsequently to healing his groins felt heavy and swollen when he was standing. The operation on the hydrocele was performed on March 17th, and on April 14th, after he had been completely cured of the hydrocele, the left groin was operated on, as it presented more urgent symptoms than the other. Two enlarged glands were removed from the inguinal region and they presented on dissection small cavities containing milky fluid, one large gland, which was like a horseshoe in shape, curling behind the vessels on the inner side and having a large portion posterior to them. Several lymphatic vessels, which were much enlarged, were cut during the operation but they gave no trouble after being caught with artery forceps. The wound healed within a week by first intention and on the 21st the right groin was cleared out. This gave more trouble owing to the number and large size of the lymphatic vessels, the field of operation being obscured by the amount of milky fluid which exuded notwithstanding the efforts to tie the vessels. The cavity quickly refilled each time it was swabbed out and required packing with eucalyptus gauze before being dressed. This gauze was removed on the next day and the subsequent healing took place readily under a firm antiseptic dressing; the limb was kept in the flexed position for a few days. There was no swelling of the limb itself due to the lymphatic obstruction either before or after the operation. This very interesting case was rendered of further interest by the subsequent history. The patient left the hospital with the operation incisions completely healed and remained with friends in Madras for a couple of weeks before returning to his native place. About ten days after leaving the hospital he returned to say that he had just had a slight attack, but this time the skin of the scrotum had become thick and heavy without either of the groins giving him trouble and without any implication of what he called the "testicle," alluding, of course, to the tunica vaginalis, which was the seat of trouble during his former attacks. This fact pointed to the existence of lymphatic obstruction in the neighbourhood without actual enlargement sufficient to show on the surface of the body. The emissions which were so harassing no longer occurred and he stated that he was "quite a new man." He will probably return to the hospital some day with a lymph scrotum and a further operation will be necessary. Taking the case, however, as a whole no one will doubt the propriety of the different operations performed and their success in affording relief.

CASE 2.—The patient was a Eurasian who was admitted to the hospital for a troublesome swelling in the right groin in the region of Scarpa's triangle. It was the seat of periodical enlargement accompanied by fever and uneasiness. The disease had lasted for many years and was limited to this region. No symptoms pointed to the involvement of other lymphatic vessels. A longitudinal incision exposed a mass of lymph tissue which was composed of several moderately enlarged glands and dilated vessels. Oozing of lymph was free during the removal and it was found to be impossible to secure all the discharging points. The upper half of the incision was therefore stitched and the cavity was firmly packed with antiseptic lint. Several ounces of lymph must have been lost. Healing, though delayed by the fact that the wound was obliged to be kept open, was complete and uneventful. The oozing of the lymph ceased on the third day and did not recur and the patient left the hospital with his local trouble quite cured. On examining the removed mass a probe could readily be passed along the dilated vessels, which were seen to anastomose freely. No filariæ, however, were detected in the tumour.

Remarks by Surgeon-Captain CRAWFORD.—Some interest has been excited by a paper read recently before the Bombay Medical and Physical Society on filarial disease. This disease is common in Southern India and the Madras General Hospital is seldom without a case in its surgical wards which is either being operated on or awaiting operation. After long trial we have arrived at fairly definite rules to guide us in the treatment of this affection by operation. The disease which is known as filariasis cannot now be looked upon as being of purely a local character in any instance. When a patient is attacked by the parasite he probably remains a victim as long as he lives. The question of operation therefore resolves itself into the treatment of the different local troubles and inconveniences arising from the blocking up of the lymphatic system in different parts of the body. Many of these local troubles are subjected to operation with very decided success, so much so that there is neither doubt nor hesitation on the surgeon's part provided that the general condition is satisfactory—in fact, the ordinary limitations attending all surgical procedures which are undertaken where life itself is not in the balance. I need only mention lymph scrotum, filarial hydrocele, and abscesses occurring in the course of lymphatic vessels where dead parent worms lie embedded. Though the system may still contain numbers of the parasites there is no doubt regarding the utility of the procedure and the relief obtained. In these cases, though the disease is the result of interference with the flow of lymph, the glands and the main lymphatic vessels themselves are not found to exhibit symptoms. In another class of patients the blocking of the lymphatic system in a part shows itself in dilatation of the lymphatic trunks, which contain a pinkish milky fluid and have thickened walls. These dilatations occur usually in the neighbourhood of glands and on careful dissection enlarged lymph vessels may be seen passing into and others passing from them to other dilatations or to the glands close by. Accompanying these are enlarged glands due either to

thickening of their tissue and proliferation of the numerous lymphoid cells they contain or to enlargement of the lymph spaces in their structure. The groin is commonly affected, both the femoral and inguinal regions participating in the trouble and frequently on both sides. It is extremely probable in these cases that the pelvic and other internal lymphatics are also enlarged, especially where the affection is symmetrical, and at first sight it would appear that removal of the groin glands would give only temporary relief of the symptoms and be followed in a very short time by a return of the local trouble in its former severity. Surgical interference, however, yields more favourable results than this. That treatment is urgently needed in many cases is seen by the number of patients who come to our wards and by the severity of the local symptoms. One of the cases related above is a good example of this. As swelling occurs at periodical intervals, the sense of weight and fulness increases, pain, weariness and lassitude are complained of, with reflex irritation of all the pelvic organs, rendering the patient's life a misery to him. The fever, too, is severe and quite incapacitates him in his work, sometimes each attack lasting as long as ten days. A successful operation means much to the patient, and while it cannot be said to cure the general disease it takes away completely his local trouble. It must be remembered, too, that these local manifestations take years to develop. The surgeon in India is, of course, confronted with the difficulty of tracing the subsequent histories of many of his patients and this may detract from the value of individual accounts of cases; but so far as it has been possible to trace them patients are quite satisfied with the treatment and its subsequent result. Local recurrence, too, is practically unknown.

The wounds caused by complete removal of filarial glandular enlargement and lymphangiectasis have always been looked upon here as in no way differing from ordinary surgical wounds and no case so far has occurred to induce us to look upon them in any other way. Careful dissection is naturally required, but owing to the small area involved one pair of hands suffices to carry out the necessary steps of the operation and external contamination is reduced to a minimum. For this reason we look upon these cases as peculiarly suited to operative measures. Considering the comparative simplicity of the measures and their results as detailed above I would not have thought it necessary to write on this form of local consequences of filarial disease had not very different results been obtained in Bombay following these operations. I am not aware that any elaborate statistics have been compiled on this individual subject, but the fact is we in Madras have not thought it necessary. We have looked upon all local filarial manifestations as being subject to ordinary surgical considerations when the question of operation was suggested by the arrival of a patient exhibiting them.

Medical Societies.

OBSTETRICAL SOCIETY OF LONDON.

Uterine Fibroids in Young Women.—Complete Incontinence of Urine cured by Ventro-fixation of the Uterus.—Exhibition of Specimens.

A MEETING of this society was held on June 1st, Dr. C. J. CULLINGWORTH, the President, being in the chair.

Dr. HERBERT SPENCER read a paper on Two Cases of Fibro-myoma of the Uterus removed by operation from women under twenty-five years of age. The diagnosis of the nature of the tumour was verified by examination with the microscope and the ages of the patients by obtaining their certificates of birth. In the first case, in which the age of the patient was twenty-four years, the tumour weighed 4 lb. 9½ oz. and was removed by amputation after laparotomy, the pedicle being treated extra-peritoneally. In the second case, that of a patient aged twenty-three years, the tumour with the uterus weighed 16¼ oz. and was removed by vaginal hysterectomy after the peritoneum had been opened in an attempt to enucleate the tumour. The patients were in good health two years and one year after operation respectively. A brief abstract was given of 40 recorded cases of uterine fibroid tumours occurring in women under twenty-five years of age. In at least 11 of the cases the diagnosis was clinical and in only 4 cases was the diagnosis verified by examination with the microscope. Dr. Spencer concluded that uterine fibro-myoma is rare before the age of twenty-five years and very rare before the age of twenty years and that there is no satisfactory record of its occurrence before the age of puberty.—Dr. BOXALL gave details of his case referred to by Dr. Spencer. The patient was born on Aug. 9th, 1870. She was therefore just twenty-three years of age when she came under observation in August, 1893. On account of pain and fever an operation was performed. Two fibroid nodules not larger than a nutmeg were visible on the abdominal surface of the uterus near the fundus. A mass in the left broad ligament was enucleated and removed with the uterus and appendages, the pedicle being secured by a clamp outside the abdomen. The mass proved to be composed of involuntary muscle growing from the left side of the uterus. Under the microscope it exhibited the ordinary characters of a fibro-myoma.—Dr. HERMAN, in reference to some remarks by Dr. William Duncan, said that his opinion as to the practicability of enucleation in the case of the tumour shown by Dr. Duncan at the November meeting of the society remained the same as it was in November. He did not think Dr. Duncan had shown (as was stated in the Transactions) that the uterus might easily have been perforated had enucleation been attempted. He thought, on the contrary, that by morcellement the fibroid could easily and safely have been removed. He did not think Dr. Spencer's case showed that any greater damage attended enucleation, for his patient had recovered as well as she could have done after abdominal hysterectomy and without the disadvantage of an abdominal scar. He (Dr. Herman) thought the preliminary dilatation was most safely done by tents.—Dr. PETER HORROCKS did not think that the paper was intended to provoke a discussion on the relative merits of enucleation of fibroid tumours of the uterus and their treatment by hysterectomy. It had been said by Mr. Alban Doran that these tumours never occurred, or were practically unknown, before the age of twenty-five years. It must be admitted that true fibroids—that is, fibro-myomata—of the uterus were rare before the age of twenty-five years and were unknown before puberty. They were also much commoner in single women than in married women, and in women who had never been pregnant than in women who had. Moreover, the tumours began to atrophy, as a rule, after the climacteric. All these facts proved that in some way fibroids were associated with active menstrual life.—Dr. LEWERS agreed with the remarks which had been made by Dr. Herman as to enucleation. He considered that the justifiability of enucleation *per vaginam* depended chiefly on the position of the fibroid in relation to the uterine wall. When the fibroid was so situated that its largest diameter projected free in the uterine cavity and only a moderate part of the tumour (one-third or less) still remained embedded in the thickness of the uterine wall enucleation by morcellement *per vaginam* was free from any great risk and was the proper treatment for the case. When, however, examination showed that the largest diameter of the tumour was still in the thickness of the wall of the uterus he regarded enucleation as exceedingly dangerous.—The PRESIDENT said that in the course of a discussion upon a specimen of fibroids of the uterus in a woman twenty-six years of age shown for him by Dr. A. F. Stabb fifteen months ago Mr. Doran had remarked that a monograph on the subject of fibroids in early life was much wanted. Such a monograph had now been produced. It was to be hoped that Fellows would henceforth recognise the importance of recording on the lines Dr. Spencer had laid down as essential for scientific accuracy all cases that came under their observation of uterine fibro-myomata occurring in young subjects. As regards enucleation *per vaginam* he was bound to say that in his experience this method had proved more dangerous than removal of the entire uterus.—Dr. SPENCER, in reply, said that the object of the paper was to show that fibro-myoma of the uterus did occur in women under twenty-five years of age. Its rarity, judged by public records, was shown by the fact that Dr. Boxall's was, as far as he knew, the only other case fully and satisfactorily described by an English author. He had not discussed the treatment of these cases, but he might say

that enucleation of submucous tumours *per vaginam* had given him very good results and was an exceedingly valuable operation.

Dr. MACNAUGHTON JONES read notes of a case of Complete Incontinence of Urine cured by Ventro-fixation of the Uterus.

The following specimens were shown:—

Mr. DORAN: Blood Concretions in the Ovary.

Mr. BLAND SUTTON: An Ovary containing a Calcified Ball, probably a large calcified corpus fibrosum.

Mr. A. BURTON: A Deformed Fœtus.

Dr. HORROCKS: A Uterine Fibroid undergoing Cystic Degeneration.

Dr. LEWERS: Primary Sarcoma of the Body of the Uterus (Deciduoma Malignum), the patient remaining well sixteen months after hysterectomy.

Dr. A. ROUTH: (1) An Ovarian Dermoid Cyst removed by the Vagina during Pregnancy; and (2) Ruptured Tubal Gestation of from three to five weeks' duration.

Dr. W. DUNCAN: A Five-months' Fœtus born with Placenta and Membranes Intact.

HARVEIAN SOCIETY OF LONDON.

Jacksonian Epilepsy.—Idioglossia.—Insufficiency of Pulmonary and Mitral Valves.—Heart Disease.

A MEETING of this society was held on May 26th, the President, Dr. J. F. GOODHART, being in the chair.

Dr. JAMES TAYLOR showed a case of Jacksonian Epilepsy. The patient three months before admission to hospital had a fit commencing in the right foot, spreading upwards, and leading to loss of consciousness followed by weakness of the right side but not by any speech affection. There had been other attacks of a similar nature, and since the last the weakness of the right leg had persisted and was accompanied by weakness of the other lower extremity. Dr. Taylor thought that the symptoms pointed to a local lesion, probably gummatous, over the leg area in the left cerebral hemisphere. There was no optic neuritis and now no headache, although headache had been present.—The PRESIDENT asked whether syphilitic vascular lesions were not more commonly found in such cases than gummata.—Dr. TAYLOR, in reply, said that in his experience the condition giving rise to localised fits was more frequently a thickening of the meninges than arterial disease.

Dr. LEONARD GUTHRIE showed a case of Idioglossia associated with Pseudo-hypertrophic Paralysis. The patient, a boy aged seven years, was a well-marked example of pseudo-hypertrophic paralysis. The symptoms were of about two years' duration. The lower extremities were chiefly affected, the gastrocnemii and vasti externi being extremely large and firm. A brother of his had died from this disease at the age of fifteen years. The term "idioglossia" had been given to the peculiar defects of speech exhibited by this patient. It was open to objection because the subjects did not speak a peculiar language of their own; they spoke English, but mis-pronounced letters and words. In this case the defect consisted in the substitution of consonants for each other and in the substitution of vowel sounds for certain consonants. (The patient then illustrated his mode of speech by repeating the alphabet, reciting certain nursery rhymes, and singing a well-known hymn.) It was shown that whilst capable of producing all the elementary sounds of which language is composed he used them in the wrong place and was unaware whether or not he produced them correctly. The defect was therefore rather in his ear than in his motor vocal apparatus. He was unable to discriminate shades of difference between sounds. In favour of this view was the fact that he had almost no ear for music. If his attention could be gained he could be made to frame his lips and tongue in imitation of the speaker and then he pronounced letters and words correctly. But his attention soon wandered and his utterance became as faulty as before. His auditory memory was probably defective; his visual memory was certainly so, because he could not copy letters correctly unless he could keep his eyes on the copy and on his pencil at the same time. Such cases were sometimes much improved by training on the oral method. Dr. Guthrie did not regard the condition as pathological but as an exaggerated form of defective enunciation common in minor degrees. The patient's elder brother (who died from pseudo-hypertrophic paralysis) and also a younger sister had similar defects of speech, but there was no causal connexion between pseudo-hypertrophic paralysis and idioglossia.

Dr. MACLURE showed a woman, twenty-four years of age, who was the subject of Insufficiency of the Pulmonary and Mitral Valves. She had suffered from cardiac symptoms ever since she could remember and her life till two years ago had been spent in various hospitals. She came under his notice eighteen months ago and remained bed-ridden till last March when she had an attack of mania, since which time her general health had much improved. A to-and-fro murmur could be heard loudest in the pulmonary area and conducted downwards to the left of the sternum. The apex beat of the heart was felt in the fifth intercostal space in the nipple line. There was a presystolic thrill at the apex with other evidence of double mitral disease. Against the view that the case was one of mitral disease pure and simple were the point of maximum intensity and characters of the to-and-fro murmur, whilst the absence of Corrigan's pulse, capillary pulsation, and of much hypertrophy and dilatation of the left ventricle pointed to pulmonary rather than aortic disease.—Mr. JACKSON CLARKE observed that the appearance of a swelling in the left supra-clavicular region was due to a very sharp spinal curve (scoliosis) high in the dorsal region. This degree of scoliosis would be sufficient to account for some of the dyspnœa present.

Dr. G. A. SUTHERLAND showed a boy, aged nine years, who was suffering from Heart Disease. His peculiar complexion and the duskiness of his hands suggested a congenital lesion. There were also definite evidences of acquired endocarditis and pericarditis. The extensive area of præcordial dulness and pulsation further suggested the possibility of mediastino-pericarditis, to which support was lent by the extremely chronic character of the pericarditis. — Dr. ALEXANDER MORISON, remarking on Dr. Sutherland's case, considered that in view of the cyanosis present and the great transverse dimensions of the heart congenital stenosis of the pulmonary arterial orifice with patent septum ventriculorum suggested itself; but further examination of the case, associated as it was with triple rhythm and chronic pericardial friction, pointed rather to mitral regurgitation with pericardial adhesion. The case exhibited by Dr. Maclure he regarded as one of mitral stenosis. He could not satisfy himself that there was any pulmonary arterial reflux.

EPIDEMIOLOGICAL SOCIETY.

Enteric Fever at Norwich.

A MEETING of this society was held on May 20th, Professor J. LANE NOTTER, President, being in the chair.

Dr. W. H. COOPER PATTIN read a paper on Enteric Fever at Norwich. The city, he said, was on the chalk, which was there about 1000 feet deep, and where it did not come to the surface was thinly covered by loose drift gravels. The water-supply, in the hands of a company, was drawn from the River Wensum, which rose on a plateau nearly thirty miles distant, flowing through a purely agricultural district. The intake, which averaged 1,500,000 gallons per diem, was about a mile above the city, the nearest source of serious pollution being a paper mill four miles higher up the river. The arrangements for subsidence and filtration were excellent and the water was served from covered storage reservoirs by gravitation at the rate of 18 gallons per head a day, but the actual quantity available was greater, since one-fifth or until recently one-fourth of the population obtained their supply from private wells, and very few houses had baths. These wells were shallow and more or less suspicious, and he had during his five years of office obtained the closure of nearly 200. The sewerage was by no means satisfactory, the old sewers being very ill-laid; they were freely ventilated by gullies and shafts and the flow of the sewage was assisted by Shone's ejectors, but bad smells were frequent, especially on the escarpment of the higher ground. There was no adequate hospital accommodation for fever patients and secondary or successive cases in the same house were of frequent occurrence. Only a minority of the houses were provided with water-closets, the usual form of convenience being the "bin," a sort of combined privy, ash and refuse pit, or a pail closet, but there was as a rule only a single pail, which was emptied by the scavenger but never cleaned. Notification of infectious diseases had been in

force since 1880, but the few cases and apparently high case mortality during the first few years were probably to be explained by imperfect diagnosis of the milder forms of enteric fever. Since 1883 the cases had varied between 106 and 314 per annum, and the deaths between 19 and 36, except in 1885, in which year with 584 cases and 92 deaths the disease assumed the proportions of an epidemic. The average for the whole period had been 214·5 cases with 30·5 deaths, or a mean case mortality of 14·5 per cent. Dr. Cooper Pattin then gave analyses of the age incidence, the relative overcrowding of the affected houses, the proportion of the houses attacked supplied with the company's water and from wells, the relative incidence of disease on houses with water-closets, pail-closets, and bins respectively, proximity to sewer gullies, the state of the yards and other domestic sanitary conditions, the occupations of the persons attacked, and the possible influence of milk, shellfish, and the conditions under which the food was kept for the last three years. As regards age 43 per cent. were under fifteen years, and the persons attacked belonged almost exclusively to the working classes; but beyond the facts that while a fourth of the houses in the city were provided with water-closets only one-tenth of the cases occurred in such, and that 70 per cent. of the affected dwellings were surrounded by soil sodden with impurities, no definite conclusions could be drawn from these figures.

Dr. PARSONS expressed his belief that the direct transmission of enteric fever from one person to another was more frequent in the overcrowded dwellings of the poor than was commonly supposed and remarked that the case mortality to a great extent depended on accuracy of diagnosis, that the lesser incidence on houses with water-closets might be due to the more cleanly habits of the occupants in other respects, and that outbreaks caused by milk were often so local and limited as not to influence the general prevalence of the disease and to be seen only in spot maps.

Dr. CHILDS asked if Pettenkofer's ground-water theory had been worked out in Norwich.

Dr. BULSTRODE and Dr. REGINALD DUDFIELD criticised the statistics, as did Dr. WILLOUGHBY, who pointed out the fallacies consequent on the relations between the incidence of the disease and the several factors under consideration having been calculated on the affected houses only instead of on the total number in the city. He called attention to the probability under the conditions described of the contamination of wells at great distances from the source of pollution.

MANCHESTER THERAPEUTICAL SOCIETY.

Diuretin.—"*Glucophenin.*"

THE fifth meeting for the session 1897-98 was held at the Owens College on May 25th, Dr. J. DIXON MANN presiding.

Dr. DRESCHFELD read a paper on Diuretin. After referring to the experimental results and clinical experiences of this drug recorded by some continental observers Dr. Dreschfeld stated that he had employed diuretin in many cases during the past eight years and he considered it a valuable remedial agent. He had found it act well in acute Bright's disease, especially in cases in which the urine was scanty. He had frequently seen the urine increase in amount from 12 or 15 to 80 or 100 oz. in the twenty-four hours. In post-scarlatinal nephritis the drug did not seem to give such good results. In chronic parenchymatous nephritis he had found it act when digitalis and other drugs had not succeeded, but the effects were only temporary. There was no definite reduction of the amount of albumin. On the other hand, there was no evidence of irritating action. In interstitial nephritis the results had been disappointing and in these cases toxic effects were more liable to occur. As regards its use in heart disease Dr. Dreschfeld had found diuretin of great value in cases of mitral disease, especially when the dropsical symptoms had come on suddenly. In aortic disease the results had not been so satisfactory: there was no relief to the anginal symptoms, no great diuresis, and the drug was not always well borne. In simple dilatation without valvular lesion where digitalis had failed diuretin had sometimes succeeded. In cirrhosis of the liver the effects of diuretin were sometimes startling. He had seen diuresis amounting to four or five quarts of urine in the twenty-four hours. The cases which seemed to respond best to diuretin were those in which dropsy had developed suddenly. In older people with ascites coming on gradually diuretin had failed. In two cases of pleuritic effusion Dr. Dreschfeld had observed rapid recovery under the use of diuretin, but in other cases no marked effect was observed. In cases of peritonitis no relief had been obtained; he had not tried the drug in pericarditis and did not think it likely to be of much use. Dr. Dreschfeld considered diuretin to be a useful and powerful diuretic, acting probably on the epithelium of the convoluted tubules of the kidney. He gives it in from 10 to 12 gr. doses three times a day at first, increasing to 30 gr. doses if necessary. As regards its ill-effects, sometimes diuretin is not well borne, producing nausea, vomiting, and occasionally signs of collapse. Often when diuretin alone does not answer it succeeds on combining it with digitalis.—The SECRETARY, on behalf of Dr. STEELL, showed a series of charts illustrating the Diuretic Effects of Diuretin in cases of aortic disease, mitral disease, functional heart disease, cirrhosis of the liver, and pleurisy. One of the charts showed a marked diuretic effect obtained three times in succession in the same patient. Dr. Steell gives diuretin in 2 gr. doses every hour day and night. In two cases of Bright's disease he had observed hæmaturia following the use of diuretin and had not employed the drug in such cases since.—Dr. MANN had observed similar results to those described by Dr. Dreschfeld, but he had obtained no good effects in cases of large white kidney. In heart cases he had found diuretin very useful. In cirrhosis of the liver he had observed little result, perhaps because the cases were of more gradual onset. He had found theobromine alone very useful and suggested that theobromine in some soluble form might be more advantageous than diuretin, which was sometimes depressing owing to the salicylate of sodium which it contained.—Dr. WILD and Dr. COUTTS also took part in the discussion.

Dr. WILD then made a preliminary communication on the Constitution and Pharmacological Action of a New Synthetic Compound "Glucophenin," in which the phenetidin molecule was combined with a glucose molecule. The product was a crystalline solid, soluble in water, and almost tasteless. The drug showed a remarkable absence of toxic effect and there was already some evidence of therapeutic value in certain cases.

Reviews and Notices of Books.

Die Infectiös-eiterigen Erkrankungen des Gehirns und Rückenmarks. Von WILLIAM MACEWEN, M.D. Glasg. Autorisirte Deutsche Ausgabe von Dr. PAUL RUDLOFF. (*Pyogenic Infective Diseases of the Brain and Spinal Cord.* By WILLIAM MACEWEN, M.D. Glasg. Authorised German Edition by Dr. PAUL RUDLOFF.) Wiesbaden: J. F. Bergmann. Glasgow: F. Bauermeister. 1898.

THERE are few surgical works which more merit the honour of translation into a foreign language than the one wherewith Dr. Macewen enriched our literature some five years ago. By common consent this admirable monograph upon the "Pyogenic Infective Diseases of the Brain and Spinal Cord" was admitted to be amongst the most scientific and practical writings upon a subject which opened up new prospects for the successful intervention of surgery in a class of disease which hitherto had been regarded as almost beyond the reach of such interference. Thus apart from its intrinsic merits the work assumed from the first a very important position in surgical literature. Its thoroughness and accuracy are such as cannot but commend it to the favour of the profession in Germany, accustomed as they are to exhaustive literary enterprises, and Dr. Paul Rudloff has doubtless gauged rightly the cordial reception which the book will receive in his country. He has, too, acquitted himself well in the task of translation and has wisely refrained from adding anything to a book which is so largely based on the personal experiences of its author. We may briefly recall the fact that the work opens with a compendious and faithful description of the surgical anatomy

of the temporal region, the cerebral membranes and sinuses, and then deals with the pathology of cerebral abscess and meningitis, the clinical chapters treating first of the symptoms of cerebral abscess and then of sinus thrombosis. Then come a chapter upon treatment and a final summary of the results obtained by the author in his surgical advances in these regions. On these results of a series of operations, commencing with the opening of an abscess in the temporo-sphenoidal lobe in 1881, there is little need to dwell. They comprise operations on the mastoid in middle ear disease, for suppurative pachymeningitis and lepto-meningitis, thrombosis of the longitudinal and the sigmoid sinuses, as well as for cerebral and cerebellar abscesses. And the encouraging results obtained, constituting true surgical triumphs, have become familiarised to the profession, thanks mainly to the pioneer work of the Glasgow surgeon.

Handbuch der Gynäkologie. In drei Bänden. Herausgegeben von J. VEIT (Leiden). Zweiter Band. Mit zahlreichen Abbildungen. Wiesbaden: Verlag von J. F. Bergmann. (*Handbook of Gynæcology.* In Three Volumes. Edited by J. VEIT (Leyden). Vol. II. With numerous Illustrations. Wiesbaden: J. F. Bergmann.) 1897. Pp. 814.

WE had occasion to notice with approbation the first volume of this valuable work in which the editor has had the advantage of the coöperation of some of the best gynæcologists in Germany, amongst whom may be mentioned Professor E. Bumm of Basel, Professor A. Döderlein of Leipsic, Dr. H. Fritsch of Bonn, and Professor W. Nagel, Dr. R. Olshausen, Dr. R. Schaeffer, and Dr. G. Winter, all of Berlin, besides others with not less illustrious names. The distribution of the subjects amongst the contributors has been carefully made and the several memoirs are written by men not only of acknowledged ability but who are in most instances well known to be familiar with the subject which has been assigned to them.

The second volume opens with an article by Dr. Heinrich Fritsch of Bonn on the Diseases of the Bladder in the Female and is illustrated by 50 woodcuts. The teratology of the bladder is given, followed by some statistics in regard to the capacity of this organ. He finds that the quantity of urine passed by women as a rule varies from about 1½ oz. to 10 oz., a certain number voiding a small quantity with frequency as a precautionary measure against possible emergency. In cases of cystitis, in which the bladder was washed out and the patient directed to complain as soon as pain was felt, the injection of from 10 to 12 cz. of water usually produced discomfort. When, however, from any slowly operating cause the bladder becomes distended as much as 38 oz. of urine may be evacuated with the catheter and in one instance he drew off 109 oz. Dr. Fritsch, whilst enumerating the causes of cystitis in accordance with the scheme of Dr. Barlow—viz., (1) chemical; (2) bacillogenous, including tuberculosis, bacterium coli, urobacillus liquefaciens septicus of Krogius and Schnitzler, coccobacillus of Rovsing; and (3) coccogenous, including diplococci, staphylococci, streptococci, and gonococci—holds that this view cannot be as yet unconditionally accepted because there is a want of accordance in the statements of different authors, Krogius in particular having observed a bacterium without cystitis and, conversely, cystitis without microbes. When micro-organisms are found in the bladder they may easily have been introduced by a want of care in the cleansing of catheters, and acute cystitis may be established within a few hours of such introduction. At the same time there can be little doubt that microbes may penetrate into the bladder and be shown to be present in the urine without a catheter having been at any time introduced and, indeed, a sufficient proof of such spontaneous entrance is afforded by the occurrence of gonorrhœal cystitis. Dr. Fritsch gives a striking picture of the consequences which may befall an unfortunate patient who is pregnant and who suffers from retroflexion of the uterus in the hands of an ignorant midwife, for with retention of urine, with congestion, hyperæmia, infection, and injury to the bladder from the unskilful attempts to introduce a catheter it would be a wonder, he remarks, if cystitis were not produced, and in such cases fatal septic peritonitis is not uncommon. In the treatment of cystitis, besides injections of boric acid he recommends salol taken internally in doses of 30 or 40 grains per diem, salicylate of soda, potassium chlorate, and opium and belladonna.

A good account is given of urogenital fistulæ, upon nearly 200 cases of which Dr. Fritsch has operated during the last ten years, all with one exception having been caused by injuries inflicted during childbirth. He gives drawings of various specula, forceps, retractors needle-holders and needles, as well as of a table and appliances well adapted for the performance of operations for the relief of this affection. Many drawings also illustrate the direction in which incisions should be made and the manner in which the sutures should be introduced. He recommends sterilised water, boric acid in 4 per cent. solution, and silver nitrate in ½ per mille solution for the purposes of irrigation.

In the chapter on Inflammations of the Uterus by Professor Döderlein it is shown that whilst various bacteria inhabit the vagina none are found in the cervix or in the body of the uterus or in the Fallopian tubes. This constitutes an important criterion for diagnosing the healthy from the inflamed uterus, and the concordant results of many observers demonstrate that there is one group of cases of metro-endometritis which arise without the coöperation of bacteria and another which includes the varieties denominated septic and saprophytic, gonorrhœal, tuberculous, syphilitic, and diphtheritic. Each of these is minutely described.

Just one-half of this volume is devoted to the subject of Myoma of the Uterus, which is subdivided into six sections. Professor K. Gebhard of Berlin gives the anatomy and histology of myoma; Dr. J. Veit of Leyden its symptomatology, diagnosis, and prognosis; Dr. R. Schaeffer of Berlin the treatment of the affection by electricity; Dr. J. Veit the palliative treatment and the vaginal operations required for its removal; Dr. R. Olshausen of Berlin the abdominal operations for myoma; and the same writer the relations of myoma to pregnancy. The subject, therefore, is treated in the most exhaustive manner and the account here given of this formidable and formerly very fatal disease may be regarded as the most complete and instructive that is extant. True myoma, in which the tumour consists exclusively of muscular tissue, is only found in the early stages of its development; at a later period its becomes mingled with connective tissue and is then known as fibro-myoma or fibroid. Such tumours are often numerous in the same uterus and may attain a very large size. In regard to position, they may be submucous, interstitial, or subserous. Many woodcuts are appended to Dr. Gebhard's paper showing their position and form. A special variety of myoma is adenomyoma, in which gland tubes are found supposed by some to be the uterine glands and by others to be the remains of the canal of Gaertner, but which have been demonstrated by Recklinghausen to be either the uterine glands or remains of the Wolffian body. The pathological changes which may take place in myomatous tissue (such as atrophy, calcification, fatty and amyloid degeneration, necrobiotic degeneration, and gangrene) and the mixed tissue which may appear (such as enchondroma, sarcoma, osteoma, carcinoma, rhabdomyoma, and malignant leiomyoma) are all fully described. The diagnosis of myoma and of its complications is given with great care and minuteness of detail by Dr. Veit. The section on the treatment of myoma by

means of electricity by Dr. Schaeffer is practical and will be read with interest by every practitioner, showing, as it does, the advantages of this method, which was first applied by Dr. E. Cutler and greatly improved and extended by Dr. Apostoli. The instruments required and the mode of their application are described in great detail and references are given to an immense number of cases by different operators which seem to have been in most instances attended with extraordinary success, though various surgeons are opposed to this plan of treatment probably from want of care in attending to the contra-indications, such as hysteria, intestinal catarrh, pregnancy, malignant degeneration of the myoma and fibrocystic degeneration and suppurative inflammation in the adnexa. Dr. Veit naturally discusses at some length the relative merits of the vaginal and abdominal sections for the removal of the tumour, and describes in detail the methods of operating through the vagina for the removal of myomatous polypi for the enucleation of submucous myomata and for the extirpation of the uterus, leaving the abdominal section to Dr. Olshausen. Dr. Veit lays down the rule that all tumours which occupy the pelvis or can be pressed down into that cavity can be removed through the vagina, though the steps of the operation must vary with the size of the tumour, its seat, and the extensibility of the cervix. In any case the whole of the tumour should if possible be removed at one sitting and Dr. Veit, if enlargement of the cervix is required, makes an incision directly downwards in the middle line.

The removal of fibroids by abdominal section and enucleation seems to us to be in every respect preferable to the vaginal operation and is strongly advocated by Dr. Olshausen in his article on the subject. The exposure and complete removal of the tumour or tumours is certainly more easily effected. The bleeding can generally be restrained by pressure without having recourse, as Dr. Olshausen states that on one occasion he practised, to ligature of the two internal spermatic arteries. Sepsis, if due precautions are adopted, can be avoided and damage to the bladder must surely be very exceptional, whilst this method has the immense advantage of leaving the organ in a fairly healthy condition, as is sufficiently proved by the circumstance that pregnancy has occurred on more than one occasion after it has been practised. Dr. Olshausen quotes a case under Dr. Biermer's care, however, in which after removal of a small fibroid vomiting followed by stoppage of pulse and arrest of breathing occurred—symptoms which a post-mortem examination showed were due to the entrance of air into the uterine veins and the formation of foam and froth in the right auricle. Dr. Olshausen himself has had 3 deaths in 38 operations, all from sepsis.

The mortality in the practice of different gynæcologists is given in great detail, Professor Chrobak after Dr. Olshausen taking the lead in the success which has attended his operations, for in 141 operations for myoma with 9 enucleations he had not a single fatal result, and Dr. Carl von Braun had in 8 cases only one death. Martin in 96 cases had 18 deaths. The accounts of these cases make it abundantly clear that the opening from without into the uterine cavity greatly increases the risks of the operation.

We regret we have no space to do more than allude to the section on Physical Methods of Examining the Bladder, written by Dr. F. Viertel of Breslau, in which the value of endoscopy is shown in the diagnosis of catarrh of the bladder, of hæmorrhage into it, and for the determination of the presence of tuberculosis, calculi, foreign bodies, and tumours in its interior. Many drawings illustrate the instruments which are in common use and an excellent bibliography precedes this as well as every other section of the work.

Technical Mycology. By Dr. FRANZ LAFAR, Professor of Fermentation-Physiology and Bacteriology in the Imperial Technical High School, Vienna, with Introduction by Dr. EMIL. CHR. HANSEN, Principal of the Carlsberg Laboratory, Copenhagen. Translated by CHARLES T. C. SALTER. In Two Volumes. Vol. I., Schizomycetic Fermentation. London: Charles Griffin and Co., Ltd. 1898. Price 15*s.*

THE study of Bacteriology has indeed opened a wide field. The subject is generally associated with disease, but we have learned and are still steadily learning how friendly is the action of by far the greater number of species of bacteria. The bacteria of disease, the pathogenic organisms, are after all but a tithe compared with the numbers and species which are found working faithfully in the interests of mankind. When specific non-pathogenic microbes are in healthy action and in out-numbering quantities the pathogenic microbes succumb and give up the race for existence. We have therefore to deal with countless microscopic engineers, so to speak, organisms productive on the one hand of evil and on the other of good, and our endeavours should be to study the conditions under which the former may be overthrown and their growth prevented, and to discover those congenial conditions under which the useful functions of the latter may not be frustrated or hindered but rather encouraged. The volume before us is doubly instructive. It shows the false conceptions of the past and it suggests in the future a field of enormous importance in the arts and industries and in sanitation by indicating how bacteria may be serviceably engaged in the production of a great number of useful substances and in the disposal as well as in the utilisation of effete and harmful products. When to destroy and when not to destroy bacterial life is the problem to be solved. Sanitary diagnosis has not infrequently erred in this direction to the detriment of life and at a considerable waste of public money. In the matter of sewage disposal perhaps we have the best example of the result of applying incomplete knowledge. At one time it was considered correct to sterilise sewage by chemical treatment and thus arrest the development of bacteria. The object was, of course, to destroy the pathogenic organisms. Such methods invariably failed not only from the economical point of view, but, it must be admitted, from the hygienic point also. It is well known now that when full opportunity is given to the action of the ubiquitous microbes sewage may not only be disposed of in the cleanliest possible way but converted into innocuous products which are a decided gain to vegetation. The benign functions of certain bacteria are being ascertained in other directions and a new application of bacteriological science appears which takes for its name the title of this book—viz., technical mycology. The chapters teem with interesting matter from beginning to end. Nor are the subjects which are discussed of interest to a few only. When the work is described, and correctly described, as "a practical handbook on fermentation and fermentative processes for the use of brewers and distillers, analysts, technical and agricultural chemists, pharmacists, and all interested in the industries dependent upon fermentation," it is obvious that the circle of readers whom it should directly interest will not be very narrow. Further, the student of pure science, the inquirer after truth, and the teacher will welcome such a valuable collection of material—material which has accrued from the labours of patient and ardent workers in bacteriological science during the last decade or so.

The plan of the work is as follows. Volume I., the copy of which is before us, treats of bacteria. The first chapters are devoted to an introduction to the subject, which is subdivided into three parts: I. The Theory of Spontaneous Generation; II. Theories of Fermentation; and III. The

Organisms of Fermentation. Under Division I. occurs the heading Schizomycetic Fermentation, the subject being classified into the following sections: Section I., General Morphology and Physiology of the Schizomycetes; Section II., General Biology and Classification of Bacteria; Section III., Principles of Sterilisation and Pure Cultivation; Section IV., Chromogenic, Photogenic, and Thermogenic Bacteria; Section V., the Heat-resisting Bacteria, their Place in Nature and their Importance in the Fermentation and Food-stuff Industries; Section VI., Lactic Fermentation and Allied Decomposition; Section VII., the Formation of Mucus and Allied Phenomena of Decomposition; Section VIII., Decompositions and Transformations of Organic Nitrogenous Compounds; and Section IX., Oxidising Fermentations. In the section on the filtration of drinking-water we find that no reference is made to the great purifying effect of sedimentation, as in the removal of micro-organisms from water by entanglement with finely-divided, insoluble substances in the act of subsiding. As both Sir Edward Frankland and his son, Dr. Percy Frankland, have shown, water may be rendered practically sterile by the addition in proper quantity of certain powdered insoluble substances, and on a large scale sedimentation is undoubtedly a most important factor in the bacterial purification of water for drinking purposes. All these sections afford most interesting reading. Here may be learned the best means of cultivating bacteria to useful ends in the arts and manufactures, the methods enjoined being clearly and practically indicated to the intelligent reader. The part played by bacteria in distilling and brewing, in the preparation of wines, in the manufacture of vinegar, in the dairy, in farming, in the preparation of agricultural fodder, and in the manufacture of tobacco and sugar, &c., are plainly described and the moral of it all is clearly conveyed. Next are chapters on the bacteria busily occupied in the great natural processes, the nitrifying organism, the nitrogen-assimilating organism, and the iron and sulphur bacteria. Chemists have failed to account for the great natural beds of iron, sulphur and saltpetre in various parts of the earth. It is probable that these after all are the harvest of the countless microscopic agencies evolving simple substances out of complex compounds.

We have said enough in evidence of the very interesting character of the book. It is the first work of the kind which can lay claim to completeness in the treatment of a fascinating subject. The plan is admirable, the classification simple, the style good, and the tendency of the whole volume is to convey sure information to the reader. We look forward with more than ordinary anticipation to the second volume.

Die Blennorrhöe der Sexualorgane und ihre Complicationen. Dargestellt von Dr. ERNEST FINGER, K.K.A.Ö., Professor der Dermatologie und Syphilis an der Universität in Wien. Mit 36 Holzschnitten im Text und 9 Lithographischen Tafeln. Vierte wesentlich vermehrte und verbesserte Auflage. 1896. Leipzig und Wien: Franz Deuticke. (*Gonorrhœa and its Complications.* By Dr. ERNEST FINGER, Professor of Dermatology and Syphilis at the University of Vienna. With 36 Woodcuts in the Text and 9 Lithographic Plates. Fourth considerably enlarged and improved Edition. 1896. Leipsic and Vienna: Franz Deuticke.) Pp. 396. Price 9 marks.

GONORRHŒA is a disease the importance of which has too often been under-valued; but, quite apart from its prevalence, the complications which accompany it are so extremely numerous that the treatment of the disease itself is certainly deserving of much more care than is frequently devoted to it. Professor Finger's work has been widely recognised from its first appearance in 1888 as probably the most thorough and complete treatise extant on the subject. This edition, the fourth, contains all recent additions to our knowledge of the subject, the chief new matter being the histology of Acute Urethritis, and of Gonorrhœal Rheumatism, Periostitis and Bursitis. Recent improvements in the methods of treatment have also been added.

The Treatment of Wounds, Ulcers, and Abscesses. By W. WATSON CHEYNE, M.B. Edin., F.R.S., F.R.C.S. Eng., Professor of Surgery in King's College and Surgeon to King's College Hospital and Paddington Green Children's Hospital, London. Second edition. 1897. Edinburgh and London: Young J. Pentland. Pp. xii. and 197. Price 3*s.* 6*d.*

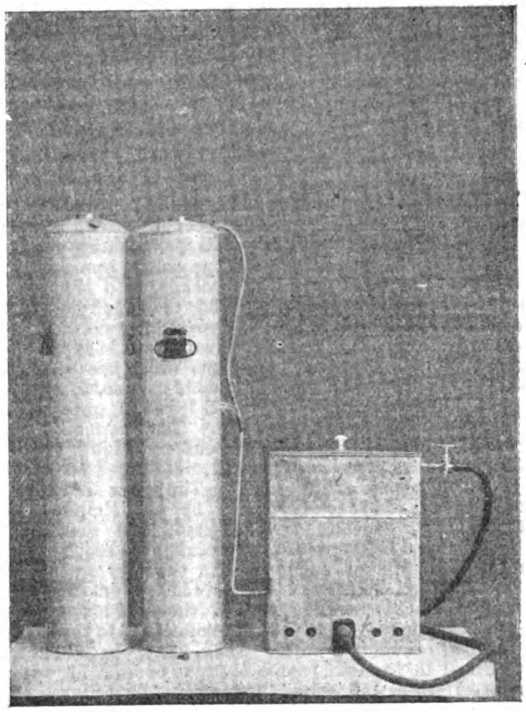
WHEN reviewing the first edition of Mr. Watson Cheyne's little manual we praised it as being likely to serve as an admirable guide to the practical application of antiseptic methods. The author tells us in the preface to this, the second, edition that "continued experience shows that uniform results may be reckoned on if the methods here recommended are followed," and we fully agree that a surgeon who can count on obtaining healing by first intention by any method is fully justified in continuing to practise that method. The failures which often follow so-called "aseptic surgery" are not necessarily due to the method but to the want of care on the part of the person who applies it, and the aphorism which Mr. Cheyne has placed at the commencement of his book, "Suppuration occurring in a wound made by a surgeon through unbroken skin is due to some oversight on his part," is as applicable to "aseptic" as to "antiseptic" surgery.

LIBRARY TABLE.

Transactions of the Pathological Society of London. Vol. XLVIII. London: Smith, Elder, and Co. 1897.—No one who has the interests of British medicine at heart can be unmindful of the excellent work which is constantly being done in this and kindred societies. The present volume has, moreover, an especial claim to notice, for it marks the period of this society's jubilee, which was duly celebrated in October, 1896. The address of the President, Mr. Butlin, here reproduced, gives an interesting account of the origin of the society and of its progress and not obscurely hints that the tendency of the society will in the future be more and more towards experimental and chemical pathology rather than in the field of morbid anatomy in which its greatest achievements have hitherto been gained. Doubtless there is room for all aspects of pathology to be discussed at its meetings, provided always that the members bear in mind the fact that oral exposition of a subject need not of necessity embrace all the minuter details which will subsequently find a place on the printed pages. The volume also contains a list of the specimens of more or less historical interest which were gathered from museums to illustrate the society's work of fifty years. Of the communications during the session which are here printed and illustrated may be cited one on Actinomycosis of the Pleura by Dr. S. West, one on Multiple Cavities in Bronchopneumonia by Dr. H. Tooth, a communication on the Minute Anatomy of Intussusception by Mr. D'Arcy Power, a case of Acromegaly with Diabetes by Dr. N. Dalton, Non-calcifying Plastic Osteitis by Mr. Pitts and Mr. Shattock, on the Tabetic Foot by Mr. Targett, and on the Plurality of Ringworm Fungi by Dr. Colcott Fox. The volume is fully worthy to rank with its predecessors and affords evidence of the sustained interest taken in the work of the society.

An Atlas of Histology for the Use of Students. By ARTHUR CLARKSON, M.B., C.M. Edin. Bristol: John Wright and Co. 1898. Price 9*s.*—This little atlas is a separate issue of the 174 original coloured illustrations from the author's "Text-book of Histology," with just sufficient descriptive letter-press to make the drawings intelligible. The book is

well got up and the illustrations are clearly printed in colours. They are, of course, somewhat diagrammatic, but that is no drawback from the student's point of view. The modest price of the work should place it within everyone's reach and it will be of considerable assistance to beginners in histology. Although the figures are naturally less numerous than in the atlas by Klein and Noble Smith and are, perhaps, drawn with less finish, yet they compare not unfavourably with those of that expensive work. It is, perhaps, a pity that in the teaching of histology to medical students the tissues of the dog, the cat, and the rabbit, should so largely replace those of man. They can, of course, be more readily procured in a fresh condition, but in the case of most organs excellent human material can be got readily enough. Many a student is puzzled by the slight differences which exist between certain organs in animals and in man when he is first confronted with the latter in his more advanced studies. There are certain omissions in the present work to which attention may be drawn. The different varieties of leucocytes are now of such importance that they should certainly be figured in any modern atlas; no illustration is given of the mammary gland; and the enormous advances in nervous histology due to the methods of Golgi and others are altogether unrepresented. A few of the illustrations are not up to the standard of the rest—notably that of the human uterus—and in figure 97 the student would be led to believe that there were no glands in the rectum. The use of the term "squamous epithelium" for the lining cells of serous cavities and blood-vessels is also to be deprecated. Though we have mentioned these slight defects, yet the illustrations are, as a whole, so good and clear that we have no hesitation in recommending the atlas to students as an excellent and serviceable little work.



Liverpool Royal Infirmary Medical Report. Vol. II. 1897. Price 1*s.*—The second volume of the Liverpool Royal Infirmary Medical Report recently issued is larger than that of the previous year. The reports of the medical and surgical registrar have been extended by the addition of new sections upon the eye and x ray statistics, and by increasing the remarks upon the various surgical and medical cases wherever found necessary. There is an increase in the number of necropsies in the pathological report and in each case a brief *résumé* is given of the history and symptoms. Many rare specimens obtained from the post-mortem room have been added to the museum. The compilers have drawn up the statistical tables with every care and they hope that the present volume will prove of greater value both to the student of the infirmary and to those interested in the statistical work of a large hospital than the former volume. Much credit is due to Professor Boyce of University College, Liverpool, and to Dr. E. A. Smith and Dr. H. T. Nixon, the medical and surgical tutors respectively, for the care and labour which they have bestowed upon the present number.

Skin Diseases of Children. By GEORGE HENRY FOX, A.M., M.D., Clinical Professor of Diseases of the Skin, College of Physicians and Surgeons, New York, &c., With Twelve Photogravure and Chromographic Plates, and Sixty Illustrations in the Text. London: J. & A. Churchill. Pp. 166. 1898. Price 12*s.* 6*d.*—Although it can hardly be said that there are any diseases of the skin in children which are not represented in the adult, yet there are many morbid conditions of this structure which occur much more commonly in childhood. The vulnerability of the skin in infants, the frequent digestive disturbances in the young, and the very great chance of contagion are doubtless in great part responsible for the frequency with which diseases of the skin are met with in early life. During the year 1896 Dr. G. H. Fox contributed a series of illustrated articles on certain skin diseases which are apt to occur in infants and childhood to the *American Journal of Obstetrics and Diseases of Women and Children*, and he has now issued them in book form with some additions, but the book is not intended to include a full account of all the cutaneous affections which may occur in the young, rather it deals only with those symptoms which are commonly met with in children. Eighteen diseases in all are described, and most of them are very artistically illustrated by reproductions of photographs. The most elegant of the illustrations are the photogravures, which are equal to anything we have ever seen in a monochrome representation of a disease of the skin. There are two coloured plates, which are good. The illustrations in the text are also reproduced from photographs and are satisfactory.

New Inventions.

THERMO-SYPHON AND RAPID STERILISER.

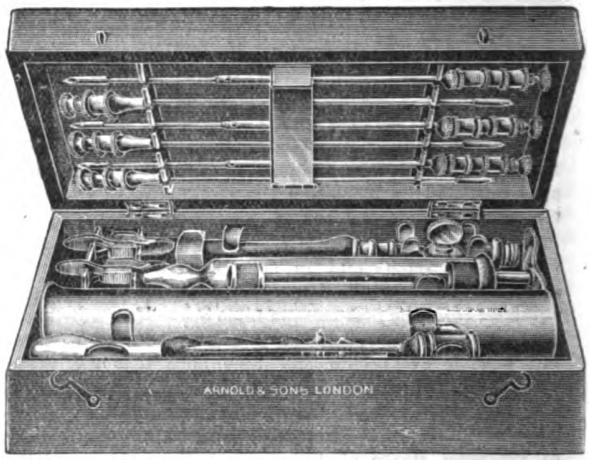
DR. R. MARTIN GIL, Medical Director of the Hospital "Noble" of Malaga, recognising the increasing necessity of employing a scrupulous asepsis in surgery and at the same time the difficulty of obtaining sterilised water rapidly in sufficient quantity, has designed a simple apparatus for the purpose and of which he sends us the following description:—

Dr. Martin Gil's Syphon.

"This apparatus consists of a series of tubes of tin-coated copper with an inner diameter of 5 mm. and forming 52 elements arranged in alternating series like the boilers of Velbill. These tubes communicate with other transverse tubes of 7 mm. interior diameter, these latter being attached to a further set of four tubes with an inside diameter of 10 mm. These four just mentioned support the other two sets. This collection of tubes forms a *bloc* of 25 cm. in length, 18 cm. in breadth, and 19 cm. in

height. The aggregate total length of the tubes if placed one after the other would be 17 m. and they are capable of containing half a litre of water. To one of the vertical tubes at the angles another thin tube is screwed, which conducts the water to two cylinders of which I shall speak further on. The multitubular boiler is screwed on to the inside of a copper box, forming a vessel or receptacle. With an ordinary gas, petroleum, or spirit lamp the water is heated and penetrates into the elements of the boiler, and as the heat also acts directly on it the process of ebullition soon takes place. A wire basket serves to contain the instruments to be sterilised. It is 26 cm. long, 20 cm. wide, and 10 cm. deep, thus being of sufficient capacity to hold the instruments required for an ovariotomy or the largest Doyen's retractors required to be used for vaginal or combined hysterectomies. A lid is put on when the instruments are being sterilised. It should not be put on during the sterilisation of the water.

"The question of proper receptacles for keeping cold and boiled or sterilised water without fear of its becoming infected before the operation is a matter that must also be attended to. For this purpose I have designed two cylindrical containers of galvanised iron of certain construction. Each of these vessels is capable of containing 15 litres and measures 85 cm. in height and 15 cm. in diameter. The upper is furnished with two brass mouthpieces which can be screwed on, thus closing it hermetically. By means of the one in the centre, which is the larger of the two, the water is emptied out, and through the smaller one, which is on the side, is inserted the tube that conducts the boiling water and serves at the same time, if left open when the water is poured into the irrigators, to form a compact jet without spray.



"Everything being ready the apparatus is started by admitting common water by means of a rubber tube connected with any water-tap or receptacle whatever and the upper vessel having been filled the valve communicating with the boiler is left open till this latter also becomes full and the lamp on the fireplace is then lighted. According as the water passes to one of the cylindrical vessels at the temperature of 135° C. under the pressure of a quarter of atmosphere developed by the steam generated in the boiler it becomes replaced by an equal quantity of water which enters hot from the upper vessel by means of a simple valve, ensuring the working of the thermo-syphon and precluding all danger from the steam. When the water begins to boil it takes 3 or 4 minutes to reach one of the cylinders, but according as the elements and the water of the upper vessel become heated the boiling of each half litre of water, which is the quantity contained in the tubular boiler, and its passage to the iron containers are effected in from 40 to 45 seconds. To sterilise the 30 litres of water capable of being contained in the two receptacles 30 or 40 minutes are required according to the pressure of the gas. We have already seen that the upper reservoir of the apparatus, after the water has been sterilised, serves to render the instruments aseptic, this process commencing 3 minutes after the 5 litres of water capable of being held in it begin to boil. The thermo-syphon is small in compass, being only 37 cm. in height, 29 cm. in front and 21 cm. from front to back. It weighs 7 kilos., and is therefore easily carried about. The water in one of the cylinders can be rapidly cooled by any simple method without being in any way infected, and that of the other one can be kept hot for mixing as required. The 30 litres capable of being held in the two are sufficient for all the requirements of a laparotomy, from the washing of the hands of the operator and those of his assistants, as also the preparation of aseptic solutions, to the washing of the peritoneum if needful. These vessels have been made cylindrical in form to enable them to be used for warming purposes. It is well known how frequently collapse supervenes in operations of the abdomen, and it is therefore always advisable to promote the warmth of patients who have been kept exposed to the air during the course of a lengthy operation while under the influence of an anæsthetic or who have had much hæmorrhage. In these and other cases the operator frequently freely employs a foot-warmer and for this purpose I have found nothing so handy as these vessels with two or three litres of water inside and placed wrapped in towels close to the patient.

"In military surgery, in the ambulances and field hospitals, as well as on board the battleships and transports for the conveyance of the wounded, it is well known that grave difficulties are met with in the practical application of a proper asepsis, and one of the greatest of these difficulties is that of not being always able to count upon a supply of sterilised water for the operations, the daily dressing of wounds, &c. This is from want of a rapid and easily-handled steriliser capable of affording the needed supply of water, with vessels to keep it aseptic for preparing the necessary solutions. With my thermo-syphon I think this obstacle can be surmounted even under the most unfavourable circumstances.

"In conclusion the thermo-syphon and the two cylinders are from their small bulk easily carried to the house of the patient, where all kinds of operations can be performed in complete accord with the canons of asepsis."

A NEW ASPIRATING INSTRUMENT.

THIS instrument, which was made for me by Messrs. Arnold and Sons, London, is a modification of Potain's aspirator and Dr. Garratt's syphonage instruments for tapping the chest. Its parts form (1) an exploring needle; (2) an aspirator; and (3) a syphon tube. The functions of all these it performs with a single insertion of the needle. It is constructed entirely on the model of Potain's aspirator, with this exception, that the mount for the cannulæ is a single tube and stopcock instead of being a V-shaped one. This change has been made in order that the whole of the tube can be cleared in the event of its becoming blocked and also to enable the pleural cavity to be completely shut off while the instrument is being changed from an exploring needle to an aspirator. The method of using this instrument is as follows:—The trocar and cannula having been introduced in the ordinary way the trocar is withdrawn and the stopcock turned off. The exploring syringe is then applied by means of an adapter, which is connected with it by means of a piece of rubber tubing. The exploration having been completed the tap is again turned off and the aspirator or syphon tube applied by means of

another adapter; the adapters used are the same as in Potain's aspirator. A metal test tube is provided for boiling the metal parts and bulldog clamps are supplied for the syphon tube. I have now used this instrument a great number of times and have found it simpler and quicker than the ordinary aspirator. On most occasions I used the syphon tube, which I prefer to the aspirator because it is continuous in its action and the aspirating force is uniform. The air-pump and (cork for) aspirating bottle form part of this instrument because it is sometimes required for very small pleural effusions surrounded by a thickened pleura, but on account of the infrequency with which it is required I prefer to have it in a separate case.

L. B. BURNETT, M.R.C.S. Eng.
Royal South Hants Infirmary.

ROYAL UNITED HOSPITAL, BATH.—As the result of a ball which was recently held in aid of the Royal United Hospital, Bath, the sum of £200 has been raised for the building fund of that institution.

THE LANCET.

LONDON: SATURDAY, JUNE 11, 1898.

THE General Medical Council rose at 7.30 P.M. on Tuesday, May 31st, having sat the whole of seven days and having dealt in a more or less thorough way—we fear we must say less rather than more—with a very large number of subjects. Upon the whole the new President has had a difficult experience. What was nominally the first meeting under his presidency began somewhat stormily and did not end much otherwise. The Council is full of his friends, who recognise his high authority, his unequalled experience of the Council's work, and his great business capacity. But even so he did not escape criticism and many thought that he might have prevented some of the personal episodes which disfigured the proceedings. The fact is that for the time being the air of the Council is heavily charged with personal electricity which breaks out in occasional storms. Let us hope that the storms will soon pass and leave the Council a better body for the discharge of its great duties. For better or for worse it includes in its membership a number of gentlemen of great ability but of incompatible temper, who no doubt all agree in wishing to make the Council efficient, but who continue to differ even on questions on which they are for all practical purposes agreed.

Amid the multifarious questions which occupied the attention of the Council we select one or two as important in themselves and also interesting as illustrations of the faulty way in which the Council too often does its work. Take, for example, the question of the use of unqualified assistants. The Council in November last carried a motion meant to increase the stringency of its rule on this subject. Roughly it conveyed the general impression that henceforth—without waiting till the year 1900—any employment of an unqualified assistant in the seeing or treatment of patients might involve the peccant principal in a serious charge before the General Medical Council. We pointed out at the time that there was a want of definiteness in the language, leaving in the minds of many practitioners an uncertainty as to the exact meaning of the Council. This uncertainty has been felt extensively by those who have been in the habit of employing unqualified assistants under their own careful supervision and, as they thought, in accordance with the views of the General Medical Council. Amongst such practitioners a wide and extensive panic has undoubtedly been created. The discussion on Tuesday on Mr. TEALE'S motion, which aimed at a reconsideration of the subject, shows that this uncertainty was not confined to such practitioners, but that it was actually shared by members of the Council. Mr. BROWN said that he would regard attendance on midwifery or an emergency case of any kind as not inconsistent with the November notice. He was sharply corrected by Dr. DONALD MACALISTER, who, as framer of the notice and chairman of the Business Committee, as well as in virtue of a clear and logical mind, speaks with authority on the subject. But it is well known that other and influential members of the Council share Mr. BROWN'S views and have given them categorical expression. The final result of the reopening of the matter is simply to leave things where they are and were. This means that this serious question is to be settled by cases and not by explicit instructions, that men employing unqualified assistants, no matter what the limitations, will be liable to answer for their conduct before the Council, and that no one can tell in any individual case whether the views of Mr. BROWN or of Dr. MACALISTER will prevail. This vagueness may be a master-stroke of policy in the view of certain minds, but it is not business and is a great practical cruelty to men wishing to do what is right under difficult and often hard conditions of practice.

We regret to say that the proceedings of the Council ended, as we have hinted, unfortunately. The resolution which was passed giving members power to see documents with the consent of the Council, or the Executive Committee, or the President, was not broad enough for Mr. HORSLEY (to whose letter in our columns last week we refer our readers), and although by silence he appeared to give consent to the resolution when it was under discussion, at the last moment of the Council's sitting he raised the whole question again on practically a formal motion. The President refused to allow the reopening of the subject. It would seem only fair before the rule by which the inspection of documents by members is condemned that it should be tested by experience. It is obvious that the documents of the Council must be safeguarded. Some of them affect the character of members of the profession against whom charges of misconduct may have been hastily and incorrectly made. All of them are of such a nature as to be valuable for use and reference and consequently their loss or damage could not be considered with equanimity. On the other hand, they can only be made useful by inspection and study, and we assume that in the future for any good purpose they will be available under reasonable conditions. Nothing could be more unfortunate than for the Council to offer an unmeaning opposition to such a use of its documents or an opposition which would convey the impression of fear lest its action or that of its legal advisers or officers would not bear investigation. It is understood to be the legal officers of the Council against whom Mr. HORSLEY'S shafts are most pointed, but it is a poor compliment to these old and well-tried servants to think that their work needs to be guarded from honest, even if somewhat severe, criticism. In this view it is much to be regretted that a committee was not appointed as the motion of Mr. HORSLEY and Dr. GLOVER suggested. An investigation by a committee is an entirely different thing from a personal inquiry and is much more likely to carry satisfaction.

ALTHOUGH the profession has not yet got over a certain amount of dissatisfaction that the recent Crown vacancy in the General Medical Council was not filled by a

general practitioner, it is generally recognised that the dentists have been fortunate in the appointment of Mr. TOMES. The discussion on dental education gave the new representative a good opportunity of justifying the selection of the Crown. There are two extremes in the views on this subject which need reconciliation in the Council. According to one party, represented in the debate by Dr. MCVAIL with his unfailing fervour of expression, the time is fully come when the dentist ought to be a surgeon and ought to have as complete a knowledge of surgery as any medical practitioner. According to another view, represented perhaps by Sir RICHARD THORNE, we are making too much of dentists and training them beyond the necessity of the case, with the effect that they are apt to think themselves fully fledged medical practitioners and to poach on the field of the medical man. The truth doubtless lies midway between these extremes and the General Medical Council has made an honest attempt to suggest a curriculum and an examination which will tend at once to make the dentist efficient and yet help him to see that it is no part of his duty to invade the domain of the medical practitioner. There is the less excuse for any such invasion when we consider the fact that coincidently with the development of the dentist's art the public have developed a praiseworthy solicitude about their teeth.

The warmth of the discussion in the Council was not, it should be said, entirely due to divergence in the views of the members. The real inwardness of the debate could be guessed at by those who remember that the Council is a very complex body and represents schools in different portions of the kingdom whose methods of education differ, whose interests are not always identical, and who are not altogether free from the jealousy of rival and competitive bodies. Whether chemistry should include physics, whether instruction should take the form of lectures or laboratory work, whether a dentist should know more than the anatomy of the mouth and how much more, whether his teaching on disease should enable him to recognise any lesions in the mouth of more than local significance, were questions which seemed almost to raise the temperature of the members concerned in their debate. It must be admitted that Mr. TOMES exercised a moderating influence and did much to show that it was in the interest of the public that the dentist should be more than a mere extractor or stopper of teeth and that the degree of medical education required of him had the effect of restricting him within the sphere of his own specialty. Medical men generally will recognise the truth of this view. Undoubtedly the less educated a man is the more conceited he is apt to be and the more likely is he to assume status and duties beyond those for which he is licensed. A great part of the interest of this discussion and of the whole question of the evolution of dentistry lies in the fact that it involves the larger question of specialisation in what is essentially medical work. How far is this process to go? How far is it fair to the medical profession and in the interest of the public to divide the human body into petty areas to be cared for by th se alone who have devoted their attention exclusively to such limited areas, as if these localities were not parts of the whole, and as if their diseases could only be understood and treated in this isolated way? If such specialisation is demanded by the public, how far should it be recognised and encouraged by the medical profession? The answer of the profession doubtless would be that it has gone far enough and that any further extension of it should be resisted. The legalisation of the dentist has not yet sufficed to raise all men who enjoy registration above the methods of tradesmen. Many advertise and vaunt their skill in a way altogether foreign to the methods and the tradition of the medical profession. But it has doubtless tended to check that evil, and the effect of education, as Mr. TOMES argued, has been considerable. Still, we must resist, on the score of science and of public interest alike, any more registration of specialties. And here we join hands with Dr. MCVAIL and admit that the medical art, as far as education goes, is one and indivisible, and must know no limitation of parts and recognise no division of the body into bits.

ON June 6th the trial of WALTER HORSFORD for the murder of his cousin ANNIE HOLMES, a widow, was concluded. After five days' investigation at the Huntingdon assizes before Mr. Justice HAWKINS the prisoner was convicted and sentenced to death. The facts of the case were briefly as follows. HORSFORD, who had recently married, had received an intimation from Mrs. HOLMES that she believed herself *enceinte* with the implication that he was the author of her trouble. In his reply he repudiated liability on the grounds that she had received monetary consideration and expressed a wish that no more letters should be sent to him, as he did not wish his wife to know of the relations which had existed between them. In December last HORSFORD purchased at a chemist's a large quantity of arsenic and 90 gr. of strychnine, alleging that he wanted them to exterminate vermin. One day early in January Mrs. HOLMES, who had been in her usual health, retired to bed taking with her a glass of water—an unusual circumstance. Shortly afterwards her daughter, aged about thirteen years, found her mother in great agony. The neighbours were called in and Dr. JOSEPH HERBERT ANDERSON, acting as assistant to a local practitioner, was fetched. He found deceased suffering from symptoms of strychnine poisoning and administered antidotal sedatives. Treatment proved of no avail and in a short time the unfortunate woman expired.

At the inquest HORSFORD in his evidence denied that he had had immoral relations with his cousin, or that he had visited her, or that he had sent anything to her. These statements were demonstrably contrary to fact, for he had been twice to see her and there was the letter above referred to. He was arrested on a charge of perjury and was subsequently indicted for wilful murder. After Mrs. HOLMES'S death some letters were found beneath the mattress of the bed, together with two papers, one of which though nearly empty contained a little strychnine whilst the other held 35 grs. of the alkaloid. On one of the packets was written "one dose take as told," and also the significant expression "it is quite harmless." The analysis

of the viscera and their contents revealed the presence of a large quantity of strychnine. From the characteristic symptoms and the chemical analysis there could be no shadow of doubt that the deceased had died from strychnine poisoning. The questions to be determined were—Was the alkaloid taken by accident or was it administered with a felonious intent? and if the latter, who was the guilty person? Although strict inquiries were made none other than HORSFORD likely to be known to Mrs. HOLMES and to be interested in her affairs was found to have purchased strychnine from the chemists for some distance around. Fortunately there was no difficulty in comparing HORSFORD'S known handwriting with the direction on the packet containing the powder. The likeness between the two was so striking that it scarcely needed an expert to appreciate it. Now, whether HORSFORD caused to be administered the poison with the intent to procure abortion—a proposition purely visionary—or to compass death mattered not. The post-mortem examination showed that Mrs. HOLMES had not been pregnant within a short period of her death. But even this mistake as to her condition would not have diminished the criminal responsibility, since the Act in considering the penalties for the procuring of abortion distinctly says "whether the woman be pregnant or not." The chief contentions for the defence were (1) that some other person than HORSFORD might have been the guilty party; (2) that the strychnine found in the papers might have been put unde the bed subsequently to the death of Mrs. HOLMES; and (3) that it was not likely that HORSFORD, "who only valued Mrs. HOLMES'S body at half a crown"—a sum he acknowledged to have given her—would sacrifice her body and soul at the risk of losing his own life. As regards the first, it may be remarked that there was not the slightest testimony that any other person than HORSFORD had any reason for taking her life. The other points are too puerile to merit discussion.

Touching the adequacy of motive we submit that the history of murders committed of malice aforethought shows that from an ordinary standpoint the prime cause is seldom commensurate with the deed—in fact, it is more often than not so utterly disproportionate that some ethical writers have questioned whether the act is not the final result of a state of mind that is hovering on, or that has passed beyond, the frontier of sanity. And, again, there is the propensity to trust in the chances which may favour the failure of detection of the crime. Since the time of PALMER no case of murder by strychnine poisoning so foul in every sense of the word has been brought to light as that now under consideration. United to his victim by ties of blood, in debt to her morally for the wrong he had done to her, HORSFORD hesitated not to treacherously take the life of a lonely widow and make her innocent children orphans, and all for the miserable gain of freedom from the consequences of his lust. The links in the chain, or rather the strands in the rope, of evidence were so convincing, so natural in their connexion and cohesion that none but the wilfully blind could for a moment hesitate to endorse the verdict. The compliment and thanks rendered by the jury to the presiding judge might be deemed superfluous, but *facile princeps* as is MR. JUSTICE HAWKINS in directing juries in criminal trials it seems to us that his latest exposition will be considered his masterpiece. Biassed undoubtedly he was, but in the justifiable sense to which the late MR. JUSTICE MELLOR gave his judicial sanction when he said "if the evidence is strong the summing up should be strong." It would be wrong on the part of a judge simply to enumerate the facts which might be arrayed against a prisoner or presented in extenuation or disproof of his alleged guilt. His remarks should be directive and not merely descriptive. They should be of such nature and strength as will assist the jury in arriving at a just conclusion.

Annotations.

"Ne quid nimis."

THE EXPENDITURE OF THE METROPOLITAN ASYLUMS BOARD.

THE expenditure of the Metropolitan Asylums Board and the inattention of the public to it have long been the surprise of those who take any interest in such matters. Those who are keen to replace our voluntary hospital system by a State-supported one should immediately begin their study of the working of this Board. The technical nature of the questions in architecture involved and their remoteness from the burning contests of politics, and a vague impression that everybody is benefited all round by the hospitals, in part account for the general apathy with which their administration is regarded. It is at least satisfactory to see indications that the Local Government Board is uneasy on the subject and keeps up its demand for more specific information. At the meeting on Saturday last a letter from the Local Government Board was read stating that the report of the Special Committee on the Brook Hospital expenditure did not give specific replies to the letter of the Local Government Board of Oct. 22nd; that the special committee did not employ a competent surveyor as suggested by them and as ordered by the managers; and that they were still of opinion that such a course should be adopted. It is also satisfactory to find that some members of the Board are alive to the seriousness of the facts. Mr. F. Purchese is reported in the *Times* of the 6th inst. to have characterised the construction of the hospital as a gross scandal, the cost exceeding the architect's estimate by £70,000, about £38,000 being for work authorised by the architect without the consent of the committee or of the Board. He moved for a special inquiry by the Local Government Board. It was finally decided to forward the report of the Special Committee, and a letter answering the questions raised and promising help to the Local Government Board in any further inquiries. We hope the Government will spare time from its larger cares to pay some attention to this question and the various bearings of it. The whole subject of the administration of the hospitals and their effect on the limitation of disease is one of immense public importance.

THE ADULTERATION OF DRUGS.

IN the matter of adulteration the subject of food is generally uppermost in the mind and of recent years the interest taken in suppressing fraud in this direction has been very keen, so as to have resulted at last in an organised movement urging upon the present Government the necessity of providing more effective measures. All this time the question of the sophistication of drugs is to a large extent likely to be lost sight of. Indeed, it has been proposed

to entitle the new Act simply the Adulteration Act, apparently without reference to drugs at all. The matter of keeping vigorously maintained a system of control in drugs is certainly next in importance to that of a similar control over food; it obviously directly concerns the public and, it need hardly be added, the medical adviser. Yet judging from the Government returns the ratio of drugs examined to food is most insignificant and not in accordance with public and professional requirements. In the last Local Government Board return (1896-1897) out of a total of 45,555 samples taken for analysis only 1380 specimens (about one-fortieth part of the total number) of drugs were taken, the extent of adulteration amounting to 11·3 per cent., against 9·2 per cent. in the case of food. It invariably happens when the authorities become active that offences are proved. Such was the case in Sunderland a few weeks ago, when several druggists were convicted for selling drugs of inferior quality. In Gregory's powder carbonate of magnesia had been used instead of oxide and in one case calcium carbonate. In another instance the powder consisted of two-thirds of sulphate of lime. Again, precipitated sulphur was shown to have contained a percentage of sulphate of lime, due probably to careless preparation; and, lastly, a druggist had supplied sublimated instead of precipitated sulphur. The proceedings in regard to drugs, unlike those in regard to the adulteration of food, are instituted upon a much more definite and satisfactory line, since, of course, the British Pharmacopœia lays down the kind and strength of the preparations sold. It is in a similar direction that new legislation is required in regard to food—that there may be definite standards fixed and more precise titular definitions of various articles of food. And in regard to drugs a greater proportion of samples than 3 per cent. should be taken under the provisions of the Food and Drugs Act by the authorities if a satisfactory standard of purity and quality is to be maintained.

MEASURES FOR PROTECTING TURKEY AND EUROPE AGAINST PLAGUE.

DR. ZAVITZIANO, United States Sanitary Commissioner at Constantinople, reports to his Government that, in spite of the steps of the International Sanitary Commission, there are many questions which render such steps delusive. He instances the condition of the sanitary defence of Bassorah.

"I reported," he says, "the arrival on the 10th inst. of the Steamship *Patna* from Bombay with 125 passengers. During the journey from Bombay to Karachi bubonic plague made its appearance on board. It was a fireman who fell ill and was landed at Karachi. A second case occurred off Bushi and a third at Bassorah. I have already written in my previous reports how much Turkey is exposed to the invasion of epidemics through the Persian Gulf and that the different members of the International Sanitary Commission expressed on the contrary their opinion, which is quite different, and according to which no epidemic ever entered Turkey from that way."

It has been frequently stated that only the cholera epidemic in 1882 entered through Bassorah and probably that of 1888-9. *Ex post facto*, now that a case of bubonic plague exists already in the would-be lazaretto of Bassorah, it has been decided that any ship arriving at Bassorah and having on board cases of bubonic plague will be turned back after the mail has been landed. The foreign sanitary representatives, seeing that in spite of the orders given by the sanitary authority the danger of the spread of the epidemic is always imminent, have decided (1) to present to the ambassadors or ministers whom they represent at the International Sanitary Commission a memorial according to which diplomatic action would be taken in order to compel the Ottoman Government to respect and put into execution the decisions of the International Sanitary Commission without modifying them and adhere to the sanitary conferences of Paris and Venice; (2) to cause a meeting of a commission in order to decide how to put into execution the decisions of said sanitary conferences and decide upon the necessary steps to be taken for the protection of Turkey and Europe against the plague; and (3) at last to insist upon the adoption by the Ottoman Government of an efficient system of hygiene and sanitary improvements of all the cities of the empire. We fear that to compel the Turkish Government to do such things as are included in the third heading, which would involve an immense expenditure of money from Constantinople to the Persian Gulf, is rather a hopeless task.

OBSTETRICAL SOCIETY OF LONDON: PRESIDENTIAL ADDRESS

WE have received the annual presidential address which was delivered before this society in February last and which has now been printed in separate form. As a rule the appreciation of these addresses is largely restricted to those who happen to be present on the particular evening when they are delivered, for the volume of the society's Transactions in which the address appears does not generally come out till about a year afterwards, by which time much of the interest, which is necessarily partly of an ephemeral character, has evaporated. This is certainly to be regretted when, as in the present instance, so much care has been taken in the preparation of the address. It contains especially a statement of the present condition of the society, which we are glad to see is one of vigorous activity and prosperity; a review of the work done in the past session; and an account of the life and labours of those Fellows of the society who have been removed by death during the year. We observe that the alterations made in the form of the certificate granted to midwives after examination by the society has not had the effect of diminishing the number of candidates, but that, so far from this being the case, the number is increasing. Dr. Cullingworth defines the position of the society in this matter as follows. He says: "It must be clearly understood that the society undertook the work merely as a temporary expedient and from a sense of public duty after having tried in vain to induce the Government to move in the matter, and that it will only be too glad to relinquish it whenever the State can be prevailed upon to take upon itself functions that properly belong to it and that it alone can adequately fulfil." It is interesting to observe that the papers read at the society's meetings last session were equally divided between midwifery and gynæcology—subjects naturally allied, which cannot without disadvantage be studied, or indeed practised, separately. To our thinking, it is the biographical portion of the address which especially taxes the industry and, we may add, the tact of the writer; he has to deal with the history of the lives of men who have been for the most part his contemporaries, who have been engaged in the same kind of work as himself, who have necessarily sometimes thought as he does and at other times perhaps held opinions largely at variance with his own. Dr. Cullingworth had to deal with four names of the first importance—viz., Sir Spencer Wells, Dr. Lusk, Dr. Braxton Hicks, and Professor Tarnier. We think his somewhat delicate task in writing a biographical sketch of each of these eminent men has been admirably performed. Dr. Cullingworth has not restricted himself to merely describing the comparatively uninteresting facts of birthplace, parentage, and the like in each case, but has given some account of the principal work done by each of them. Probably the sketch of the life of Professor Tarnier is the one which contains most that is not generally familiar. The work he did in adopting measures at the

Paris Maternité to reduce the mortality from puerperal fever—"in slaying the dragon of puerperal infection," to use Dr. Cullingworth's expression—calls for especial remembrance. The invention of the axis-traction forceps which, as is well known, was due to Professor Tarnier, constitutes, in Dr. Cullingworth's opinion, "the most important improvement that has been made in the construction of the instrument since the introduction of the pelvic curve." Altogether we may congratulate Dr. Cullingworth on having produced an interesting and instructive address.

HYGIENE IN INDIA.

IF any apology were needed for publishing an introductory treatise on Indian hygiene the lessons of the plague would amply suffice. The lamentable want of sanitary knowledge among the natives of India has been the cause of much sickness and suffering and any attempt to supply that lack of knowledge should be cordially welcomed. A little book has just been published by Surgeon-Captain Buchanan for medical subordinates in India[1], but there are others to whom the book would be useful and if it has a wider circulation than the author intends much good will be done. An Indian gaol, it would seem, according to the author, is the only place in India where a sanitarian has a free hand and where he can readily act up to his theories. From this *obiter dictum* some novelties in the book might be expected, but the author has not travelled very far from beaten paths, except in regard to certain special details which apply solely to a country like India. The book, however, does not pretend to be a classical treatise on hygiene and, as far as it goes, is really an admirable little work. The term "medical subordinate," according to the Indian jail code, means an assistant surgeon, an apothecary, or a civil hospital assistant, but it is not to be supposed that any one of these has undergone the training of a fully qualified medical man. Nevertheless they often have to undertake duties appertaining to the fully qualified practitioner, and any endeavour to make the subordinate less a machine in the more responsible departments of his work deserves great praise. After reading Surgeon-Captain Buchanan's little manual the subordinate should not only be able to carry out the orders of the medical officer more intelligently but to know why those orders are given.

DIFFUSE LIPOMATA.

THIS disease is characterised by the symmetrical formation of diffuse fatty tumours in the neck and much less frequently in other regions, such as the front of the abdomen, the back, the mammary region, the groins, the suprapubic region, the buttocks, and the extremities. In the neck the growths may become so large as to produce considerable deformity. The disease was first described by Brodie in 1846 and only a limited number of cases have been recorded since that time. In a communication recently made to the Société Médicale des Hôpitaux M. Launois and M. Bensaude stated that they were able to collect only 65. The term "lipoma" seems to be a misnomer, as Mr. Roger Williams has insisted on; the growths are local hypertrophies of the subcutaneous adipose tissue and may be regarded as a form of obesity. But the lymphatic system appears to be in some way specially concerned in their production. In an important paper published in the sixth-ninth volume of the Transactions of the Royal Medical and Chirurgical Society by the late Mr. Morrant Baker and Mr. A. Bowlby the writers remark that the fatty masses are prone to develop in regions occupied by lymphatic glands—viz., in the neck, in front of the pinna, and in the inguinal region, but they could not say for certain whether the glands were involved. M. Launois and M. Bensaude have brought forward further evidence in favour of the view suggested by Professor Hayem, that the affection has its origin in disease of the lymphatic glands. To the objection that the growths form sometimes in regions where no lymphatic glands are supposed to exist they reply that glands have been described in such regions—for example, in the external aspect of the deltoid, on the internal surface of the forearm, on the thorax, and on the abdominal wall—by Sappey and Cloquet, and recent researches show (see the thesis of Petit) how numerous are the groups not described by the authorities. A more important argument than the situation is the presence in the growths of glands more or less voluminous. Again, lymphangitis and splenic enlargement have been found and also alterations in the number of leucocytes in the blood. Virchow has already stated that the lymphatic glands may be the starting-point of lipomatous formations. Analogous to the disease according to this view is the perirenal accumulation of fat which may occur with renal disease. But in speculating on the nature of the disease the writers, strange to say, do not refer to its etiology. In England the disease has been observed almost without exception in persons addicted to alcohol; and general obesity is a well-known effect of the same cause. Possibly the reason is that alcohol does not, or has not been observed to, play the same part in the French cases, for the habit is not mentioned in the very complete analytical table which accompanies the paper, whilst it is frequently referred to in the English cases.

THE CLINICAL SOCIETY'S COMMITTEE ON ANTITOXIN IN DIPHTHERIA.

IN its main results the investigation into the use of antitoxin in diphtheria undertaken by a committee of the Clinical Society of London harmonises with the experiences which have from time to time been published in different quarters. The summary report read by Dr. Church at the last meeting of the society does not enter into details, but gives in general terms conclusions which are eminently favourable to the value of the treatment. The committee would appear to have taken great pains to avoid fallacies and to have made a rigid selection of the reports furnished to them from various hospitals in order that erroneous inferences might be avoided. By comparison of the series of cases treated with antitoxin with another series not so treated it would seem that the use of the serum was marked by a reduction in the fatality of diphtheria from 29 6 per cent. to 19 5, a reduction most marked in patients under the age of five years. But perhaps the most striking evidence of the efficacy of antitoxin, particularly when it is early administered and in adequate amount, is to be found in the results of tracheotomy. It would seem that since its employment there has been a diminution of cases requiring tracheotomy and, what is more obvious, a very marked lessening of the mortality amongst those subjected to this operation. A fall in fatality-rate from 71 6 per cent. to 36 0 per cent. speaks volumes and by itself must carry conviction as to the powerful action exerted by antitoxin upon the local process. The committee inquired into the relative results accruing from variations in the period of the disease at which the injections were made, and also the comparative effects of different amounts injected at once but we must wait for the full text of the report before being able to give their experience in these particulars. It was stated, however, that no connexion could be discovered between the amount of antitoxin injected and the subsequent occurrence of paralysis. It is instructive to

[1] A Manual of Jail Hygiene for the Use of Medical Subordinates. By Surgeon-Captain W. J. Buchanan, I.M.S. Calcutta: Bengal Secretariat Press. 1898. Price Rs. 3.

learn that in very nearly one-third of the cases some form of rash, mostly erythematous, occasionally urticarial, supervened at periods varying in the majority of from six to twelve days after the injection. These rashes were accompanied by rise in temperature in about one-half of the cases and in a certain number by joint-pains. As regards suppression of urine no difference was observed in the liability to this grave event amongst those treated and those not treated by antitoxin. The general result of the inquiry is succinctly yet sufficiently stated to have been "that in the cases treated with antitoxin not only is the mortality notably lessened, but the duration of life in fatal cases is also prolonged," and it is added: "The injection of antitoxin may produce rashes, joint-pains and fever; with these exceptions no prejudical action has been observed in the series of cases investigated to follow even in cases in which a very large amount of antitoxic serum has been used." This deliverance, modest though it be, made after most careful scrutiny of clinical facts, should go far to establish the routine employment of antitoxin and encourage the hope that as time goes on its efficacy may, by improved methods, be even more strikingly exhibited. The thanks of the profession are due to the committee and especially to its chairman, Dr. W. S. Church, and its secretary, Dr. W. Pasteur, for the manner in which their important task has been accomplished and the clearness with which its conclusions are stated.

THE GLYCERINATED CALF LYMPH ESTABLISHMENT.

As the result of inquiries which we have instituted as to the progress made by the Medical Department of the Local Government Board in the matter of a supply of glycerinated calf lymph we find that no definite decision can be come to as to the date when this lymph will be issued until after the passing of the Vaccination Bill. In the meantime the laboratories taken over by the Government at the premises of the British Institute of Preventive Medicine are being rapidly fitted with all the necessary appliances, and it is expected that work will commence there in about a fortnight, under the direction of Dr. F. Blaxall of the Westminster Hospital School of Medicine, who has been appointed bacteriologist in connexion with the new laboratories. It is also stated that special arrangements have been made as to stabling for the calves which will be used and for the regular transmission of the lymph in bulk to the laboratories. It is also a matter of satisfaction to be able to record that on putting to the test, by the primary vaccination of a large number of infants, some samples of glycerinated calf lymph which had been prepared by Dr. Copeman and Dr. Blaxall and had subsequently been kept in stock for no less than nine months every single insertion resulted in typical vaccine vesicles.

ULCERS ON THE CONJUNCTIVÆ IN SECONDARY SYPHILIS.

As the virus is diffused through the whole system in secondary syphilis, theoretically a lesion might occur in any position; but as a fact, on those parts exposed to observation—the skin and certain mucous membranes—the lesions show a preference for some positions and occur but seldom on others. This difference, like all others of the kind which are found when the whole system is exposed to a virus or poison, depends no doubt on structural or functional differences of various parts. The secondary eruption of syphilis scarcely ever affects the conjunctivæ and we know of no instance in which ulcers like those described in the following case have been observed, but that they were true secondary lesions admits, we think, of no doubt. The case is described in the *International Medical Magazine of Philadelphia*, April, 1898, by Dr. C. A. Veasey, and is accompanied by an engraving. A man, aged twenty-eight years, acquired syphilis. In the seventh month he came under treatment with a papular eruption and mucous patches in the mouth. Each upper eyelid was markedly swollen and red and there was a thin muco-purulent discharge. On eversion there were found symmetrically situated on the external halves of the palpebral conjunctivæ two extensive, irregularly outlined phagedænic ulcers, with undermined edges and covered with greyish yellow sloughs. Protiodide of mercury was given and the ulcers were cleansed with a solution of formaldehyde and occasionally stimulated with nitrate of silver. At the end of two months they had entirely healed, leaving slight scars, and the skin eruption and mucous patches had disappeared. The symmetry of the ulcers, the associated lesions, and the result of treatment completely establish the diagnosis in this case. They may be very well compared with the analogous symmetrical ulceration of the tonsils which is so usually found in secondary syphilis.

BRITISH MEDICAL ASSOCIATION.

ON Tuesday evening last the President and Council of the Metropolitan Counties Branch of the Association gave a conversazione which by permission of the President and Council of the Royal College of Surgeons of England was held in the Museum and House of the College, Lincoln's Inn-fields. A very large gathering, including many ladies, assembled, the guests being received by Mr. Frederick Wallace and Dr. Robert Farquharson, M.P., respectively President and President-elect of the branch, in the Museum of the College. During the course of the evening the excellent band of the Royal Artillery played a selection of music in the Museum; the Folk-Song Quartet performed Folk and other music, received with much applause, in the Lecture Theatre; and Mr. Walter Churcher gave some humorous sketches which, to judge from the crowded state of the theatre, were greatly appreciated. Many well-known and distinguished members of the profession and guests were present, and the Metropolitan Counties Branch of the British Medical Association may be congratulated on the complete success of their pleasant entertainment.

PREVENTIVE HYGIENE IN FRANCE.

THE statement that in our own insulated country the opponents of sanitary notions are not as rare as Juvenal's black swans will probably not be gainsaid; but in the case of enlightened France, the land of Pasteur and progress, it is truly remarkable to find a man of education publicly disavowing all belief in the benefits of protective hygiene. When the Budget of the Agricultural Department was recently under consideration in the Chamber of Deputies the section devoted to epizootic diseases was discussed at great length, prominent among the speakers being M. Denis, member for the Landes, who demanded a supplementary credit of two millions (francs) in order to indemnify the owners of animals slaughtered *under the pretext* that they were tuberculous. According to M. Denis veterinary surgeons are inclined to see tuberculosis everywhere; but he confessed that the zeal of these honourable practitioners filled him with the gravest anxiety. "Doubtless," continued the honourable member, "statistics will be invoked to support them, but we protest against men of science who under the pretence of saving our lives render that life intolerable. I am aware that I am tilting against theories that are generally admitted; but in these latter days, as it seems to me, veterinary surgeons as well as medical men have become far too scientific. I should like to see the return of those good old times when, instead of

inventing diseases with jaw-breaking and barbarous names, doctors used simply to give their patients purgatives and gummy syrups. A great many highly scientific things have been said of *tuberculine* [*sic*]. Before this discovery our flocks and herds used to wander none the less joyously and actively o'er hill and vale, and I do not believe that tuberculosis ever caused the slightest uneasiness to our forefathers." "After an exhibition such as this," says a medical critic, "can anybody be surprised when deputies and even ministers call in quacks to treat themselves and their families? Poor humanity! Verily the opponents of progress are not always to be sought for in the ranks of ignorance." It is, of course, true that the apostles of sanitation have ever encountered depreciators. Just as Pasteur had his Pouchet, so Goiffon had his Pestalozzi, the amazing author of a scientific dissertation on Jonah in the whale's belly, who nevertheless wrote as follows to the Lyons physician: "You have gone quite far enough, sir; you have gone too far. Let us abstain from creating in our brilliant imaginations troops of flying insects which multiply themselves *ad infinitum*, whereof the generations never cease, which swarm in the air, in merchandise, even in the bodies of living creatures!" Goiffon's theory was correct, but as yet the world was not ready for it. In this connexion, however, it may be as well to recall the fact that the enemies of hygiene have not always been confined to the laity. The foolish utterances of Pestalozzi were well-nigh universally applauded by the various medical authorities of the day.

ADMISSION TO ISOLATION HOSPITALS.

A SOMEWHAT instructive discussion has taken place in the Urban District Council, Redditch, in reference to the mode of admitting patients into a temporary infectious hospital which a joint isolation hospital committee has determined to open. The question turned upon the right authority to decide on the admission of infectious cases. In such cases there are two questions to be decided. First, the diagnosis of the disease. This is obviously a question to be decided by the medical man in attendance on the case. With him rests the responsibility of notification which follows on diagnosis. The medical officer of health may be also the medical adviser of the patient. But in any case the act of diagnosis and the responsibility of notification rest with the medical attendant. In model districts there is such a friendly understanding between the medical profession and the medical officer of health that in any difficulty the medical officer is willing to help with his advice. But there is a second question not so easy as the first, how and by whom are patients to be admitted? This is a legal and social question. In some places they are admitted indiscriminately, the sole qualifications being that they are ratepayers or the children of ratepayers and are the subjects of notifiable infectious disease. But the Legislature, we think, originally in such legislation contemplated a certain preference of cases. It gave powers to the Local Government Board in regard to the Metropolitan Asylums Board Hospitals to make regulations on the subject, which it has been very slow, we admit, to make. According to the high view of some medical officers of health isolation is impossible in ordinary houses. But even in ordinary houses there is a difference. Some are more crowded, some more clean and well cared for, than others. There is a wonderful power in some families of carrying out the instructions of a medical man and managing and curtailing even infectious disease. Some families need isolation much, some scarcely at all. Some are numerous, others not so. We do not approve the notion that all have an equal claim on an infectious hospital supported by rates. It is erected for the public safety and those have a claim to it who cannot isolate at home. Where there is any difference in need the best persons to judge are the medical officer of health and his staff, who are in touch with the medical attendant.

MEETING OF FELLOWS OF THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

IT will be remembered that in consequence of the absence of a quorum at the January meeting of Fellows the Council decided in future to call only one meeting of the Fellows, in each year. It is therefore important that any Fellow, who has a matter to bring before the meeting of Fellows, should give notice of it to the Secretary of the College on or before Thursday, June 16th, otherwise it cannot be discussed until July, 1899. The meeting itself will be held on Thursday, July 7th, 1898, at 5 P.M., after the election of three members of the Council.

THE EPIDEMIOLOGICAL SOCIETY.

AT the annual meeting of this society, which was held recently at 11, Chandos-street, Cavendish-square, Professor Lane Notter, who has occupied the Presidential chair with so much credit to the society for the last two years, retired from office and was unanimously elected one of the Vice-Presidents. It is customary in this society to appoint in turn as President representatives from the several branches of medical and sanitary sciences, and it was decided in keeping with this rule and having regard to the fact that no representative of the central health authority had occupied the chair since Sir Richard Thorne that an effort should be made to obtain the services of Dr. Franklin Parsons of the Medical Department of the Local Government Board. This choice is, it appears to us, a very happy one, as Dr. Parsons is possessed of such encyclopædic knowledge in matters scientific that his assistance at the debates of the society cannot fail to be of very great value and we shall look forward with interest to his presidential address. We note, too, that at the same meeting it was resolved to confer upon Sir William Jenner the honorary membership of the society, the highest honour which the society has in its power to bestow. Sir William Jenner's historical researches in connexion with the differentiation of the continued fevers as well as in numerous other directions render him especially entitled to such honorary membership. It was arranged to hold the annual dinner of the society at the Grand Hotel, Trafalgar-square, on June 24th, and we hear that Sir Douglas Galton, Sir Walter Foster, the Director-General of the Army Medical Department, Dr. Klein, and many others are to be present.

URTICARIA OF MUCOUS MEMBRANES.

THE eruption of urticaria does not affect the skin only, but may extend to the mucous membranes. On some patients it can be observed; on others its existence is to be inferred from the symptoms. Affection of the stomach usually shows itself by vomiting, but in a few rare instances hæmatemesis has occurred. In the *British Journal of Dermatology*, May, 1898, Dr. T. H. Chittenden has published the following case. An unmarried woman, aged thirty-eight years, became subject to attacks of urticaria. They increased in severity; the tongue and lips became very swollen, there was sore-throat with dysphagia and dyspnœa lasting three or four hours, and the mucous membrane of the nose was much swollen and congested. These attacks usually lasted about a week. Later they were accompanied by nausea and by vomiting of large quantities of blood which was followed by relief and the disappearance of the rash. There appeared to be some relation between the catamenia and the hæmatemesis; the latter came on about the first day of the former. Menstruation for the most part was

regular but very profuse. No cause for the disease could be traced; there was no family history of gout, asthma, or hæmophilia, and the strictest rules of diet had no effect. In the Transactions of the Clinical Society of London, 1885, Dr. Pringle recorded an exactly similar case in a man; he concluded that the hæmatemesis was the result of capillary hæmorrhage from an urticarial gastric mucous membrane. In urticaria of the skin analogous hæmorrhage may take place into the wheals (urticaria hæmorrhagica). The mucous membrane of the bronchi may be affected and a typical attack of asthma may accompany the skin disease. Of this a marked example was published in THE LANCET of May 22nd, 1886, by Mr. T. Davies Pryce. Indeed, apart from such cases of concurrence, urticaria and asthma show many analogies. Idiosyncrasy plays the same prominent part in their causation. These facts lend support to the theory of the late Sir Andrew Clark that asthma is a neuro-vascular affection of the bronchial mucous membrane.

LEAD POISONING IN THE POTTERIES.

A TIMELY contribution on this subject has reached us in the form of a paper-covered book of some fifty pages by Dr. Prendergast, who has worked professionally in the Potteries for fifteen years. The perusal of this interesting addition to the literature of the subject convinces us that our attitude in regard to the question is correct. In THE LANCET of May 14th, 1898, we pointed out that the conditions under which the operatives in potteries worked and the effects of the operations concerned had been gone into thoroughly by a competent committee the members of which were appointed by Mr. Asquith in 1893. We are quite at a loss to understand why it is now proposed to appoint experts again to go over precisely the same ground. The nature of the danger is fully understood and the means of prevention are known with certainty, the suggested remedies being, we venture to think, practicable and interfering little with the technical achievements of the potter's art at the present time. Manufacturers have pronounced the possibility and practicability of using harmless glazes which contain lead, but in an innocuous or practically soluble condition. We allude to "fritted" lead—that is, lead fused with borax or silica. Dr. Prendergast also refers to the results of this inquiry and his contention is "that it is not necessary to exclude lead altogether from the ceramic industry, but that a small quantity of this material is essential to the manufacture of pottery; and finally that it will in a boracic frit resist decomposition when brought into contact with a weak hydrochloric or other acid found in the human system." We earnestly commend the following suggestion to the Home Secretary. Let the pottery manufacturers be compelled to take one of two courses insisted upon by the laws of the country. Why not compel them to mete out compensation for injury under the Workmen's Compensation Act, which will come into force next July, or allow them exemption from the Act *provided that they employ only "fritted" glazes?*

THE WEST LONDON HOSPITAL DINNER.

THE first dinner of past and present staff, residents, and post-graduates of this hospital was held at the Trocadero Restaurant on May 31st, when over 90 were present. Mr. Alfred Cooper was in the chair and in proposing the toast of "The West London Hospital" described the work which had been done there with reference to teaching. The post-graduate course, which had been established five years ago, was now developing into a post-graduate school and over 80 gentlemen from all parts of the world had attended the hospital practice as post-graduates. He also referred to the improved school accommodation which was shortly to be provided for post-graduates. He announced the establishment of a pathological laboratory, not only for specimens from the hospital, but to which practitioners in West London could send specimens for examination and report. He next referred to the origin of the West London Medico-Chirurgical Society, which held its meetings at the hospital, and mentioned the great success which this society had achieved; it now had 500 members and a journal of its own. Finally he referred to the Masonic lodge, the Cavendish, which had been founded in connexion with the hospital and with the society. Dr. Thorowgood briefly replied for the hospital. "The Health of the Past Residents and Post-graduates" was proposed by Mr. Keetley, who mentioned that the past residents had given two beds to the new wards which were now being furnished. Dr. Schacht replied for the past residents and Dr. Darley Hart of South Africa replied for the post-graduates, pointing out the necessity of having a hospital for post-graduates where no students were admitted and speaking in high terms of the post-graduate teaching. "The Visitors" was proposed by Mr. Swinford Edwards and responded to by Dr. Campbell Pope. Mr. Butlin, a former surgeon of the hospital, proposed the health of the Chairman, who in his reply gave the toast of "The Honorary Secretary of the Dinner" (Mr. L. A. Bidwell, who was also the dean of the post-graduate school). Mr. Bidwell in his reply said that the committee were extremely gratified with the result of the dinner and stated that they hoped to hold another dinner next year. For the benefit of those who were unable to be present he had arranged that a full account should appear in the *West London Medical Journal*.

KRYPTON.

AN additional discovery in regard to the composition of the air has been made in a London laboratory, but for a reason which does not appear the announcement was made in Paris by M. Berthelot on June 6th before the Academy of Sciences. It was communicated in a letter from Professor Ramsay of University College. It is interesting to wonder whether such a course was dictated by personal or political motives, but surely the investigations of pure science should be beyond such influences. Still, the departure not unreasonably suggests something of the kind. It is well known that Professor Ramsay has expressed doubt as to the achievements of Professor Dewar in connexion with the liquefying of hydrogen being the first of the kind, and before the Royal Society when Professor Dewar announced the liquefaction of hydrogen in practical quantity Professor Ramsay said that Professor Olszewski of Cracow had done the same thing some years ago. There appears, however, strong reason for doubting whether Professor Olszewski succeeded in doing anything like that which Professor Dewar has accomplished lately at the Royal Institution, and we learn that Professor Ramsay has now admitted as much. Professor Dewar has produced liquid hydrogen in sufficient quantity to enable certain constants to be made and one of the important conclusions he has recently arrived at is that the reaching of absolute zero is practically a physical impossibility, since even when employing liquid hydrogen for the purpose the lowest possible temperature attained is 20 or 30 degrees higher. Professor Dewar was the first to show the method of preparing and preserving liquid air in large quantities, and to this achievement Professor Ramsay most probably owes his quite recent discovery of yet another constituent of the air. That being so, the present should serve as an excellent opportunity for sinking all questions of priority. We would refer all scientific controversialists to the excellent words contained in a lecture by Dr. W. J. Smith Jerome published in our issue to-day. He

says, alluding to the paradise of toil, that there may enter into it "one insidious sin—the lust of what is called priority. ..... This must be fought against and overcome or else, like a gathering cloud, it will, if left unchecked, roll onwards and darken all. And why should it not be fought against and overcome? Each fact discovered in the pursuit of knowledge, discovered it matters not by whom or when, and even when unimportant in itself may prove a stepping stone by which that knowledge mounts to other and far higher things. This is the worker's real recompense; it is this pregnant possibility which makes work, honest work, like virtue, its own great reward." The newly-discovered gas Professor Ramsay proposes to call "krypton," from the fact that it has been concealed from observation until now. It occurs with the argon after separation from oxygen and nitrogen of the air by now well-known methods. How krypton is separable from argon is not yet announced. Krypton belongs to the helion group, its density is somewhat greater than that of oxygen and it appears to be simple in constitution and mon-atomic. It gives a characteristic green line in the spectrum. This discovery may be of marked importance in clearing up the apparently anomalous behaviour of argon and helion and the difficulty of finding a place for them in Mendelèeff's wonderful classification of the elements.

PLAGUE IN HONG-KONG: THE DEATHS OF TWO NURSING SISTERS.

THE deaths of two nursing sisters in Hong-Kong from plague contracted in the course of their hospital work are very sad events in themselves and are rendered additionally painful by the shortness of the interval between them. The first of these victims to duty was Miss Elizabeth Frances Higgin (Sister Frances). One of the plague patients in his delirium coughed in her face on April 20th, she became ill on April 25th, and it was soon found that she was suffering from pneumonic plague, the worst form of the disease. In spite of devoted care and attention on the part of the sisters and the principal medical officer she succumbed early on the morning of April 29th and was laid to rest in the Happy Valley Cemetery in a spot chosen by herself some months ago, the funeral being attended by a large concourse of friends and mourners of every grade of society. Sister Frances was a native of Carrick-on-Fergus and received her training at Guy's Hospital. Miss Emma Gertrude Ireland (Sister Gertrude), one of those who attended Sister Frances in her illness, complained of feeling unwell on the evening of May 2nd and was admitted to hospital early next morning, when the typical bacilli were found in her sputum. She died on May 5th and was buried the same day next to Sister Frances. Sister Gertrude was the daughter of Mr. Ireland of Salle Repham, Norfolk, and was trained at the London Hospital, where she held the posts of "night sister" and "Sister Blizard." Both of the late sisters went to Hong-Kong in 1890 and served all through the plague epidemic of 1894. Miss Macintosh (Sister Catherine) became ill on the same day as that on which Sister Gertrude was attacked and was found to have plague bacilli in her sputum, but the most recent information as to her condition is favourable. She suffered from plague in 1896 and was saved as if by a miracle.

THE NATIONAL SOCIETY FOR THE PREVENTION OF CRUELTY TO CHILDREN.

H.R.H. THE PRINCE OF WALES presided over the annual dinner of the supporters of the National Society for the Prevention of Cruelty to Children on June 8th and was able to repeat in an excellent little speech the satisfactory information conveyed by the report for the past year. The society has every reason to feel satisfied with its position. A doubt as to the wisdom of the methods employed by the society which had been suggested by certain members was, it will be remembered, effectually settled in the society's favour by Lord Herschell's Commission. This year's report affords unimpeachable evidence that the society enjoys the confidence of the public. The annual subscription list has so far recovered from the temporary check which it had sustained that it shows a total income of £27,560, as against £28,980 for 1896–97, and this, moreover, in spite of the expensive diversion caused by the Diamond Jubilee. There are certain points of interest in the report which ought not to be overlooked. One relates to the fact that the public already show a greater readiness in giving evidence where it is found necessary to prosecute in cases of cruelty. Another and most important feature in connexion with the society's work is its beneficial influence over many of the defaulting parents themselves. Cases have repeatedly been reported in which a parent actually imprisoned for cruelty has thus been enabled to learn the lesson of self-restraint and has returned home a welcome inmate because altered in conduct and character. It must, of course, happen sometimes that the interference of the society is resented. In this connexion it is only fair to recognise the fact that every means is used to avoid all practice which savours of officious meddling and to have recourse to a court of law only in the last extremity. Mr. Justice Hawkins recently had occasion, in an action for libel brought against the society, to commend an inquiry conducted by its managing director as "the humane, right, proper, most feeling, and most prudent course to adopt." At the same time he warmly commended the society's work and the manner in which it was carried on. Lord Herschell has expressed a similar opinion with equal confidence. It was announced at the close of the dinner that over £5000 had been subscribed, a donation of 100 guineas having been made by the Prince of Wales.

THE CONVERSAZIONE OF THE ROYAL SOCIETY.

THE rooms of the Royal Society at Burlington House are no longer equal to the demands of the interesting yearly exhibition of the results of scientific work. This is especially felt on the occasion of the second conversazione to which ladies are admitted. On Wednesday evening last it was difficult to move comfortably and get anything more than a cursory view of the experiments shown. Still more difficult was it to get a satisfactory explanation of the phenomena concerned. We should like to suggest that the exhibition should be continued for at least another evening. Quite nine-tenths of the exhibits shown at the previous conversazione, which were described in some detail in THE LANCET of May 14th, were shown again. We noticed, however, the following interesting additions. Professor Ramsay occupied a darkened corner with blackened apparatus in which it was evident something mysterious was going on. It was a demonstration of the spectrum of krypton, the properties of which are described in another column. Not far off was a new form of induction-coil devised by M. Wydts and M. Rochefort of Paris and shown by Messrs. W. Watson and Sons. The length of the spark was 8 in., although the secondary wire weighs less than 2 lb., the insulation being effected by means of a thickened oil. The Linden wave-motor boat in action attracted very general interest. In this device the propelling power of waves alone is utilised, the mechanism consisting simply of two elastic horizontal fins directed backwards and suspended below water line at both ends of the boat. An escape from the enemy, supposing this was its only means of propulsion, may be made by means of this boat by destroying the waves in its rear by allowing a stream of oil to escape. By the utilisation of wave motion alone the boats will attain a velocity of five kilometres an hour against both wind and

waves. The invention had its origin in observing the action of dolphins in swimming. Another striking [demonstation was the new automatic telephone exchange system which dispenses with the employment of operatives at the exchange to connect the wires from the transmitter to the receiver. In a word, by this most ingenious apparatus it is possible to "switch on" the person with whom communication is desired without ringing up the exchange. Needless to add there was a very large and distinguished company present, the exhibits in general being, in regard to number, variety, and interest, distinctly in advance of previous occasions.

THE British Balneological and Climatological Society held a conversazione on June 8th, at Limmer's Hotel, when Dr. G. Vivian Poore delivered an address on Circumstances which Influence the Effectiveness of Climatic Treatment. The President, Dr. W. V. Snow, presided. Dr. W. S. Hedley showed a new form of stereoscope for exhibiting x ray pictures in relief.

H.R.H. THE DUCHESS OF CONNAUGHT will open a bazaar in aid of the Hospital for Incurable and other Sick Children of the Poor, St. Leonard's-square, Shoreditch, on Tuesday, June 21st, at 12, Hyde Park-gardens.

THE RIGHT HON. A. J. BALFOUR will distribute the prizes to the successful students in the Medical School of Guy's Hospital on July 13th, at 3.30 P.M.

THE registered offices of the Medical Defence Union, Limited, have been removed from 20 and 21, King William-street, W.C., to 4, Trafalgar-square, Strand, W.C.

AN OBJECT-LESSON ON THE NECESSITY FOR THE EDUCATION, REGISTRATION, AND CONTROL OF MIDWIVES.

BY WILLIAM ALEXANDER, M.D. R.U.I., F.R.C.S. ENG.,
VISITING SURGEON, LIVERPOOL WORKHOUSE HOSPITAL, ETC.

ON Friday morning, May 20th, a poor woman was seen by me in the surgical wards of the Liverpool Workhouse Hospital who had been admitted during the previous night. She was very much collapsed; the pulse at the wrist was imperceptible; the heart-beat was rapid and feeble, with only one cardiac sound audible; and the abdomen was tender and somewhat tympanitic. She was vomiting and had the appearance of a patient with a fatal peritoneal inflammation. She said she "took ill" on Tuesday morning and had been actively delivered by a midwife on Wednesday morning, who told her she had had "a cross birth." The midwife had also given her "drugs three times to assist the labour." She died about an hour after my visit, being then too far gone even to stand the examination necessary to ascertain the condition of the pelvic organs. The case was reported to the city coroner, who made inquiries into the case but was very reluctant to hold an inquest on the ground that the midwife was a very respectable woman and had been very attentive to her patient. He, however, kindly allowed us a post-mortem examination provided an inquest were to be held or not according to the result of the necropsy. This offer we accepted and the necropsy was made by Dr. Moyles and Dr. Smith in my presence on Monday, May 23rd. We found a round, ragged opening through the upper part of the vagina on the right side, going down to the peritoneum, which was stripped off the uterus for some distance. The large cavity thus formed contained half a pint of broken-down blood-clot. The stripped-off peritoneum was black and gangrenous and the peritoneal cavity contained dark purulent fluid. The uterine cavity contained foul broken-down clots and pus. The other organs of the body were sound except some old-standing adhesions of the præcordium.

Dr. Moyles reported the results of our examination to the coroner, who even then was disinclined to hold an inquest on the ground that such ruptures were natural and might happen in the practice of any medical man. An inquest was, however, held and a verdict of "Accidental death" was returned, the midwife being not only exonerated from all blame but commended for "staying by" her patient to the end. She said the child had water on the brain, that this caused the tear, and that the drug she administered three times was opium, not ergot.

About fifteen years ago a woman was brought into my wards at the Liverpool Workhouse Hospital with a coil of intestine protruding from the vagina. She had miscarried a few days previously, but the placenta was retained. The midwife who was called in pulled upon the cord to detach the placenta; the cord broke, and she tried with her finger to enter the uterus and to remove the placenta, but entered Douglas's pouch instead, and made a hole in the upper zone of the vagina only a little nearer the median line than the aperture in the present case. I think this woman was cautioned by the coroner, but no punishment was awarded for exceeding her duty and no means were taken to prevent her from acting in the future as she had done in the past.

There is no doubt that the woman who died on May 20th last did not owe her death to accident, but to want of the most ordinary medical attention at birth. The woman who attended her lamentably failed in her duty as a midwife in going on with the case when she found the child had water on the brain. Any medical man could, and probably would, have saved the mother's life. The poor patient at last being somehow delivered, and bleeding internally from a ruptured vagina, is three times dosed with opium. Even then her life might have been saved had the condition been detected and the patient removed to a hospital at once. Some time on Wednesday afternoon an order for the district medical officer was obtained, and Dr. Maguire, who saw her, gave an urgent note for admission to hospital. She did not reach the hospital till late on Thursday night in a septic and dying state, too weak to be touched and beyond the power of stimulation to produce reaction. The four points in the case which strike a medical man as requiring elucidation and upon which no light was shed by the inquest are—(1) Why did the midwife persevere with the management of a case of hydrocephaloid fœtus? (2) the cause of the rupture of the vagina; (3) the principle of the administration of opium by the midwife; and (4) the cause of delay in removing this poor woman with a ruptured vagina to hospital so that the time had passed within which her life might have been saved before she arrived there.

These two clear cases and several other midwives' cases which have died at different times in the surgical wards of the workhouse hospital from "inflammation" have made me a strong advocate for the education, registration, and control of midwives. They require to be educated so that they can recognise an unnatural labour and can acutely perceive its difficulties and the dangers of delay and of unskilful interference either by force or by drugs. They must be registered somehow so that they may be known to be educated and trustworthy, and they must be controlled to prevent such unnecessary deaths as the two I have detailed and the others I have referred to. The coroner's court and jury are not fitted for such investigations. The verdict of manslaughter which looms up in such an inquiry makes coroners recoil from ascribing blame and the jurymen are more likely to be influenced by compassion for the living woman "who did her best to relieve" than to guard the interests of her whose life has ceased, no matter how prematurely. To control these women we require local authorities where experts and legal assessors would make an unbiased inquiry, often from the midwife's own story, whether she did what she ought to do as well as what she could. If any blame attached to the midwife after a careful and intelligent inquiry then let that blame be apportioned by advice, caution, reprimand, suspension, or other ways, so that a just and righteous punishment may be inflicted, or if she were cleared from blame she would be cleared in the eyes of all whose opinion is worth having. In the interests of the public as well as in their own interests medical men should endeavour to recommend to the State a method of registering and controlling and helping midwives. Examples in Liverpool in the workhouse lying-in wards and in the Ladies' Charity Maternity show how successfully poor women can be treated by midwives aided by medical men. Surely some arrangement could be come to by which

those who can pay for a midwife should be saved from the risks to which this poor woman succumbed. If midwives are registered without any such skilled control these two inquests show how powerless the ordinary courts of law are to sift the points of a midwifery case or to ascertain whether the midwife was skilful, careful, and wise, or the reverse.

THE MILITARY MEDICAL SERVICES OF CUBA.

(FROM A SPECIAL CORRESPONDENT.)

THE sanitary services of a field army have always been most difficult to organise. Those who remember the Crimean war will have a painful recollection of these difficulties, but will also realise that great progress in such organisation has been accomplished since those days. In Cuba the Spanish forces have had to face obstacles quite as great as those which partially overwhelmed the Allies in the Crimea. Dr. Angel de Larra Cerezo, chief of the clinic at the Cuban hospitals of Madera and Alfonso XIII., has ably explained this situation. Dr. de Larra Cerezo will be known to some English medical men as having presided over the military section of the International Congresses of Hygiene, held at London (1891) and at Budapest (1894). He is also a member of the British Sanitary Institute and of many other societies interested in the promotion of sanitary science. His opinion, therefore, on the condition of the military sanitary services in Cuba will be of interest especially at this moment. The plans, diagrams, explanations, and reports presented to me by Dr. de Larra Cerezo are carefully drawn up and I will attempt to summarise the information which was thus courteously placed at my disposal. Even in times of peace it was not found an easy matter to provide for the needs of an army which numbered only about 14,000 men, for a great number of the troops were soon invalided by the effects of the climate. Those, on the contrary—and they constituted the majority—who became acclimatised were placed in garrisons where they had but little fatigue to incur. Then suddenly, within the brief period of one year, 200,000 soldiers were sent to Cuba and within from one to two months of their arrival half these soldiers were invalided. Thus in the course of some twelve months need arose for hospital accommodation for about 100,000 men. Now before the outbreak of the insurrection, that is to say, at the commencement of the year 1895, there were hospitals only in the towns of Havana, Santiago de Cuba, Santa Clara, and Puerto Principe, and nine local regimental infirmaries established in distant places where the difficulties of communication were such that the sick could not be sent to the above-mentioned towns. The necessity of creating new hospitals soon became evident and this work was begun in March and April, 1895. At the commencement of the insurrection the military sanitary corps had throughout the island of Cuba only 2500 beds at its disposal. On Jan. 1st of the present year there were 45,685 beds ready to receive the sick and wounded. The largest hospitals are first that of Regla, which had 3600 beds in November, 1896, and now possesses 5000 beds. Then there are the hospitals of Alfonso XIII. and of Manzanillo, each with 3000 beds; those of Beneficencia, with 2100 beds; Santiago de Cuba and Sancti Spiritus, with 2000 beds each; Ciego de Avila, with 1700 beds; Cienfuegos and Sagua la Grande, with 1450 beds; Remedios, with 1400; Holguin, with 1300; Madera, with 1100; and Pinar del Rio, Matanzas, Santa Clara, Casild-Trinidad, Isabela de Sagua, Puerto Principe and Bayamo, each with 1000 beds. The other hospitals have less than 1000 beds.

During the last ten months of the year 1895, the whole of the ensuing year, and during the first three months of the year 1897, nearly half a million patients have been treated in these hospitals. The precise numbers were—from March to December, 1895, 49,485; from January to December, 1896, 232,714; and from January to June, 1897, 201,247. The number of deaths was 3200 in 1895. In 1896 there were 10,610 deaths and 3691 during the first quarter of 1897, making a total of 17,501. During the three periods mentioned, of the patients admitted 35,250 were suffering from yellow fever and of this number 11,347 died. These figures relate only to the military hospitals. Many more patients were treated in the civil hospitals, in camps, in towns and villages where there are no hospitals, in forts, in private houses, and sometimes in sugar refineries. Statistics have also been drawn up extending over eighteen years giving the number of soldiers who have been treated in the hospitals and infirmaries for yellow fever. The proportion of deaths varies considerably and is sometimes highest when there were but few cases. Thus in 1880 there were 1470 cases of yellow fever with a mortality equal to 37·85 per cent. In 1883 there were 1235 cases and a mortality of 45·34 per cent., and in 1885 only 120 cases with a mortality of 55 per cent. The next year, however, the mortality fell to 26·92 per cent. and yet there were only 130 cases. Indeed, since that date the proportionate mortality has never reached 40 per cent. The highest on record is that of 1895, with 7085 cases, of which 39·46 per cent. died. The previous year there had been only 859 cases (mortality 32·82 per cent.). The following year (1896), in spite of the tremendous strain on the hospital services, the mortality fell to 30·99 per cent., and this out of no less than 23,580 cases of yellow fever. During the first five months of 1897 there was a still greater improvement for out of 4636 cases only 27·20 per cent. died. As might well be expected yellow fever and other diseases have proved far more fatal than the bullets of the insurgents. The number of wounded nursed in the hospitals amounted to 11,902—1989 in 1895, 7270 in 1896, and 2643 in 1897. From March, 1895, when the insurrection began, to May, 1897, there died in the hospitals, from the effects of wounds and from all diseases, 22,497 soldiers.

What with the stress occasioned by the war and the enormous number of patients presenting themselves at the hospitals it has not been possible to keep very precise statistics as to the number of cases treated for malarial fever, dysentery, typhoid fever, tuberculosis, &c. It is known, however, that in the years 1896 and 1897 there were 79,552 cases of malarial fever of sufficiently severe a character to compel the sufferers to enter the hospitals. Many thousand other cases occurred among the troops who were too far away to be conveyed to a hospital. There is also a record showing that in the second quarter of 1896 there were 3193 cases of dysentery, of which 351 proved fatal, and 2903 cases of typhoid fever, resulting in 576 deaths, treated in the hospitals. In the first quarter of 1897 the cases of dysentery amounted to 4200 with 461 deaths, and of typhoid fever to 1374, resulting in 210 deaths. From July to December, 1896, and from January to June, 1897, there were 2281 cases of tuberculosis, followed by 299 deaths. These figures, though incomplete, give an approximate idea of the extent of the strain placed upon the hospitals and medical services of the island. The expense thus entailed, though estimated at a very low figure, represents for a poor country like Spain a ruinous outlay. Fortunately, a great part of the requirements for the Cuban hospitals were sent from the Government pharmaceutical laboratories and military sanitary service of Madrid and were thus supplied at a much cheaper rate than if they had been bought in the open market. 17 ambulance carriages were brought over the Atlantic from Madrid, 13 being of the Lohner type, which with some slight modifications was adopted for the Spanish army. Cases of surgical instruments were also sent over containing many of the newest and best models. The most serious operations were thus rendered possible and everything was provided for elaborate aseptic precautions. No less than 189,000 complete packages of dressings for wounds reached Cuba from Madrid; then over and above this supply each battalion brought with it the usual regimental medical supplies. From Spain 600 Pravaz syringes, 500 lancets, 850 forceps of the Fergusson, Péant, and Gollin models, 4500 sounds and bougies, 800 ordinary syringes, and 500 Davidson irrigators were sent over to Cuba. Then there were 1850 splints for fractures; 1410 elastic ferrules; 2500 bistouries, saws, &c.; a number of portable electric batteries, pulverisers, and amputation cases; all the instruments necessary for operations on the eye, ear, nose, mouth, and for lithotomy and tracheotomy; laryngoscopes, speculums, 1525 clinical thermometers, and many other objects—all sent over to Cuba by the central Government at Madrid.

The exports of pharmaceutical products were equally important. In this the pharmaceutical laboratory of the Spanish military sanitary services realised a great saving for the State. In respect to medicaments of course quinine holds the first place. No less than 11,887 kilogrammes of various

salts were sent out to Cuba, comprising 6400 kilogrammes of basic sulphate, 312 kilogrammes of bromide, 280 kilogrammes of valerianate, &c. Then there were 6950 kilogrammes of cinchona bark and 950 kilogrammes of extract. Salts of soda, potash and magnesia were also dispatched in great quantities—i.e., 63,200 kilogrammes of sulphate of soda, 85,100 kilogrammes of hypochlorite of lime, 15,000 kilogrammes of sulphate of magnesia, &c. The salts of bismuth were likewise in great demand; 4500 kilogrammes of sub-nitrate, &c. The need of sedatives was equally felt and 400 kilogrammes of opium together with 51 kilogrammes of salts of morphia were forwarded to Cuba. Among the antiseptics may be mentioned 28,900 kilogrammes of carbolic acid, 4450 kilogrammes of boric acid, 1400 kilogrammes of chloride of mercury, 560 kilogrammes of calomel, 300 kilogrammes of white precipitate, 200 kilogrammes of chloride of zinc, 2370 kilogrammes of iodoform, 680 kilogrammes of naphthol and naphthaline, 950 kilogrammes of salol, &c. Among miscellaneous articles there were 6300 kilogrammes of cod-liver oil, 2530 kilogrammes of castor oil, 1730 kilogrammes of camphor, 6220 kilogrammes of citric acid and 1950 kilogrammes of tartaric acid, 1126 kilogrammes of iodine and iodide of potassium, 800 kilogrammes of Fioraventi's balsam, 700 kilogrammes of antipyrin, 120 kilogrammes of caffeine, 1030 kilogrammes of chloroform, 270 kilogrammes of chloral hydrate, 110 kilogrammes of ergotin, 239 kilogrammes of pepsin and pancreatin, 720 kilogrammes of ipecacuanha, 350 kilogrammes of rhubarb, 910 kilogrammes of sulphuric ether, 225 kilogrammes of collodion, &c. No less than 571 kilogrammes of pills or granules were prepared and sent out. Judging from the weight this would mean about 25,000,000 granules, each being accurately prepared according to the prescription. Then 66 070 kilogrammes of carbolic absorbing cotton wool and 545,000 metres of sterilised gauze were also prepared for the use of the Cuban hospitals.

Apart from what was sent over from Spain and what was prepared by the military medical services in Cuba some purchases were made from druggists, &c., established in Cuba. These were not very extensive, as at war prices such objects were far too dear. The value of what was imported into Cuba from Spain for the use of the military hospitals from the commencement of the insurrection to the end of January, 1898, is estimated at 3,059,456 pesetas, and it has been calculated that if the same medicaments, &c., had been bought from the druggists and others of Cuba at the war prices the cost would have been 8,826,248 pesetas. Thus what is known as the Central Park of the Military Sanitary Service at Madrid, and the State institutions generally, have saved the Spanish nation, in the period mentioned, the sum of 5,766,792 pesetas. In this manner vast supplies were forthcoming at small cost and the quality and purity of the goods provided are stated to have been very strictly controlled.

The field and railway ambulances are described as having rendered valuable service. But the bad condition of the ground was a great obstacle. There are but few roads, and even roads which have been but recently made are soon overrun and obstructed by the exuberant vegetation of the country. The greatest efforts, therefore, were made to bring the sick and wounded to the railway lines, where the railway ambulance waggons greatly facilitated their conveyance to town hospitals. There were 30 such hospital railway waggons running at Havana, Santiago de Cuba, Matanzas, Santa Clara, Manzanillo, Sagua la Grande, Trinidad, and Cienfuegos. Some fine steamships of the Spanish Transatlantic Company were also converted into hospital ships so as to bring back the wounded and the sick to Spain. These ships generally contained four hospital wards of 96 berths each, with free space or air passage at the head and foot and on one side of every berth. These ships are painted white, so that any lack of cleanliness may be more readily seen and remedied. The furniture, folding tables, basins, &c., are of metal so as to be more readily cleaned. Apart from the four large wards or cabins these ships also contain four smaller compartments with in all 78 berths, which are reserved for purposes of isolation or for the more serious cases. The floors are kept as smooth and as free from obstacles as possible and fans worked by steam or electricity help to assure a good ventilation. A Geneste and Herscher disinfecting stove is placed on each hospital ship and porcelain and asbestos filters are employed for the drinking water. The pharmacy is situated in the middle of the ship so as to be of easy access and all that is necessary for operations, post-mortem examinations, &c., is provided. These hospital ships can accommodate some 500 patients.

The military hospital at Havana, named after Alphonso XIII., is one of the best in Cuba. It occupies nearly an entire kilometre of ground and is situated on an elevation rather more that a mile outside the town. It was opened at the end of the year 1895, when Marshal Martinez Campos was Governor-General of Cuba. There are fifty different clinics; these include twelve separate pavilions for infectious diseases, with kitchens, residence for staff, &c., attached and apart from the services of the rest of the hospital. The operating room is also in a separate building and furnished on aseptic principles. There are four wards set aside for officers, one of these wards being reserved for cases of yellow fever and another for the wounded. Then there is a separate building devoted to hydro-therapeutics, and there is a special building for the pharmaceutical department. A disinfecting stove is in constant work and a steam laundry close at hand, which enable the authorities to wash and disinfect all the clothing of the patients when they enter the hospital. Another large building contains a model steam kitchen, where the meals for some 3000 patients can be prepared and cooked daily. Many more separate buildings are occupied by the resident surgeons, the nursing staff, &c. Finally, there are six pavilions near at hand but separate from the hospital which serve as a sort of convalescent home or residence for invalids. All these buildings, which number close upon a hundred, drain into a system of sewers constructed especially for the hospital and there is an ample water-supply. This water is pumped into two metallic reservoirs situated on a hill behind the hospital. The steam power is used for this purpose and is also employed to provide the electric lighting of the buildings. Though the statistics of the number of patients in all the hospitals of Cuba have not been kept in full, the cases treated at the Alphonso XIII. hospital are carefully recorded. Thus in 1896 there were 36,202 patients. The greatest number of patients (4611) were entered in the month of October. The month of August with 4576 new patients, November with 3943, and July with 3740 patients were, with October, the four worst months of the year. The best months were February with 1343 new patients, January with 1525, and April with 1916 new patients. There were in the course of the year 1494 deaths and 32,420 patients were discharged as cured, the total number of patients being, as mentioned above, 36,202. The greatest number of deaths occurred in the months of August, October and November. Of the patients treated 21,731 were medical cases and 4154 were surgical cases. There were 2201 cases of venereal disease, 2381 wounded in war, 2202 cases of yellow fever, 1290 cases of cutaneous disease and 600 of infectious fevers other than yellow fever. The mortality is subdivided as follows: 710 deaths from yellow fever and 86 deaths from other fevers, 618 deaths among the general medical cases, 72 deaths from wounds and 8 resulting after surgical operations.

Though in 1897 there was a greater number of patients there was a reduction in the mortality. At the commencement of the year 2288 cases remained in the hospital. During the year 42,540 entries were made, giving a total of 44,828 patients treated in 1897. The worst months were: July, 4930; August, 4759; June, 4755; September, 4529; and October, 4239 entries. It was only during the months of February and March that the entries (1864 and 1831) were below 2000. In these same months there was the smallest number of deaths. The greatest number of deaths were in the months of December, November, October, and August respectively. In all, there were only 13 more deaths than during the previous year, though the hospital had received 8500 more patients, a fact due principally to a diminution of yellow fever. The 44,828 patients are grouped pathologically in the following manner: 34,002 internal diseases, 1480 cases of yellow fever, 1347 other infectious diseases, 3585 surgical cases, 952 wounded, 1846 skin diseases, 1074 venereal diseases, and 522 ophthalmic cases. Among these patients 1056 died from internal diseases, 327 from yellow fever, 68 from other infectious diseases, 37 from wounds, and 17 from surgical and syphilitic affections. Thus it will be seen that though there was a great reduction in the death-rate from yellow fever that of the general medical department had greatly increased. This is attributed to the lowered health of the army resulting from the bad climate and the hardships of the campaign. The deaths due to wounds were also

comparatively less; the great evil results from the anæmic condition of the troops, and though these figures relate to but one hospital still they may be accepted as typical of all the military medical services of the island. The staff of the Alphonso XIII. hospital consisted of 170 persons, including 27 surgeons. Nevertheless, on many occasions this staff proved insufficient for the work which had to be done and it was only accomplished by extra zeal and by trespassing on the hours set aside for rest. Altogether, and for the entire medical military services of Cuba from the commencement of the insurrection to the middle of the year 1897, no less than 600 surgeons have been engaged in attending to the sick and wounded. Of these 50 have died in the accomplishment of their duty, the greater number being victims of yellow fever. 6 dispensing chemists have likewise met with the same honourable fate. 25 surgeons were wounded on the field of battle and 4 were killed. There can be no doubt that the military medical staff showed under the most trying and dangerous circumstances all the courage and heroism which have so often distinguished the Spanish people in general and the medical profession in particular.

Madrid, May 31st.

THE IRISH LOCAL GOVERNMENT BILL.

IV.[1]

IN the last article those provisions of the Bill which bear specially on matters directly affecting the medical profession were examined. A few words will conclude the consideration of this department of the subject. Clause 120 runs as follows: "Every existing officer declared by this Act to be entitled to compensation, and every other existing officer, whether before mentioned in this Act or not, who by virtue of this Act, or anything done in pursuance of or in consequence of this Act, suffers any direct pecuniary loss by abolition of office or by diminution or loss of fees or salary, shall be entitled to have compensation paid him for such pecuniary loss by the county council, to whom the powers of the authority whose officer he was, are transferred under this Act, regard being had to the conditions on which his appointment was made, to the nature of his office or employment, to the duration of his service, to any additional emoluments which he acquires by virtue of this Act or of anything done in pursuance of or in consequence of this Act, and to the emoluments which he might have acquired if he had not refused to accept any office offered by any council or other body acting under this Act, and to all the circumstances of the case, and the compensation shall not exceed the amount which, under the Acts and rules relating to Her Majesty's Civil Service, is paid to a person on abolition of office." It is further enacted in Sub-section 4 of the same clause that: "If a claimant is aggrieved by the refusal of the county council to grant any compensation, or by the amount of compensation assessed, or if not less than one-third of the members of such council subscribe a protest against the amount of the compensation as being excessive, the claimant or any subscriber to such protest (as the case may be) may, within three months after the decision of the council, appeal to the Treasury, who shall consider the case and determine whether any compensation, and if so, what amount ought to be granted to the claimant, and such determination shall be final." Sub-section 7 of the same clause enacts that: "If a person receiving compensation in pursuance of this section is appointed to any office under the same or any other county council, or by virtue of this Act, or anything done in pursuance or in consequence of this Act, receives any increase of emoluments of the office held by him, he shall not, while receiving the emoluments of that office, receive any greater amount of his compensation, if any, than, with the emoluments of the said office, is equal to the emoluments for which compensation was granted to him, and if the emoluments of the office he holds are equal to or greater than the emoluments for which compensation was granted, his compensation shall be suspended while he holds such office." These provisions are evidently equitably designed, though it may be a question whether it is perfectly just to mulct an existing officer of a portion of his compensation in case he should refuse to act under the new county councils. The case of Ireland is peculiar in this respect, and those who know the country would not be surprised to find instances of officers at present in the employ of the grand juries who for various reasons, might decline to accept office under the new *régime*.

The Bill has now passed through Committee in the House of Commons and no amendments of substantial importance have been carried. The discussions have largely centred upon the financial arrangements, which have been sharply but unsuccessfully attacked by the English Radical party as involving improper concessions to the Irish landlords. It is significant that the official Opposition has not to any extent joined in these attacks and that the conduct of the Bill by Mr. Gerald Balfour and the Attorney-General for Ireland has received high encomiums from every quarter of the House. Mr. G. Balfour, though invariably courteous and patient, has not made any important concession, and it is evident that every detail of the Bill had been carefully thought out beforehand and that he has expressed his fully matured views. It is interesting to observe that while the proposal of Sir Thomas Lea to provide out of the local taxation account the salary of more than one trained nurse in every union was rejected the majority supporting the Chief Secretary in opposing the proposition was one of the smallest recorded for the Government in the course of these discussions. An effort was made to reject that sub-section of the Act which provides that where any part of the salary of an officer of a county council was paid out of money provided by Parliament or from the local taxation account, he should not be appointed or removed without the concurrence of the Local Government Board. This effort was unsuccessful, the general sense of the House being evidently in accord with the view of Mr. G. Balfour that this provision would tend to induce a better class of men to become candidates. An amendment moved by Sir Walter Foster to the effect that every resident medical superintendent of lunatic asylums should have served for not less than five years as a medical officer in an institution for the treatment of the insane was accepted by the Chief Secretary. This proposal is not only an important and reasonable one upon its merits, but it will tend in some measure to safeguard the interests of the present assistant medical officers in asylums, whose position under the Act will be somewhat insecure. A proposal that officers and servants after twenty years' work in an asylum should, if not less than fifty years of age, be entitled to an annuity amounting to two-thirds of their salaries was rejected. An important discussion of much interest to the members of the medical profession arose in connexion with a new clause dealing with county infirmaries and fever hospitals which was moved by the Chief Secretary. In moving the clause Mr. G. Balfour said that "it was feared by many that with the transference of the powers of grand juries to county councils county infirmaries would be left out in the cold, and that the subscriptions hitherto made to them by the grand juries would no longer be paid by the new bodies, and that consequently these institutions would come to grief. They provided against that by what was itself a somewhat strong provision—namely, that county councils should be compelled to subscribe to these county infirmaries as much as the grand juries had done in the past." In resisting an amendment which proposed to compel county councils to provide funds for the completion of any county infirmary which might be in course of erection at the time of the passing of the Act and for which adequate funds from private sources were not available, Mr. G. Balfour said that if this proposition were adopted private subscribers would not subscribe anything further and that he felt bound to resist this proposal, but that if he had an assurance that it would be acceptable to all sections of Irish representatives he would undertake to insert a sub-section providing that county infirmaries might, if they pleased, contribute money towards the erection or maintenance of private infirmaries. It is impossible not to recognise in these proposals a generous recognition on the part of the Government of the importance of the county infirmaries and the necessity of securing them against possible vicissitudes in the future. In further discussion of this subject Sir Walter Foster moved an amendment to the effect that "nothing in the Act should deprive any existing officer of any infirmary or hospital to which the section applied of any privileges, salaries, and allowances

[1] Nos. I., II., and III. were published in THE LANCET of May 14th and 21st and June 4th, 1898, respectively.

enjoyed by him under any Act. He pointed out that it was usual to pay surgeons a salary and then at stated periods to vote them an additional sum from the voluntary contributions which were received. He did not anticipate that there would be in the future any falling off in such receipts, but if there should be it would be an injustice to a most useful class of public officials if they were to be deprived of any part of their emoluments." Mr. Gerald Balfour resisted this proposal, remarking that the object of this amendment seemed to be to secure to the medical officers of infirmaries an absolute guarantee that their present salaries and allowances should be continued out of the rates in the event of what had hitherto been provided from charitable sources falling short of the requirements. Sir W. Foster's proposal was rejected and the clause ultimately passed in the form suggested by the Chief Secretary.

The Meath Hospital (Dublin) and the mode of electing officers which prevails at that institution came in for adverse comment in the discussion upon the new clause above referred to. Mr. Plunket moved an amendment providing that nothing in the Act should affect the mode of election of the physicians and surgeons of the Meath Hospital and County Dublin Infirmary. Sir Walter Foster condemned the system of coöption which prevails at this hospital, while Mr. J. H. Campbell defended it on the ground that the present arrangements arose out of an agreement made 100 years ago whereby the then staff surrendered a Government grant of £100 a year on condition that they should enjoy the privilege of coöption. This is surely a very extraordinary contention. Of all the modes of electing honorary medical officers to a hospital that by coöption seems absolutely the worst and most indefensible. Mr. Plunket's amendment was very properly rejected. A new clause moved by Mr. G. Balfour transferring to the council of every urban district excepted from Section 160 of the Public Health, 1878, the business of the board of guardians as burial board was added to the Bill. The Chief Secretary also moved a new clause for preserving the right to superannuation allowances of officers transferred to the new councils, and after some debate it was added to the Bill. A number of suggested new clauses were postponed to the report stage and the Bill finally passed through Committee without substantial modification. The changes which have been effected in the Committee stage are, on the whole, improvements, and some of the amendments, though apparently of minor importance, touch the medical profession somewhat closely. Mr. Gerald Balfour deserves much credit for intervening on behalf of the county infirmaries in Ireland and taking steps to secure them against loss of income in the future. These institutions are of great practical value and are, on the whole, ably and impartially administered. Whether the new elective bodies will be any less disposed to maintain these infirmaries in a state of efficiency than are the present grand juries remains to be seen, but apprehensions on this score were not unnatural, and the Chief Secretary has acted wisely in introducing the new clause which has been explained in the present article. It need not be resented by anyone, inasmuch as the present Bill in many other instances limits and defines the financial powers of the new county councils, and the clause will quiet fears which, whether justly or not, had been generally excited. Few things would be more regrettable than any impairment of the efficiency or limitation of the usefulness of the county infirmaries of Ireland. But, as alluded to in a previous article, their present constitution and government are anomalous and can hardly be permanent. Some better system must be devised and it should aim at attracting more voluntary financial support to these institutions.

Unless further changes are effected on the report stage of the Bill, it is not evident that the position of dispensary medical officers in Ireland will be improved under the new *régime*. That some improvement is desirable, even indispensable, may be freely admitted, but it is a question whether the remedy for existing evils is to be sought by Act of Parliament, or by influencing the new elective bodies or by better organisation among the members of the medical profession. Mr. Robert Gray of Armagh, President of the North of Ireland Branch of the British Medical Association, in his presidential address recently delivered before that body remarked:— "Let us consider what has been accomplished for the Poor-law medical service during the past fifty years. Are the men in it better or worse than those holding office then? No doubt some slight improvements have been effected and benefits have been obtained by the energy of the Irish Medical Association. This association has been in existence for about sixty years. It was established to protect and advance the interests of the medical profession in Ireland. ..... Permit me to enumerate some of the results of its work. The association, by a Bill drawn by itself, doubled the vaccination fees; by its agitation it caused the certification of lunatics, which had been previously gratuitous, to be paid for at the rate of £2 per examination; by pressure it secured that the Poor-law medical officers of Ireland should be the agency for working the public health system and should be paid for the work, and by further agitation secured payment for the additional work of attending at sanitary prosecutions; by its efforts it induced the authorities to double the fee for attending the constabulary and it secured for Poor-law medical officers the pensions which they enjoy and which were denied them by earlier legislation; and it is still most earnestly and untiringly engaged in the effort to overcome the objections of a section of Parliament to make these pensions a matter of right, upon which object it has lavished time, thought, and money. ..... Look at the salary paid to a medical officer of a dispensary. He is somewhat like his *confrère* the physician to a hospital—i.e., he practically works for nothing. The salary of the dispensary officer over Ireland averages about £120 a year. For that sum he attends all the sick poor in his district. You are aware that his work is spread over a district perhaps of thirty miles, some districts larger, very few smaller. He requires two horses and a man to attend them (a calculation is given showing that the expense of maintaining these will practically eat up the entire salary). ..... In the intervals between his attendance at the dispensary and visiting the sick poor at their own homes, the medical officer may be content if he can earn enough to feed and clothe himself. I need not tell you that in numbers of districts there are not enough wealthy or paying patients to afford this. In many cases life is not worth living in such places. Why should such a state of things exist? It is simply because if one of these dispensaries becomes vacant dozens are fighting and canvassing and bringing every particle of influence to get pushed into it." This is a somewhat gloomy picture, but there is no reason to think that it is exaggerated. Mr. Gray evidently puts his finger upon the weak spot when he shows that the evils of the present system are chiefly due to the willingness of medical men to accept onerous and ill-paid posts. The remedy lies with the medical profession itself and the complete success which has attended recent efforts to improve the status of medical men in the army should be laid to heart by the Poor-law medical officers in Ireland. They should warn off intending candidates until the conditions of the service are made more tolerable. Many changes will be required, but at present the most urgent question is to secure adequate pensions on completion of a certain period of service and to provide that these pensions shall not, as at present, depend upon the caprice or goodwill of any elective body, but shall be granted strictly according to rule, as in the civil service.

The Irish Local Government Bill will no doubt easily pass through the House of Lords and become law. In less than a year Ireland will in all probability be trying this new and great experiment in the matter of local self-government. That some temporary confusion and disappointment may arise is not improbable, but the ultimate result can hardly fail to be salutary. Much will depend upon the spirit in which the new legislation is received. It is earnestly to be hoped that the Irish gentry will not stand aloof, but that they will accept their altered position and endeavour to exert under new conditions that influence in the country to which their wealth, talents, and experience fully entitle them. They have in the past produced some of the greatest administrators of many of the most important portions of the British Empire. India, Canada, Australia, and the Cape have repeatedly benefited by the energy and capacity of governors and administrators drawn from the ranks of the Irish gentry. Their fortunes in their own country have been much less brilliant and the causes of their failure there might be enumerated if this were the place to do so. But why should not a new day dawn for Ireland and the Irish gentry? Democratic conditions of Government must now be accepted as a matter of course, but rank, energy, wealth and experience must always

command their due meed of influence and authority. At present the omens are favourable. Everything will depend upon the spirit in which the present legislation is accepted and carried into effect. When Pope wrote the well known lines:

> For forms of government let fools contest;
> Whate'er is best administered is best,

he expressed only a half truth, but it is a half truth which finds a special application in the circumstances of the present legislation affecting local government in Ireland.

THE MEDICAL, SURGICAL, AND HYGIENIC EXHIBITION.

As we announced last week it has been decided to hold an exhibition of medical, surgical, and hygienic appliances in London every year which should afford the busy practitioner in the metropolis and its environments a convenient opportunity of inspecting new appliances, new foods, new drugs, and other novelties and improvements of interest to the profession. The exhibition, of course, has its commercial side, but discretion is evidently exercised in this important particular, and the exhibits which are allotted a space are in general of a selected character having a direct bearing on the progress of medical science in some way or other. The visitors to the exhibition which was held in the Queen's Hall, Langham-place, May 31st to June 3rd, comprising chiefly medical men, hospital nurses and ambulance officers, could not have failed to have had their interest aroused and their inquiry rewarded by even a cursory glance of the many and varied exhibits exposed to view. We may therefore, as briefly as possible, give an outline of those exhibits which we consider are well worth bringing before the notice of our readers. For this purpose the exhibition may be conveniently divided into six sections—namely, drugs, foods and food products, surgical appliances, sanitary appliances, mineral and medicinal waters and beverages, and miscellaneous objects.

In regard to drugs, Messrs. Parke, Davis, and Co., of 21, North Audley-street, W., displayed a great variety, a feature of their exhibit being their standardised fluid extracts which represent therapeutically in the proportion of cubic centimetre for gramme the drugs from which they are prepared. The preparations are also carefully assayed chemically, and, where this is not possible, physiologically. The preparations shown included the digestive ferments, amongst the most remarkable of which is taka-diastase, which will convert at least, as we ourselves have shown, 100 times its weight of starch. Then there was a list of articles described as chemists' specialities and physicians' requisites, amongst which may be noticed euthymol, an agreeable liquid antiseptic which is described as not being poisonous, irritant, or escharotic; ferratin, a chemical combination of iron and albumin and identical with the form of iron occurring naturally in many foods; and, lastly, lactophenin, an antipyretic, antineuralgic, and analgesic, upon which we have already reported. Messrs. Oppenheimer, Son, and Co. (Victoria House, Thames Embankment) again brought their palatinoids forward, the latest application of this ingenious and satisfactory form of administration being devoted to the animal substances. The exhibit also included palatinoids of liquids such as amyl nitrite, chlorodyne, beechwood creasote, and British Pharmacopœia tinctures. Illustrations of the value of the administration of unstable mixtures by means of the bi-palatinoid occurred in the compound syrups and in the combination of ferrous carbonate with red marrow. The feature of Messrs. Cooper and Co.'s (80, Gloucester-road, South Kensington) exhibit was the flexible, tasteless, and readily soluble wafer capsules known as "cachoids." This satisfactory means of administering nauseous and insoluble powders may be applied to almost any drug. Among the preparations which we noticed were those containing quinine, antipyrin, sulphonal, phenacetin, and bismuth. A combination of interest and value was the liquor quininæ salicylatis, which is more readily absorbed in this form than in powder or pill. Mr. B. Kühn, 36, St. Mary-at-Hill, E.C., exhibited some new preparations of interest. Of these we may select the colchi-sal capsules, containing a compound of chemically pure colchicine dissolved in natural methyl salicylate. For external application betul-ol (methyl oleo-salicylate) is recommended. The excellent antiseptic chinosol in several forms was shown and there is little doubt of the powerful nature of this remarkable disinfectant, which so long as it is used in the form of a solution of prescribed strength presents no drawbacks. The exhibit included also ethyl-chloride and tannalbin, an intestinal astringent, diuretin, and ferropyrin, a combination of antipyrin with perchloride of iron which is a useful hæmostatic and styptic. Chloroform was, of course, the chief subject of Messrs. Macfarlan and Co.'s (9 and 11, Moor-lane, E.C.) exhibit. Their chloroform was introduced in 1892 and was amongst the first having any claim to purity for medicinal purposes. In the same exhibit were shown sulphur cones, which are convenient for use as a means of disinfection. Messrs. Lewis and Burrows, of 67, Piccadilly, occupied a stall upon which could be seen distinct evidence of the advance of pharmaceutical art. Their exhibit included "cremol," an emulsion of cod-liver oil with the hypophosphites of lime and soda; the preparation is stable and as free as can be from the taste of cod-liver oil. Quite up to date were the pharmaceutical novelties shown by Messrs. Southall Brothers and Barclay of Birmingham. These included the preparations of the new British Parmacopœia and some well-arranged collections of materia medica for colleges and students. The somewhat complex compounds as exemplified in the liquor auri brom-arsenatis and the liquor auri brom-hydrarg. arsenatis were again exhibited by Messrs. Arthur and Co., of 69, Berners-street, W. These preparations have been used with encouraging results in the treatment of nervous diseases and especially in epilepsy and in the morphia habit. The preparations shown included also a neutral combination of lime and iron, which is non-astringent and practically tasteless, and tannopumilio, a combination of digallic acid with the essential oil of pinus pumilionis, and is said to be a good external remedy for irritation of the skin set up by friction or sunburn. Not far away were the specialities of Messrs. S. Kutnow and Co., of 41, Farringdon-road, E.C. Amongst these were the improved effervescent Carlsbad powder, an anti-asthmatic powder, and cigarettes with the same purpose in view as the last.

Unquestionably the major portion of the exhibition was devoted to foods and food products, humanised milk and sterilised milk being particularly in evidence. The exhibit of Messrs. Welford and Sons, of Elgin-avenue, Maida-vale, W., showed considerable enterprise. The preparations included asses' milk, facsimile human milk, peptonised milk, sterilised milk, koumiss, and milk specially prepared in accordance with medical prescription. In the same way the Aylesbury Dairy Company exhibit afforded similar evidence of the care and precision now devoted to the preparation of milk products. The exhibit, also, of the Milk Preparations Company of Brentwood conveyed an assurance to the medical visitors of the excellence of their several preparations, including humanised, peptonised, and sterilised milk, butter, malted food, and milk-sugar. They are all known as the "Sap" brand. Close by was an exhibit devoted to the products of the Excel British and Colonial Milk Sterilising Co., of 23, Queen Victoria-street. Human milk prepared by Gaertner's process, which was fully described in THE LANCET of July 3rd, 1897, formed the subject of exhibition by the Friern Manor Dairy Farm Co. of 20, Farringdon-street, E.C. As still illustrating the remarkable advances now made in the preparation of milk products we should mention also the Milkmaid brand condensed milk of the Anglo-Swiss Milk Co., of 10, Mark-lane, who have been very energetic in laying stress upon the full amount of cream being retained. Then there were the samples of unsweetened condensed milk shown by the First Swiss Alpine Milk Exporting Co. of 3, Laurence Pountney-hill, E.C. An excellent example of a milk-derived food was shown in the food prepared by Mr. Henri Nestlé, 48, Cannon-street, E.C., which presents a composition which is completely in accordance with infantile requirements. At the same stall were shown condensed Swiss milk, containing a maximum proportion of cream, and Viking milk, also a condensed milk but without sugar. Next we noticed a preparation which has deservedly been held in good favour—namely, Horlick's malted milk, which consists of a dry powder containing all the elements of milk in a malted form. Its excellent flavour is not the least satisfactory feature. Malt preparations

were well represented; thus there was the original malt extract of Messrs. Leopold Hoff of 29, New Bridge-street, E.C., and the many excellent maltine preparations of the Maltine Manufacturing Company, Ltd. These latter include maltine with pepsin and pancreatin, maltine with the hypophosphites, maltine with Easton's syrup, maltine with the phosphates, and maltine with coca wine. There were many carbohydrate foods exhibited which had been partially converted by the digestive action of diastase. Amongst these may be mentioned the food for infants and invalids prepared by Mellin's Food Company, Ltd., Stafford-street, Peckham, S.E. This firm also prepare "lactoglycose," a combination of the above food with fresh cow's milk, thus comprising a highly nutritious preparation. Again, Beane's Food is described as "diastased farina" and contains a large proportion of dextrine and maltose. It possesses a rich malty flavour, and is unquestionably a readily assimilated preparation. Under the carbohydrate category must be included also the Hovis flour and bread of the Hovis Bread Flour Company, Ltd., 27, Millbank-street, Westminster, S.W. As is well known, Hovis flour contains the germ of wheat and is very nutritive, pleasantly malty to the taste, and the bread made with it keeps agreeably moist. On the other hand, starchless foods were represented in the exhibits of Messrs. Callard and Company, of 65, Regent-street, the specialities shown being food for the diabetic, food for reducing weight, food for the rheumatic and gouty, and food for indigestion. A large assortment of diabetic foods was also shown by Messrs. G. Van Abbot and Sons, of 6, Duke-street Mansions, Grosvenor-square, W. In addition to these there were also submitted specimens of mock and real turtle soups, beef tea, meat lozenges, hypophosphite of lime biscuits, digestive biscuits and their well-known nutritive biscuits containing 20 per cent. Mosquera beef meal. The food products connected with the name of Mosquera were represented by Messrs. Parke, Davis, and Co., the preparations including beef jelly, beef cacao, nutrient suppositories and beef meal. The latter is a predigested meat powder containing in entirety the nourishing and stimulating constituents of beef in a concentrated form. There were several preparations of beef shown, and the exhibit of the Bovril Co., of 30, Farringdon-street, E.C., contained a very large assortment. Besides bovril itself a special invalid bovril was offered for inspection and trial. Then there were the emergency cartridges for military and naval purposes, for expeditions, &c., and bovril "stamnoids," consisting of a specially concentrated meat lozenge, very serviceable for travellers, cyclists, and others. On this stall also were the Liquor Carnis preparations now in the hands of the Bovril company. Another fluid beef which has found favour of late is the Vimbos fluid beef, the feature in which is said to be a high percentage of albuminous matter. This company (130, Queen Victoria-street, E.C.) also prepare some excellent lozenges which are free from gelatin and contain muscular fibre. Portable meat preparations were also represented on the stall of Messrs. Cosenza and Co., of 94, Wigmore-street, W., who devoted the exhibit exclusively to Maggi's Consommé, which is a cartridge containing all the materials for the preparation of an excellent soup. A very convenient method of preparing beef-tea for soup was shown by the Valentine Extract Company of St. George's House, Eastcheap, E.C. The preparations shown consisted of "valtine" meat globules, beef-tea or soup globules known as "peloids," and globules for swallowing whole. A novelty in the preparation of meat lozenges was shown by the Marvine Syndicate, Ltd., of 45, Wilson-street, E.C., in their "geloids," which by their fruit contents serve as thirst-quenchers in addition to being nutritive. The largest known beef extract, Liebig's Extract of Beef, of 9, Fenchurch-avenue, was adequately represented at the stall of the company. In addition to the ordinary extract peptarnis was shown, which, as our own analyses have demonstrated, is a powerful nutrient and stimulant containing the peptones of beef in addition to extractives. The visitors were interested in making practical trials of "Vejos" (Vejos, Ltd, 143, West Hamlane, E), which, though a pure vegetable extract, presents an appearance and taste very closely resembling meat extract, while it possesses similar dietetic properties. Both digestive and digested products were well illustrated in the exhibit of Fairchild Brothers and Foster of Snow-hill, E.C. Besides the "zymines" there were shown the interesting preparation "panopepton," a liquid preparation containing the digested products of beef and wheat flour; "pepsencia," a liquid containing the organic ingredients of the gastric juice extracted directly from the peptic glands of the stomach; and lastly, peptogenic milk powder, which affords one of the best methods for extemporising milk as closely as possible on the lines of composition of human milk. Messrs. Broomfield and Co., of 83, Upper Thames-street, employ an excellent method for especially refining vegetable fat, the product termed "albene" being well adapted for cooking purposes. It does not become rancid and offers many advantages as an adjunct in cooking over butter or other animal fats. A well-designed exhibit was that of Messrs. Scott and Bowne, of 95 and 98, Great Saffron-hill, E.C. Their cod-liver oil emulsion has been so recently reported upon in our analytical columns as to need no further comment.

Apparatus, instruments, and appliances formed not the least interesting part of the exhibition, particularly to medical men. Practically all the leading makers of surgical appliances were represented. Amongst these should be mentioned the comprehensive displays by Messrs. Mayer and Meltzer, of 71, Great Portland-street, W.; Messrs. John Weiss and Son, of 287, Oxford-street, W.; Messrs. Evans and Wormull, of 31, Stamford-street, E.C.; Messrs. Maw, Son, and Thompson, of 7 to 12, Aldersgate-street, E.C.; and Messrs. Down Brothers, of St. Thomas's-street, Borough, S.E. Manifold hospital and other appliances were shown by Mr. Blass, of 155, Camden-road, N.W., who showed an improved machine for moving sick beds; the Domen Belt Co., of 456, Strand, had on view their excellent series of abdominal supports, belts and corsets; Messrs. Anderson, Anderson and Anderson, of 37, Queen Victoria-street, E.C., had a wide assortment of rubber appliances, including water-beds, cushions, pillows, waterproof mattresses, and elastic hosiery; Mr. Stacey, of 4, Newgate-street, E.C., showed some serviceable apparatus for the use of nurses; Messrs. Salmon Ody and Co., of 292, Strand, W.C., devoted their space to the exhibition of trusses, artificial limbs, &c.; Messrs. Bailey and Son, of 38, Oxford-street, W., also exhibited some admirable nursing appliances as well as aseptic instruments, ward tables, water beds, &c.; Mr. Frank A. Rogers, of 327, Oxford-street, W., exhibited medical sprays, inhalers and douches, the exhibit including also the "hypodermules," consisting of small sealed glass flasks containing accurately measured doses of sterilised solutions for instant hypodermic injection; Messrs. Macfarlane showed Listerian surgical dressings and catgut ligatures and silk sutures. The jacketed vessels shown by Messrs. W. A. S. Benson and Co. are worthy of more than passing notice. These vessels are made of copper with an inner body or liner, separated from the outer body or jacket by insulating material, so that heat passes very slowly from or to the contents. Thus, boiling water in the No. 1 size took one hour to cool to 185° F.; that is, it was still hot enough to cook eggs or to make tea. After five hours the water was still as hot as is comfortable to the hand, while the outer case never becomes more than gently warm. The two-gallon size maintains its contents warm for some twelve hours, so that a supply of hot water can be kept in the bedroom from morning till evening or through the night. Mr. Louis P. Casélla, of 147, Holborn-bars, E.C., presented an admirable display of clinical instruments, and the exhibit included a specially devised portable anemometer and his well-known standard meteorological set of instruments. Lastly, Messrs. Watson and Sons of 313, High Holborn showed all the apparatus with their own improvements now requisite in the application of the x rays to medicine and surgery.

The sanitary section of the exhibition consisted mainly of various disinfectant preparations. Amongst these should be mentioned the sulphur dioxide preparations of Messrs. A. Boake Roberts and Co., of Stratford, E. In addition was a new fluid preparation called "lozar," which is remarkable (carbolic acid being the basis) in being miscible with water in any proportion. The Sanitas Co.'s exhibit was very extensive, and included the great number of useful and pleasant sanitary preparations now contained in their list. The merits of izal have already been described in our columns, since which time the number of preparations has been largely extended, as in izal lint, wool, gauze, lozenges, and ointment. The exhibit was undertaken by Messrs. Newton, Chambers, and Co., of 331, Gray's-inn-road. Ventilation was represented in the Blackman Fan combined with an electric motor shown by the Blackman

Ventilating Co., 63, Fore-street, E.C. Ronuk was exhibited by Ronuk, Ltd., of 83, Upper Thames-street, E.C., as an example of a sanitary polish for the floors of hospital wards. Messrs. D. Blair and Co. demonstrated the usefulness of the "Instra" warmers, which may be used in the pocket or as chest-warmers or foot-warmers. The only novelty shown in soap was the ovaline soap of the Ovaline Soap Company, Ltd., of 203, High Holborn. It is said to be advantageous to the hair on account of being prepared with yelk of egg, while it is free from irritating properties. The Fleming Oil and Chemical Co., Ltd., of 101, Leadenhall-street, E.C., exhibited a useful list of moth preventive substances besides several disinfectants and toilet soaps. The Jeyes Sanitary Compounds Co., of 64, Cannon-street, found an excellent assortment of their well-known disinfectant preparations to form an attractive exhibit. Lastly, the application of asbestos to garments for protection against fire was illustrated by Messrs. Zimmer and Co., of 82, Mark-lane. The exhibit included also admirably designed workmen's health-protecting and safety appliances, such as safety spectacles and various patterns of respirators of use in dangerous trades. Some toilet preparations, generally of a pleasant character, like rose-water, hair-wash, and emollient skin applications, were placed on view by the Anti-Fermentine Co., Ltd., of 16, Bedford-street, Covent-garden, W.C.

Natural and artificial mineral waters were represented by most of the well-known aerated water makers and several natural purgative waters (Condal, Hunyadi Janos, &c.) decorated the stalls of well-known agents. Suffice it to describe two exhibits which attracted considerable interest. The first (shown by Aerators, Ltd., of Broad-street-avenue, E.C.) consisted of a method by which soda-water or any liquid aerated with carbonic acid gas can be easily prepared. A specially constructed bottle protected with gauze is fitted with a hollow stopper which serves as a container for a little bomb, or "sparklet," as it is called, containing carbonic acid gas. On screwing the stopper into position the sparklet is pierced by a hard steel point, the bottle is reversed and the liquid within thus aerated. The apparatus may be used for the aeration of milk without diluting it. It should prove useful also for travellers or on any occasion where the extemporaneous preparation of an aerated beverage is desired. The bottle costs 3s. and the sparklets 1s. 6d. per dozen. Tablets are also prepared containing definite amounts of various ingredients, such as carbonate of soda, lithia, &c., to imitate mineral waters. The other distinctly novel exhibit was that shown by Messrs. Cooper and Co., of 80, Gloucester-road, S.W. We refer to the oxycarbonated mineral waters—i.e., waters charged with oxygen as well as carbonic acid gas. The water used is distilled, and on examination both bacteriologically and chemically by Sir E. Frankland proved trustworthy.

Several spaces were fitted up as bookstalls, the publishers so represented being the Rebman Publishing Co., of 11, Adam-street, Strand; Messrs. John Bale, Sons, and Danielson, of 85, 87, and 89, Great Tichfield-street, Oxford-street, W. (this exhibit including medical diagrams and charts); and The Scientific Press, Ltd., of 28 and 29, Southampton-street, Strand.

The preparation of pure yeasts in the treatment of disease was illustrated in the "Backèrine" Laboratory under the direction of Mr. Horace Manders and M. E. Lachenaud. The fact that yeast cells have the property of assimilating microbes or "inglobing" them has suggested the injection of yeast in lupus and pulmonary phthisis. It is said that these pathological conditions have improved remarkably under injections of yeast. It is even suggested to use yeasts as a source of antitoxin by nourishing them with the specific pathogenic micro-organisms. It may thus be that the ferments may be substituted for animals as a source of immunising material.

At the conclusion of the exhibition the Executive Committee of the Medical, Surgical, and Hygienic Exhibitors Association presented Mr. Fred. Weiss, the President, with a beautiful silver bowl; Mr. F. J. Rebman, the honorary treasurer, with a solid silver tea-set and a case containing solid silver salt-cellars, pepper-boxes, and mustard-pot; and Mr. H. Blau, the honorary secretary, with a handsome cheque for the arduous services which each and all had rendered in the formation of the exhibition, which proved most successful from every point of view.

THE ROYAL MILITARY TOURNAMENT.

THE Royal Military Tournament closed on June 4th, after what we think will have been one of the most successful seasons since the inception of the tournament nineteen years ago. Year by year this annual military display has increased until it has outgrown the limits of its cradle. On several occasions we have pointed this out, but for some reason, probably a sentimental one, the committee still cling to the original home of the tournament in Upper-street, Islington. That there should be a reluctance to remove the tournament from the scene of its past successes we can quite understand, but is there not a debt owing to the public who, after all, have made the tournament a success? Besides, a larger building might be made to render larger profits, and the military charities which receive the proceeds of the tournament would be the gainers. We have no doubt that the authorities in charge of the tournament have done all that lies in their power to render the building as sanitary and as convenient for the public and the troops as they can, but without entirely reconstructing the building it would be absolutely impossible to make it both sanitary and safe for the public and for the troops. For a detailed account of many of the imperfections of the building from this point of view we must refer our readers to the articles which we have published in past years, but there is one point to which we should like to call attention and which if not remedied will sooner or later be the cause of a serious catastrophe. As those of our readers who have visited the tournament know, the arena in which the performances and contests take place is surrounded by tiers of seats beneath which is the space allotted to those of the general public who can only afford the popular shilling. Around the arena outside these seats and the space allotted to the "shilling" portion of the public stalls are fitted up for horses and only a narrow gangway is left for the performers to congregate with their heavy guns, horses, or both, immediately preceding their entrance to the arena. What if a panic should take place among the public from any cause? That such a thing might take place when least expected the history of panics in public buildings conclusively shows. We have suggested that Olympia could become the home of the tournament, but if there are objections to this place other sites in London might be rented for the purpose—for instance, the Alexandra Palace, the Crystal Palace, or Wembley Park. But whether or not any of these places are suitable one thing is certainly clear, and that is that the Royal Military Tournament has entirely outgrown the limits of the Royal Agricultural Hall at Islington.

Whoever is responsible for the stable arrangements at the Agricultural Hall we must congratulate on having done the best he could with limited possibilities to improve the sanitary arrangements in his own department, which are excellent. The hospital in case of accidents was in the charge of Surgeon-Major Alexander, who was assisted by Surgeon-Captain Tate.

THE ROYAL COMMISSION ON THE METROPOLITAN WATER-SUPPLY.

THE twenty-third meeting of the Royal Commissioners was held in the Council Chamber of the Westminster Town Hall on Monday, May 23rd. With the exception of Mr. Cripps, Q.C., all the Commissioners were present. Sir John Dorrington and Sir George Barclay Bruce were not present after the luncheon adjournment. The whole of the sitting was occupied by the cross-examination of Sir Alexander Binnie, engineer-in-chief to the London County Council. The witness laid before the Commissioners estimates giving the relative cost of obtaining an increased supply of water from the Thames and from Wales. The information has been

condensed by Sir Alexander Binnie into the smallest possible space and is as follows:—

Cost of obtaining from the Thames by the Staines scheme the 114½ million gallons, being the difference between the total 300 million gallons of the Staines scheme and the 185½ million gallons sanctioned taking of water from the Thames by the companies up to date.

	£
Cost of obtaining 300 million gallons from the Thames with a minimum flow of 250 million gallons at Teddington	18,039,945
Cost of obtaining 185½ million gallons from the Thames with a minimum flow of 250 million gallons at Teddington	7,336,375
Difference between the above estimates, being the cost of obtaining 114½ million gallons from the Thames when the minimum is taken at 250 million gallons at Teddington	10,703,570
Cost of obtaining 300 million gallons from the Thames with a minimum flow of 200 million gallons at Teddington	15,589,990
Cost of obtaining 185½ million gallons from the Thames with a minimum flow of 200 million gallons at Teddington	4,705,185
Difference between the above estimates, being the cost of obtaining 114½ million gallons, from the Thames when the minimum is taken at 200 million gallons at Teddington	10,884,806

For the purpose of forming a comparison between the Staines scheme and the Welsh gravitation project nothing is included in the above estimates for distribution mains and pipes or filters, which it is assumed are common to any scheme of extension, nor is anything included for law, parliamentary, or engineering charges.

Cost of obtaining by the Welsh gravitation scheme the 114½ million gallons, being the difference between the total 300 million gallons of the Staines scheme and the 185½ million gallons sanctioned taking of water from the Thames by the companies up to date.

	£
Yrfon yield, 121 million gallons per day.	
Yrfon reservoir and head-works	1,850,000
Aqueduct, 162 miles in length, composed of 117 miles of covered conduit and tunnel to carry 200 million gallons a day and 45 miles of pipe to carry 114 million gallons a day	6,867,500
Terminal works at Elstree for 114 million gallons per day exclusive of filters...	1,314,750
Total	10,032,250

	2,434,000
Add former estimate for 147 million gallons a day ...	14,112,000
Total	16,546,000

In answer to Sir GEORGE BARCLAY BRUCE the witness said that in his opinion whether the water companies' undertakings remained in their present form or were transformed to a public body it would be necessary to go beyond the Thames Valley for an additional supply of water.

In answer to Mr. MELLOR the witness said that a point in favour of commencing the Welsh scheme soon was that if the water rights were not secured for London they might be taken by some other authority.

In answer to Major-General SCOTT the witness said that in dealing with the water of the Thames, which was liable to contamination in consequence of the large population which lived on its banks, it became a serious matter when the filters were infected with microbes. The presence of microbes indicated the decay and decomposition of organic matter.

Mr. PEMBER, Q.C., on behalf of the water companies, cross-examined the witness at some length with regard to the size of the reservoirs which he had said would be necessary at Staines. The counsel contended that on three points the estimate was too great: (1) That an unnecessary amount of storage capacity was allowed for reservoirs which were out of use for cleansing purposes; (2) that an excessive amount was allowed for "bottom water" impurities; and (3) that too much was allowed for evaporation. The amount allowed for "bottom water" was about 28 per cent., and the witness computed that two reservoirs out of fourteen would be out of use for cleansing purposes. Counsel questioned the witness with regard to the service reservoirs now in use by the companies, and contended that one-sixth of the water-supply, if the Welsh scheme were carried out, would have to be pumped into the high service reservoirs. Mr. Pember cross-examined the witness at some length with regard to the diagrams which he had put in to show how the Staines reservoir scheme would have worked out had it been already carried out and applied to the flow of the river during the year 1893. The witness complained that the questions asked were meant to confuse, but on this point counsel only succeeded in showing that if the tables had been made from different data the result would have been different.

Mr. RICKARDS, on behalf of the Chelsea Company, cross-examined the witness with a view to demonstrating that when the company did not draw their full authorised amount on some day it was not because the water was "bad," but because when they did not require their full authorised amount they took the water when it was clear, because the less turbid it was the less was the cost of filtration. Reference was made to Dr. Frankland's report that an excess of microbes was found in the water of the Chelsea Company in June, 1896, and the CHAIRMAN asked whether a representative of the Southwark and Vauxhall Company was present to explain why water containing 1600 microbes per cubic centimetre had been sent out by them.

At the end of the meeting Sir ALEXANDER BINNIE sketched the method in which he would divide the water between London and the county of Surrey in case the London County Council bought the water companies' undertakings and transferred part of them to the outlying authorities.

The twenty-fourth sitting of the Royal Commissioners was held on Monday last, June 6th, at the Guildhall, Westminster. The whole of the sitting was occupied by the cross-examination of Sir Alexander Binnie by Mr. Pember, Q.C., Mr. Pope, Q.C., and Mr. Lewis Coward on behalf of the Water Companies, and by Lord Robert Cecil on behalf of the Hertfordshire County Council, and by his re-examination by Mr. Freeman, Q.C., on behalf of the London County Council.

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

In thirty-three of the largest English towns 5417 births and 3611 deaths were registered during the week ending June 4th. The annual rate of mortality in these towns, which had been 16·4 and 16·5 per 1000 in the two preceding weeks, further rose last week to 16·8. In London the rate was 16·1 per 1000, while it averaged 17·2 in the thirty-two provincial towns. The lowest rates in these towns were 9·9 in Derby, 10·6 in Bolton, 11·1 in Brighton, and 11·3 in Croydon; the highest rates were 22·7 in Liverpool, 23·1 in Gateshead, 24·3 in Newcastle-upon-Tyne, and 24·6 in Sunderland. The 3611 deaths in these towns included 389 which were referred to the principal zymotic diseases, against 380 and 400 in the two preceding weeks; of these, 136 resulted from measles, 110 from whooping-cough, 54 from diphtheria, 44 from diarrhœa, 32 from scarlet

fever, 13 from "fever" (principally enteric), and not one from small-pox. No fatal case of any of these diseases occurred last week in Swansea, in Blackburn, or in Bolton; in the other towns they caused the lowest death-rates in Brighton, Preston, and Huddersfield, and the highest rates in Manchester, Halifax, Liverpool, Bradford, and Newcastle-upon-Tyne. The greatest mortality from measles occurred in Manchester, Halifax, Bradford, and Newcastle-upon-Tyne; and from whooping-cough in Bradford, Newcastle-upon-Tyne, and Sheffield. The mortality from scarlet fever and from "fever" showed no marked excess in any of the large towns. The 54 deaths from diphtheria included 30 in London, 4 in Liverpool, and 2 each in West Ham, Portsmouth, Cardiff, Birkenhead, Burnley, Leeds, and Gateshead. No fatal case of small-pox was registered last week in any of the thirty-three large towns, and only one case of small-pox was under treatment in the Metropolitan Asylums Hospitals on Saturday last, the 4th inst. The number of scarlet fever patients in these hospitals and in the London Fever Hospital at the end of the week was 2207, against 2247, 2241, and 2195 on the three preceding Saturdays; 220 new cases were admitted during the week, against 229, 223, and 256 in the three preceding weeks. The deaths referred to diseases of the respiratory organs in London, which had been 177 and 216 in the two preceding weeks, further rose last week to 226, but were 49 below the corrected average. The causes of 47, or 1·3 per cent., of the deaths in the thirty-three towns were not certified either by a registered medical practitioner or by a coroner. All the causes of deaths were duly certified in Bristol, Cardiff, Nottingham, Leeds, and in thirteen other smaller towns; the largest proportions of uncertified deaths were registered in Birmingham, Leicester, Liverpool, and Huddersfield.

HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in the eight Scotch towns, which had increased in the three preceding weeks from 19·8 to 21·4 per 1000, further rose to 23·0 during the week ending June 4th, and was 3·2 per 1000 above the mean rate during the same period in the thirty-three large English towns. The rates in the eight Scotch towns ranged from 18·7 in Perth and 18·9 in Aberdeen to 26·2 in Paisley and 27·2 in Greenock. The 694 deaths in these towns included 43 which were referred to whooping-cough, 34 to measles, 23 to diarrhœa, 6 to "fever," 4 to scarlet fever, and 2 to diphtheria. In all, 112 deaths resulted from these principal zymotic diseases, against 104 and 91 in the two preceding weeks. These 112 deaths were equal to an annual rate of 3·7 per 1000, which was 1·9 above the mean rate last week from the same diseases in the thirty-three large English towns. The fatal cases of whooping-cough, which had been 31 in each of the two preceding weeks, rose to 43 last week, of which 25 occurred in Glasgow, 5 in Paisley, 4 in Dundee, and 4 in Aberdeen. The 34 deaths from measles showed a slight further increase upon the numbers recorded in recent weeks, and included 19 in Glasgow, 10 in Aberdeen, and 5 in Edinburgh. The deaths referred to different forms of "fever," which had been 6, 4, and 13 in the three preceding weeks, declined again to 6 last week, of which 5 were recorded in Glasgow. The mortality from scarlet fever and from diphtheria showed a further decline from that recorded in recent weeks. The deaths from diseases of the respiratory organs in these towns, which had been 119 and 125 in the two preceding weeks, further rose to 133 last week, and were 13 above the number in the corresponding period of last year. The causes of 40, or nearly 6 per cent., of the deaths in these eight towns last week were not certified.

HEALTH OF DUBLIN.

The death-rate in Dublin, which had been 24·0 and 23·1 per 1000 in the two preceding weeks, further declined to 19·7 during the week ending June 4th. During the past four weeks the rate of mortality in the city has averaged 22·3 per 1000, the rate during the same period being 15·9 in London and 19·5 in Edinburgh. The 132 deaths registered in Dublin during the week under notice showed a decline of 23 from the number in the preceding week, and included 10 which were referred to the principal zymotic diseases, against 10 and 14 in the two preceding weeks; of these, 5 resulted from whooping-cough, 2 from "fever," 2 from diarrhœa, 1 from scarlet fever, but not one from measles, diphtheria, or small-pox. These 10 deaths were equal to an annual rate of 1·5 per 1000, the zymotic death-rate during the same period being 2·1 in London and 3·0 in Edinburgh. The fatal cases of whooping-cough, which had been 1 and 3 in the two preceding weeks, further rose to 5 last week. The deaths referred to different forms of "fever," which had been 4 and 3 in the two preceding weeks, further declined to 2 last week. The mortality from scarlet fever corresponded with that recorded in the preceding week. The 132 deaths in Dublin last week included 22 of infants under one year of age and 36 of persons aged upwards of sixty years; the deaths both of infants and of elderly persons showed a decline from those recorded in the previous week. 8 inquest cases and 6 deaths from violence were registered; and 46, or more than a third, of the deaths occurred in public institutions. The causes of 9, or nearly 7 per cent., of the deaths in the city last week were not certified.

THE SERVICES.

NAVAL MEDICAL SERVICE.

STAFF-SURGEON FRANCIS A. JEANS to be Fleet-Surgeon. The following qualified candidates for the Naval Medical Service have been appointed Surgeons:—Henry Cadman Whiteside, Robert Lumley Dickinson, Herbert Wells Bayly Shewell, John Martin, Christian Beverly Fairbank, Francis Frederick Lobb, Gerald Burton Brown, Strafford Dobrée Tollemache Halliday, John Gallagher Corry, Lancelot Bew Todd, Harold John Chater, Reginald St. George Smallridge Bond, Charles Clarke Macmillan, Fred Claude Bromley Gittings, Ramsey Martyn Richards, Henry Edward Raper, Alan Grant Eastment, George Ernest Duncan, James George Watt, and George Edward Glynn.

The following appointments are notified:—Staff-Surgeons: Samuel W. Vasey to the *Barfleur;* Harold G. T. Major and Anthony Kidd to the *Diadem;* and Charles W. Sharples to the *Furious*. Surgeons: Malcolm Cameron to the *Mars;* James W. O. Underhill and Robert V. Gilmour to the *Blenheim;* John E. H. Phillips to the *Tamar;* and James D. S. Milln to the *Cæsar*.

ARMY MEDICAL STAFF.

Surgeon-Major-General Thomas Walsh is placed on retired pay. Surgeon-Colonel John W. Maxham, M.D., to be Surgeon-Major-General, vice T. Walsh. Brigade-Surgeon-Lieutenant-Colonel James F. Supple to be Surgeon-Colonel, vice J. W. Maxham, M.D., Surgeon-Lieutenant-Colonel Henry Charlesworth to be Brigade-Surgeon-Lieutenant-Colonel, vice J. F. Supple.

INDIA AND THE INDIAN MEDICAL SERVICES.

The services of Surgeon-Captain Gray (Bengal) are replaced at the disposal of the Chief Commissioner of the Central Provinces. The services of Surgeon-Major Narendra Prasanna Sinha (Bengal) are replaced at the disposal of the Government of Bengal. The services of the undermentioned officers are replaced at the disposal of the Government of the North-Western Provinces and Oudh: Surgeon-Major Baker (Bengal), Surgeon-Captain Moorwood (Bengal), Surgeon-Captain Fischer (Bengal), and Surgeon-Captain Crawford (Bengal). The services of the undermentioned officers are replaced at the disposal of the Government of the Punjab: Surgeon-Captain Clark (Bengal), Surgeon-Captain Coleman (Bengal), and Surgeon-Captain Buist Sparks (Bengal). The services of the under-mentioned officers are replaced at the disposal of the Government of Madras: Surgeon-Captain Donovan (Madras) and Surgeon-Captain Robert King Mitter (Madras). The services of the undermentioned officers are placed temporarily at the disposal of the Government of the North-Western Provinces and Oudh: Surgeon-Captain Austen Smith (Bengal), Surgeon-Captain Birdwood (Bengal), and Surgeon-Lieutenant Stevenson (Bengal).

VOLUNTEER CORPS.

Artillery: 6th Lancashire: David Franklin Williams to be Surgeon-Lieutenant. *Royal Engineers:* 1st Devonshire and Somersetshire: Surgeon-Captain G. B. Fraser to be Surgeon-Major. *Rifle:* 1st Volunteer Battalion the Lincolnshire Regiment: Surgeon-Lieutenant J. W. Jessop to be Surgeon-Captain. 3rd (Cambridgeshire) Volunteer Battalion the

Suffolk Regiment: Arthur William Clark to be Surgeon-Lieutenant. 3rd Volunteer Battalion the Welsh Regiment: John Richardson Armstrong to be Surgeon-Lieutenant. 1st London: Surgeon-Lieutenant-Colonel W. R. Smith, from the 3rd Volunteer Battalion Royal West Kent Regiment, to be Surgeon-Lieutenant-Colonel. 7th Volunteer Battalion the Royal Scots (Lothian Regiment): Second Lieutenant William Robert Martine resigns his commission and is appointed Surgeon-Lieutenant. 2nd Volunteer Battalion the Northumberland Fusiliers: Lieutenant Andrew William Messer resigns his commission, and is appointed Surgeon-Lieutenant.

VOLUNTEER INFANTRY BRIGADES.

East Yorkshire Brigade: Surgeon-Captain J. Porter, 2nd Volunteer Battalion the Princess of Wales's Own (Yorkshire Regiment), to be Brigade-Surgeon-Lieutenant-Colonel on being appointed Senior Medical Officer to the Brigade.

SICKNESS AND MORTALITY IN THE GERMAN NAVY.

IN Germany the statistical returns bearing on the health of the navy are calculated from April 1st in one year to March 31st in the next. The following figures, compiled by Dr. Globig, refer to the biennium 1893-95. Average strength: afloat, 10,886; ashore, 9172; total, 20,058. Admissions to hospital, 873·5; invalided from the service, 38·2; died, 4·4; number of men constantly sick, 36·1; all per 1000 of strength per annum. Average duration of each case in days, 13·6. Of the total deaths 48 per cent. were due to accidents and 6·2 per cent. to suicide. The principal causes of death from disease were as follows: tuberculosis, 21; inflammation of lungs and pleurisy, 15; typhoid fever, 7; cardiac affections, 6. 25 men were killed by a boiler bursting on board the *Brandenburg* and 10 by an explosion of gunpowder on board the *Baden*. 40 men lost their lives by drowning and 6 by falls from the rigging. In the first twelvemonth under report 55 cases of typhoid fever were treated, 43 on the American station, but in the second the number fell to 17. There were 7 deaths from this disease during the biennium, 2 of the men who died having been convalescent from yellow fever when they were attacked. Malarial fevers caused 723 admissions, 18·2 per 1000, and 2 deaths, the latter occurring on the African station. 4 cases of yellow fever occurred on board the *Alexandrine* at Rio de Janeiro, 1 proving fatal. A fifth case showed itself nineteen days after the departure of the vessel, the patient having formed one of the boat's crew which last communicated with the shore. This outbreak was the first manifestation of yellow fever in the German navy since 1870. Every man-of-war in the harbour at Rio was attacked with the exception of one Portuguese cruiser and it was noted that only men who had landed for night duty contracted the disease. 4 cases of cholera were treated in a vessel off Valparaiso with one death. Acute rheumatism seems to have been very prevalent, especially in the Mediterranean, where the admissions amounted to 38·5 per 1000 of strength; 817 cases in all—20·3 per 1000—were treated. There was also a considerable increase over previous years in disorders of the circulatory apparatus. Sunstroke is said to have occurred 29 times, but only 2 cases were fatal. Amongst the diseases of the nervous system there were 30 cases referable to cerebral causes, 52 of epilepsy with 2 deaths, and 17 of hysteria. Affections of the digestive system are steadily diminishing in frequency, but afloat 2 admissions per 1000 of strength were said to be referable to faulty provisions. On shore the proportion was about 0·4 per 1000 as usual. There was no scurvy. 24 cases of dysentery occurred in African waters; all were slight. Off the Chinese coast there were 3 very severe cases requiring exceptionally long treatment but eventually they recovered. Hepatic affections were apparently trivial, no cases of hepatic abscess are noted and the fleet was likewise entirely free from small-pox throughout the period. The peculiar affection known as "stokers' cramp" temporarily disabled a man on the *Bayern*. The cause was said to be indigestion provoked by too copious draughts of an acidulated beverage. The admissions on account of venereal disease amounted for the entire force to 113·5 per 1000 per annum, but on the China station they rose to 504 per 1000. Invaliding is no longer chiefly due to diseases of the eye, the first place being now occupied by cardiac affections and the second by affections of the locomotory system (flat feet, &c.). Eye diseases come third, and fourthly affections of the ear. In the report under notice the comparative merits from a hygienic point of view of the new type of ironclad, as represented by the *Brandenburg*, and the old, or *Baden* type, are for the first time considered, the conclusion being by no means favourable to the first-named. It is said that in the more modern war ships diseases which owe their origin to cold and draughts, such as rheumatism, bronchitis, tonsillitis, &c., are much commoner than in the older vessels and also that accidental injuries and heat stroke occur far more frequently.

WOUNDED BRITISH SOLDIERS IN EGYPT.

Two convoys have arrived at Cairo from the Soudan consisting of 64 wounded men, only one of whom was wounded by a spear. Most of the injuries were caused by Snider or Martini-Henry rifles, or by a few slugs from elephant guns, but, unfortunately, a few of the wounds were also caused by the Lee-Metford rifles of our own men. Large numbers of our wounded were shot in the legs and feet and this is said to have been due to Mahmoud's precaution of causing his men to fire below fixed beams, also a little to the fact that the enemy reserved his fire until the Anglo-Egyptian force was close to his entrenchment. Each man going into action carries his own antiseptic dressing with him and this was applied in most cases by the five surgeons who accompanied the troops on the day of battle or by the orderlies acting under them. Dry dressings were used and later the wounds were syringed out with carbolic or sublimate and then again dry dressed with iodoform and cyanide gauze. The dressings were generally left for three days, but were carefully watched daily to see if there were any signs of leakage. In passing it may be mentioned that in the Citadel Hospital, where these men are lodged, there is no adequate operating theatre, in spite of the many requests which have been made for one in the fifteen and a half years during which the hospital has been in British hands. The room at present used for operations has an old wooden floor, septic walls and ceilings, and very unsatisfactory windows, while the operating table, which was supplied from England last year, is an obsolete wooden one of which Her Majesty's Government ought to be thoroughly ashamed.

QUARANTINE MEASURES AGAINST THE PLAGUE IN MADAGASCAR.

The *Archives de Médecine Navale* for May contains a note by Dr. Duville, medical officer of the Naval Department in the Indian Ocean, on the measures to be adopted in order to safeguard Madagascar from the bubonic plague. Every year, he says, a large number of native *boutres* (buggalows) arrive from Bombay during the north-eastern monsoon, the passage lasting from thirty to forty days. These vessels, many of which are of 400 tons burden, ought all to be carefully inspected, but unfortunately they frequent a variety of anchorages and Majunga is the only port where there is a lazaret. To meet the difficulty Dr. Duville proposes to arm the ubiquitous custom-house officials with sanitary powers, and thus enable them to protect the public health as well as the revenue. The *boutres* with clean bills of health should be kept in quarantine for from twelve to twenty-one days according to the time occupied on the voyage from the infected area, but if any of them should be found to be contaminated it would be worse than useless to play at disinfection seeing that effective means of applying it do not as yet exist. Whenever there is reason to suspect the presence of plague germs the implicated *boutre* should be promptly isolated and the whole of its contents forthwith burnt (*brûler séance tenante tout ce qu'il contient*). The note concludes with the information that a decree, dated March 31st, 1897, has just been promulgated in Madagascar containing regulations for the maritime sanitary police of the colony.

THE SOUDAN CAMPAIGN.

The Khalifa's forces at Shabluka are stated to have withdrawn recently to El Boga, which is some forty miles distant from Khartoum and inland from the river, so that the Nile is practically left clear to Khartoum. Shabluka was a fortified, defensible position commanding the navigable channel of the Nile. According to present arrangements it is probable that some 20,000 British troops will take part in the Anglo-Egyptian advance on Khartoum in the autumn, probably late in August. Beyond Berber to the south there are often heavy falls of rain during parts of July and August. The troops have been operating hitherto in a nearly rainless country. We regret to learn that a certain amount of sickness—climatic and enteric fevers and dysentery chiefly—still continues to prevail among the soldiers of the Soudan force.

THE BATTLE OF THE ATBARA.

The *Times* of Wednesday last states in its usually well-informed "Political Notes" that "it is alleged that the medical department attached to the British brigade at the battle of the Atbara were entirely unprovided with chloroform or anæsthetics for the performance of operations on the battlefield, and, further, that owing to the lack of light ambulances the only way of carrying the wounded after the cavalry reconnaissance before the battle of the Atbara was by tying them on to gun-limbers. Amongst military members of the House of Commons the view prevails that the matter is of sufficient importance to warrant the appointment of a special court of inquiry."

THE TRANSPORT OF SICK AND WOUNDED TROOPS BY RAIL.

Our military readers may be glad to have their attention directed to an elaborate and interesting paper by Surgeon-Captain Melville, A.M.S., published in the May number of the *Journal of the Royal United Service Institution*, descriptive of the continental regulations for the transport of sick and wounded by rail.

Correspondence.

"Audi alteram partem."

HOSPITAL SUNDAY.

To the Editors of THE LANCET.

SIRS,—Though I have had occasion to make various demands upon your courtesy in the cause of charity during the last few weeks I again solicit your assistance to allow me to draw public attention to the fact that Sunday next is "Hospital Sunday," when, for the twenty-sixth year in succession, collections will be made in all the churches and chapels of the metropolis in behalf of the hospitals and dispensaries of this great city.

At this period of the history of the Hospital Sunday Fund it is fortunately unnecessary to refer in any detail to its aims and objects. These are now so well understood and so widely appreciated that it seems only requisite to mention that there are nearly 200 hospitals, convalescent homes, and dispensaries seeking to participate in this year's collections. It is estimated that quite £100,000 will be required to make up the difference between the receipts and expenditure of these most valuable institutions and to provide for that smaller but equally useful work—which the council themselves undertake—of issuing surgical appliances to the crippled and afflicted poor.

Many appeals have recently been made for the larger hospitals, and these, I rejoice to say, have been liberally responded to, but one merit of the distribution of the Hospital Sunday collection—which it shares with the Prince of Wales's Hospital Fund—is that it enables the public to contribute to those smaller and more modest institutions which are doing excellent and meritorious work in their respective localities. All the hospitals participate, according to their needs and difficulties, in the Hospital Sunday Fund, and many of the minor charities look to this annual help to compensate them for the reduction of income and legacies from which they suffer through the pressure of more urgent claims.

Of course, the great bulk of the money raised for the fund is, as it ought to be, collected at places of worship on "Hospital Sunday," but there are many contributors who, whether from absence from town on the Sunday or some other reason, always prefer to send their personal donations direct to the Mansion House. These contributions materially help to swell the fund, and are for that reason very acceptable. I shall cordially welcome any such donations.

I desire to thank in advance those who will preach for the fund on Sunday and those who respond to their appeal, and I sincerely trust that this year's collection may equal, if not exceed, the splendid results which have been recorded throughout the history of the fund, but especially in recent times.

I am, Sirs, your obedient servant,

H. D. DAVIES, Lord Mayor.

Mansion House, London, June 9th, 1898.

"A MEDICAL GRADUATES' COLLEGE AND HOSPITAL."

To the Editors of THE LANCET.

SIRS,—The prototype of the person who would find the money to establish a new general hospital in central London for post-graduate purposes is not, I think, the wise "Johns Hopkins," but rather someone whose guileless trust would only be equalled by his ignorance both of what is good for patients and what is needed by post-graduates. Why should such a hospital be central at all? If it is complete its students will not want to run away from it to all the other London hospitals, nor will they want to lodge at Claridge's or the Albemarle. As for evening amusements there already exist within twenty-five minutes' cab drive of the theatres general hospitals without undergraduates but as richly supplied with clinical material and as ably officered as any post-graduate hospitals in either Europe or America. It is to them, if to any, that a Johns Hopkins willing to build a post-graduate college could wisely turn his attention. The idea of a central post-graduate school is greatly based on the delusion that the most famous men in the profession would teach in it. Such men do not give post-graduate courses anywhere. The Jenners and Pagets of the day have rarely had time to continue their systematic lectures. Post-graduate courses of many demonstrations crowded into a few weeks can only be given by men with sufficient time to spare. Odd lectures are but little wanted.

As for the composite scheme of eight united hospitals with schools it is necessarily doomed to failure by the fact that qualified medical men are too polite to push before students and not tall enough to stand behind them; besides, they do not want elementary instruction. And it would be unfair to the patients to have them doubly exhausted by the examinations of the qualified men in the morning and those of the younger students in the afternoon.

Why should the schools wish to compete in post-graduate teaching with the institutions which are free to fulfil such a duty properly? The united hospitals scheme is scarcely more likely to have a long and useful life than a many-bodied human fœtus. Perhaps any independent London post-graduate school and hospital is expected to "peep about under its" eight "legs to find itself a dishonourable grave." Hospitals like the West London and the Great Northern, for example, must be used for study in some way or other. Do the present London schools for undergraduates consider their number, twelve, is not sufficient? If they think, as they must do, that it is more than enough, let them unite among themselves not to interfere with post-graduate tuition, but to do their undergraduate teaching a little better.

I am, Sirs, yours faithfully,

June 7th, 1898. C. B. KEETLEY.

To the Editors of THE LANCET.

SIRS,—Your leading article on a proposed post-graduate hospital and college in the last issue of THE LANCET is one of great interest, since the need of some post-graduate school in London is apparent. As you state post-graduate teaching is practically impossible at the large London schools, since not only is a different class of teaching required from that useful to students, but practitioners do not like to receive instruction at the same clinic with students for many reasons. The difficulties in the way of the proposed scheme for a post-graduate college connected with a hospital whose only object is clinical instruction and not treatment must be almost insuperable. Under these circumstances, might I suggest that the development of an existing institution would supply the need? For some years past the nucleus of a post-graduate college has existed at the West London Hospital, Hammersmith-road, W. Courses of lectures have been given and a considerable number of post-graduates from all parts of the world have attended the hospital practice. The practice of this hospital is well adapted to the needs of post-graduates, since it is reserved for them and senior students, and the staff have now had considerable experience in the class of teaching which these gentlemen require. At the same time, as the number of occupied beds in the hospital is being increased to 150, better accommodation for post-graduate students is being arranged. There will be a large class-room, a library, and a writing-room; a pathological and bacteriological laboratory in which the post-graduates may work has also been established. We therefore venture

to hope that these arrangements will meet the needs of post-graduates in London.

I am, Sirs, yours faithfully,
L. A. BIDWELL, Dean.

West London Hospital, W., June 6th, 1898.

"TWICKENHAM AS A HEALTH RESORT."

To the Editors of THE LANCET.

SIRS,—The attention of the council has been drawn to the article which appeared in THE LANCET of May 21st under the above heading, and in justice to a district which has for so long a time maintained its good reputation as regards its sanitary condition and which is verified by an extremely low zymotic death-rate and also a very low general death-rate (average of 13 per 1000 for the past ten years) we desire on behalf of the council to say that the complaint of your correspondent was to a small extent justifiable, but the hole in which the house refuse was thrown was at least 12 ft. deep, and the refuse has been gradually covered with good earth to a depth of several feet. No houses could have been built over this site, it being at the bottom of the garden. The council firmly believe that no possible nuisance can arise in the future from the deposit of the refuse referred to. The statement that houses have already been built upon sites upon which house refuse has been deposited is absolutely untrue.

We can assure you and the public at large that the council are quite as anxious for the continued good health of the district as your correspondent.

We are, Sirs, your obedient servants,
MARTINDALE C. WARD, M.D., J.P., Chairman.
W. MARSTON CLARK, D.P.H., Medical Officer of Health.
H. JASON SAUNDERS, Clerk.

Twickenham Urban District Council, June 1st, 1898.

*** We are satisfied as to the substantial accuracy of the statement upon which our annotation was founded, and think that the Twickenham Urban District Council will do well to ensure their dust contractor's obedience to the orders of their medical officer. Otherwise, however anxious they may be for "the continued good health of the district" they will find Twickenham involved in serious sanitary troubles.—ED. L.

THE NATIONAL SOCIETY FOR THE EMPLOYMENT OF EPILEPTICS.

To the Editors of THE LANCET.

SIRS,—The rapid development of the colony established by the National Society for the Employment of Epileptics at Chalfont St. Peters has led to the existence of a widespread impression that the society is in a state of extreme prosperity, and this impression, though unfortunately erroneous, has been found most prejudicial to the movement. I am therefore desired by H.R.H. the Duke of York, the President of the society, to make known its claims to sympathy and support, its present position, and its immediate needs, which are very pressing and urgent.

Epileptics, though capable of work, are prevented by the nature of their disease from retaining employment under ordinary conditions. The object of the colony is to provide them with a home amidst healthy surroundings with suitable medical treatment, and above all with opportunities for the exercise of their industry. In a Report on the Care of Epileptics published by the Charity Organisation Society, in which the establishment of epileptic colonies is warmly advocated, it is estimated that there are in this country about 5000 persons in urgent need of such provisions as the Chalfont colony affords. But even when the additional homes now being built there are completed and opened the number of "colonists" actually provided for will be somewhat less than 200. It is evident, therefore, that the colony is, comparatively speaking, still in its infancy and that much help and effort will be needed before its ultimate growth will be attained. In the meantime, however, the necessity for increasing the accommodation has so weighed upon the minds of our principal supporters that they have from the first given their contributions specifically and inexorably for the building of new homes, every one of which has, however, necessarily involved considerable outlay over and above the cost of building. The result is that the furnishing of homes and other capital expenditure have thrown so severe a strain upon the general funds of the society that these are now quite exhausted, and works essential to the safety of the colony cannot be carried out. One home recently completed is standing empty for lack of furniture; other homes now being built will shortly be in the same position. Water is still being procured and the sewage of the colony disposed of by primitive methods quite unsuited to the increasing population. A water and a sewage scheme have been prepared and will be executed as soon as funds are forthcoming. Another urgent requirement, in order to ensure economy of management, is an administrative building with central kitchens and other offices for the whole of the colony. For these purposes about £7000 are required. This sum represents an immediate need, the importance of which is great in proportion to the amount, for it is a necessary complement to the very noble work already accomplished.

Of all the more serious forms of natural affliction epilepsy is probably the most prevalent; in the country and in the towns it is equally rife, and it spares no class of the community. It would seem therefore that it should appeal to almost universal sympathy; yet hitherto the supporters of the National Society have been distinguished rather by their individual generosity than by their numerical importance. For its permanent stability it is much to be desired that the society should stand as it were upon a broader basis, and members of all classes are therefore, according to their respective means and opportunities, cordially invited to participate in and support this very humane and necessary work.

Contributions will be most gratefully received and acknowledged by the Secretary, Mr. G. Penn Gaskell, at the society's offices, 12, Buckingham-street, Strand, W.C., or by the bankers, Messrs. Hoare & Co., 37, Fleet-street, E.C. Cheques and P.O O. should be made payable to the hon. treasurer, Mr. H. N. Hamilton Hoare.

I am, Sirs, yours faithfully,
E. MONTEFIORE MICHOLLS,
June 3rd, 1898. Chairman of the Executive Committee.

INTRATRACHEAL INJECTIONS IN PHTHISIS.

To the Editors of THE LANCET.

SIRS,—With reference to the misgivings expressed incidentally on p. 84 of my article on "Bronchiectasis" in Clifford Allbutt's "System of Medicine," vol. v., as to the value of this form of treatment in phthisis, Mr. Colin Campbell writes to remind me that in his paper in vol. lxxviii. of the Transactions of the Royal Medical and Chirurgical Society on the Treatment of Respiratory Affections by means of Large Medicinal Injections through the Larynx he sets forth the advantages of distilled glycerine instead of oil as a vehicle and relates a series of uniformly favourable cases. Inasmuch as a wider knowledge of his improvement in the method would modify any adverse impression which might be conveyed by my article I venture to beg your kind insertion of this letter.

I am, Sirs, yours faithfully,
Curzon-street, W., June 3rd, 1898. WM. EWART.

A CORRECTION.

To the Editors of THE LANCET.

SIRS,—Through my inadvertence the words "10 per cent." appear on page 1536 of THE LANCET, June 4th, 1898, lines 7 and 40. In each case the words should be *1 per cent.*

I am, Sirs, yours faithfully,
Wimpole-street, W., June 7th, 1898. WILLIAM E. BURTON.

THE ALLEGED DEARTH OF QUALIFIED ASSISTANTS.

To the Editors of THE LANCET.

SIRS,—It has been stated that any principal in a provincial town except Leeds can receive thirty or forty replies to advertisement from all sorts and conditions of men. Let me inform you that such is not the case in the Midlands. I have advertised for the last eight months and placed my

want in the hands of agents in London (three agents), Birmingham, Manchester, Liverpool, Edinburgh, and Glasgow, I have offered to pay whatever salary has been asked and find a comfortable home either indoors or out, and have not received one single application, but I have received a printed form from the Medical and Scholastic Agency, which reads thus:—

Clients of the association are naturally asking our advice. Holding as we do the opinion that the present tension is likely to *increase* rather than diminish, the only practical suggestions we are able to make are:

1. In some few cases it may be possible without serious inconvenience or loss to dispense with the services of an assistant altogether.
2. It may suffice to take an unqualified man to do merely dispensing and bookkeeping.
3. To raise substantially the salary offered to the qualified assistant.
4. To take in a junior partner.

The difficulties brought upon the profession by the abrupt action of the Council are so severe and far reaching and have been so unexpectedly sudden that only time will regulate the difficulties. Meanwhile, the struggling practitioner who under present circumstances is compelled to accept small fees to make a living must struggle on as best he can, and those who have arrived at a time of life when work becomes a burden when over-taxed, and yet who have struggled hard for many years to keep the wolf from the door must, now that qualified help is so dear, be pushed on one side to make way for the new order of things. If the majority of the members on our General Medical Council were elected from the rank and file of general practitioners more sympathy would have been shown to the profession at large, as they would have been able to judge from their own experience and not to look at general practice through such rose-coloured spectacles; or, again, they would have endeavoured to protect the members of the profession by trying to stop all such practices as are carried on by chemists, botanists, bone-setters, and patent medicine dealers. There is plenty of work in this line without harassing to the extent that has been done an already overburdened, worried, and, I would say, almost despised profession. (Read what the judges' remarks are on the profession and see how the clubs and dispensaries treat their medical officers and note the skits in the public papers.) More could be written, but I have already trespassed too long.—I am, Sirs, yours truly,

A GENERAL MEDICAL PRACTITIONER.

June 6th, 1898.

"A NEW OPERATION TABLE."

To the Editors of THE LANCET.

SIRS,—With reference to the letter of Messrs. Down Bros. which appeared in THE LANCET of May 7th, they state that several similar tables are in use at institutions in London and that these tables were on view at the Victorian Era Exhibition. We thereupon wrote asking them where such a table could be seen; not receiving an answer we wrote again. To neither of these communications have they had the courtesy to reply. We still maintain that we first introduced an operation table whereby heat by water is maintained all over the surface of the table; in whatever position the divided portion be placed water still remains in the sloping part as well as the horizontal. We saw the exhibit referred to at Earl's Court, but no table was then on view possessing the advantage we claim: "the hinged movement so arranged that the reservoir containing hot water is not interfered with in the least, and whatever the position of the divided table hot water is equally distributed over the whole surface: thus keeping the extremities warm as well as the body."

We remain, Sirs, your obedient servants,

May 26th, 1898. ARNOLD AND SON.

TYPHOID FEVER AT CAMBORNE.—The official report of Dr. R. Bruce Low, of the Local Government Board, on the recent outbreak of typhoid fever in the urban district of Camborne, Cornwall, and in portions of the adjoining rural districts of Redruth and Helston, has just been issued. This outbreak occurred in December and January last and there were 165 known and reported cases, the mortality being a little over 7 per cent. Dr. Bruce Low considers that the epidemic was caused by the specific pollution of the public water service; he severely condemns the sanitary condition of Camborne and Illogan, and points out the necessity for providing a satisfactory isolation hospital.

HOSPITAL ABUSE.

(BY OUR SPECIAL COMMISSIONER.)

XVI.—BRIGHTON.

(*Concluded from p. 1566.*)

SECOND in the number of its patients comes the Sussex County Hospital. This hospital was opened in June, 1828, and there were 1710 in-patients and 7550 out-patients, giving a total attendance of 30,847. In addition there were 3215 casualties, aggregating 13,073 attendances. The total receipts, including legacies, amounted to £13,105. Further, in connexion with this hospital there is a convalescent home at Ditchling which received 143 patients during the year. Then there is also a nursing institution, which was founded eleven years ago, and has 23 nurses in constant employment and an income of more than £1200 a year. Subscribers of half a guinea may recommend two patients, the number of recommendations of course increasing with the amount of the subscriptions. Calling on the secretary of the Sussex County Hospital to inquire what measures were taken to prevent abuse I was informed that a sub-committee of the committee of management was appointed a few years ago to deal with the question. It was then decided that the medical men in charge of the out-patient department should report suspicious cases to the secretary. Such reports, however, are but rarely handed in. When the sub-committee was first formed they took haphazard 100 letters of recommendation and made inquiries into each case. Only 4 seemed doubtful and satisfactory explanations were ultimately obtained for 2 out of these 4. This led the sub-committee to conclude that there was not much abuse. On inquiring what would be considered as constituting abuse I was told that single men earning not more than £1 a week would be admitted. This limit might be extended for a serious operation or a severe case. The wage limit for married couples was 22*s.* 6*d.* per week, which was raised to 25*s.* if they had one child, and 2*s.* 6*d.* for each additional child. The secretary thought that medical men who had very poor practices had often only themselves to blame for what might be qualified as hospital abuse. The fact was that persons with but small means did go to cheap practitioners. But poor medical men give poor drugs. What was the good, for instance, of digitalis a month old? After paying small fees for a certain time the patients came to the hospital and complained that they had derived no benefit from their treatment. As at the hospital they were given medicine of the very best quality the results were more favourable. Thus people who could afford to pay but who could pay only very small fees naturally gravitated towards the hospital. The impression did exist that at the hospital more skilful attendance and better medicine were obtained than could be expected at the hands of the cheap medical man. The sub-committee, I was told, has little or nothing to do. One of its members is a clergyman working in a very poor district and the Charity Organisation Society is willing to render any assistance required to prevent abuse, but this is rarely needed.

In spite of this optimistic view of the situation several medical men expressed their conviction that abuse did prevail at the Sussex County Hospital. For instance, a case was mentioned to me relating to a town councillor whose child, suffering from joint disease, was treated for a long time at this hospital. Another case was mentioned of a man who is in trade and who was treated for a week at the hospital. The enormous number of casualties shows that very trivial cases go to the hospital and these might well be left to the local practitioners.

Third in number of patients is the Hospital for Sick Children, which was founded twenty-nine years ago. In 1896 there were 504 in-patients and 2909 out-patients, and the total number of attendances amounted to 9589. At this hospital I was told that inquiries were made from the parents as to their income and if this exceeded from 25*s.* to 30*s.* per week they were asked to pay. The payment varied according to circumstances. There was no fixed charge and the patients were always treated no matter what payment the parents might consent to make. From what I was able to ascertain it did not seem that any effective means were employed to prevent abuse.

With regard to the Sussex Eye Hospital there are more

than 3000 out-patients and more than 120 in-patients and here the cases of abuse are even more flagrant. Some two years ago a Brighton practitioner was sent for to attend a man who had been shot in the head at Bexhill. After two days' attendance it became apparent that it was necessary to remove one of the eyes. The patient then discharged his medical attendant and was conveyed to the Brighton Eye Hospital, where the operation was performed.

While admitting that the eye does require special operative skill several practitioners urged that this was not so much the case with regard to diseases of the throat and ear. They consequently protested that there was no need for a special Throat and Ear Hospital. Yet such an institution was established at Brighton in 1878, and in 1896 there were 115 in-patients and 1195 out-patients with total attendances of 6526. At this hospital some of the patients are made to pay at the rate of 5*s*. per month as out-patients and 7*s*. per week as in-patients. The matron informed me that she always asked the patients if they were not able to pay a medical man. Some of the patients answered that they could not do so because their social position compelled them to dress well. In spite of such replies only about five or six patients were refused during the year and advised to consult as paying patients an ophthalmic surgeon.

By a careful study of the reports of the various medical charities Dr. Waring finds that whereas in 1894 no less than 38,113 recommendation tickets for the hospitals were given out, this figure had increased to 43,374 in 1896, and the population of Brighton and Hove then amounted to 152,000. But at the same time there were 14,333 persons belonging to the Provident Dispensary, the benefit clubs, and medical aid associations. Some of these organisations receive hospital tickets but most of the members are attended by their club medical officers. If to this we add also the asylum, the fever hospital, and the Poor-law infirmary it may be said that a third of the population of this prosperous town do not pay medical fees.

To cope with this grievance a public meeting was held at the Athenæum Hall on Nov. 5th last, and it was decided that a committee should be appointed to investigate the manner in which the charities of the town were managed. A provisional committee met for the first time on the 11th of that month. A letter was then addressed to all the medical charities, including the dental and homœopathic hospitals, the Brighton Medical Society, and the Charity Organisation Society, asking them each to send two delegates so as to form a general committee which would deal with the question of hospital abuse. The result was most discouraging, nearly all the hospitals refusing to send delegates. Nevertheless, the provisional committee has continued its work, though its action is greatly impeded through want of support from the hospitals. The committee at present consists for the most part of private practitioners and delegates from the Charity Organisation Society and the Poor-law guardians. In any case it forms a nucleus where information can be gathered and agitation organised. Discussing this matter with a medical man who has a large general practice he thought it was not possible to establish a hard-and-fast rule to prevent hospital abuse, but that a periodical agitation did a great deal of good, for it awakened a moral sense and prevented people transgressing out of ignorance or carelessness. He seemed to think that the means actually employed to prevent abuse were so ineffective that anyone who chose could go to the hospital. If, however, the fact that this was wrong was constantly brought before the public by means of an agitation a larger number of persons would hesitate to do so. Therefore Dr. Waring and the committee in question were rendering a great service. Among the various complications connected with the question of hospital abuse there was the difficulty of dealing with domestic servants. He knew a family in the enjoyment of an income of £2000 a year who had sent one of their servants to the hospital because she was suffering from pleurisy. This seemed quite unjustifiable. On the other hand, a family with about £300 a year would not easily be able to nurse a servant through a serious illness. He had several times been called to attend the servants of families in similar positions and then found that they refused to pay him. The servant on her side had not the means to pay and it often happened that by the time his bill was sent in the servant had left. Nor for ordinary patients was it possible in such a town as Brighton to apply a wage limit, for it often happened that though the wages earned were small a considerable income was derived from the letting of apartments.

The fact that paying patients are admitted at some of the hospitals is also a serious grievance. A case was mentioned of a lady who was asked to pay a hospital ten guineas for her child. Medical men who are in a good position and make large incomes can afford to attend gratuitously these paying hospital patients. They do not lose anything by it because though these patients pay they are not their patients. But if such patients were refused admission to the hospital they would go to some general practitioner and pay him. Thus the gratuitous work done by the visiting staff of the hospitals often takes money out of the pockets of other practitioners. Then there are a great number of wealthy people in Brighton who very readily subscribe to hospitals but will not take the trouble to go into the details. They write out a cheque and quickly dismiss the whole subject from their minds. With similar carelessness they distribute the tickets of recommendation for admission to the hospitals. Thus while the boards of guardians and the Charity Organisation Society are doing their best to propagate the principles of thrift and to teach the poor how to help themselves the medical charities are, on the contrary, encouraging improvidence. It is really wonderful under these circumstances that there are still some poor people who pay a penny a week for medical aid when it is so easy for them to obtain this aid for nothing. As an example of the carelessness with which wealthy persons recommend people to go to the hospital a medical practitioner told me that the sister of one of his paying patients went to a hospital because a wealthy gentleman who lives in London had especially recommended her to consult one of the physicians of the hospital in question. For this purpose he had sent her a hospital admission ticket. The banks who subscribe to the hospitals sometimes place the tickets of recommendation in the hands of one of their clerks who as often as not knows nothing about the question and to save trouble lets the applicants fill up the forms themselves. The latter, therefore, can make any declaration they choose about their incomes. Many patients having thus easily obtained a ticket come to the hospital and then, as they do not like the look of the place or the appearance of the poor people waiting their turn, go away, thus proving that they did not come out of sheer necessity. Such intending patients sometimes calmly drive up to the hospital in cabs. Other persons from surrounding towns when they visit Brighton for shopping purposes seize the opportunity to obtain a little gratuitous advice at one of the hospitals. Yet there are hospitals in the neighbouring towns and therefore there is no need for these outsiders to crowd the Brighton hospitals. It is urged that letters of recommendation should not be given indiscriminately to all subscribers. Above all, they should not be placed in the hands of impressionable ladies and of ministers and clergymen, who are more anxious to please members of their congregation than to check hospital abuse. It would be best, perhaps, to give the letters of recommendation only to medical men. In any case they would then have solely themselves to blame if cases of abuse arose. Of course some persons in Brighton resort to the London hospitals so as to avoid paying medical fees. A general practitioner described to me a case in point. The patient always paid him 5*s*. a visit and was suffering from stone in the kidney. He made arrangements to have the stone removed, but the patient suddenly disappeared: she had gone up to London, where the operation was performed at St. Bartholomew's Hospital.

From all these facts it is easy to see that there is much room in Brighton for improvement. The hospitals ought evidently to agree on a wage limit to be applied with equal severity by each institution and instead of refusing to participate in the proposed inquiry should on the contrary give it the most active support.

DRAINAGE OF PLYMOUTH.—A Local Government inquiry was held at Plymouth on May 27th into an application by the town council for sanction to borrow £7275 for works of sewerage. Mr. F. M. Williams, the medical officer of health, said that from a sanitary standpoint the improvements were absolutely needed, as owing to defective sewers the subsoil was seriously polluted.

NOTES FROM INDIA.

(FROM OUR SPECIAL CORRESPONDENT.)

The Protection of Sind.—The Camp at Reti.—The Plague in Karachi, Calcutta, and Bombay.

AFTER the first outbreak of plague in Karachi the city was free for several months. With the object of preventing a fresh importation into Sind and also with the view to put a stop to the influx of persons coming from Bombay and other infected places, railway inspection and a detention camp were established at Reti, the frontier station in Sind, on the borders of the Punjaub. The plague has since been extending and ravaging many villages in the Punjaub, and recently a recrudescence or, as some prefer to call it, a reimportation, has occurred in Karachi. This has been followed by a second outbreak, which promises to far eclipse the primary epidemic of last year. The measures adopted at Reti of examining all passengers have greatly deterred passenger traffic into the Sind province. Europeans are passed but native passengers of whatever class are detained if from an infected area, as are all native third-class travellers for at least 24 hours from whatever district they may come, the people themselves and their kit being disinfected, while those coming from the neighbourhood of an infected area are further detained for a period of 6 days, and those coming from an infected area are detained for the maximum period of 10 days. Since the examining station and the camp were established on Jan. 20th only one case of plague has been discovered, so that the value of these measures can only be ascribed to preventing an influx of people. Seeing how the disease has since developed in Karachi it is doubtful whether the supposed benefit is at all commensurate with the inconvenience to traffic and the expense of an elaborate organisation. Between 11,000 and 12,000 people have been detained in the camp. The country around Reti is a barren waste and the climate is intensely hot. One of the special plague medical officers from England is in charge with native assistants and a small force of the native police.

In Karachi itself the disease is rapidly developing and the mortality is excessively high; 1183 cases and 992 deaths—a death-rate of over 83 per cent. The Civil Hospital under European control and two or three small native hospitals have so far provided for the sick. English nurses are working at the former place, but the lodging accommodation for them immediately over the plague wards on the ground floor is most unsatisfactory. Moreover, sufficient leisure does not seem to be allowed them to leave the hospital precincts, so that they must be almost constantly breathing an infected atmosphere. In Bombay the English nurses working under the Plague Committee had many complaints against the lodging and board accommodation made on their behalf.

The medical advisers of the Government have at length come to recognise the probable influence of the rat in the spread of plague and the Government have recently issued instructions that in the reoccupation of towns and villages the multiplication of rats should be watched and persistent efforts made to destroy them. The occurrence of dead and dying rats in houses shortly before the plague breaks out among the occupants has now been repeatedly observed and that the disease in the rat is plague has been over and over again proved by bacteriological investigation. It is only recently, and especially at Calcutta, that any systematic attempt has been made to destroy the rat population prior to the occurrence of plague cases. In Calcutta only a few cases of plague have as yet occurred and although one or two fresh cases are being discovered daily it is gratifying to find that the outbreak is apparently under control. Inoculation is reported as being at a standstill. This sudden rejection of inoculation, not only for its own benefit but as an alternative to detention and segregation, is peculiarly unfortunate, because in view of a probable outbreak large numbers of the people might have availed themselves of the protection which it affords. In Bombay the plague is dying a rapid and natural death, the total daily mortality having at last come down to two figures, from 70 to 80 being the average daily number of deaths at this period of the year.

May 12th

The Plague in Calcutta, Bombay, and Karachi.—The Mortality in the Bombay Presidency.

The irony of fate has been plainly expressed by the course of events in Calcutta. Freed for so long from invasion of the plague, and probably by the great precautions which have everywhere been taken to prevent its importation, Calcutta is now suffering not so much from plague as from panic. Only a few cases have been reported and the disease does not seem to make any headway, but the alarm caused by the anticipated carrying out of the much-talked-of sanitary measures has been followed by strikes, disturbances, and the flight of large numbers of the people. Calcutta has been declared an infected port, which has also added to the trade disturbance, but the real cause of alarm is with the house-to-house visitation, isolation of the sick, segregation of contacts, and all the other measures laid down by Government for combating the plague. The corporation do not appear to be quite in sympathy with these measures and the proposed alternative of inoculation to segregation has had quite the opposite effect to that which was intended. False reports of different kinds have produced a state of unrest and mistrust among the natives, so that every action taken by the authorities is misunderstood. After the elaborate preparations which have been made in Calcutta in the event of an outbreak occurring this condition of panic and opposition must have proved very disturbing to those responsible for its sanitary administration and seems to have disorganised all attempts at concerted efforts.

In Bombay the plague continues to linger but it is rapidly diminishing. The number of plague cases recorded from September, 1896, when the epidemic was first discovered, or rather when cases of plague were first registered, up to April 22nd, 1898, is 29,062 with 26,239 deaths—a mortality of 90·2 per cent. This is much higher than elsewhere.

In Karachi the plague returns are very unsatisfactory. The numbers are very large for the size of the city and the mortality is very high—76 per cent. Inoculation is being carried on to a limited extent at various centres, but the effort must prove so small in its results because the numbers who will submit to the operation or who offer themselves for it are so few. The people are still leaving Karachi notwithstanding the various quarantine camps in Sind and the inconveniences of detention which they necessarily have to go through.

The returns showing plague cases and deaths in the Bombay Presidency from September, 1896, to April 24th, 1898, give the following rates of mortality: Bombay city, 90·2 per cent.; Karachi city, 80·5 per cent.; Thana district, 80·0 per cent.; Satara district, 78·0 per cent.; Poona district, 75·0 per cent.; Poona city, 74·4 per cent.; and Surat, 74·4 per cent. It is almost certain that the figures for Bombay are vitiated by the false returns made at the cemeteries and burning-grounds. Large numbers of cases were probably never reported. The returns from the hospitals show a mortality of about 80 per cent.

May 18th.

BIRMINGHAM.

(FROM OUR OWN CORRESPONDENT.)

The Lunatic Asylums.

THE report of the Lunatic Asylums Committee of the town council has just been issued. The medical superintendents show that there has been considerable crowding in the wards, but that some relief had been obtained by the lease of Sandwell Hall for male patients and the exchange of 30 female for 30 male patients by agreement with the Lancaster county authorities. The admissions during the year were 250 males and 189 females, that is 60 patients more at the end of the year than at the commencement, there being an increase of 87 males and a decrease of 27 females. It is pointed out that taking the ratio of these admissions to 10,000 of the population they do not show any appreciable increase in the disease itself, but merely that the excess is due to increase in population. In reviewing the causes it is found that intemperance in drink claims no less than 61 males and 47 females as its victims, showing a proportion to the total admissions of 24·4 per cent. males and 24·8 per cent. females. This is an excess over previous years and the greatest number hitherto recorded. The hereditary tendency was found to exist in 48 males and in 13 females, while no less than 99 of the total number admitted had had previous attacks of insanity. The necessity of abstinence from alcohol in those thus predisposed is emphasised by this testimony. Among other causes

22 males and 20 females suffered from epilepsy; and in the case of 16 males and 8 females some other bodily disease is attributed as a cause. Domestic troubles are assigned in 15 males and 5 females, the remaining cases being 17 puerperal and 14 congenital. The question of prevention is dealt with from a social standpoint and other subjects of interest are discussed in a very able report.

Medical Benevolent Society.

The seventy-sixth annual meeting of this society was held on May 27th. The report stated that the invested funds now amounted to £12 582 2*s.* 2*d.* and that there was a balance at the bank of £776 12*s.* 9*d.* The society has received a valuable addition to its funds in the form of a legacy of £2000 from the late Mrs. Bromell and one of £250 from the late Dr. Sharples. There were 17 annuitants on the books, the annual value of the grants ranging from £20 to £40, the total being £560. The benefit members of the society numbered 373, 17 new members being admitted during the year. The reports were adopted, votes of thanks were passed, and a dinner was subsequently held as usual.

Hospital Saturday Fund.

The Hospital Saturday collection this year amounts to £16,877 3*s.* 2*d.* from 1694 contributing establishments, as compared with £16,734 12*s.* 9*d.* from 1714 contributors at the corresponding stage of the collection last year, an increase of £142 10*s.* 5*d.*

The Ticket System at Hospitals.

At the Coventry and Warwickshire Hospital this question was discussed at a special meeting on May 25th. A sub-committee had reported that they were not satisfied with the ticket system as at present conducted. They considered that applicants for treatment, if members of sick clubs, should produce a certificate from the medical men that they were cases for hospital aid and that the medical officers should have more discretionary power in dealing with them. An amendment was carried that the report be referred back and the sub-committee asked to see whether they could not suggest proposals which would be really effective in preventing abuse of the hospital.

June 7th.

MANCHESTER.

(FROM OUR OWN CORRESPONDENT.)

Manchester Medical Staff Corps.

WHITSUNTIDE is a great holiday time in Lancashire and the people—gentle and simple—pour out of Manchester and the other large towns in crowds, while numbers more from the surrounding districts come into Manchester in search of amusement. It is a great week for Volunteers camping out and on the coast of North Wales and Lancashire their white tents may be looked for every Whitsun week. Sometimes they have good weather and enjoy their experience of life under canvas, but this year the rain has interfered much with their comfort. The two Manchester companies of the Volunteer Medical Staff Corps went into camp at Lytham under the command of Surgeon-Captain Coates. There were also present Surgeon-Captain Fairclough, Surgeon-Captain Mann, Surgeon-Lieutenant and Adjutant Phillips, Surgeon-Lieutenant Smith, Surgeon-Lieutenant Pritchard, and the acting chaplain, the Rev. Canon Kelly. The number of men under canvas was about 130. Instruction was given in bearer-company drill, the establishment of field-dressing stations, ambulance and waggon drill, &c. The corps were inspected on June 3rd by Surgeon-Colonel Scott, C.B., the principal medical officer of the north-western district. He said that he was struck with the smart and soldier-like bearing of the men and he commended the rapidity with which the work was done and the excellent manner in which the stretcher exercises were performed. He thought "the whole of the camp, and especially the work of the bearers, reflected very considerable credit upon Surgeon-Captain Coates and the officers under his command." There is one matter in which an improvement in the treatment of the Volunteers might and ought to be made. A large proportion of the tents used by the Cheshire and Lancashire Volunteer Brigade were old and worn and they "acted like sieves when the rain came, and time after time deluged their occupants as they lay in bed." They were unhesitatingly condemned by an officer of the Ordnance Department as "unfit for further service." As is well known, when a tent is thoroughly wet if it is touched on the inside by a man's head or anything else the water, instead of running down outside, drips on to the unfortunates within, much to their discomfort. The first four days of this year's camping out were excessively wet and when eight men were inside one of the bell-tents its shape rendered it almost certain to be touched by a head or two, as one of the sufferers feelingly pointed out. Notwithstanding this there seems to have been very little sickness.

Poor Children at the Seaside.

Among the most commendable of the efforts for benefiting the slum children of Manchester is that of sending them in relays through the season for a week's sojourn in summer camps by the sea. There are two small camps at St. Anne's-on-the-Sea, to which forty children will be sent weekly till the end of September. Tents have given place to corrugated iron buildings, and an excellent feature of the scheme is that military discipline is maintained—a most valuable lesson. There is another camp for little slum girls, where some 240, from six to twelve years of age, will have a fortnight's holiday during June, July and August. About two miles from St. Anne's-on-the-Sea 488 boys and 44 officers of the Manchester battalion of the Boys' Brigade have been under canvas, and at Birkdale, Southport, the committee of the Strangeways Refuges, Manchester, have their annual camp. Since the latter was started, about fifteen years ago, from 12,000 to 14,000 poor lads from the crowded districts—the back streets and alleys of Manchester and Salford and other places—have had the benefit of a week's holiday at the seaside. It is difficult for those in a different condition of life to realise what this must mean to children who have known nothing but crowded streets with all the sordid and depressing surroundings of slum life in town. In addition to the physical benefit, the mental effect of the marvellous revelation of the existence of a brighter world than that hitherto known will be difficult to calculate, but altogether good. If there are any previous ideas of cleanliness they are extended and some notion of method and orderly arrangement is obtained from the rules and regulations which are carried out with military precision. The health of the boys while in camp has been very good. On arrival their own coat, vest, and cap are exchanged for a scarlet tunic and a round forage cap bearing the name of the institution and the lad's own clothing is fumigated. At the opening of the camp this year Sir George A. Pilkington, M.R.C.S., and other gentlemen addressed the boys. There are more of these agencies for giving poor town children a country holiday, but though much is done the numbers are so great that if all are to benefit these agencies may be extended almost indefinitely

Manchester Corporation Dwellings.

It may be remembered that after the demolition of some notoriously insanitary property the Manchester corporation built large blocks of dwellings in Oldham-road and Pollard-street, which were ready for occupation in the summer of 1894. There was a strong prejudice at first among the labouring class and others against these "barracks" as they were often called, but in a couple of years it died away and now applications for tenements are so numerous that a selection can be made of the most suitable as to character. Payments are made weekly, the total number in Oldham-road being 284 and in Pollard-street 135. The rents are paid regularly and from April 1st to May 14th last there was not in either block of dwellings a single penny of arrears.

An Unfortunate Case.

An inquest was held on May 27th by Mr. Smelt, the city coroner, on the body of Thomas Smith, a carter, of Nelson, who died in the Manchester Infirmary on the previous day "from delirium consequent on his injuries." He was kicked by a horse about 9 A.M. on May 13th and sustained "a compound fracture of the right knee-cap," was taken to a medical man, who, after having attended temporarily to the leg, sent him on an ambulance to the Victoria Hospital, Burnley. To make a long story short he was received at the hospital, but as there was—or had been shortly before—a case of scarlet fever there it was thought safer for him to be removed to the workhouse infirmary. This was not done at once, and after having passed a night in the infected hospital they would not have him at the infirmary, so he was sent home and got there between 8 and 9 o'clock on Saturday night, the 14th.

He was taken to the Manchester Infirmary on Tuesday, the 17th, where he died. There has been a good deal of newspaper correspondence on this most unfortunate case under the heading, "The Burnley Hospital Scandal," and an inquiry is being arranged for between the guardians and the hospital authorities, presumably to apportion the blame, if any. A verdict of "Accidental death" was returned, but it will be difficult to convince the public that no one was at fault.

June 7th.

SCOTLAND.

(FROM OUR OWN CORRESPONDENTS.)

Glasgow University.

THOUGH no official announcement has been intimated it is generally understood that Principal Caird has resigned. He has occupied the positions of Principal and Vice-Chancellor for nearly twenty-five years and has devoted himself not without success to the cultivation of the highest and best interests of the University. His dignified presence and lofty eloquence have for long been recognised distinctions of academic tradition, and it is not less true that in the inner life of the University his scholarship, culture, and devotion to the noblest ideals have been influences of the highest value. The appointment, which is in the gift of the Crown, is of the value of £1000 a year, with a residence in the University grounds.—During the past week the examinations for degrees in medicine and surgery have been in progress. For the first time the written examinations have been taken first, the clinical tests being fixed for a later date. The 127 candidates include 19 women students from Queen Margaret College.

Glasgow Samaritan Hospital.

The dispensary for out-door patients in connexion with this hospital has until recently been carried on in a building at some little distance from the main institution presented to the directors by the late Miss Agnes Barr. An opportunity recently presented itself of selling this building to the corporation and in this way the directors have been enabled to build a new dispensary in connexion with the hospital This has now been opened and is to be called "The Agnes Barr Dispensary." The building is admirably adapted for its purpose and is fitted up with all modern conveniences.

Convalescent Home for Nurses.

The late Dr. Samuel Johnston Moore of Glasgow directed his trustees to apply the residue of his estate, amounting to about £45 000, to the provision and endowment of a convalescent home for nurses whose health might have temporarily or permanently broken down in the exercise of their profession. In conformity with this bequest the trustees have recently acquired some property at Busby, a few miles from Glasgow, and this will shortly be utilised for the above purpose. The house, which has been a family residence, stands in its own grounds and commands a beautiful stretch of country. It has undergone appropriate alterations and seems admirably adapted in every respect for a convalescent home. Dr. Moore also bequeathed a number of his books, ornaments, and pictures to the home and the comfort and convenience of the nurses have been fully consulted.

Glasgow Public Dispensary.

It has for some time been rumoured that an unfortunate dispute has been in progress between a section of the medical staff of this dispensary on the one hand and the directors with a majority of the staff on the other. The minority somehow or other appears to have managed to assert its position, for an official announcement intimates that the leading directors and five members of the staff have resigned their connexion with the dispensary.

Aberdeen City Hospital.

It has been agreed to extend this hospital (for infectious diseases) by erecting three new wings for the accommodation of servants, and as reception- and departure-rooms for patients, at a total cost of £4650. The accommodation will now be as follows: in wards for patients, 150 beds; matron, 1 room; resident medical officer, 1 room; nurses, 30 rooms; wardmaids, 7 rooms; laundrymaids, 6 rooms; head laundress, 1 room; house servants, 6 rooms; cook, 1 room; total, 53 rooms. The whole buildings have cost about £40,000.

Aberdeen Medical Volunteer Staff Corps.

This company, which is 100 strong, went into camp on June 2nd on the picturesque grounds of Urie, near Stonehaven, the county town of Kincardineshire, under the command of Surgeon-Captain J. Mackenzie Booth, and returned to Aberdeen on June 6th.

June 8th.

IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

The Royal College of Surgeons in Ireland.

THE annual ballot for the election of the President, Vice-President, and Council of the Royal College of Surgeons in Ireland took place on June 6th and excited more than usual interest on account of the close contest for the Vice-Presidency. Dr. Myles, surgeon to the Richmond Hospital, was elected by a small majority. Mr. R. L. Swan succeeds Sir William Thomson as President of the College.

The Royal Institution of Public Health.

The Lord Mayor of Dublin visited the Royal University Buildings on May 26th to confer with the Exhibition Committee in connexion with the coming Hygienic Congress. The announcement has now been made that a Health Exhibition will be held at the Royal University Buildings from Aug. 18th to 27th under the auspices of the Royal Institute of Public Health and in connexion with the Hygienic Congress which will take place at Trinity College during the same week. The proceedings will open on the morning of Aug. 18th with a reception there, after which the reading of papers, &c., will commence. On Friday evening Alderman Meade, the Chairman of the Reception Committee, will give a garden party at Ailsbury-road, while Sir Christopher Nixon will entertain the visitors at Roebuck. During that week Dublin is always overcrowded and its hotels are filled by people who come from all parts of the kingdom to attend the horse show. Visitors should remember this and make their arrangements beforehand.

The Irish Medical Association.

The annual meeting of the Irish Medical Association was held at the Royal College of Surgeons in Ireland on June 6th, the President, Dr. T. H. Moorhead, occupying the chair. The annual report, which was read, dealt largely with the provisions of the new Local Government Bill, which will make serious and important changes in matters affecting the medical officers of the Poor-law service. Dr. Arthur Benson, after speaking in favour of medical superannuation and with reference to the continued abuse of the so-called *red tickets* for free medical relief, moved the following resolution:—

That the Council be requested to persevere in the efforts made for so many years to induce successive Governments to amend the present Poor-law system; that particular regard be given to the question of superannuation of medical officers; the issue of medical relief tickets so that persons in independent circumstances may be prevented from availing themselves of the means provided by the ratepayers for the sick poor; and that annual leave of absence be granted to medical officers.

The ballot for officers for the ensuing year resulted in the election of Sir Thornley Stoker as President of the association. The annual dinner took place at the College of Surgeons on the same evening and was attended by many distinguished non-medical visitors — the Lord Mayor of Dublin, the Right Hon. the Lord Chancellor (Lord Ashbourne), the Right Hon. Alderman Meade, LL.D., the Right Hon. C. H. Hemphill, M.P., Sir Andrew Reed, C.B., Mr. J. H. Campbell, Q.C., M.P., and many others.

The Royal Medical Benevolent Fund Society of Ireland.

The fifty-sixth annual meeting of this society was held in the afternoon of June 6th at the Royal College of Physicians of Ireland. Sir George Duffey, President of the Royal College of Physicians, occupied the chair, and received the report of the Central Committee read by Dr. J. W. Moore, one of the honorary secretaries. Sir William Stokes, in moving the adoption of the report, alluded to the deficient funds of the society and to the advisability of founding free medical studentships whereby some deserving student in poor circumstances would be assisted in the progress of his profession and education. Professor Bennett, President of the Royal

Academy of Medicine, having been voted to the second chair a vote of thanks was unanimously passed to Sir George Duffey.

Gallantry.

A man named Kenny was cliff-climbing on Whit-Monday near the falls at Paula-phouca and fell into the river. A member of the Irish Constabulary, Constable A. Madden, instantly plunged in after him but was dashed against a rock to which he had to cling, while Kenny was seen clinging to another rock. A rein was brought from a neighbouring hotel and placed round Kenny's body by Mr. Richard Shaw of Dublin and Constable Madden, who had succeeded in reaching him. On Kenny being brought safely to land both Mr. Shaw and Constable Madden were warmly cheered by the spectators.

The Health of Belfast.

At the meeting of the city corporation held on June 1st it was reported that between April 24th and May 21st 428 cases of zymotic fever had been notified, viz.: 254 cases of typhoid fever, 90 of simple continued fever, 42 of scarlet fever, 21 of erysipelas, 17 of diphtheria, and 2 cases each of membranous croup and puerperal fever. The total death-rate from all causes in Belfast was 25·5 per 1000. The number of cases of typhoid fever, though large, was less than in the preceding month. An animated discussion followed the reading of the report of the Public Health Committee at the corporation meeting, several members of the city council speaking of the inefficiency and unsatisfactory condition of the Public Health Department. A sub-committee has been appointed to inquire into and report upon the working of the Health Department of the corporation. There is no doubt that there is an unusual amount of sickness in Belfast for the present season of the year. There seems to be widely prevalent an epidemic of an influenza type, some of the cases culminating in sharp attacks of laryngitis, others ending in gastric catarrh. They may in part be caused by the present weather, as few remember such an extraordinary wet season as that which we are at present experiencing. There would appear also to be cases of typhoid fever in almost all parts of the city.

Workmen's Compensation Act.

Notice has been given by the Home Secretary that applications for appointments as medical referees under the Workmen's Compensation (Ireland) Act, 1897, may be sent to his office. The referees are to be men of independent position and high standing in their profession and should have such experience of the class of questions arising as will enable them to decide with authority points in which there may be divergence of medical evidence. Other things being equal, preference, it is announced, will be given to those holding important hospital appointments or having had other special opportunities of gaining wide experience of accidents and their consequences. The Treasury have fixed the scale of fees as follows: For a first reference, to include examination and written report, two guineas; for a further written statement on the same reference, one guinea; for a second or subsequent reference in the same case, one guinea; for attendance at the proceedings on the request of a county court judge at a time and place to be arranged, three guineas. If the medical "referee" has to travel more than two miles from his residence he will be paid an addition of 5*s.* for each mile of distance. These medical referees (of whom at first one or more will be appointed for each county and paid by the Treasury) will have as their principal duty to act as the advisers in medical matters of the committees, arbitrators, and county court judges who are empowered to decide all questions arising in proceedings under the Act.

June 7th.

PARIS.

(FROM OUR OWN CORRESPONDENT.)

Treatment of Pott's Disease by Forcible Reduction.

M. CALOT brought before the Academy of Medicine on May 31st about twenty young persons who had suffered from Pott's disease and had been successfully treated by his method. He allows his patients to walk some weeks after the reduction of the deformity if the disease has come to an end, but only some months after it if the disease is still in progress and they continue to walk as long as the treatment is continued. He attaches much importance to this part of the procedure, which by enabling the children to move about has the best effect on their general health and appears to promote the consolidation of the spinal column. It can, however, be accomplished only when the apparatus is large and well made, surrounding the body and fitting the lower part of the skull; it must keep the spinal column exactly in position without interfering with the act of walking. As soon as consolidation has begun the large plaster apparatus is replaced by a corset, which is worn for a year or two, or even longer, if requisite for ensuring the rigidity of the spine. With this corset—which is very little, if at all, perceptible under the clothing—the children can attend school and in most respects do as other children do. M. Calot showed two children who walked about wearing a large plaster apparatus which fitted the lower part of the skull and also two children with the little corset.

Foreign Bodies in the Œsophagus.

At the same meeting of the Academy of Medicine M. Monod read a report on an observation by M. Monier relative to a case of a foreign body in the œsophagus. A child, five years of age, had swallowed a coin of the size of a halfpenny which had become impacted at the level of the left bronchus. M. Monier ascertained its position by means of the Roentgen rays and performed external œsophagotomy, which resulted in recovery. M. Monod considered that this operation was preferable to direct extraction, as the foreign body had been swallowed a year previously and was by this time embedded. Radiography was of conspicuous advantage in cases of this kind. M. Réclus mentioned a similar observation in which a coin had been swallowed for five days and was already embedded. In this case, also, radiography enabled its exact position to be determined.

A New Tuberculin.

MM. F. Ramond and P. Ravaut reported to the Society of Biology on May 28th that bacilli of the tuberculosis of fish, discovered by Dubard, had been cultivated by them in bouillon containing glucose and glycerine, and that on filtering these cultures through porcelain they obtained a toxin which by its smell and its biological reactions exactly resembled the tuberculin derived from the bacillus of tuberculosis occurring in the human subject. With this new toxin they made experiments in two series as follows. First, a tuberculous guinea-pig was inoculated with the toxin, the result being the production of pyrexial reaction with shivering and prostration lasting for six hours, although neither the control guinea-pig nor even the tuberculous guinea-pig, which had received control injections of glycerinated bouillon, showed any pyrexial reaction. Secondly, two guinea-pigs, which had been inoculated on different dates with the bacillus of fish tuberculosis and which exhibited some emaciation, were injected with half a cubic centimetre of ordinary tuberculin; they both showed a well-marked pyrexial reaction, amounting in the first to 2° C. and in the second to 1·5° C.

Mental Derangement after Operations.

At the Surgical Society M. Picqué, on May 5th, resumed a long discussion, which has already occupied several meetings, on the subject of Mental Derangement after Operations. His conclusions were as follows:—1. There are lunatics who only seek surgical advice under the influence of insane ideas and against whom the operator must be on his guard. 2. There is a class of patients who do not show any signs of mental disorder at the time of the operation but subsequently become deranged sooner or later. These are examples of mental derangement after operations, a state which must not be mistaken either for toxic delirium or for that produced by infection. Gynæcological operations do not predispose to it more than others. 3. The mental disorder does not assume any constant form; it may be marked either by excitement or by depression. 4. As regards the cause of these phenomena the majority of the observations show that a great number of the patients have either suffered from actual insanity or have an hereditary predisposition to it. 5. The mental state of the patients ought to be examined before every operation, but this examination would not enable mental disorder following the operation to be foreseen.

The Maternity Hospital.

M. Felix Faure, the President of the Republic, accompanied by M. Barthon, M. Le Gall, and General Hagron, visited the Maternity Hospital in the boulevard de Port Royal on May 27th. The President passed through all the

wards of the establishment and spoke to the patients whose circumstances called for any special remark, listening to the recital of their needs and wishes. Many of them had husbands who were at home either ill or out of work and children with no one to look after them, the consequence being that the women refused to remain in the hospital till their health and strength were fully restored and many serious complications originated in this way. The President of the Republic has consulted the Director of the Assistance Publique and the presidents of the municipal council and the general council with respect to this question and has expressed a desire to take joint action with them. The part of the hospital last visited was the ward containing the incubators for prematurely born infants. On leaving, M. Faure complimented the staff on their zeal and devotion and in his own name handed to the director a sum of 500 fr. (£20) to assist necessitous patients on their discharge.

A New Ambulance Station.

A new station for municipal and city ambulances in the rue Caulaincourt, in the north of Paris, was formally opened on June 3rd at 5 P.M. After an inspection of the premises lunch was served in one of the rooms, and M. Veber, a member of the municipal council, speaking in the name of the council, enlarged on the necessity for developing all the public services connected with hygiene. M. Strauss, a member of the Senate, then briefly recounted the endeavours which had been made by the council to organise a system of first aid for sick and injured persons. The new ambulance station has nine vehicles, together with a large staff of male and female attendants, telephone clerks, and coachmen, and is furnished with every requisite not only for first aid to the sick and injured, but also for the disinfection of living rooms and personal effects.

June 6th.

Obituary.

ROBERT WALLIS, M.R.C.S. ENG., L.S.A., J.P.

THE death of Mr. Robert Wallis of Old Ridley, New Stocksfield, Northumberland, in his eighty-ninth year, is felt as a real loss in the neighbourhood of Newcastle. He was one of a considerable number of medical men whose constitution and whose talents enabled them to live, as it were, two lives. Mr. Wallis filled for the last fifty years many most important public offices. He was alderman and twice mayor of South Shields, of which town he was a native, before his removal to Old Ridley nearly forty years ago. He was for fifty years a director of the South Shields Gas Company and for forty of these its chairman, only on one occasion failing to attend its annual meeting, where he was in the habit of making lucid statements of the state and prospect of the business. He discharged this function so lately as February last. He was a member of the River Tyne Commission. He was an active county magistrate and for some time chairman of the Hexham bench. He was also an energetic member of the county council of Northumberland and held the very important position at one time of chairman of the Standing Committee. Such are the public offices which Mr. Wallis filled and filled with such ability as to call forth the wide and just praise of the press of his district. But such accounts, which are exceedingly gratifying to us to read, scarcely mention his professional life, which was an honour to his native town. He was trained at University College and was a pupil and, if we remember rightly, a house surgeon under Mr. Liston. He had all the qualities which endear a practitioner to the community which he served. Naturally, and by the privilege of his pupilage, he was a good surgeon; his judgment in the treatment of disease was sound; and his courtesy and kindness were unfailing and without respect of persons. No wonder that his advice was much sought and that he was much consulted and entirely trusted by his fellow practitioners as well as by his fellow townsmen. Such professional lives may be partly eclipsed when they are succeeded by a public life of great activity and usefulness. But it is our duty as it is our pleasure to recall the medical basis of the whole life and to show that such a basis is one of the best on which to build public character and public work. Mr. Wallis married somewhat late in life and leaves a widow and two sons to mourn their loss.

WILLIAM ILIFFE, M.R.C.S. ENG., L.S.A.

MR. ILIFFE, medical officer of health for the borough of Derby, died very suddenly about 10 P.M. on June 3rd at his residence in Osmaston-road. He had felt unwell for some little time, but had nevertheless on the day of his death attended to his professional engagements as usual, including a visit to the infectious diseases hospital, and was passing the evening with his family when the fatal seizure occurred. Mr. Iliffe was a native of Nuneaton and was fifty-three years of age. He studied medicine at St. Bartholomew's Hospital and in 1866 took the diploma of M.R.C.S. Eng., to which he added that of L.S.A. in the following year. About 1870 he went to Derby, where he practised in partnership with his brother, Mr. Frank Iliffe, and showed such professional ability that in 1876 he received the appointment of medical officer of health, the duties of which he carried on concurrently with an extensive private practice until 1895, thenceforth devoting his whole time to the service of the borough. Mr. Iliffe was very energetic in his public health work, and did much to improve the sanitary condition of the district under his charge. He has left a widow, one son, and three daughters. An inquest was held by the coroner on June 4th, when the jury returned a verdict of "Death from syncope" and expressed their sympathy with the family.

THE GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION.

TUESDAY, MAY 31ST.

THE earlier proceedings of the Council on this the last day of the session have been reported in THE LANCET of June 4th.

The Pharmacopœia.

The Pharmacopœia Committee beg leave to report to the Council as follows:—

Since the last meeting of the Medical Council the fourth British Pharmacopœia, which has been in preparation during the past five years, has been published. The final revise having been approved by the Pharmacopœia Committee on Feb. 21st, 1898, the Chairman of the Committee, our late President, Sir Richard Quain, handed over the completed proof to the Executive Committee for publication, and subsequently, on behalf of the Executive Committee, ordered the printing of 20,000 copies. Thus by almost the last official act of his life he completed a work in which he had taken the greatest interest and over which he had watched with solicitude and care. It is worthy of note that his official connexion with the revision of successive Pharmacopœias dates from 1864 and remained unbroken up to the time of his death.

The distribution of the Pharmacopœia of 1898 commenced on May 7th, and up to the 25th of the month 11,385 copies have been sold. The committee desire to place on record their special indebtedness to two members of their own body, Dr. Leech and Dr. MacAlister, whose original investigations have greatly assisted in the solution of many problems which called for anxious consideration and who have brought to bear upon the whole of the work a very remarkable combination of great chemical, pharmacological, and pharmaceutical learning with the skill and experience of practical physicians. In the preface to the Pharmacopœia of 1898 it is stated that "the Council have in contemplation the early preparation of an addendum, in which medicinal plants and other substances suggested for inclusion by Indian and colonial authorities will be dealt with more fully than has now been possible." The committee have already initiated the necessary arrangements for the preparation of this addendum. A first proof will be ready in about six months and will be submitted to the Indian, colonial, and other medical authorities interested. It is hoped that the addendum may be completed for publication in eighteen months.

Resolutions have been passed by the committee to the following effect:—(1) That Dr. Tirard be asked to continue his service as secretary until the publication of the colonial addendum; and (2) that Dr. Attfield be appointed editor of the addendum, and that he be assigned an additional honorarium of one hundred guineas.

The Pharmacopœia Committee have drawn up, with the assistance of the editor and secretary, the appended account of the methods adopted in preparing the British Pharmacopœia of 1898:—

The British Pharmacopœia of 1898 has been prepared by methods more or less resembling those adopted in preparing the pharmacopœias of 1864, 1867, and 1885, and the Addenda of 1874 and 1890, but with important modifications and elaborations of former procedure.

In the British Pharmacopœia of 1864 the Pharmacopœias of London, Edinburgh, and Dublin were merged, hence its compilation was appropriately carried on by three sub-committees sitting respectively in the three capitals. The members of the Pharmacopœia Committee appointed by the Medical Council associated with themselves Members from the three Colleges of Physicians, members of the Pharmaceutical

Society of Great Britain, and several experts. This body of compilers then divided into three sub-committees, each undertaking a third portion of the whole work. To each sub-committee a secretary was appointed. The resulting volume was in two parts: (1) Materia Medica; and (2) Preparations and Compounds (Minutes of Council, vols. i., pp. 6, 70, 89; ii., 30, 80, 159, 213, 238; xxxii., 17). In 1867 the Pharmacopœia of 1864 was revised by two editors under the direction of a small committee sitting in London. The division of the book into parts was discontinued, the metric system of weights and measures was recognised in an appendix, while many of the published researches that had been reported at the suggestion of the Medical Council (Minutes, vols. iii., p. 464, and v., pp. 312, 323) and by the present editor (*Pharmaceutical Journal*, second series, vols. v., pp. 561, 628, and vi., p. 7) were utilised. A small volume of "Additions" was issued in 1874. The third British Pharmacopœia in 1885 was prepared under the direction of the Pharmacopœia Committee of the Medical Council by three editors aided by suggestions and assistance from several of the medical bodies, from medical practitioners, and from pharmacists. The methods adopted in its compilation were those of the previous Pharmacopœia, but the chemical nomenclature was modernised, proportional parts were freely introduced as gradually leading up to the more general use of the metric system of weights and measures, and the omission of detailed processes for chemical substances was commenced. In 1890 an Addendum was issued under the supervision of the Pharmacopœia Committee of the Medical Council, aid in selecting the additions being rendered by twelve of the medical bodies of Great Britain and Ireland and practical assistance being given by a committee of the Pharmaceutical Society of Great Britain. The annual reporter to the Council, who had been appointed in 1885, was the editor of the Addendum.

The British Pharmacopœia of 1898 was prepared, like the three previous Pharmacopœias, under the supervision of the Medical Council's Pharmacopœia Committee, which includes representatives of the medical bodies of England, Scotland, and Ireland. All the meetings of the committee were held in London. In selecting additions to, and in deciding on omissions from, the previous Pharmacopœia aid was rendered by sixteen medical bodies of the kingdom. Assistance, advisory and experimental, was rendered by a committee of the Pharmaceutical Society of Great Britain. For the first time medical and pharmaceutical bodies in India and the colonies contributed to the production of the Pharmacopœia. The help of referees in chemistry, botany, and therapeutics was occasionally obtained. The editor advised specially on all matters relating to pharmaceutical chemistry. The yearly abstracts of published researches which had been drawn up by the reporter from 1886 onwards at the desire of the Council were found of much value. The metric system of weights and measures appeared in the text of the Pharmacopœia, side by side with the imperial system, and was alone employed in all paragraphs relating to analysis. Except in the Latin titles the chemical nomenclature was further modernised and the exclusion of details of the modes of making chemical substances, begun in 1885, was completed.

So far the methods of preparing the British Pharmacopœia of 1898 have been described broadly and in relation to the methods adopted in preparing the Pharmacopœias of 1864, 1867, and 1885; some details will now be given. The decision to alter, amend, and republish the British Pharmacopœia of 1885 was taken by the Medical Council in December, 1893. Soon after the publication of the third Pharmacopœia—namely, on Nov. 17th, 1886—the attention of the Council had been drawn to "the question as to whether or not any changes—and, if any, what changes—can be effected in a British Pharmacopœia to better adapt it to Indian and colonial requirements" (Minutes, vol. xxiii., p. 127). A letter received by the Council in 1892 from the Government of India, suggesting the omission of saffron from certain official preparations and the use of an oil indigenous to India in the manufacture of official ointments, emphasised the question. The result was that letters were written by the President of the Council to the Lord President of Her Majesty's Privy Council, stating that if the medical and pharmaceutical authorities resident in India and the colonies would bring before the Medical Council such a list of suggestions relating to any part of the British Pharmacopœia as their knowledge of the pharmacology and pharmacy of their respective countries or districts might enable them to make, the communication should receive the fullest and best consideration of the Medical Council, and praying the Lord President to direct the attention of the Indian and colonial authorities to the matter. The development of this action induced the Council on Dec. 4th, 1893, to decide on the preparation of another Pharmacopœia and to appoint an editor (Minutes, vols. xxix., p. 77; xxx., pp. 73, 74, 122, 162).

In the earlier portion of 1894 the President, at the suggestion of the editor, decided that when omissions and additions had been settled, and the first series of preliminary experimental investigations had been completed, the alphabetically arranged Pharmacopœia should be temporarily broken up into ten sections and that proofs, one section at a time, should be set up in type and laid before the Pharmacopœia Committee of the Medical Council and a Committee of the Pharmaceutical Society (Minutes, vol. xxxi., pp. 82 to 84, and 164 to 171). In November, 1894, the Pharmacopœia Committee of the Council decided that letters should be addressed to the respective medical authorities of Great Britain and Ireland asking for their coöperation and assistance, replies being requested before the ensuing April. At the same meeting the Council of the Pharmaceutical Society of Great Britain was invited to nominate a Pharmaceutical Pharmacopœia Committee to report, with the concurrence of the Society's Council, to the Medical Council through the Pharmacopœia Committee of the latter Council. At the May Session of the Council in 1895 the Pharmacopœia Committee had the following 34 printed documents at disposal as material for preparing the new Pharmacopœia: Nine Annual Reports, 1886 to 1894, on the Progress of Pharmacy in relation to the revision of the Pharmacopœia, 194 pages; Reports from Sixteen of the Medical Bodies of Great Britain and Ireland containing suggestions as to omissions, additions, and alterations, 84 pages; a Tabulated "Summary" of the sixteen Reports just mentioned, arranged for ready reference and discussion by committees and including blank columns on which to record the decisions reached, 123 pages; a Summary of Twenty-eight Communications from India and the colonies respecting the revision of the Pharmacopœia and respecting local requirements which might be met should any extension of the usefulness of the Pharmacopœia to all parts of the empire be carried out, 57 pages; a Tabulated Memorandum on the British Pharmacopœia by the Therapeutic Committee of the British Medical Association, including statements from nearly 6000 medical practitioners as to official medicines "often," "rarely," or "never" used, and opinions respecting additions, alterations, and omissions, 12 pages; Statistical Tables founded on answers to questions as to official medicines "frequently," "seldom," or "never" prescribed or sold, and conclusions as to additions and omissions, from the Pharmacopœia Committee of the Pharmaceutical Society, 17 pages; Analysis of 10,000 Prescriptions dispensed by pharmacists in various districts of the United Kingdom during the first quarter of the year 1886, extracted from the *Chemist and Druggist* of April 24th, 1886; Analysis of 12,000 Prescriptions dispensed in six pharmacies in Aberdeen, Bournemouth, Carlisle, Cork, London, and Oxford, by W. Martindale, 91 pages; a Tabulated Summary of the four preceding documents, arranged in columns and including a column showing how many of 13 medical bodies of the United Kingdom recommend omission of the respective official articles, 79 pages; the Unofficial Formulary of the British Pharmaceutical Conference, 32 pages; a General Report from the editor giving (*a*) a description of the work already accomplished; (*b*) an outline of the contents of the foregoing documents; (*c*) an estimate of the amount of work to be done and an estimate of the date on which the first proof of the whole Pharmacopœia might be expected to be ready, the estimated date being four years from the commencement of the work. (Minutes of Council, vol. xxxii., p. 90; also the Minutes of the Meetings of the Pharmacopœia Committee of May 31st, June 3rd, and June 5th, 1895.)

To deal with this mass of material it was decided on June 5th, 1895, to call the members of the Pharmacopœia Committee together for three days towards the end of July and again in the following November prior to the autumn session of the Council. The Pharmaceutical Society's Committee was at the same time requested to be good enough to give the Council the benefit of its advice on the pharmaceutical questions raised in the summaries of the suggestions by the British, Indian, and colonial authorities and generally on the preparations in the Pharmacopœia, copies of the summaries accompanying the request as well as copies of the nine annual reports, bound together, with a general index. The editor was instructed to place his services at the disposal of the Pharmaceutical Committee. On June 5th, also, a secretary to the Pharmacopœia Committee of the Medical Council and at the same time referees in chemistry, in botany, and in pharmacology and therapeutics were appointed.

A year and a half had now been occupied in getting together from all parts of the empire the material necessary for the production of the fourth British Pharmacopœia. The next two years were fully occupied with the elaboration of the respective ten sections of the book and then nearly one year was required for (*a*) the scrutiny by the Council of the reunited sections; (*b*) the preparation of eleven appendices; (*c*) the harmonisation of text, appendices, prefatory pages, and index; (*d*) the preparation of a few scores of copies of the Pharmacopœia for a month's inspection by pharmacists and for notice by the journals of medicine and pharmacy; and (*e*) for seeing an edition of 20,000 copies through the press. It may here be stated that every proof of each of the ten "sections" was submitted four times at least to the Council's committee and four times to the Pharmaceutical Committee. Thus, the editor having prepared a proof of a given section, it was submitted to the committees; the first time for general examination and for any additional adaptations of general principles, the second for revision, the third for provisional acceptance, the fourth for confirmed acceptance; each time the corrections were incorporated in a single proof, which was reprinted and distributed to the members of the two committees. For three of the sections five different proofs were necessary, for one of the sections six proofs, and for the first section seven proofs. The following statement shows the classification of the sections, the number of separate proofs examined, and the percentage proportion of the Pharmacopœia occupied by each of the respective sections.

1. Alcohol, spirits, tinctures. Seven proofs. 7·4 per cent. of the pages of the book.
2. Materia medica. Four proofs. 13·3 per cent.
3. Waters, decoctions, infusions, mixtures, wines. Five proofs. 3·3 per cent.
4. Confections, mucilages, oxymels, sugars and syrups, tablets, lozenges. Five proofs. 3·5 per cent.
5. Chemical substances, in text and appendices. Five proofs. 28·4 per cent.
6. Fats, glycerins, liniments, oils, ointments, plasters, resins, suppositories. Four proofs. 9·4 per cent.
7. Extracts, pills, powders, juices. Four proofs. 7 per cent.
8. Vinegars, hypodermic injections, discs, solutions, lotions. Four proofs. 6 per cent.
9. Preface and prefatory pages. Four proofs. 5·7 per cent.
10. Index. Three proofs. 16 per cent.

The Pharmacopœia Committee of the Medical Council met on thirty-five days; the Pharmaceutical Society's Committee also met on thirty-five days; every sitting of a committee occupied an average of four hours. The editor attended each of the seventy meetings to contribute his editorial services and as far as possible to keep the two committees in communication with each other. When the material of the eight sections of the text had been re-arranged in alphabetical order the whole was revised, and the appendices, prefatory pages, and index were duly added. There were four revisions of the completed book before a proof of the whole was presented by the Medical Council's Pharmacopœia Committee to the Executive Committee on Feb. 21st, 1898. The type of the book was set up for the ultimate octavo-page volume, but the proofs were printed on a quarto page, and on one side only, thus allowing ample margins and blank pages for comments. Every proof was marked "Private and Confidential."

On assembling for three days in July, 1895, the Pharmacopœia Committee of the Medical Council proceeded to deal with the material and with the subjects described in the foregoing paragraphs. Several matters of detail having been disposed of, the committee considered a long preliminary report from the Pharmaceutical Society's Committee on the many pharmaceutical questions which had been raised by the medical authorities of Great Britain. The second important subject was only provisionally dealt with; it was that of the 95 suggested "additions" to the Pharmacopœia. The consideration of the 410 suggested "omissions" was commenced on the third day, and of 175 substances it was decided to retain 78 and postpone decision respecting 24. On re-assembling for two days in November, 1895, the committee,

after dealing with many matters of detail, completed the consideration of the remaining 235 "omissions" suggested by the medical authorities. As a result the "omissions" recommended by the committee amounted to 188, the "additions" to 80, while 11 articles were transferred from the text to an appendix. The official articles in the text of 1885 and the additions of 1890 amounted to 943. Deducting the 11 transferred articles, the previous Pharmacopœia contained 932 articles, the present 829. The prefatory pages of the present Pharmacopœia may be consulted for further results of these methods of dealing with the subject of additions to and omissions from official remedies prior to 1898, but allowing for any slightly altered substances which appear under new names and for any altered substances which still retain old names, there is a reduction of at least 10 per cent. in the very large number of official remedies at the disposal of prescribers prior to 1898. The application of similar methods in future may be expected to result in the gradual elimination of other less trustworthy medicinal articles and the possible inclusion of newer remedies.

The editor's proofs were in the first instance placed before the Pharmacopœia Committee of the Medical Council and then were submitted to the Pharmacopœia Committee of the Pharmaceutical Society for general consideration and suggestions, while special difficulties were reserved for the referees. The President of the Medical Council in his address on June 2nd, 1896, stated that "the Pharmaceutical Society's Pharmacopœia Committee has been engaged more or less continuously in replying to the many questions of the Pharmacopœia Committee of the Council and has already sent in three reports." A fourth report, dated Feb. 5th, 1897, was subsequently received. Moreover, the results of the deliberations of the Pharmaceutical Committee and of pharmaceutical processes carried out by its members were noted by the editor on the margins of his proofs and duly conveyed to the Medical Council's Committee, the deliberations of the latter in all matters pertaining to pharmacy being similarly conveyed to the Pharmaceutical Committee in accordance with the understanding between the two committees. The work of the Pharmacopœia Committee of the Medical Council during 1896 and 1897 included the consideration of reports on doses by a sub-committee, reports from the eight referees, reports from the secretary and the editor respecting the index to the Pharmacopœia, the examination of some hundreds of samples of tinctures, spirits, concentrated solutions, ointments, and other substances prepared by the editor; reports from the editor on the strengths of certain dilutions of alcohol respecting which he had sought the assistance of officers of the Excise, on weights and measures in which he had unofficially sought the help of the Warden of the Standards, on the descriptions of the processes by which chemical substances are prepared in which he had been assisted by manufacturing chemists, a report on chemical nomenclature appropriate to the Pharmacopœia, and a report on a practical method of introducing metric weights and measures into the text of the Pharmacopœia. But the chief and most laborious duty of the committee was the detailed consideration and correction of the proofs of the ten sections of the Pharmacopœia and of four proofs of the whole Pharmacopœia. Not only were the proofs considered at the meetings, but the members of the committees both of the Medical Council and of the Pharmaceutical Society gave much attention to them in the intervals of the meetings and frequently corresponded with the editor respecting them. Completed copies of the volume were submitted to the members of the Medical Council, and their corrections having been inserted the final revised proof was by the authority of the Council put into the hands of the Executive Committee for publication.

To minimise the inconvenience to medical practitioners and pharmacists inevitably attending the publication of an altered and amended Pharmacopœia the Executive Committee, on the recommendation of the Pharmacopœia Committee, gave to all persons concerned access to copies of the final proofs in London, Edinburgh, and Dublin, and placed copies of the proofs at the disposal of the editors of the chief British journals of medicine and pharmacy during the period occupied in printing, binding, and preparing for sale a very large edition of the book. The plan has been so far satisfactory that not only during a whole month did a large number of persons attend at the chief office and branch offices and examine the copies, but the journals gave full and in some cases most minute and carefully compiled descriptions of all omissions, additions, and alterations as between the issues of 1885 and 1898.

All important documents relating to the production of the British Pharmacopœia of 1898, including correspondence and all proofs annotated by compilers, have been arranged and preserved for any future reference that may be necessary.

In submitting the motion Mr. CARTER said he hoped that in future the chairmanship of this Pharmacopœia Committee would be filled by Dr. Leech. The appendix to the report was intended to be a history of the steps and methods in which the new edition of the British Pharmacopœia had been compiled and would be a valuable piece of historical information.

Dr. LEECH congratulated the Council on the completion of the work. Their late President, Sir Richard Quain, had been most anxious that the new edition of the book should be completed during his life and that his name should be associated with it and he (Dr. Leech) thought the Council would be glad that Sir Richard Quain's wishes were realised. The Council should express their obligation to other workers on the book. To the referees they were much indebted for criticisms and suggestions. In the committee of the Pharmaceutical Society they had a large number of the ablest pharmacists in this or any other country who had paid the greatest attention to the subjects remitted to them, with the result that they had more correct descriptions of doses, &c., than ever previously published. Then the Council were indebted to the nineteen corporate bodies which sent reports and very greatly indebted to Dr. Attfield for his editorship and excellency of organisation in the preparation of the book.

The PRESIDENT proposed:—

That the best thanks of the Council be given to the Pharmacopœia Committee for the laborious duties which they have discharged during the last five years and which have resulted in the production of a work which they have every reason to believe will be satisfactory to the profession.

This proposal was unanimously carried, as was also a second motion tendering thanks to the committee of the Pharmaceutical Society; to the referees in chemistry, botany, and pharmacology; to Dr. Tirard, the secretary; and to Dr. Attfield, the editor.

A Special Case.

On the motion of Dr. MACALISTER, seconded by Mr. BRYANT, it was agreed, on the recommendation of the English Branch Council, to register the name of Dr. Robert Arnold Barker, Lic. Soc. Apoth. Lond. 1861, M.D. Univ. St. And. 1862. The mover explained that the case was on all fours with others dealt with in previous sessions.

Students' Registration.

On the motion of Sir DYCE DUCKWORTH, seconded by Dr. MACALISTER, a six-page report by the Students' Registration Committee was adopted.

Unqualified Assistants.

Mr. TEALE, on behalf of the committee appointed on the previous Thursday to consider certain petitions and communications relating to the Council's new regulations respecting the employment of unqualified assistants, presented a report. He thought it was to be regretted that a subject which had attracted so much attention should have been reached only on the last day of the session, and owing to the hour of the day which had been arrived at he was compelled to speak under great pressure for want of time, and he was consequently afraid he would hardly do justice to the subject matter in hand. When the question of the employment of unqualified assistants was before the Council at their meeting in November last he had tried to get the Council to see that they were making a new departure. He had failed to convince them of that and he maintained still that their resolutions formed an entirely new departure. Certainly it was foreseen that their action must come and he was not saying that the Council were not right in doing what they did, but what he contended was that in introducing such a change they ought to have given sufficiency of notice to all who might be affected by it. It had been his view that it would be reasonable notice if it was decided that the Council's resolutions should not take effect until 1900. He, however, had been overruled on this point also, and the insufficient appreciation accorded to his position on the matter was made clear, he thought, in what had resulted. Many members of the Council had had it brought to their notice that the resolutions had inflicted very great hardships on unqualified assistants and very great inconvenience and some hardships upon medical men who had been using unqualified assistants. A sort of panic had been created among the latter, mainly, however, because they had not quite understood the Council's meaning. Anxious not to do wrong they had read into the Council's resolutions more severe requirements than the Council intended. He did not suppose the Council would now go into a more minute explanation of what was meant and the committee on whose behalf he now spoke did not recommend that they should do so. But in carrying out the new rule he hoped, if the Council did not see their way to go back to his proposal that the resolutions should remain in abeyance until 1900, that they at least would adopt the view of the committee. On examining the documents referred to them the committee had found that the chief questions raised therein might fairly be classified under the following heads:—

1. Whether the Council can consistently with the law authorise the examining bodies to hold special examinations for a particular class of persons who have lately been employed as unqualified assistants.
2. Whether the Council is prepared to suspend the operation of the resolution adopted on Nov. 24th, 1897, in the interest of certain practitioners who state that they are at present unable to obtain qualified assistance in their practice.
3. Whether the Council can take any steps for the reinstatement of certain unqualified assistants who have been dismissed by their employers since the issue of the Council's notice.
4. Whether the Council should issue any detailed definitions or explanations as to the extent to which unqualified persons may be "legitimately employed" by registered practitioners.

The committee, Mr. Teale went on to show, had carefully considered these questions and they recommended that the

answers to them by the Council, who should not receive deputations on the subject, should be:—

1. The Council has no power under the Medical Acts to request or to authorise any of the licensing bodies to institute special examinations for a registrable licence other than the "Qualifying Examinations" in Medicine, Surgery, and Midwifery defined by the Act of 1886.

2. There appears to be evidence that at the present moment certain practitioners do find difficulty in obtaining the services of legally qualified assistants. Junior practitioners are no doubt unwilling in many cases to accept the inferior and ill-paid positions which have hitherto been occupied by unqualified men. But it is reasonable to expect that before long improvement in the terms and conditions offered by principals and the natural operation of the economic law of supply and demand will remove the difficulty complained of. The Council cannot regard such a temporary inconvenience as a ground for suspending the operation of a resolution deliberately adopted by it with a view to the repression of fraudulent and dangerous practices.

3. It is not within the province of the Council to take any steps in the direction suggested.

4. The terms of the notice issued by the Council convey with sufficient clearness the limitations which it was intended to place upon the employment in connexion with medical practice of unqualified persons by registered practitioners. The registered practitioner will be liable to proceedings before the Council: (1) if he knowingly allows "such unqualified persons to attend or treat patients in respect of matters requiring professional discretion or skill"; (2) if he thus allows "such a substitution of the services of an unqualified person" for his own, this substitution being "in its nature fraudulent and dangerous to the public health"; (3) if under cover of his own qualifications he knowingly does anything to enable "an unqualified or unregistered person to attend or treat any patient, to procure or issue any medical certificate or certificate of death, or otherwise to engage in medical practice, as if the said person were duly qualified and registered."

The employment of unqualified "dressers, midwives, dispensers, and surgery attendants" can be "legitimate" only (1) if it does not come under one of the foregoing heads, and (2) when it is carried out "under the immediate personal supervision of registered medical practitioners." The Council do not think it necessary or expedient to issue more precise definitions or to lay down regulations intended to meet all the particular cases which may arise. As in all other instances the Council must deal with each case on its merits. Whenever a practitioner is alleged to be making improper use of unqualified assistance the Council will have to be satisfied that the allegation is fully substantiated.

These recommendations were moved one by one by Mr. TEALE and seconded chiefly by Dr. BRUCE. In seconding the last of the four Dr. MACALISTER remarked that if the Council's position was made clearer by it he should be very glad. The sub-headings and definitions had been taken from the notice already issued and in this "No. 4" there was nothing fresh in principle.

The new form for the notice was supported by Mr. BROWN and Mr. HORSLEY and all the four recommendations were unanimously adopted.

It was stated by Dr. MACALISTER, in reply to the PRESIDENT, that these answers would be sent to the persons who had communicated, or might communicate, with the Council on the subject of the employment of unqualified assistants.

Council Documents.

Dr. MACALISTER, seconded by Mr. BRYANT, moved:—

That in pursuance of the Council's resolution of May 25th in reference to the inspection of documents, the following chapter be added to the Standing Orders.

XXIII.—INSPECTION OF DOCUMENTS.

1. Members of the Council who desire access to unpublished documents (other than documents relating to Penal Cases) which are the property of the Council shall be required to obtain leave for inspection thereof either from (1) the Council, or (2) the Executive Committee; or (3) if neither body be in session or about to be in session from the President.

2. The application for leave shall be in writing and shall specify so far as is possible the nature of the documents to which access is desired and also the purpose for which the inspection is to be made.

3. Leave to inspect documents relating to penal cases shall not be given except by the Council itself.

4. Documents to which access is permitted under this Standing Order shall not be removed from the offices of the General Council.

5. All information derived from the inspection of the Council's documents under this Standing Order shall be regarded as strictly confidential.

Dr. MACALISTER said that he had added paragraph 4.

Mr. HORSLEY rose to resist this motion because, he said, he was convinced from what he had heard that members of the Council had agreed to the resolution without a full knowledge of the facts. He did not intend to repeat the points raised when Dr. Glover's proposal was under consideration. He had abstained absolutely from taking part in the discussion and division on the proposal, but now that it was proposed to make the resolution into a Standing Order the situation had become too serious to permit it to go forward without at least a protest. Mr. Horsley was proceeding to contend that it was within the rights of members at all times to see the documents belonging to the Council, and that the action of the President in shutting him out from documents, and of the Council under this motion, was *ultra vires*, when

The PRESIDENT informed him that he could not revive the old discussion of Tuesday, May 24th.

Mr. HORSLEY contended that he had a right to speak.

Dr. HERON WATSON pointed out to him that the President had ruled him out of order.

Mr. HORSLEY did not understand that.

The PRESIDENT said that he had ruled Mr. Horsley out of order.

Dr. HERON WATSON moved the previous question.

Dr. MACALISTER: That is an unfortunate proposal, for if it be carried the Council must proceed to the next business on the paper.

On a division the previous question was rejected by 9 votes to 6, and Dr. MACALISTER'S motion was passed by 12 votes to 3.

The PRESIDENT said that as the motion had now become a Standing Order he would make it a rule that the answer to all applications made to him should be given through the Registrar, so that there might be a copy of his answer in the office.

Mr. CARTER suggested that it would be in form if applications to the President were also made through the Registrar.

Committees.

The Council proceeded to the appointment of standing committees. The Pharmacopœia Committee was re-appointed, with Dr. Leech as chairman. No change was made in the Finance Committee. Mr. Tomes was appointed a member of the Dental Committee and also of the Dental Education and Examination Committee. Sir William Thomson was put upon the Students' Registration Committee in the place of Dr. William Moore. The other committees were composed as follows:—

EXAMINATION COMMITTEE.—Sir Dyce Duckworth, Mr. Bryant, Mr. Teale, Dr. Heron Watson, Dr. Pettigrew, Dr. McVail, Sir Philip C. Smyly, Sir William Thomson, and Sir Christopher Nixon.

EDUCATION COMMITTEE.—Dr. Mac Alister, Dr. Glover, Dr. Church, Sir John Batty Tuke, Sir William Gairdner, Dr. Reid, Dr. Bennett, Sir William Thomson, and Dr. Little.

PUBLIC HEALTH COMMITTEE.—Sir Richard T. Thorne, Mr. Teale, Dr. Church, Dr. Bruce, Dr. McVail, Dr. Cameron, Mr. Tichborne, Dr. Bennett, and Sir P. C. Smyly.

The Registrar's Salary.

It was agreed to increase the salary of the Registrar (Mr. H. E. Allan) from £500 to £600. Mr. Miller, the former Registrar, had, it was stated, a salary of £700 per annum.

This having concluded the business of the session, the Council adjourned till November next.

Medical News.

ROYAL COLLEGE OF SURGEONS IN IRELAND.—At a meeting of the Fellows of the College on Monday, June 6th, the following were elected for the ensuing year: President: Robert Lafayette Swan, F.R.C.S. Vice-President: Thomas Myles, F.R.C.S. Secretary: Sir Charles A. Cameron, F.R.C.S. Council: Archibald H. Jacob, F.R.C.S.; Edward Hallaran Bennett, F.R.C.S.; Henry Gray Croly, F.R.C.S.; Sir Philip Crampton Smyly, F.R.C.S.; Sir William Stokes; Henry Rosborough Swanzy, F.R.C.S.; William Ireland Wheeler, F.R.C.S.; Sir William Thomson, F.R.C.S.; Austin Meldon, D.L., F.R.C.S.; Sir Charles A. Cameron, F.R.C.S.; L. Hepenstal Ormsby, F.R.C.S.; Richard D. Purefoy, F.R.C.S.; John J. Cranny, F.R.C.S.; Henry Gregg Sherlock, F.R.C.S.; Henry Fitzgibbon, F.R.C.S.; Arthur Henry Benson, F.R.C.S.; Francis T. Heuston, F.R.C.S.; John Lentaigne, F.R.C.S.; and Arthur Chance, F.R.C.S.

UNIVERSITY OF CAMBRIDGE.—The following have been appointed Examiners for the M.B. and B.C. final examinations:—*Medicine:* Dr. Humphry, Dr. Foxwell, Dr. Martin, and Dr. Mitchell Bruce. *Midwifery:* Dr. Cullingworth and Dr. Freeland Barbour. *Surgery:* Mr. Pitts, Mr. Bennett, Mr. Watson Cheyne, and Mr. Golding-Bird. Honorary degrees are to be conferred in connexion with the approaching Congress of Zoology and of Physiology on the following distinguished men of science:—Dr. A. Dohrn, Professor Milne Edwards, Professor Haeckel, Professor Hubrecht, and Professor Kowalevsky, in Zoology; Professor Bowditch, Professor Golgi, Professor Kronecker, Professor Kühne, and Professor Marey, in Physiology.

FOREIGN UNIVERSITY INTELLIGENCE. — *Bonn:* Dr. Albert Peters, Dr. Adolf Schmidt, and Dr. Leonhard Jores, *privat-docenten*, have been granted the title of Professor. Dr. Robert Rieder, *privat-docent* of Surgery, has been appointed Extraordinary Professor.—*Breslau:* Dr. Henke of Tubingen has been recognised as *privat-docent* of Pathological Anatomy.—*Cracow:* Dr. Klecki has been appointed Extraordinary Professor of General and Experimental Pathology.—*Halle:* Dr. Kurt Heilbronner has been recognised as *privat-docent* of Psychiatry.—*Munich:* Dr. R. Hecker has been recognised as *privat-docent* of Pædiatry.—*Rio de Janeiro*: Dr. Joaquim Xavier Pereira da Cunha has been appointed Professor of Clinical Ophthalmology.—*New York (College of Physicians and Surgeons)*: Dr. Edwin B. Cragin has been appointed Lecturer in Midwifery.—*St. Petersburg (Military Medico-Chirurgical Academy)*: Dr. Kirikoff has been recognised as *privat-docent* of Internal Medicine and Dr. Mikhnoff as *privat-docent* of Midwifery and Gynæcology.—*Budapest:* Dr. Ludwig Makara has been recognised as *privat-docent* in Surgery, Dr. Géza Krepuska as *privat-docent* in Otology, Dr. Desider von Kuthy as *privat-docent* in Hydrotherapy, and Dr. Ludwig Nékám as *privat-docent* in Dermatology.

WIGAN MEDICAL SOCIETY.—A meeting of this society was held on April 5th.—The President (Mr. Berry) read his opening address on the Sanitary Progress in Wigan during the last Thirty Years.—In moving a vote of thanks to the President for his address Mr. William Mitchell Roocroft said that it was advisable for each sanitary authority to have a bacteriological assistant employed in its public health department. This met with the approval of the members present. The following cases were exhibited by members of the staff of the infirmary: (1) Fracture of the Patella; (2) Double Inguinal Hernia; Radical Cure; (3) Lumbar Colotomy for Cancer of the Rectum; (4) Compound Fracture; Excision of the Malleoli; (5) Severe Lacerated Wound of the Arm; (6) Resection of the Inferior Maxilla; and (7) Talipes, Equino-varus.—A meeting was also held on June 2nd, Mr. Berry (President) being in the chair, and there was a good attendance of members.—Dr. Charles Macalister, honorary physician to the Stanley Hospital, Liverpool, gave an address on Osteo-arthritis, illustrated by lantern demonstrations of the disease and of radiographs taken from interesting cases, which came out well on the screen.—The lecture was much appreciated and a discussion followed, Dr. R. Prosser White, Dr. Blair, and Dr. Benson taking part in it. A hearty vote of thanks was accorded to Dr. Macalister, on the proposition of Mr. Graham, seconded by Mr. Brady.

PRESENTATIONS TO MEDICAL MEN.—Mr. R. Buttercase, M.B. Glasg., was the recipient, on May 14th, from the members of the ambulance class at Benton-square, Newcastle-on-Tyne, of a marble timepiece as a mark of esteem.—Mr. Ian G. Sibbald, M.B. Edin., of the Northern Infirmary, Inverness, who has been appointed to the Stirling Hospital, was presented on May 12th with a testimonial from the matron and nursing staff of the infirmary, which took the form of a silver curling-stone and requisites in silver and two silver ash trays.—On May 17th, at the Victoria Hall, Auchtermuchty, in the presence of a large assembly of friends and residents of the district, Mr. W. F. MacDonald, M.B. Edin., was presented, on the occasion of his leaving Auchtermuchty after thirteen years' professional service there with a silver bowl on an ebony stand, bearing a suitable inscription, and a purse of sovereigns, as tokens of goodwill and regard.—Mr. William Edwin Williams, F.R.C.S. Edin., J.P., the medical officer of health of Abertillery (Mon.), has been presented with a dessert service and a set of dessert knives and forks on the occasion of his marriage.—At a social meeting on May 26th at Reading Mr. David T. Key, M.R.C.S. Eng., of that town, who has been the honorary instructor for the past four years of the local branch of the St. John Ambulance Brigade, was presented, on his leaving Reading, with a gilt mounted inkstand and a gold "Swan" fountain pen as tokens of appreciation of his gratuitous services.—On May 31st Mr. William Christie, M.B., C.M. Aberd., of Woodside, was the recipient from friends in the district of an illuminated address and several volumes of medical works on his leaving that locality.—On the same day Mr. George M. Robertson, M.B., F.R.C.P. Edin., medical superintendent of the District Asylum, Murthly, Perth, was presented by the staff, on the occasion of his marriage, with a revolving writing-desk and blotting-pad.—At the recent distribution of certificates in connexion with the St. Buryan (Cornwall) ladies' branch of the St. John ambulance class, Mr. Ashley T. Jago, L.R.C.P. Lond., M.R.C.S. Eng., was presented with an inkstand suitably inscribed in appreciation of his services as honorary lecturer.—The medallions and certificates awarded to members of the St. John ambulance classes held in connexion with the Great Western Railway at Plymouth were distributed on June 3rd by Mrs. Adye, wife of the divisional superintendent. After the distribution the secretary (Mr. Evans), on behalf of the class, presented Mr. W. A. Buchan, M.B., C.M. Edin., with a silver-mounted walking-stick in appreciation of his services as honorary lecturer.

NEWTON ABBOT COTTAGE HOSPITAL.—Mr. W. S. Penley recently gave a dramatic performance at Newton Abbot in aid of the funds of the cottage hospital, with the result that the institution benefited to the amount of £43.

MRS. JACKSON desires to express through THE LANCET her very sincere thanks to all those who, by their interest and votes, secured her son's election to the Royal Medical Benevolent College on the 27th ult.

ROYAL MEDICAL BENEVOLENT COLLEGE.—The following are the names of the successful candidates at the recent election for pensionerships and foundation scholarships:—Pensioner: Henry Morrison, 3539 votes. Foundation Scholars: John B. Rankin, 8195 votes; Horace D. Sawtell, 8172 votes; Vyvyan St. A. Phillips, 7860 votes; Clarence Francis Quin, 7312 votes; Frank H. Wilson, 6555 votes; Lancelot R. Jackson, 6286 votes; Wm. Arnold Stables, 4670 votes; and Wm. R. Ward, 4600 votes.

THE LATE DR. H. MARSHALL.—A meeting at which the Dean of Bristol presided was held on May 29th for the purpose of initiating a movement for perpetuating the memory of the late Dr. Henry Marshall, and on the motion of the Roman Catholic Bishop of Clifton it was unanimously resolved that the memorial should commemorate Dr. Marshall's connexion with the Bristol General Hospital. A committee was appointed to consider the form which the memorial should take.

THE MARY WARDELL CONVALESCENT HOME FOR SCARLET FEVER, STANMORE.—With the exception of the Metropolitan Asylums Board Hospitals this is the only home which receives persons recovering from scarlet fever. It is to be hoped, therefore, that the efforts which are being made to raise a sum of £2000 in order to clear off the debt and to provide for the thorough cleansing and repairing of the home will meet with success. Contributions may be sent to Messrs. Barclay and Co., 1, Pall-mall East, S.W., and to Miss Mary Wardell, hon. secretary, Stanmore, Middlesex.

THE LATE DR. WRIGHT OF WAKEFIELD.—The celebration of a golden wedding is an event so comparatively unusual that it is due to the memory of Dr. T. G. Wright of Wakefield, whose obituary we published in THE LANCET of June 4th, to mention that he and Mrs. Wakefield were many years ago the principal figures on such an auspicious occasion. Dr. Wright commenced practice in Wakefield in 1833 and in 1835 he married a Miss Hubbard of Leeds, by whom he had thirteen children. Mrs. Wright died in October, 1890, in her seventy-eighth year. When the time for the golden wedding arrived Dr. Wright's medical brethren entertained him at dinner and presented him with a silver kettle. He was also some years later the recipient of a testimonial consisting of nine hundred guineas.

LITERARY INTELLIGENCE. — Among the new books shortly to be issued by Messrs. J. & A. Churchill, the following may be mentioned:—A work on Ovariotomy and Abdominal Surgery, by Mr. Harrison Cripps, the scope of which may be gathered from the following extract from the preface: "The chief object of this work is to record only such operative details as I have found valuable in my own experience, for without the book running into a larger scope than was intended it is impossible to describe in detail the various methods adopted by other operators"; a Treatise on the Mental Affections of Children — Idiocy, Imbecility, and Insanity — by Dr. W. W. Ireland; a second edition of the Attendant's Companion, a manual of

the duties of attendants in lunatic asylums, by Dr. Charles Mercier; a second edition of Lectures on Medicine to Nurses, by Dr. Herbert Cuff, which will include two new lectures, namely on Dropsy, and on Diseases of Children; and the ninth edition of Valentin's Practical Chemistry, Qualitative and Quantitative Analysis, by Dr. Hodgkinson, Professor of Chemistry in the Royal Academy, Woolwich.

ROYAL MICROSCOPICAL SOCIETY.—There will be an exhibition of sponges by Mr. B. W. Priest at the next meeting of the society on Wednesday evening, June 15th, at 7.30, at 20, Hanover-square, W.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

The Plague in India.

IN the House of Commons on Tuesday, June 7th, Lord George Hamilton, Secretary of State for India, made a statement with regard to the general condition and finances of the Indian empire. As to the plague, he said we are now at a time of the year when this terrible disease is least destructive in its ravages and when it is most easily kept under control; but while saying this there was no use disguising the fact that in spite of the vigilance and exertions of the local authorities the plague had made great ravages during the past six months. Every effort had been made by the Government to prevent its spread and no pains had been spared to reassure the people as to the measures to be adopted for its suppression and to secure if possible their coöperation. In many districts, he said, they have heartily coöperated and with successful results.

Corporal Punishment in Prisons.

During the week this question has been considered in two connexions. On Tuesday the House had before it a private Member's Bill in which it was proposed to prohibit personal correction altogether, but the House declined by 112 votes to 38 to give it a second reading. In the Grand Committee on Law the Home Secretary brought up a clause for insertion in the Prisons Bill of the Government providing that the prison rules issued by the Home Office shall not authorise the infliction of corporal punishment except in case of mutiny or incitement to mutiny or gross personal violence to an officer or servant of the prison and after there has been a formal inquiry on oath before not less than three members of the Board of Visitors or Visiting Committee of the prison. Several members of the committee, including Mr. Asquith, the late Home Secretary, expressed themselves in favour of a judicial tribunal of some sort and an open inquiry, and Sir M. White Ridley undertook before the report stage of the Bill to see whether something cannot be done in this direction.

HOUSE OF COMMONS.

MONDAY, JUNE 6TH.

Chest Measurement of Recruits.

Sir Charles Dilke asked the Under Secretary of State for War why there had been omitted from the annual reports of the Army Medical Department for 1895 and 1896 the average chest measurement of the total number of recruits approved in the year, always given in previous years, and whether the missing statement for the two years could be supplied.—Mr. Brodrick replied: The returns hitherto rendered showed chest measurements exceeding 35 in. in one group as measurements above 35 in. without giving details, and in calculating the average these have been taken as being all 35 in. This does not represent the true average and an alteration has been made so as to approximate to it more nearly. The report for 1897 will show an average calculated in this manner. The averages for 1895 and 1896, worked out on a basis similar to previous calculations, were in each year 33·7 in., as compared with 33·6 in. in 1893 and 1894.

TUESDAY, JUNE 7TH.

Phosphorus Poisoning in the Match Trade.

Mr. Tennant asked the Home Secretary whether he was aware that in France the Government issue of lucifer matches to strike everywhere was marked "sans phosphore"; and whether, in view of the serious disclosures revealed by the recent prosecution of Messrs. Bryant and May and the statement by that firm that it was only for the manufacture of the matches which strike everywhere that yellow phosphorus was required, he would confer with the French Government with a view to prohibiting the use of yellow phosphorus.—Mr. Provand, Mr. Holland, and Mr. Steadman asked questions on the same subject. — Mr. Charles McArthur asked the right hon. gentleman whether he was aware that the danger of phosphorus poisoning might be obviated by modern machinery capable of making, drying, and boxing the matches without close proximity to the worker, and whether, before taking the drastic course now suggested, he would make inquiries as to the system adopted in other match factories than those of Bryant and May.—Sir M. White Ridley said: In answer to the last question I have to say that I am, through the inspector of factories, aware of the machinery and appliances to which the hon. Member alludes, and so far I have had nothing but satisfactory accounts of them. But it is too early to give any conclusive opinion about them. I have already stated that I am making inquiries as to the use of yellow phosphorus in France and other foreign countries. The suggestion of a conference seems to me to be somewhat premature at the present stage. I may also say, in reply to the questions of the hon. Members for Glasgow and Stepney on the same subject, that the prosecution they refer to was ordered by me and is the result of inquiries made by the factory inspectors at my request. I am now considering what further steps I shall take in the matter, particularly in the direction of strengthening the special rules and securing additional medical inspection; but though I have power to regulate I have none to prohibit the use of yellow phosphorus. I should like it to be clearly understood that the medical man who failed so seriously in his duty in this case was the works doctor and not the certifying surgeon. The latter, who, I may say emphatically, by the nature of his appointment, is a perfectly independent medical man, was in no way concerned in this case and had no power to intervene. The answer to the remaining question is that the lady inspectors have their headquarters in London and their services are available in the fullest manner for the inspection of the match factories in the London district.—Mr. John Burns asked whether the Home Secretary would lay the conduct of the works doctor before the Royal College of Surgeons.—Sir M. White Ridley said he must ask for notice of this question and assured the House that the whole subject was receiving his most anxious consideration.—Mr. Burns intimated that he would repeat his question on another occasion.

Lead Poisoning in the Potteries.

Mr. Hedderwick asked the Home Secretary whether, having regard to the large number of women and children employed and subjected to the risk of slow poisoning by lead in English potteries, he would consent to appoint a lady inspector for the purpose of protecting as far as may be the interests of these workers in their unhealthy and dangerous occupation, and whether he could see his way to prohibit the use of lead in glazing processes in potteries altogether or to bring such processes within the scope and operation of the Workmen's Compensation Act.—Sir M. White Ridley replied: The hon. Member is evidently unaware that the existing staff of lady inspectors has already done most useful work in the Potteries district and will continue to be available in future as often and for as long as may be necessary. I am most sensible of the value of inspection by women in this industry and shall not hesitate to increase the staff if I find it necessary, though the most urgent need in the dangerous trades appears to me to be the appointment of a medical inspector, a matter which I am carefully considering. I am in hope that the use of dangerous glazes will diminish, and, as the hon. Member must remember, I have appointed experts to inquire into the subject, and am making inquiries abroad. I have no power, however, to prohibit the use of lead entirely. The extension of the Workmen's Compensation Act which the hon. Member suggests would require legislation which I am not prepared to propose; but I trust that the new special rules will materially diminish the dangers to which the workpeople are exposed.—Mr. Tennant asked whether the House was to understand that he had definitely decided to increase the number of lady inspectors.—Sir M. White Ridley replied: No, sir, I have not said that, but the whole question of the increase of the staff has been under consideration for some months and a good deal depends on what is done in a medical direction.

WEDNESDAY, JUNE 8TH.

Pharmacy Acts Amendment Bill.

This Bill was passed through the committee stage and read a third time. The object of the Bill is to alter in several respects the constitution of the Pharmaceutical Society—for instance, to make persons registered as apprentices or students eligible to become student associates of the society and to make those whose names appear on the register of chemists and druggists eligible to become members of the society. When the Bill was in committee several members, including Dr. Farquharson and Dr. Clark, took advantage of the opportunity to press upon the Government the necessity of introducing a Bill on the subject of the sale of poisons and Colonel Brookfield, speaking as the Member in charge of the Bill, said he would invite the Pharmaceutical Society to coöperate with the Government in any attempt they may make to further safeguard the sale of poisons in the interest of the public.

Appointments.

Successful Applicants for Vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward it to THE LANCET Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week for publication in the next number.

BURGES, R. E., M.D., M.Ch. Dubl., has been re-appointed Medical Officer of Health by the Hoole Urban District Council.

DEARDEN, C. R., L.R.C.P., L.R.C.S. Edin., L.F.P.S. Glasg., has been appointed Medical Officer for the No. 2 Sanitary District of the Ecclesall Union, vice J. H. Wilson, resigned.

ELLIS, H. D. A., L.R.C.P. Edin., M.R.C.S., has been appointed Medical Officer of Health by the Ambleside Urban District Council.

FLINN, D. E, M.R.C.P., F.R.C.S. Irel., D.P.H., has been appointed a Medical Inspector by the Local Government Board for Ireland.

GREY, J. T., L.R.C.P. Lond., M.R.C.S., has been appointed Medical Officer for the Fourth Sanitary District of the Hollingbourn Union.

HIGGINSON, C. G., L.R.C.P. Lond., M.R.C.S., has been appointed Senior Resident Medical Officer for the Workhouse by the Chorlton Board of Guardians, vice G. Ashton, resigned.

JACKSON, T. VINCENT, F.R.C.S. Edin., M.R.C.S., has been appointed Consulting Surgeon to the Orphan Asylum, Wolverhampton.

LEWIN, OCTAVIA M. S., M.B., B.S. Lond., has been appointed a Junior Resident Medical Officer for the Workhouse by the Chorlton Board of Guardians.

MARKS, H. G. K., M.D., L.R.C.S., L.K.Q.C.P. Irel., has been appointed a Medical Officer at Herberton, Queensland, vice L. G. A. MacDonnell.

MARTIN, JAMES, L.R.C.P., L.R.C.S., L.F.P.S. Glasg., has been appointed a Health Officer for Black Flag, Western Australia.

MATTHEWS, T., L.R.C.P., L.R.C.S. Edin., has been appointed a Government Medical Officer and Vaccinator for the districts of Shoalhaven, Nowra, and Terara, New South Wales, vice J. B. Brereton.

MCILROY, A. J., M.B., C.M. Edin., has been appointed a Public Vaccinator for Brunnerton, New Zealand.

MCKEE, J. C., L.R.C.P., L.R.C.S. Edin., has been appointed Officer of Health and Public Vaccinator for the Borough of Eaglehawk, Victoria, Australia, vice L. J. Thom.

MONTGOMERY, J. P., M.B., Ch.B. Melb., has been appointed Officer of Health for the Shire of Rosedale, Toongabbie Riding, Victoria, Australia.

MORRIS, W., M.D. Erlang., has been appointed a Public Vaccinator for Little River, New Zealand.

MURRAY, G. L., M.B., M.Ch. Syd., has been appointed a Medical Officer for the Mount Morgan Hospital, Queensland.

MYERS, CHAS. J., M.R.C.S., has been appointed Medical Officer of Health by the Louth Rural District Council.

PIM, J., F.R.C.S., L.R.C.P. Irel., has been appointed a Medical Officer to the Royal Irish Constabulary of the Ballybrack and Cabinteely District, vice C. C. Mayne, resigned.

PLAYER, C. R., M.B., Ch.B. Melb., has been appointed Officer of Health for the Shire of Melton, East Riding, Victoria, Australia, vice N. C. A. Vance, resigned.

REYNOLDS, FRANCIS MORTIMER, M.B., C.M. Edin., has been re-appointed Medical Officer of Health by the Ottery St. Mary Urban District Council.

ROUGHAN, J. A., M.B., B.S. Irel., has been appointed a Resident Medical Officer for the Williams District and a Public Vaccinator for the Urban, Suburban and Rural Districts of Williams, Western Australia.

SIMPSON, D., M.B., Ch.M. Glasg., has been appointed Officer of Health for the Shire of Fern Tree Gully, Victoria, Australia, vice W. J. Craig, resigned.

SMITH, E. C. T., M.B., B.S. Irel., L.R.C.P. Lond., M.R.C.S., has been appointed an Honorary Medical Officer for the Hospital, Mount Morgan, Queensland.

SPENCE, H., M.B., Ch.B. Melb., has been appointed, pro tem., Officer of Health for the City of Footscray, and for the Shire of Braybrook, Victoria, Australia, and also Acting Public Vaccinator for Footscray.

SPRAKELING, R. J., M.R.C.S., L.S.A., has been re-appointed Medical Officer of Health for the Borough of Bootle.

TEARE, JOHN, M.B., B.S., Victoria Univ., Manchester, has been appointed a Public Vaccinator for the District of Wellington, New Zealand.

WILLIAMS, SAMUEL, M.D., L.R.C.P. Lond., M.R.C.S., has been appointed Medical Officer for the Llanelly School Board.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).

CARDIFF INFIRMARY.—Assistant House Physician for six months. Board, washing, and apartments, and an honorarium of £10.

CLAYTON HOSPITAL, Wakefield.—Junior House Surgeon, unmarried. Salary £60 per annum, with board, lodging and washing.

CHELSEA HOSPITAL FOR WOMEN, Fulham-road, S.W. — Resident Medical Officer for twelve months. Salary £60 per annum, with board, lodging, and washing.

CHESTERFIELD AND NORTH DERBYSHIRE HOSPITAL AND DISPENSARY, Chesterfield.—Resident House Surgeon for two years. Salary £100 per year, with board, apartments, and laundress.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria-park, E.—House Physician for six months. Salary at the rate of £30 per annum, with board and residence.

DONCASTER GENERAL INFIRMARY AND DISPENSARY.—In-door Dispenser and Assistant to the House Surgeon. Board, lodging, and washing provided.

Medical Diary for the ensuing Week.

OPERATIONS.

METROPOLITAN HOSPITALS.

MONDAY (13th).—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), St. George's (2 P.M., Ophthalmic 1.15 P.M.), St. Mary's (2.30 P.M.), Middlesex (1.30 P.M.), St. Mark's (2 P.M.), Chelsea (2 P.M.), Samaritan (Gynæcological, by Physicians, 2 P.M.), Soho-square (2 P.M.), Royal Orthopædic (2 P.M.), City Orthopædic (4 P.M.), Gt. Northern Central (2.30 P.M.), West London (2.30 P.M.), Westminster (2 P.M.).

TUESDAY (14th).—London (2 P.M.), St. Bartholomew's (1.30 P.M.), Guy's (1.30 P.M.), St. Thomas's (3.30 P.M.), Middlesex (1.30 P.M.), Westminster (2 P.M.), West London (2.30 P.M.), University College (2 P.M.), St. George's (1 P.M.), St. Mary's (1 P.M.), St. Mark's (2.30 P.M.), Cancer (2 P.M.), Metropolitan (2.30 P.M.).

WEDNESDAY (15th).—St. Bartholomew's (1.30 P.M.), University College (2 P.M.), Royal Free (2 P.M.), Middlesex (1.30 P.M.), Charing-cross (3 P.M.), St. Thomas's (2 P.M.), London (2 P.M.), King's College (2 P.M.), St. Mary's (2 P.M.), National Orthopædic (10 A.M.), St. Peter's (2 P.M.), Samaritan (2.30 P.M.), Gt. Ormond-street (9.30 A.M.), Gt. Northern Central (2.30 P.M.), Westminster (2 P.M.), Metropolitan (2.30 P.M.).

THURSDAY (16th).—St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), University College (2 P.M.), Charing-cross (3 P.M.), St. George's (1 P.M.), London (2 P.M.), King's College (2 P.M.), Middlesex (1.30 P.M.), St. Mary's (2.30 P.M.), Soho-square (2 P.M.), North-West London (2 P.M.), Chelsea (2 P.M.), Gt. Northern Central (Gynæcological, 2.30 P.M.), Metropolitan (2.30 P.M.).

FRIDAY (17th).—London (2 P.M.), St. Bartholomew's (1.30 P.M.), St. Thomas's (3.30 P.M.), Guy's (1.30 P.M.), Middlesex (1.30 P.M.), Charing-cross (3 P.M.), St. George's (1 P.M.), King's College (2 P.M.), St. Mary's (2 P.M., Ophthalmic 10 A.M.), Cancer (2 P.M.), Chelsea (2 P.M.), Gt. Northern Central (2.30 P.M.), West London (2.30 P.M.).

SATURDAY (18th).—Royal Free (9 A.M. and 2 P.M.), Middlesex (1.30 P.M.), St. Thomas's (2 P.M.), London (2 P.M.), University College (9.15 A.M.), Charing-cross (3 P.M.), St. George's (1 P.M.), St. Mary's (10 P.M.), Cancer (2 P.M.).

At the Royal Eye Hospital (2 P.M.), the Royal London Ophthalmic (10 A.M.), the Royal Westminster Ophthalmic (1.30 P.M.), and the Central London Ophthalmic Hospitals operations are performed daily.

SOCIETIES.

TUESDAY (14th).—ROYAL MEDICAL AND CHIRURGICAL SOCIETY (20, Hanover-square, W.).—8.30 P.M. Dr. R. Bradford and Dr. H. B. Shaw: Five Cases of Acute Leukæmia.—Dr. A. P. Luff: The Influence on Gout of the Mineral Constituents of Various Vegetables. Dr. N. Moore will show a Case of Displaced and Moveable Kidney.

WEDNESDAY (15th).—NORTH-WEST LONDON CLINICAL SOCIETY (North-West London Hospital).—8.30 P.M. Monthly Demonstration of Cases.

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

MONDAY (13th).—LONDON POST-GRADUATE COURSE.—London Throat Hospital, Gt. Portland-st., W., 8 P.M., Dr. Whistler: Catarrhal Conditions of the Nose and Throat.

CENTRAL LONDON THROAT, NOSE, AND EAR HOSPITAL (Gray's Inn-road, W.C.).—5 P.M. Mr. Wyatt Wingrave: The Origin and Nature of Polypi of the Nose, Throat, and Ear.

TUESDAY (14th).—ROYAL COLLEGE OF PHYSICIANS.—5 P.M. Dr. S. Martin: The Chemical Products of Pathogenic Bacteria considered with special reference to Enteric Fever. (Croonian Lecture.)

LONDON POST-GRADUATE COURSE.—Hospital for Skin Diseases, Blackfriars, 4.30 P.M., Dr. Abraham: Nævi.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC (Bloomsbury).—3.30 P.M. Mr. M. Gunn: Lecture.

CITY ORTHOPÆDIC HOSPITAL.—5.30 P.M. Mr. J. Poland: Deformities of Bones after Injury.

LONDON SKIN HOSPITAL (40, Fitzroy-square, W.).—4 P.M. Mr. A. Harbord: Syphilis.

WEST-END HOSPITAL FOR DISEASES OF THE NERVOUS SYSTEM (73, Welbeck-street).—4.30 P.M. Mr. H. W. Dodd: On Disorders of Vision in relation to Diseases of the Nervous System.

WEDNESDAY (15th).—LONDON POST-GRADUATE COURSE.—Parkes Museum, Margaret-st., W., 4.30 P.M., Prof. A. Wynter Blyth: Infectious Diseases.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST (Brompton).—4 P.M. Dr. Arkle: Aortic Valvular Disease.

WEST LONDON POST-GRADUATE COURSE (West London Hospital, W.).—5 P.M. Mr. McAdam Eccles: Femoral Hernia.

THURSDAY (16th).—ROYAL COLLEGE OF PHYSICIANS.—5 P.M. Dr. S. Martin: The Chemical Products of Pathogenic Bacteria considered with special reference to Enteric Fever. (Croonian Lecture.)

LONDON POST-GRADUATE COURSE.—Central London Sick Asylum, Cleveland-st., W., 5.30 P.M., Dr. P. Manson: Clinical Lecture.

CHARING-CROSS HOSPITAL.—4 P.M. Dr. M. Murray: Demonstration of Medical Cases. (Post-graduate Class.)

THE HOSPITAL FOR SICK CHILDREN (Gt. Ormond-street, W.C.).—4 P.M. Mr. Kellock: Demonstration of Selected Cases.

CENTRAL LONDON THROAT, NOSE, AND EAR HOSPITAL (Gray's Inn-road, W.C.)—5 P.M. Dr. D. Grant: Diseases of the Antrum of Highmore.

FRIDAY (17th).—LONDON POST-GRADUATE COURSE.—King's College 3 to 5 P.M., Dr. Wilkinson: Erysipelas and Suppuration.

Notes, Short Comments, and Answers to Correspondents.

EDITORIAL NOTICE.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITORS," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.

Lectures, original articles, and reports should be written on one side of the paper only, AND, WHEN ACCOMPANIED BY BLOCKS, IT IS REQUESTED THAT THE NAME OF THE AUTHOR, AND IF POSSIBLE OF THE ARTICLE, SHOULD BE WRITTEN ON THE BLOCKS TO FACILITATE IDENTIFICATION.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers, not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET *should be addressed "To the Manager."*

We cannot undertake to return MSS. not used.

MEDICAL DISPENSARIES IN LANCASHIRE WANTED.

Soulby's Ulverton Advertiser of June 2nd publishes in a leading article a plea for self-supporting proprietary dispensaries for the very poor in Lancashire villages, where "doctors and trained nurses ..... are practically unknown." There are besides the very poor, the writer points out, those who cannot afford to run a bill for attendance but who are really in need of skilled medical advice; yet between the private practitioner whom they cannot afford to pay and the chemist who will charge 1*d.* for a box of pills there is no intermediate refuge. It is suggested that the working man of this class would often be saved from a premature grave if he could obtain medical advice for about 1*s.* 6*d.* per week. That the writer does not wish to encourage the abuse of cheap medical practice is evident from the following paragraph: "Of course the man who can easily spare half-a-guinea will go to his private medical man; and if he does not he ought to, for medical men have to keep up expensive establishments, in addition to which their mental training has cost them many years of study and has been a considerable expense, for which they ought to be recouped by those who are well able to pay."

"THE LADY DISPENSER."

To the Editors of THE LANCET.

SIRS,—In reply to "M.D. Lond." (THE LANCET, June 4th) I am writing to say that there is a College and Pharmacy for Ladies at 7, Westbourne-park-road which has been established for some years. The lady dispensers educated there find no difficulty in getting appointments. Any particulars can be obtained from the Secretary.

I am, Sirs, yours faithfully,

June 6th, 1898. A LADY DISPENSER.

THE LATE MR. ARTHUR JEFFARES BARLOW: A SECOND APPEAL.

AN appeal was made in these columns a month ago by certain medical men to their fellow practitioners and others on behalf of the young widow of Mr. Arthur Jeffares Barlow, who died suddenly on March 11th last at the early age of thirty-seven years. We have been asked to repeat this appeal, which resulted in the collection of the sum of £32 11*s.*, in the hope that a few more subscriptions may accrue for Mrs. Barlow's benefit. Arthur Jeffares

Barlow was the eldest and only surviving son of the late Frederick Archer Barlow of 14, North Great George-street, Dublin, and will be remembered by many old friends and fellow students at Trinity College, Dublin. Unfortunately his position through ill health prevented his making any provision for his widow, who is without any means whatever and has no friends to assist her. She is in delicate health caused by long strain of nursing her husband and the shock of his sudden death. It is hoped that a generous response will be made to the appeal and that substantial aid may be given to such a sad and deserving case. Subscriptions will be received by Dr. J. W. Moore, 40, Fitzwilliam-square West, Dublin; Dr. John Barton, 26, Upper Merrion-street, Dublin; Dr. C. J. Clibborn, 76, Owen-terrace, University-street, Belfast; Dr. L. H. Ormsby, 92, Merrion-square West, Dublin; Dr. Henry, 2, Lewisham-park, Lewisham, London; and Dr. A. Matson, 619, Holloway-road, London. To the subscriptions which have been from time to time announced in our columns the following should be added:—Per Dr. Moore: Acquaintance, Dublin, £1; Freemason, Godalming, 10s.

"THE VALUE OF A DIPLOMA IN PUBLIC HEALTH."

To the Editors of THE LANCET.

SIRS,—In THE LANCET of May 28th in an annotation under the above heading you relate a case in Essex where at an election of medical officer of health the holder of a D.P.H. was passed over and the appointment given to one who had no public health diploma. The same thing has occurred recently in this the opposite side of England. A rural sanitary council advertised for a medical officer of health. I applied, and was the only candidate with the D.P.H. who did, but I was not elected. When I obtained the diploma I naturally supposed that it would stand me in good stead at such an election. I find now, however, that it is perfectly valueless where the population is under 50,000, as in my case. It seems to me that experience such as mine is not calculated to encourage men to go to the trouble and expense of getting a diploma from which they obtain no practical advantage.

I am, Sirs, yours faithfully,

June 6th, 1898. D.P.H. CAMB.

AUSTRALIAN BRANDY.

IN THE LANCET of July 2nd, 1892, and March 16th, 1895, we dealt analytically with a specimen of brandy from the Victorian vineyards which was submitted to us by Messrs. Joshua Brothers, of 26 and 28, Mark-lane. We then expressed the opinion that the sample submitted was a genuine grape spirit, at the same time pointing out the undoubted advantages of spirit having such an origin over one distilled from grain. We are now informed that the Government of Victoria (Australia) have issued a special guarantee with each bottle of this brandy certifying the same to be pure and the product of wine only, their official stamp being branded on each cork.

THE PERILS OF WINDOW-CLEANING.

To the Editors of THE LANCET.

SIRS,—An inquest was held at Crewe on May 28th on the body of a girl, aged sixteen years, who was killed by falling from a window which she had been cleaning. She had been in the service of her employer for eighteen months, so that he must have known that she was subject to "fits," as one account gives it, or "fainting fits," according to another. But whether fainting or epileptic no one subject to any kind of fits ought to have been employed in such dangerous work. It is some satisfaction, though very slight, to know that the coroner, at the request of the jury, recalled the employer, a builder, and "censured him for having permitted the girl to engage in this work knowing that she was subject to fainting fits." He got off very easily.

I am, Sirs, yours faithfully,

June 7th, 1898. X. Y. Z.

HOLLAND'S INSTEP ARCH SOCK FOR FLAT FOOT.

THE relaxation of the natural arch of the foot, commonly known as flat-foot, not only leads to an ungainly manner of walking, but causes those who suffer from it to be less capable of active exertion than normal individuals. When the condition is of such long standing that there is no prospect of the muscles, tendons, and ligaments regaining their proper tension it may sometimes be advantageous to have a mechanical support which will partially restore the shape of the foot. The instep arch sock, introduced by Mr. Thomas Holland, of 40, South Audley-street, W., is a useful appliance of this kind. It consists of two layers of leather shaped like the inner sole of a shoe, the proper form for supporting the instep being given by a thin elastic metal plate interposed between them.

"THE UNQUALIFIED ASSISTANT."

To the Editors of THE LANCET.

SIRS.—Permit me through the columns of THE LANCET to offer the following suggestion *re* "the unqualified man"—viz., let two or three examinations be held for all men who have taken out their full curriculum, or nearly so, and on passing the said examinations allow them to become registered and enjoy all the advantages of the present qualified assistant—viz., inquests, post-mortem examinations, death certificates, legal evidence, &c., but do not permit them to practise on their own account or recover fees by law except for their principal. If such were possible I think it would settle the matter and be a decided benefit to the present unqualified man and to the practitioners who would employ them; if they choose afterwards to obtain any other diploma let them do so by conforming to the four or five years' regulations and passing the necessary examinations.

I am, Sirs, yours faithfully,

June 6th, 1898. UNQUALIFIED.

WANTED A HOME.

To the Editors of THE LANCET.

SIRS,—May I ask through the columns of THE LANCET if any of your readers could tell me of a home, private or otherwise, where a youth of eighteen years suffering from occasional attacks of epilepsy would be looked after on reasonable terms? As the attacks are neither very severe nor very frequent the youth could make himself useful on a farm or in a workshop. He at present is engaged on the waterside and is continually exposed to danger. His friends have made application to the Colony for Epileptics, but may have to wait years for a vacancy. I thank you in anticipation for the courtesy of inserting this letter and would ask that correspondence should be addressed in the first instance to THE LANCET Office, 423, Strand, W.C.

I am, Sirs, yours faithfully,

June 7th, 1898. M.

BUDE.

To the Editors of THE LANCET.

SIRS,—It may interest your readers to know that the railway to Bude is to be opened in August next, thus bringing this favourite health resort into touch with London, one result of which, it is hoped, will be to make the place better known to the medical profession as a place to which to send convalescents in the winter and spring, its genial but bracing climate being especially suited for the overworked either in brain or body. I shall be happy to give any information to your readers as to temperature, &c.

I am, Sirs, yours faithfully,

THOMAS WHITEHEAD.

Erdiston, Bude, North Cornwall, June 4th, 1898.

J. M.—The catalogue of the Motor Manufacturing Company, Limited 47, Holborn-viaduct, E.C., contains the notice of a motor bicycle, price £50. The same firm manufactures motor tricycles. The catalogue of the British Motor Syndicate, Limited, 40, Holborn-viaduct, E.C., also contains a notice of a motor tricycle. Our correspondent might communicate directly with the companies. We regret we have no extended practical experience.

L.R.C.P. should certainly be paid a fee, but would it not be better to send in a bill to the patient? If the patient repudiates the account and the arrangement made by the other medical man a strong representation should be made to that gentleman. If this does not produce any result legal proceedings may have to be taken; but our correspondent will do well to have a solicitor's advice.

Electro, M.R.C.S.—The process is described in most modern text-books and forms a routine treatment at general and special hospitals. The answer to the second question is that every man in such matters must be a law to himself. So long as the methods employed are not unprofessional the work should not be looked upon by anyone as derogatory.

Mr. Sidney C. Lawrence.—This position is the one which has previously been assigned to the physicians and surgeons at State and Royal funerals.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

During the week marked copies of the following newspapers have been received: *Derby Telegraph, Scotsman, Newcastle Leader, Alford Gazette, Bradford Observer, Dundee Advertiser, Times of India, Pioneer Mail, North British Daily Mail, Southport Times, Midland Times, Architect, Isle of Wight Chronicle, Warwick Advertiser, South Wales Daily News, Rugby Advertiser, Yorkshire Post, Builder, Preston Guardian, Glasgow Herald, Hinckley Times, Brighton Gazette, Lymington Observer, Liverpool Daily Post, Ormskirk Advertiser, North Wales Chronicle, Devon Gazette, Bristol Mercury, Sussex Daily News, Kidderminster Shuttle, Rochdale Observer, Citizen, Leeds Mercury, Accrington Observer, Isle of Man Examiner, Walsall Observer, Malvern Advertiser, Birmingham Daily Post, Birmingham Gazette, Leicester Post, Cambridge Times, Manchester Courier, Eastern Morning News, Hampshire Independent, Warwick Advertiser, Leighton Buzzard Observer, Boston Independent, Lynn Advertiser, Louth Times, Alfreton Journal, Bury Guardian, Bromley Telegraph, Durham Chronicle, Kentish Gazette, Southampton Times, Sanitary Record, Friendly Societies' Recorder, Local Government Chronicle, Public Health, Reading Mercury, City Press, Hertfordshire Mercury, Mining Journal, Daily Mail, London, Local Government Journal, Sowby's Ulverston Advertiser, Leytonstone Express and Independent, Surrey Advertiser, Weekly Free Press and Aberdeen Herald, Wrexham Advertiser, West Middlesex Herald, Canterbury Times, New Zealand Morning Mail, &c., &c.*

Communications, Letters, &c., have been received from—

An original and novel feature of "THE LANCET General Advertiser" is a Special Index to Advertisements on pages 2 and 4, which not only affords a ready means of finding any notice, but is in itself an *additional* advertisement.

Advertisements (to ensure insertion the same week) should be delivered at the Office not later than Wednesday, accompanied by a remittance.

Answers are now received at this Office, by special arrangement, to Advertisements appearing in THE LANCET.

The Manager cannot hold himself responsible for the return of testimonials, &c., sent to the Office in reply to Advertisements; copies only hould be forwarded.

Cheques and Post Office Orders (crossed "London and Westminster Bank, Westminster Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Office, 423, Strand, London, to whom all letters relating to Advertisements or Subscriptions should be addressed.

THE LANCET can be obtained at all Messrs. W. H. Smith and Son's and other Railway Bookstalls throughout the United Kingdom. Advertisements are also received by them and all other Advertising Agents.

Agent for the Advertisement Department France—J. ASTIER, 8, Rue Traversière, Asnières, Paris.

The Croonian Lectures

ON

THE CHEMICAL PRODUCTS OF PATHOGENIC BACTERIA CONSIDERED WITH SPECIAL REFERENCE TO ENTERIC FEVER.

Delivered before the Royal College of Physicians of London

BY SIDNEY MARTIN, M.D. LOND., F.R.S.,

FELLOW OF THE COLLEGE; PROFESSOR OF PATHOLOGY, UNIVERSITY COLLEGE; AND ASSISTANT PHYSICIAN TO UNIVERSITY COLLEGE HOSPITAL AND TO THE HOSPITAL FOR CONSUMPTION, BROMPTON.

LECTURE I.[1]

Delivered on June 14th, 1898.

MR. PRESIDENT AND GENTLEMEN,—I propose in the following lectures to discuss generally the nature and action of the poisons and chemical products formed by pathogenic bacteria and to illustrate the subject by an investigation which has occupied me recently of the pathogenic action and the chemical pathology of the typhoid bacillus and of two other bacilli closely related to it. Most of the poisons which are to be considered are substances which cannot be defined chemically and this at the outset is a very great difficulty in an attempt to classify such poisons accurately.

The transformations which bacteria, both non-pathogenic and pathogenic, produce in substances are of great variety. Some non-pathogenic bacteria are concerned, for example, with nitrification, a process in which ammonia compounds are transformed into nitrates and nitrites. These bacteria are more or less specific, and although some pathogenic organisms have a somewhat similar action in this respect it is very slight. Another example of a similar character is the splitting up of urea into ammonia and carbonic acid by the micrococcus ureæ. These actions, however, are not of the nature of the chemical changes produced by pathogenic bacteria. The changes which bacteria produce in carbohydrate substances—e.g., starches and sugars—are the transformation of the starch into one or other kind of sugar and the decomposition of the sugar into alcohol and acid bodies such as lactic, acetic, and butyric acids. Such changes are usually spoken of as those of fermentation and are allied to changes which occur in the digestive processes of the higher animals, by means of the organic, as distinguished from the organised, ferments.

Some bacteria are capable of still further acting on the acids produced in the first-named fermentations; thus, the bacillus butyricus can transform lactic acid into butyric acid with the formation of carbonic acid and hydrogen. These are, again, not the changes which are of the greatest importance in considering pathogenic bacteria. Although some pathogenic bacteria act on starches and sugars with the formation of acid bodies and gases, yet the products so formed play but a small part in the production of disease. Fats which are largely present in the body and are taken in with food are also broken up by bacteria of one kind or another. The products, however, from a pathological point of view, are of minor importance. From the albuminous substances, however, the third great class of organic substances which serve as food and act as important chemical constituents of the body, the pathogenic bacteria produce substances possessing important physiological actions. The albuminous molecule, containing carbon, hydrogen, nitrogen, sulphur and frequently phosphorus, is unknown as regards its chemical constitution. It is no doubt highly complex and is capable of being broken up both by organic ferments and by bacteria into numerous bodies of the most complex nature. Although the actual constitution of the albuminous molecule is at present undetermined it is capable of being transformed only in certain directions. Thus, by the action of mineral acids and alkalis with the aid of heat, white of egg or the serum proteids are transformed into acid and alkali albumin which differ from the original proteid mainly in their solubilities in acid or alkaline solution. The acid form is precipitated by an alkali and *vice versâ*, the precipitate being capable of coagulation. Like the original proteid, however, these bodies are capable of digestion. The digestive transformation which takes place in the stomach and small intestines consists in the change of these slightly soluble and coagulable proteids into more soluble and diffusible ones, the formation of the so-called albumoses and peptone. The important members of this class are soluble in water, are not precipitated by heat and are capable of some amount of diffusion. They all give a bright pink colour with a trace of copper sulphate solution and an excess of potash. True peptone differs from some of the albumoses in the fact that it is not precipitated by nitric acid. One of the characteristic albumose reactions, for example of proto-albumose, is that the precipitate by nitric acid is soluble on heating the solution and comes down again on cooling. Peptic digestion probably does not go farther than the formation of peptone and results chiefly in the transformation of the proteids into albumoses. Pancreatic digestion, however, can split up the proteid molecule or part of it into crystalline bodies containing nitrogen, such, for example, as leucin and tyrosin. This digestive action on proteids produced by organic ferments is also a feature of the action of some of the organised or bacterial ferments, except that the effect is more pronounced and results in the breaking up of the proteid molecule into many different non-proteid substances, which may be considered the final products of the digestive action. This digestive action of pathogenic bacteria is, however, only a part of the question we shall have to consider. The chief cell of the peptic gland secretes pepsin, which is discharged in the gastric juice into the stomach cavity; the pancreatic cell secretes trypsin and other ferments, which are discharged into the small intestine with the pancreatic juice; and, therefore, in any digestive mixture obtained from the stomach or intestine there is present, besides the products of digestion, the ferment or the active agent in the transformation. In the case of bacteria growing in an artificial medium outside the body or developing in the body there is, in addition to what digestive products may be formed, a living bacterial cell and any secretion which it may produce; and it will be seen that the body of the bacterium as well as its secretion, whether this be of the nature of a ferment or not, are both of the highest importance in the consideration of the diseased conditions and processes. In bringing these aspects of bacterial action to your notice it will be seen to what extent the products of their digestion of albuminous substances or the mere secretion of poisonous substances act in disease.

The study of putrefaction, which is produced by many different micro-organisms, has shown that, besides the production of albumoses as the early products of digestion, numerous chemical substances or final products are formed, some of which are not toxic, although many are highly poisonous. It is not necessary to dwell on this part of the subject except to say that the effects of these toxic bodies of putrefaction are (1) that of intense local irritation, whether they are injected under the skin or introduced into the digestive tract; and (2) an action on the central nervous system whereby, besides the production of muscular twitchings and clonic and tonic spasms, there is with many of them a tendency to the production of stupor and coma, ending in death. These chemical products of putrefaction, with perhaps one exception—that of mydaleine—do not cause a rise of body temperature, so that the fever which is observed in cases of poisoning by putrefactive products, such as those occurring in some cases of food poisoning, are due to other products of the bacteria. At one time similar chemical products, or animal alkaloids as they are called, were supposed to play a large part in the processes of specific infective diseases. Thus Brieger isolated two bodies, tetanin and tetano-toxin, which were supposed to be the active agents in the production of the convulsive spasms of tetanus. He also isolated typho-toxin, a chemical body which was supposed to be an active poisonous agent in typhoid fever. The existence of these bodies has, however, not been confirmed by subsequent research. It does not follow, of course, that in all diseases such final products may not play a part in the production of the symptoms. As I have shown, in anthrax such a product is formed and is one of the active poisons in the disease. Of later years, especially as the result of the study of the chemical pathology of diphtheria and of tetanus, the most active poison which is

[1] Lecture II. was delivered on June 16th, and Lectures III. and IV. will be delivered on June 21st and 23rd respectively.

produced by the micro-organism is not of the nature of an animal alkaloid but a substance which cannot be defined chemically but only by the investigation of its physiological action.

Separation of bacterial poisons.—The three kinds of poisons which have been indicated must be borne in mind—(1) the poisons secreted by the bacterium itself; (2) the products of the digestive action of the bacterium—i.e., the albumoses; and (3) the final non-proteid products, which may be provisionally called animal alkaloids. The first two poisons are precipitated from solution by means of alcohol. Generally speaking, the last class of poisons is soluble in alcohol. In the separation of the first two classes of poisons by means of alcohol great care has to be taken that they are not exposed for too long a time to the action of the reagent, so that their toxic properties may not be diminished. The prolonged action of alcohol, for example, on pepsin will diminish its activity, and so it is found that its prolonged action on the poisons of diphtheria and tetanus greatly diminishes their activity. Any method, therefore, in which alcohol is employed must be a rapid one, the poison not being exposed to its action for longer than a few hours.

Another method which is employed in the separation of these poisons is precipitation by means of saturation of the liquid with neutral ammonium sulphate. By this means all the proteids are thrown down with the poisons and may be collected, redissolved, and dialysed. To my mind, however, this method is open to grave objections. Ammonium sulphate is itself poisonous and it is extremely difficult to remove the last traces of the salt except after prolonged dialysis in the presence of antiseptics, which may be hurtful to the poisons. During the process of dialysis the solution becomes greatly diluted owing to the absorption of water from outside the dialyser, so that there is at the end a very dilute solution of the poison which has to be concentrated before it can be used. There is no advantage in this method because, although it gives rapid precipitation of the poison, yet the final product is not any purer than when alcohol is used as a precipitant. Other methods have been used by Brieger and others whereby the poisons have been precipitated by the salts of heavy metals which are got rid of afterwards by various means. Even in this case we are not much nearer the chemical identification of the poisonous substances.

Preparations of secretory products of the bacteria.—The two best known examples of toxic secretory products of bacteria occur in the bacilli of diphtheria and of tetanus. They are produced by growing the bacillus in a medium made of sterilised extract of meat, to which 1 or 2 per cent. of commercial peptone and a small proportion of common salt are added. This is the ordinary broth peptone. It is a medium in which the proteids exist in a digested form, so that any digestion by the bacterium of the proteids does not take place as it might do if serum albumin or white of egg were present. After growing in the medium for a certain time—three weeks, a month, or longer—and after filtering off the bacilli through a porcelain filter a clear sterile liquid is obtained which is extremely poisonous. This liquid when injected into an animal gives rise—in the case of diphtheria—to the characteristic symptoms of the disease—namely, a palsy, which is mainly dependent on the degeneration of the peripheral nerves, and in the case of tetanus to the characteristic symptoms of the disease. In this poisonous liquid no manipulation has as yet demonstrated the chemical identity of the poison. Such a liquid gives a copious precipitate with alcohol or on saturation with ammonium sulphate and this precipitate is itself highly poisonous, containing most of the poison present in the liquid, and consists almost entirely of the peptone which has been added to the liquid in the preparation of the culture medium with some of the salts of the broth.

An attempt was made by Roux and Yersin to isolate this poison by adding phosphoric acid and then lime to the liquid, the precipitate of calcium phosphate formed carrying down the poison. It was found that the small amount of this calcium phosphate mixture which killed an animal did not show any appreciable difference in weight from the amount of calcium phosphate present; that is, the amount of poison present was practically imponderable. This may also be appreciated by the statement that even as little as one-twenty-fifth of a cubic centimetre of the broth filtrate may kill a guinea-pig weighing 300 grammes in 48 hours. Kitasato also found in his experiments on the bacillus of tetanus that the broth filtrate was poisonous in what were practically infinitesimal doses. It is evident that in these cases we are dealing with a poison which is at present quite outside the domain of chemistry; it cannot be expressed chemically, it can only be expressed from its pathological effects.

Separation of the digestive products.—To obtain these it is necessary to grow the bacillus in a liquid containing either alkali-albumin, serum, or any of the liquids of the body containing proteids in solution. Extract of meat and salt (i.e., broth without peptone) is with advantage added, as it thus makes a better culture medium for the bacterium. After the bacillus has grown in this liquid for from three to five weeks and it is filtered off through porcelain the clear filtrate after concentration at 40° C. is precipitated by an excess of alcohol, and the precipitate collected and redissolved in water, reprecipitated by alcohol, and after washing in alcohol and ether is dried over sulphuric acid. In this way a lightish brown powder is obtained, readily and completely soluble in water and giving the reactions of albumoses—namely, the biuret reaction and the characteristic precipitate with nitric acid.

Some bacteria, for example, the anthrax bacillus, have practically no toxic secretion and the albumoses are readily separated in as pure a form as can be obtained; but with others, for example, the diphtheria bacillus, where there is not only a secretory product, but also digested products: the powder which is obtained by the method thus stated contains not only the secretion but also the albumoses. There are no chemical means of separating these secretory products from the albumoses, but some degree of separation may be obtained by keeping the solution at 60° C. for a longer or shorter period, whereby the secretory product is rendered inert. This is, of course, only a rough method, inasmuch as heat also damages, in some instances, the action of the albumoses.

Separation of the final products.—The third point is the separation of the final products. These final products are contained in the alcoholic filtrate after precipitation of the proteids in solution. This alcoholic filtrate is evaporated to dryness at a temperature of 40° C. and extracted with absolute alcohol. The extract is filtered, evaporated again to dryness, and redissolved in alcohol. After filtration and if necessary concentration it is thrown into an excess of ether, which causes a precipitate; and the alcoholic extract may thus be separated into two parts, one of which consists of substances which are soluble in alcohol and insoluble in ether and are precipitated by ether and other substances—chiefly fats—which are soluble in ether and alcohol, but insoluble in water. This manipulation and separation of the substances is of course at present a very imperfect one inasmuch as the substances so separated have not been obtained in a sufficiently large quantity, nor are their chemical characteristics sufficiently worked out to enable a definite idea of these characteristics to be obtained, but for the purposes of physiological experiment and of determination as to the general nature of the poisons produced by pathogenic bacteria I have found this method of great value.

In the investigation of toxic products formed in infective disease not only must they be studied by means of the artificial culture of the bacillus in suitable media, but a chemical examination of the body itself, especially as regards the blood, the spleen, and the liver, is necessary in order to determine whether the same products are found in the body as in the artificial culture. This study is of great value when the poisons have a specific action—for example, in the case of diphtheria and of tetanus; but in the diseases in which there is no specific symptom due to a chemical poison it may be impossible to prove the identity of the poisons produced by the bacterium and those found in the bodies of patients dead from the disease.

Intra cellular bacterial poisons.—The three classes of poisons just considered or described are extra-cellular bacterial poisons, but besides these, which are present in the culture fluid in which the bacteria are grown, poisons may be present in the bodies of the bacillus—intra-cellular poisons—and these have to be studied by means of other methods. One method is to kill the bacillus which is grown in broth by chloroform. If a few drops of chloroform are added to the liquid and shaken up and allowed to act for twenty-four hours or longer the bacilli are killed, so that on testing the liquid is found to be sterile. The bacilli are still suspended in the liquid, and after evaporation of the chloroform *in vacuo* the liquid may be used for experiment. Besides the bodies of the

bacilli it of course contains any secretory poisonous product it may form. The results obtained by the injection of this liquid may be compared with those observed with a broth culture also chloroformed, and from which the bodies of the bacilli are removed by centrifugalisation. The comparison of the two results enables one to observe the difference in the action between the poison contained in the body of the bacillus and the secretory product; between the intra-cellular poison and the extra-cellular.

Another method is, after growing the bacillus on a large surface of agar, to scrape the culture from the surface and suspend it in sterile salt solution. Some amount of extra-cellular poison may be present in this suspension as well as in the first case. In filtering a culture fluid through a Chamberland filter some of the toxic products may be held back by the filter itself, and this is the more likely to be the case if the solution contains a large amount of undigested proteid—for example, serum. The method of killing the bacillus in the fluid by means of chloroform and centrifugalisation to get rid of the bodies of the bacilli is therefore a very important one in the investigation of the toxic products of the bacterium, especially as in this way the intra-cellular poisons of the bacillus can be investigated.

Toxic action and reaction.—The physiological action of these products may be investigated by studying the effects produced by their injection subcutaneously, into the peritoneal cavity or into the venous system. As the result of the intravenous injection of poisons a more rapid effect is produced than by other methods and observations may be made in rabbits as to the effect of the poison on the temperature, on the body weight and on the intestine (as regards the production of diarrhœa), as well as its effect on the production of microscopical lesions in the nervous system, the heart, liver, spleen, and kidneys. From the experimental point of view infective diseases may be divided into two great classes. In one of these the symptoms are only those of what we must call a toxæmia or blood-poisoning—that is, there is fever in a greater or less degree, with great bodily depression and loss of weight, with some alteration in the secretion of the glands, more evidently those of the kidney and the skin. At some period or other of this process the fever may be absent and yet the process of poisoning may be progressive. In the second class of cases besides the symptoms of toxæmia there are present during the acute disease, or following as sequelæ, specific lesions, mainly of the nervous system. Examples of toxæmia without specific lesions occur in anthrax or malignant pustule and in typhoid fever. Examples of the second class are diphtheria and tetanus, in both of which, besides the toxæmia, there are specific symptoms referable to the nervous system.

The animals which have been used in the investigation were rodents (rabbits and guinea-pigs), between which and the higher animals there is a great gap, chiefly on the side of the nervous system. This point must be borne in mind in any deductions made upon the action of poisons upon the nervous system in rabbits. The method of procedure in the experiments was as follows. The weight and rectal temperature of a healthy rabbit are taken for two days at least previously to the experiment. In this way an indication is obtained by the increase of weight in the animal and by the regularity of the temperature as to whether it is healthy or not. The injection is then made, usually into the marginal vein of the ear, and the effect of the poison on the temperature, body weight, &c., observed during the life of the animal. After death or at killing cultivations are made from the heart's blood, the peritoneal cavity, and the spleen or liver, to demonstrate the absence of bacterial action, and the nerves (the phrenic and branches of the anterior crural) are stained with osmic acid for the investigation of degeneration, and a portion of the left ventricle of the heart is also stained in the same liquid for examination of any change in the fibres. Bacterial poisons appear to have a specific action on the heart of the rabbit in the production of degeneration of the muscle fibre, a degeneration which is the expression of the cardiac failure so frequently observed in infective disease in the human animal.

One important point as regards the action of these bacterial poisons must be noted—namely, that they have in many cases a very slow action, so that following on a single dose there may be some slight change observed in the temperature or in the body weight which passes off. Subsequently, the animal either progressively goes downhill and succumbs after a week or fourteen days or longer or there may be no apparent downward progress and death occurs suddenly. This slow action of the bacterial products is so common as to be noted particularly and in some cases it precludes any exact investigation of their effects on the circulation of the blood within the time limits of an experiment.

Toxic reaction.—Besides the poisonous effect of the bacterial products on the body whereby an injury is effected on the tissues, producing either alteration in function with or without obvious degeneration of the tissue itself, bacterial products may produce what may be called a toxic reaction. This occurs most readily as the result of the injection into an animal refractory to the disease of small but gradually increasing doses of poison. There is no accumulation of the poison in the body, but there is a gradual increase in the blood and tissues of a substance or substances which are inimical to the poison or the bacillus—that is, under certain conditions they may prevent, when injected at the same time, the fatal effects of the poison on the bacillus. These substances probably fall into two groups: (1) the antitoxic, which counteract the effects of the poison itself; and (2) the anti-microbic, which counteract the effects of the bacillus itself. In one and the same animal the blood may contain a substance or substances which are both antitoxic and anti-microbic—such, for example, as occurs in the process of the formation of the diphtheria and tetanus antitoxic serum. As an introduction to the investigation which I have more recently done it will be well to discuss as examples the chemical and pathological processes which occur in anthrax, diphtheria, and tetanus.

Anthrax.—I have previously shown, and subsequent experiment has only confirmed the observation, that the bacillus of anthrax produces in the body of an animal the subject of anthrax and in an artificial culture medium containing digestible proteids a large quantity of albumoses and of a body which gives some of the reactions of an alkaloid. Both these classes of bodies are poisons, the albumoses producing fever and causing death in coma when given in large doses; the alkaloidal body, which is much more poisonous, producing no rise of body temperature and causing stupor ending in coma and death in mice, guinea-pigs, and rabbits. According to the dose given death may not be produced, but the stupor and coma may last for a certain time and then be recovered from. The bacillus of anthrax is a typical infective micro-organism and it is the chief example of the class of micro-organisms whose toxic products are the results of the transformation of the proteid solutions in which it grows. Practically it produces no toxic secretion. If any is produced at all it must be in very small amount, inasmuch as when grown in peptone broth it imparts little or no toxicity to the liquid as tested by injection after removal of the bacilli through the filter.

Tetanus.—This is quite different from the results obtained in the bacillus of tetanus. If this is grown in a solution of peptone broth under suitable conditions it is found to produce a highly toxic substance, which, as has been previously stated, is practically unweighable. This substance, which must be considered a secretion of the bacillus, possesses a characteristic physiological action in that it produces the characteristic convulsions of the disease tetanus. It is the chief toxic agent produced by the bacillus. Kitasato once found it in the heart's blood of a patient dying from tetanus. In a number of cases of tetanus which I examined chemically I did not find this poison, although perhaps this result is not of much value, as the method I employed would possibly destroy the somewhat sensitive toxin. I found in the spleen and blood of patients dying from tetanus albumoses in fair quantity which did not possess any other action than that of producing fever; they produced no convulsions and did not cause death. I have previously stated that in one experiment I found that the ether extract of the spleen in tetanus produced convulsions when injected intravenously in rabbits. This undoubtedly occurred, but I am not at all sure that it is of very great significance; at any rate, I could not confirm the observation and I do not wish to lay any stress on it. It must be considered at present that the chief, if not the only, active poison in tetanus is the secretion of the bacillus, which when injected into the body after a certain period produces convulsions. With regard to the albumoses which are present in the body, in the spleen and blood of patients dying from tetanus, they may be in some cases the result of a mixed infection by the bacillus of tetanus and other

bacteria, but they may be the result of the direct action of the tetanus bacillus or of its toxin, although the proof of this is at present wanting. I did not find that the tetanus poison had any digestive action.

Diphtheria.—The chemical processes in diphtheria closely resemble those in tetanus. There is a secretory product which is produced when the bacillus is grown in peptone broth which is present in the membrane of diphtheria and probably in the tissues as well. This secretory product possesses a characteristic action on the nervous system, causing in rabbits paralysis dependent on nerve degeneration. When the bacillus is grown in a solution containing digestible proteids it digests these with the formation of albumoses and certain bye-products. These albumoses separated in the ordinary way have a toxic action, similar to, although not so powerful as, that shown by the secretory product. They are also found in the spleen and blood of persons dying from diphtheria and possess a similar action. Whether the whole of the toxic action of the products is to be ascribed to the albumoses themselves is perhaps a matter of debate, inasmuch as the only method by which the physiological action of the secretory product can be separated from that of the albumoses is that of heat, which also affects the action of the albumoses.

What I have called the secretory products of tetanus and diphtheria are remarkably sensitive to heat; that of tetanus, for example, is completely destroyed by raising to a temperature of 80° C.; that of diphtheria is destroyed at a temperature of 60° C.; and heating to lower temperatures weakens the action of the poison or alters its effects.

It is evident that the action of the powerful secretory products of pathogenic bacteria is unlike that of crystallisable poisons. Firstly, they produce a large effect in very small doses; secondly, this effect does not come on immediately after injection, but is preceded by a period during which no apparent change is occurring in the body; thirdly, the poisons are frequently selective in their action, affecting mainly the nervous system, on which they produce a profound effect; they may also disorganise the general nutrition of the body; and fourthly, they are very sensitive to heat and external conditions. Their injection into the body—their effect being preceded by a period of incubation—reproduces the action of the bacillus itself, so that one has to do with a poison which, although not living, possesses a progressive change in the tissues of the body like the bacillus.

ON

EXTRA-UTERINE PREGNANCY.

Delivered at Mason College, Birmingham, on May 11th, 18th, and 25th, 1898,

BY JOHN W. TAYLOR, F.R.C.S. ENG.,

PRESIDENT OF THE MIDLAND MEDICAL SOCIETY; SURGEON TO THE BIRMINGHAM AND MIDLAND HOSPITAL FOR WOMEN; CONSULTING SURGEON TO THE WOLVERHAMPTON HOSPITAL FOR WOMEN, ETC.

LECTURE III.[1]

Delivered on May 25th.

ON THE DIAGNOSIS AND TREATMENT OF EXTRA-UTERINE PREGNANCY.

Diagnosis.

MR. DEAN AND GENTLEMEN,—When extra-uterine pregnancy is present and has by its symptoms driven the patient to seek for advice, at every stage—up to "term" with death of the fœtus—there are certain indications to be derived from history, symptoms, and physical signs which are sufficient in most cases to establish a correct diagnosis. In my own series of 37 cases a correct diagnosis was formed in 27 cases. In one case (the first case) no diagnosis was made. In 3 cases the diagnosis was made of tubal disease only. In 2 cases the diagnosis was made of myoma. In 4 cases the diagnosis was made of ovarian cystoma. Three of these were instances of ovarian cyst complicated by the co-existence of tubal pregnancy, and in one of these an alternative diagnosis was recorded of ovarian cyst or tubal pregnancy. In only 3 of the cases was the diagnosis absolutely mistaken and in two of these, and even in some of the cases of imperfect diagnosis, I think it may be said with perfect truth that the fault was my own and that imperfect knowledge, carelessness, or some false suggestion at the outset was responsible for the blunder. The omissions or mistakes which I have just enumerated are necessarily confined to cases on which I have operated. I believe I know of 2 other cases in which I did not fully recognise the condition and therefore failed to do my duty. The one was a case of diffuse hæmorrhage—probably from early rupture of the tube. The patient was quite pulseless when I was called to her and although there was some history of delayed menstruation I could not find on examination any pelvic tumour or physical sign pointing to a misplaced pregnancy. I did not know at that date that in some cases of very early rupture this may be entirely wanting. I was uncertain and the possible moment for action was lost. The other case was one of early tubo-ligamentary pregnancy. The patient was herself suspicious that something was not right about her pregnancy and asked my opinion. After careful bimanual examination I came to the conclusion that the pregnancy was intra-uterine and normal and reassured the patient. Some nine or ten months after this I found that the time for confinement had been passed without result and that one of my colleagues had operated on the patient, removing a dead fœtus from an intra-peritoneal sac which was exactly similar to those I have described as posterior-ligamentary or retro-peritoneal. It is worthy of notice that the only case of this kind which figures in my own series (No. 4) had been seen at an early stage of the pregnancy by the same colleague and had been considered by him to be intra-uterine and normal. There is probably some good reason for the occurrence of the same mistake in the practice of two surgeons, both of whom have had special experience of extra-uterine gestation. Again, my operation list does not of course contain any case in which I have diagnosed an extra-uterine pregnancy and found a different condition. Four of such mistakes I can remember. One was a case of retroflexion of the gravid uterus with intra-peritoneal adhesions. This occurred very early in my practice. Two were cases of double pyosalpinx with temporary cessation of the menses; the other case was one of malignant tumour of both ovaries. In this case also there was consequent amenorrhœa. Other cases in which an alternative diagnosis was made or in which the possibility of extra-uterine pregnancy was entertained will be referred to under "differential diagnosis." Finally, I have to add to my list of successful diagnoses some six additional cases of extra-uterine pregnancy in which the operation was performed by another surgeon. In one of these cases a tubal pregnancy of one side was complicated by a pyosalpinx of the opposite side, the only instance in my own practice in which I have found tubal pregnancy and suppurative salpingitis directly associated. As subsidiary material helping to form my experience I have also to add nearly 50 cases of extra-uterine pregnancy which I have watched during the last fourteen years in the practice of my colleagues.

In considering both the diagnosis and the treatment of extra-uterine pregnancy I shall follow as nearly as possible the divisions already framed when dealing with its pathological history. Our first consideration, accordingly, will be the diagnosis of a case of earliest rupture of the tube with diffuse hæmorrhage. The patient is probably a married woman and one who of course must necessarily be within the limits of the child-bearing period. She has probably been in perfect health until an hour or so ago. She was then suddenly seized with a pain in the abdomen, "as if something had given way inside her." She became faint and collapsed, was sick and lay down upon the couch or was assisted to her bed. She was given a little stimulant and for a few minutes felt perhaps slightly better. On reflection the attack did not altogether surprise her. Her proper menstrual period was due last week, but instead of coming on as usual was delayed for some days (an uncommon occurrence for her), and during the last three or four days, although there has been some discharge of blood from the vagina, which for an hour this morning was quite profuse, the period has not come on "properly" or in a customary manner. Such, or something like it, is the history. On glancing at the patient the observant practitioner will probably notice at once the paleness of her

[1] Lectures I. and II. were published in THE LANCET of May 28th and June 4th, 1898, respectively.

countenance and lips and her seriously "passive" expression. This can only arise from simple faintness with but little or no loss of blood or from active hæmorrhage. The pulse will decide it. If from simple faintness, although it may be temporarily lost or difficult to find, the pulse when felt again will be found to be slow and moderately full, while if hæmorrhage be still in progress the pulse increases in frequency as the hæmorrhage proceeds and after a time becomes perceptibly weaker. Perhaps the normal pulse-rate is known, and if so it will be found that it is twenty or thirty or forty beats in the minute faster than is usual and that the ratio is still increasing. This is obviously not due to nervousness or excitement, for the patient is curiously self-contained and quiet. Every now and then the pulse becomes fluttering and difficult to count and at these times there is usually some nausea and vomiting. Between these periods of extra-faintness it may temporarily improve in quality, but its rapidity does not diminish so long as the bleeding is unchecked. The temperature is sub-normal. If the hæmorrhage continue unabated a colder greyness slowly creeps over the countenance, the voice becomes feeble, the sight is dimmed, the fingers become white and rather cold, and the patient now speaks but little or only in answer to direct questions. Still, however, the mind remains clear and the patient is often acutely observant of all that passes around her. I have known a patient in this condition, rescued from imminent death by operation, speak afterwards of several things connected with her operation of which at the time it was thought she was practically unconscious. It is needless to try to trace the symptoms any farther—the patient is dying—and if anything is to be done to save her life it must be done at once.

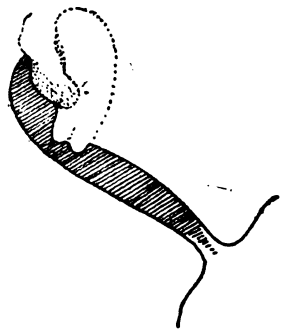
In some of the worst cases (the symptoms of which I have been attempting to describe) there are no pelvic or abdominal signs of any definite importance or certainty. The hæmorrhage may come from a very little swelling near the cornu of the uterus and if the latter be inclined to retrovert the tubal swelling may be inaccessible. The blood is fluid; it is continually pouring or dribbling into the abdomen and the patient never has vitality enough for any kind of inflammatory reaction. In addition the patient may be stout, the abdominal parietes thick, and a satisfactory bimanual examination be altogether impossible. Then without any sign directly pointing to the tube the symptoms of internal bleeding must be our ground for action. Fortunately, however, in the majority of cases there is additional, and sometimes abundant, evidence to be obtained by careful examination. Sometimes a tumour is to be distinctly felt at one side of the uterus—sometimes a "decidua" has been passed *per vaginam;* usually the pouch of Douglas may be felt distended by blood-clot, the sensation of an ill-defined but full and boggy swelling being communicated to the finger of the examiner. In one case I detected absolute fluctuation of the blood through the abdominal walls before opening the abdomen, and other indications of blood in the abdomen may be elicited by percussion—dulness in the flanks very slowly changing with changes of position (Mayo Robson)—while in all cases which survive the first few hours, and in which the bleeding is temporarily checked, there is difficulty in the passage of flatus and motion—the patient suffers from considerable abdominal pain and, in short, the signs are present of peritonitis as well as those of recent hæmorrhage. In these cases it is but very rarely (if ever) that any evidence pointing to pregnancy is to be obtained from the condition of the breasts or areolæ or from the sensations of the patient. These are always feeble and more often wanting in the early stages of extra-uterine pregnancy, and any search for them with reliance on their importance will probably increase doubt at a time when certainty and action are of the utmost value.

Now as to differential diagnosis: in a case of early rupture with diffuse hæmorrhage the symptoms are so notably sudden and instant in their origin that there is but small danger of any other affection being suspected save those of similar acuteness. To one unversed in gynæcological disease the idea of poisoning is apt to come uppermost. Gastric or intestinal perforation from ulcer of the stomach or acute appendicitis may also be suspected. In all of these there may be the same sudden onset, but except as a curious and improbable coincidence there would not be the contemporaneous presence of an irregular blood-discharge from the vagina, and the history, however poor, of some delay in the appearance of the period. In all of these, too, the immediate pain and distress are much more violent than in hæmorrhage, while in gastric perforation (which usually occurs in young unmarried women) and in acute appendicitis there are antecedent symptoms or attacks which point to the stomach or the appendix as the source of trouble. As a matter of fact the question of these diseases has occurred to those concerned rather as post-mortem doubts and fancies after the patient has died than as serious diagnostic difficulties during life. The chief danger of the practitioner in my own experience has been to under-estimate the importance of the condition before him. The medical attendant has been unaffectedly surprised at the consultant's diagnosis and in one case he was evidently incredulous until the blood was pouring out of the opened abdomen. It has been the difficulty of making any diagnosis at all rather than the making of a wrong one which has usually been the stumbling-block and in two of my cases a physician was the first consultant who was sent for. In both of these cases I am happy to say the condition was recognised by the physician, and the surgical interference recorded was the result of his diagnosis.

Our next consideration is the diagnosis of an unruptured tubal pregnancy—of tubal mole and of peri-tubal hæmatocele. In the preceding section, when dealing with early rupture and diffuse hæmorrhage, we found that of the three chief factors which go to form the diagnosis, the symptoms—symptoms of internal abdominal bleeding—were on the whole the most reliable, that the history was of next importance, and that the physical signs of any tumour (although of the utmost value when present) were uncertain and might be practically wanting. As we proceed with our subject and discuss later and still later developments of extra-uterine pregnancy we shall find both history and physical signs increasing in value, and it is to these, therefore, that we shall mainly direct our attention: but at all the stages referred to (except the very latest) diffuse internal hæmorrhage may intervene and add its special signs and symptoms to those already present.

The previous history of the patient—the history before the pregnancy begins—is of some importance. There is a certain amount of well-being of the genital organs which is probably necessary for conception to take place, and in any case of pregnancy, whether uterine or extra-uterine, the patient has usually been moderately well and free from any marked pelvic trouble immediately before the act of impregnation. This period of ante-pregnant or ante-amenorrhœal well-being, which is of little or no importance in normal pregnancy, is worthy of special attention when there is a possibility of misplaced pregnancy, because the tumours with which this is liable to be confounded have usually some history of illness rather than of health immediately preceding their formation. Again, in rather more than half the number of cases of extra-uterine pregnancy several years have elapsed since the last normal pregnancy took place, and although the absence of this interval is of no diagnostic significance (as the accompanying tables will show), its presence in a suspicious case may be held as slightly increasing that suspicion and as being in accordance with the history of other recorded cases.

From the consideration of these two points we pass on to the history of the pregnancy itself. It is obvious that as the duration of the pregnancy increases so must its history be traceable for longer and still longer measures of time, and the chief sign which marks this is the absence of the normal menstrual period—not necessarily the absence of all sanguinolent discharge, but the absence of the normal period in its usual course. Some critical discrimination is often needed in order to arrive at a just conclusion on this point. For instance, in tubal mole (as I pointed out in 1894), there is often no definite history of amenorrhœa—that is, the patient has never gone "over her time" without vaginal loss, and if carelessly questioned such a patient will probably answer that she has been "regular" throughout, but that the present period is unusually protracted. On closer inquiry (of the same patient) we may, however, probably elicit the fact that the hæmorrhage which has been taking place during the last three or four weeks is very different in character from that of a normal menstrual period, and the patient has no difficulty in fixing a date some seven or eight weeks previously when she was last "properly poorly." Dr. Cullingworth has recently drawn attention to the characters of the hæmorrhage observed in this condition. He writes: "The blood is



almost invariably dark in colour, moderate in amount, thickish in its consistence, and steady in its rate of flow. Gushes of bright red blood occur occasionally but are quite exceptional." If we add to this that the hæmorrhage is very persistent and that it may carry with it some shreds or portions of decidual membrane, all its special features have been noticed. Apart from the presence of decidua the most practical point, in my opinion, is the contrast often afforded by this bleeding to the normal bleeding of the menstrual period in the same individual. The type of menstruation often varies but little for years together and it is very rare that an intelligent patient is unable to detect the difference. Amenorrhœa, then, together with or followed by persistent, dark-coloured uterine bleeding of moderate amount is almost always met with. The hæmorrhage is usually due to some separation of decidual membrane from the interior of the uterus and is, moreover, a sign that the vitality of the pregnancy is endangered or destroyed. So long as the pregnancy—although out of place—is growing and uninjured there is, as a rule, no uterine bleeding. If the decidua be shed it does not follow that the bleeding ceases. Hæmorrhage continues from the interior of the uterus while the abortive pregnancy remains as a source of irritation within the tube, and in some cases at least I have very little doubt that the hæmorrhage comes directly from the tube—the tube containing the mole of pregnancy—bleeding alike into the uterus by its open uterine end and into the pelvis by its open fimbriated end.

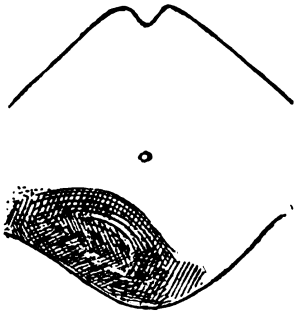
We now pass to the physical signs elicited by examination of the patient. When dealing with the pathological history of tubal pregnancy I noticed that one of the earliest and most marked phenomena attending its presence was the increased vascularity of the parts affected. There is a sign, a very constant and valuable one, accompanying this—the presence of pulsating vessels in the vaginal vault on the affected side. All the branches of the uterine artery are subject to very marked enlargement on the side of the pregnancy. It is often easy to touch a vessel the "pulse" of which is very comparable to that of the radial and, although inflammatory affections may sometimes give rise to very similar hyperæmia, the pulsation of the vessels is rarely so marked and so easy to elicit as in tubal pregnancy.

The next point is the finding of the extra-uterine tumour. If we turn to the sequence of illustrations which I used when describing tubal mole and peri-tubal hæmatocele [2] we shall at once recognise the leading features to be determined (if possible) by vaginal and bimanual examination. There is the tubal tumour caused by the misplaced pregnancy, its size, shape, position, and mobility, and there is the displacement (if any) of the pelvic viscera caused by its growth. When hæmatocele forms there may be the opportunity perhaps of following the alteration in the tumour produced by hæmorrhage—in watching the change from mobility to fixation, the rapid lateral and upward growth of the blood-mass, and the change from the insensitive little tubal tumour of the healthy and unruptured pregnancy to the acutely tender and extending hæmatocele. For at first, when the pregnancy forms within the tube, there is no pain or tenderness, and it is only by accidental good fortune that the opportunity arises for an examination under these conditions. In one case seen by me at this stage the patient had nothing to complain of except amenorrhœa of five or six weeks' standing, but to one side and behind the uterus a little moveable tumour was plainly felt which, by its shape and its contiguity to the uterus, suggested a tubal rather than ovarian origin. Another observer describes the tumour under these conditions as "sharply limited from the unaltered part of the tube, as closely corresponding to the size of the ovum, and as elastic but yielding" (Winter).

Later, if bleeding occurs within the tube its enlargement is not limited to the site of pregnancy but the whole of the tube becomes distended, and this is the stage when the diagnosis of the tumour is attended with least difficulty. The tube is not only distended but hard, its sinuous curves are easily followed, its tubal or "sausage-shaped" character is readily ascertained, and if the hæmorrhage be limited to the interior of the tube and no blood as yet has invaded the peritoneal cavity there is still but little or no tenderness and a full examination may be made without difficulty or pain. The following illustration (Fig. 36) will, perhaps, convey better than words can do what may be felt under such conditions by vaginal touch and bimanual examination. It also indicates the usual limitations to complete investigation. The uterus is inclined to retroflexion; its highest part can, perhaps, be felt bimanually, but whether this be fundus or the upper portion of the anterior surface is probably uncertain. Behind the cervix a sausage-like tumour is plainly felt closely applied to the back of the uterus and probably adherent to it. In

FIG. 36.

some cases it seems to partially encircle the uterus like a collar. One curve of it is thoroughly felt and above this the beginning of another is just accessible. Beyond this point any further investigation by ordinary vaginal or bimanual examination may be impossible. Rectal examination will afford larger and higher opportunities, but this is inadvisable except in cases of serious doubt and difficulty when the patient remains under the personal observation of the surgeon.



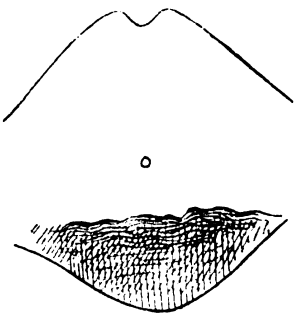
While the foregoing is a fair description of the tumour very generally found in cases of extra-uterine pregnancy it by no means follows that the tumour, or any tumour, is always met with in this situation. Sometimes the pregnant tube is altogether on one side of the uterus, the pouch of Douglas being quite empty, and when the uterus is much retroflexed the tumour may even be found in the front half of the pelvis, the pregnancy lying altogether anterior to the uterus. In this situation the tumour is very accessible to bimanual examination provided the bladder be empty. (The use of the catheter is always an important preliminary to a thorough examination of the pelvis.)

It might easily be supposed that, as hæmorrhage took place into the pelvis and the original distension of the tube was supplemented by the formation of a hæmatocele, so the resulting tumour would become increasingly prominent and more easy of diagnosis. But it is not so. With every bleeding into the peritoneal cavity there is pain, there is some collapse, and there is abdominal tenderness persisting for many days. The slightest pressure is objected to, the abdominal muscles are contracted, deep palpation is impossible, and any attempt at bimanual examination is apt to be most unsatisfactory. Furthermore, it will often be found on vaginal touch that the clearly-defined outlines of the tube are obscured or even lost in the swelling of the hæmatocele. There is evidently a tumour present and it appears to be connected with the Fallopian tube, but its upper limit cannot be palpated from the abdomen and its exact size and boundaries are uncertain. Here the displacement of the uterus, if definite and permanent, will afford valuable evidence as to the size of the swelling which causes the displacement. A little later, if the hæmorrhage is repeated and the hæmatocele increases, we find the upper limit of the swelling appearing above the pubes. In spite of the pain and abdominal distension there is then no difficulty in ascertaining the full extent of the tumour. Above one groin we usually find the convex outline of the mass arising from below. It is lateral, fixed, tender, and bulging, and may be conveniently represented in the usual way by the accompanying outline illustration (Fig. 37). The convex upper border of the mass is well marked. It is sometimes visible, it can be felt on gentle palpation, and tends to extend in an increasing curve towards the umbilicus. Below this line the percussion note is dull; above it, the adherent and probably distended intestine marks a clearly defined area of resonance. This applies to the central portion of the curve; each end of it shades off into inaccessible regions—on the one side toward

[2] Vide Figs. 8, 9, and 10, THE LANCET, May 28th, 1898.

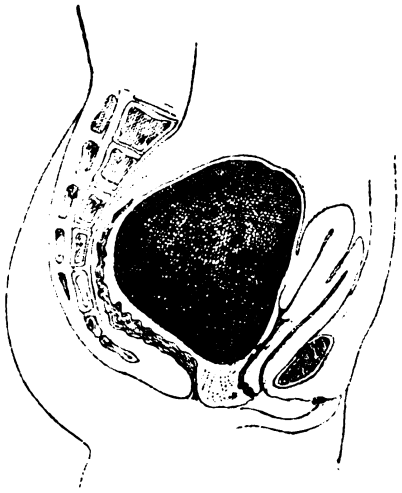
the loin of the affected side, on the other beneath the pubes. Examined bimanually the abdominal mass above the groin is felt to be one with the tubal tumour in the pelvis and the displacement of the uterus to the non-affected side (which is now extreme) is marked and unmistakeable. This tumour, which is usually characteristic of the advanced

FIG. 37.



development of intra-peritoneal hæmatocele, the result of bleeding from the unruptured tube, and which then is produced somewhat slowly or after repeated hæmorrhages, may also be more suddenly formed by later rupture of the tube; and, so far as physical signs are concerned, there is no essential difference in the resulting hæmatoceles. The same description will accordingly apply to both formations.

Very similar, too, is the tumour formed by an intra-ligamentary pregnancy about the fourth month when the pregnancy is of the anterior or sub-peritoneo-pelvic variety. There is no difference except that the uterus is liable to be raised as well as displaced to the opposite side by the growing pregnancy and that in this case one is more liable to meet with the signs of a fixed iliac tumour growing into the abdomen above the groin without any symptoms of internal hæmorrhage, because under these circumstances the pregnancy may be uninterrupted by accidental changes. Frequently, however, disturbances do arise and then no differential diagnosis between the two hæmatoceles is possible until the abdomen is opened.



The only other tumour needing consideration at this stage is that of the typical retro-uterine hæmatocele when the pouch of Douglas is acutely distended, its opening above into the peritoneal cavity being temporarily occluded. The condition occurs but rarely as the result of tubal bleeding (an example is afforded by Case 2), but when it does take place the signs—both abdominal and pelvic—are very different from those I have already described. In the (two) cases I have seen the upper limit of the blood-mass was readily felt from the abdomen, but instead of being lateral, convex, and bulging it simply formed a hard, irregular wall or line stretching right across the abdomen, midway between the pubes and the umbilicus, the abdomen below this line being uniformly hard and dull with coagulated blood (Fig. 38). The active, grow-

FIG. 38.

ing, bulging pole of the tumour in this hæmatocele was transferred (as it were) from the abdominal to the pelvic aspect. The abdomen was quiescent; the pouch of Douglas was acutely distended. With one finger in the vagina and the other in the rectum the tense elastic swelling of the over-filled pouch could be thoroughly appreciated, bulging between the two. The leading features of this hæmatocele are well represented in the following illustration. (Fig. 39.) The

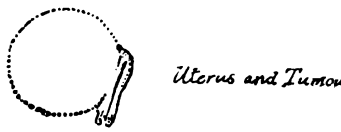


FIG. 39.

small intestines lie across and somewhat flatten the upper boundary of the blood-mass, while the fold of peritoneum between the vagina and rectum is transformed into a large sac full of blood and serum.

The next point is the determination of the size, position, and contents (if any) of the uterus. The uterus is nearly always slightly enlarged, the enlargement bearing a strong resemblance to that of the sub-involuted uterus after confinement and having but little in common with the broad and succulent enlargement of the pregnant organ. It is slightly thicker and longer than normal, as a bleeding uterus generally is, but the cervix is not specially soft and yielding, and

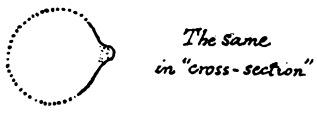

FIG. 40.

The tumour and the uterus in close relation.

if this be followed up by the finger beyond the vaginal reflexion and the tumour of the extra-uterine pregnancy or hæmatocele be encountered in its (close) relation to the uterus somewhere in the pelvis the cervix may often be followed beyond and above the lower limit of the tumour and the uterus may be felt something like a finger fixed to one side of the tumour. (Figs. 40 and 41.)

FIG. 41.

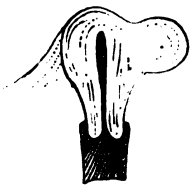
The tumour and the uterus in cross section.

We have already traced the early tendency of the uterus towards retroflexion and its later displacement to one side of the pelvis. Generally with the larger hæmatoceles produced by recurrent bleedings, and always in true retro-uterine hæmatocele, which we have just been considering, the uterus is strongly displaced forwards. When the pouch of Douglas is excessively distended it may also be carried upwards so that the cervix is difficult to reach. The exact position of the fundus and the emptiness or non-pregnant state of its cavity are very important, and sometimes very difficult, points to determine, but they must be decisively settled before any operation is undertaken. On careful bimanual examination, if (as already described) the supra-vaginal

cervix has been traced upwards by the examining finger from below, the direction of the uterus is followed as far as possible and the probable situation of the fundus—toward the front or the side of the pelvis—is definitely determined. Then, if the hand on the outside of the abdomen be carried to this point in spite of the larger displacing tumour of the pregnancy, the fingers of the outside hand may often be gently pressed down on the summit of the fundus and the whole of the uterus may be accurately mapped out (bimanually) by the fingers. Sometimes the conditions—the coexistence of peritonitis and abdominal distension—make such examination an utter impossibility, and then it may not only be allowable, but necessary, to pass the uterine sound in order to come to a certain conclusion. Both the passage of the sound and rectal examination should, however, be left to the discretion and use of the operating surgeon. All other reasonable methods for determining the condition of the uterus should have been previously used and the same delicate gauging of the probable position of the fundus and direction of its cavity as that already described should precede the final determination of the curve of the sound and of the passage of its tip within the external os.

We have now concluded the examination of the patient, but we have still to consider the symptoms which accompany intra-peritoneal bleeding and hæmatocele. Some have been incidentally referred to, such as abdominal pain and tenderness, distension, and rigidity of the abdominal muscles. The characteristic feature of these symptoms, as also of the collapse and faintness and vomiting generally accompanying them, is that they come on suddenly because they are directly due to the bleeding, and if the bleeding be slight or moderate they rather quickly diminish in intensity or entirely disappear. For instance, a patient suffering in this way may feel perfectly well all day, be attacked with sudden violent pain at 11 P.M., feel seriously ill for half the night, have a good sleep towards morning, and be attending to her usual household duties in the course of the following day. These attacks, in the same way as the bleeding which we have studied before, are almost inevitably recurrent, so that in a large number of cases treated by operation we have a clear history of three or four attacks before the abdomen is opened. The suddenness of these attacks is very frequently surprising to the patient herself. One of my patients in whom they occurred during the daytime gave a history of a fall with each attack, evidently supposing that the pain from which she suffered was the consequence rather than the cause of the fall in each case. Some of the remarks of the patients are as follows: "I was suddenly seized with pain on the left side of the belly, in the back, and in the thigh. I was bent double with it." "I was seized with sudden pain in the lower part of the stomach soon after getting out of bed." "I was seized with sudden pain three weeks ago on returning from church on Sunday, violent abdominal pain and vomiting being my chief symptoms. The pain was repeated on the following Thursday and Saturday and twice during last week." Vomiting very generally accompanies the attacks but is not persistent. At first the patient usually speaks of the pain as being all over the abdomen, but when questioned can generally differentiate one side as being more painful than the other. If the bleeding increases, and always if the hæmatocele extends above the groin into the abdomen or really fills and distends the pouch of Douglas, the condition of the patient becomes permanently serious—she is confined to her bed with abdominal pain and tenderness. She is, as a rule, visibly anæmic from the loss of blood; there is either present or there is the clear history of some acute peritonitis following the last attack. The pulse is quick and feeble—probably 120 or more. There may be considerable pyrexia, the temperature rising to from 100° to 103° F., and in a certain proportion of cases there is slight but decided albuminuria. This last symptom appears in some way to be directly due to the blood effusion, for in the cases in which I have observed it it has promptly disappeared after operation. The pyrexia in intra-abdominal hæmatocele is probably due to re-absorption of blood and need not be regarded as septic. When the peritoneum has been lifted from the rectum or the pouch of Douglas is shut off from the rest of the peritoneal cavity and this is acutely distended with blood the pyrexia which slowly comes on is of quite a different character. The proximity of the rectum, the anterior coat of which is stretched and thin or the serous covering of which may be defective, favours the passage of septic matter from the bowel into the hæmatocele; decomposition of the blood generally occurs and the temperature may rise to 104° or 105°. The iliac hæmatocele or the pouch of Douglas becomes further distended by inflammatory effusion, and all the symptoms of septic absorption are probably present. Apart from this condition the chief value of the symptoms is as a measure of the importance and severity of the internal bleeding. The anæmia, the faintness, the collapse, the vomiting, the abdominal pain, and the peritonitis will vary in direct ratio to the bleeding. If such symptoms are produced slowly they point to tubal mole with increasing hæmorrhage from the unruptured tube. If, on the other hand, they are produced suddenly they point to later rupture of the tube.

With this we complete the consideration of all the elements which go to form a positive diagnosis of extra-uterine pregnancy before and during those disturbances to its progress which are so common in the earlier months—the disturbance of intra-peritoneal bleeding and hæmatocele formation. Let us briefly recapitulate them: We have:—(1) A patient within the child-bearing limits of age, and one in whom a pregnancy is possible; (2) she has recently been in good health; (3) it is more likely than not that several years have passed since her last pregnancy; (4) there is a history of some amenorrhœa accompanied or followed by (5) irregular uterine hæmorrhage, dark in colour, moderate in amount, and persistent in its course; (6) with this there may be the history of the passage of some membrane, either in one pouch or bag as a "complete decidua," or in two pieces, or in shreds; (7) on examination pulsating vessels may be felt in the vaginal vault on one side of the uterus; (8) on this side also, and closely investing the back of the uterus, there is nearly always a tubal tumour (exceptionally this may have a different or curious situation); (9) this tumour enlarges markedly and suddenly by recurrent hæmorrhages and by the formation of a hæmatocele directly continuous with the original tubal tumour; (10) these hæmorrhages are signalised by sudden spasms of severe abdominal pain and by transient attacks of peritonitis; (11) the uterus is displaced by the hæmatocele at first backwards, afterwards to the opposite side of the pelvis, and sometimes forward (against the pubes) (it is very rarely that the uterus is permanently displaced downwards); and (12) the uterus throughout, although slightly enlarged, may be proved to be empty.



The differential diagnosis still remains for us to consider. Extra-uterine pregnancy under the conditions I have been describing may be mistaken for: (1) pyosalpinx, with amenorrhœa; (2) myoma; (3) simple abortion; (4) retroflexion of the gravid uterus; (5) anteflexion of the gravid uterus; and (6) twisted pedicle tumours—(*a*) of the tube, and (*b*) of the ovary.

1. Pyosalpinx is usually accompanied by regular menstruation, menorrhagia, or metrorrhagia. Every now and then, however, in double pyosalpinx (when the ovaries have probably been rendered temporarily functionless by dense enveloping adhesions) there is total amenorrhœa of from two to three or four months' standing, and then the symptoms and signs may be almost identical in the two conditions. The pyosalpinx will afford us a typical tubal tumour, and when both sides are affected the tube of the one side is nearly always very much more distended than that of the other, so that the main tumour is one-sided. The inflammatory thickening and adhesions closely surrounding the tube may simulate a hæmatocele. A pinhole perforation of the distended tube may cause abdominal pain, collapse, vomiting, and a consequent attack of peritonitis, and in short there may be nothing but the history to guide us to a wise and correct diagnosis. Here, the immediately preceding health or ill-health of the patient becomes a point of high importance. If the pyosalpinx be quite recent there will still be the history of purulent vaginal discharge preceding the pelvic inflammation, while if, as is more probable, the pyosalpinx be an acute recrudescence of an old affection the patient may confess to some similar attack two, three, or four years previously and to some tenderness or aching in one side during all these years.

2. The likeness to myoma is most marked when a tubal hæmatocele, not quite recent and hard from coagulation of the blood contained in it, is firmly fixed on one side of the uterus and is free from all other connexions. Then if the observer's mind be fixed on the condition of the uterus as a cause for continued uterine hæmorrhage and if on bimanual examination he can thoroughly palpate a globular immoveable "boss"—not specially tender—on one side of

the fundus uteri, he may easily imagine the case to be a clear one of myoma. Case No. 37 may be taken as an example. Mrs. K was sent to me as suffering from cancer of the uterus causing continued uterine hæmorrhage. The cervix was badly lacerated and diseased, but no certain sign of cancer could be detected. On further examination a hard tumour or out-growth was felt extending from the fundus. It moved with the uterus and had no other connexions. Here was the source of the bleeding. Yes; but not the source imagined. Instead of the myoma too hastily

FIG. 42.

Diagrammatic representation of uterus and tumour as felt in Case 37.

diagnosed the tumour was a peri-tubal hæmatocele around an early tubal pregnancy. A more careful attention to the history would have prevented such an error and would generally direct the thoughts into a right channel when extra-uterine pregnancy is present. In the present instance there was a history of acute abdominal pain corresponding to the formation of the hæmatocele and any attack of this kind is unknown or very unusual in myoma.

3. An extra-uterine pregnancy which has resulted in tubal mole and hæmatocele may easily be regarded as a simple abortion by any one who depends entirely on symptoms, for these may be very similar in both affections, the peritonitic pains of the one being closely simulated by the painful uterine cramps of the other. On vaginal examination, however, the two conditions are at once differentiated or the "abortion" is shown to be no simple one by the presence of a tumour outside the uterus. When the conditions are unfavourable for full examination, or when there are any grounds for supposing that a tumour may be present but inaccessible, great caution is needed. The interference that would be right in incomplete abortion may be very harmful when the main source of irritation is outside the uterus. No. 36 is a case in point. Mrs. L came to my out-patient room at the hospital with all the symptoms of an early abortion, and at her first visit I could find no trace of any tumour, the abdomen being rigid and the conditions generally unfavourable for full examination. The uterus was enlarged, the cervix was soft and open, and the hæmorrhage had been continuous for four weeks. Diagnosis was deferred. Some few days afterwards the uterus was dilated by the physician in attendance at the patient's home. Nothing was found within it. Severe abdominal pain set in coincidently with the dilatation. I saw the patient again, recognised a tubal pregnancy on the right side of the uterus, admitted her into the hospital, and operated. The tube was ruptured, the placenta protruding. There were also recent inflammatory adhesions about the tube and uterus.

4. Retroflexion of the gravid uterus has been recognised by most authors as a condition needing careful differentiation from extra-uterine pregnancy, because unfortunate cases have been recorded in which a distended tube in Douglas's pouch has been supposed to be the pregnant retroverted fundus and an injudicious attempt at its replacement (?) has ruptured the tubal sac and hastened the death of the patient. When one knows this and recognises the danger of any interference before a certain diagnosis is formed it will be found excessively rare or impossible for any similar mistake to recur. The position of the fundus must be ascertained by careful bimanual examination; its presence or its absence in front of the tumour must be satisfactorily determined. When there is any tumour other than the fundus filling the pouch of Douglas the whole of the uterus (generally quite straight) is pushed against the pubes; the cervix is looking directly downwards and if the bladder be empty the fundus may be felt on gentle pressure immediately above the pubes. When the pregnant fundus is in the pouch of Douglas there is of course no fundus to be felt in front of the tumour. Bimanually the fingers of both hands may perhaps be so closely approximated above the pubes that the cervix may be felt to be continuous with the posterior tumour and absolutely free from any other connexion. Retention of urine is more common in retroflexion of the gravid uterus while a discharge of blood (unattended with labour pains) is more common in extra-uterine pregnancy.

5. Anteflexion of the gravid uterus, although but rarely recognised as a possible source of error, may occasionally be quite as perplexing as the gravid retroflexion. Whether from an unusually high attachment of the impregnated ovum—quite at the fundus uteri—or from some other cause less easy to understand, a pregnant patient, usually a primipara, is sometimes found who suffers from severe pains during the early months of pregnancy and in whom the two or three months pregnant fundus forms a globular elastic tumour which appears to have little or no real continuity with the cervix (Fig. 43). The cervix remains

FIG. 43.

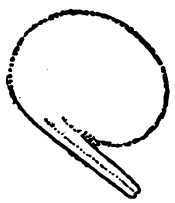


Diagram of anteflexed pregnant uterus with lengthened but undeveloped cervix.

thin, hard, undeveloped, pencil-like, and runs behind the tumour of the pregnancy as far as the finger can reach. Further, it is absolutely lengthened, so that it feels as if the whole of an infantile or ill-developed uterus was to be explored behind a sac of pregnancy. I have even known a sound passed to the top of the lengthened but undeveloped cervix under these conditions give almost or quite the normal uterine measurement, produce no abortion, and in this way afford to the practitioner who used it confirmation of his (mistaken) opinion that the pregnancy was outside the uterus. Again, the knowledge that such cases occur is the surest safeguard against error. Sometimes the round ligament can be felt on each side of the distended fundus, and if so it is certain that the tumour felt is the uterus itself. If serious doubt remains in spite of ordinary careful methods of examination (which should *not* include the passage of the sound) it may be a relief to remember that extra-uterine pregnancy as well as intra-uterine pregnancy in a misplaced uterus does not as a rule cause urgent danger or need immediate interference so long as there is no sign of uterine discharge. If the patient be kept in bed she may remain under observation until the condition becomes clearer or until a more experienced opinion can be obtained.

6. Twisted pedicle tumours—(*a*) blood tumours of the tube from twisted pedicle, and (*b*) blood tumours of the ovary from twisted pedicle. Small tumours of the tube or ovary arising from or increased after twisting of the pedicle are very liable to be mistaken for misplaced pregnancies which have resulted in internal hæmorrhage. Not only are the signs and symptoms extremely similar, but the physical condition, the resulting hæmatoma or hæmatocele, may be almost alike in the two conditions. When accompanied, as they sometimes are, with menstrual irregularity the history also may favour the suspicion of a tubal pregnancy with hæmatocele. The sudden abdominal pain which characterises the final twist when the return circulation is obstructed, the vomiting and faintness which accompany this, and the rapid formation of a prominent and tender tumour, are all suggestive. The tumour itself, however, is not so intimately connected with the uterus as a tubal pregnancy would be. Whether formed by the tube or the ovary it has rather the character of an ovarian enlargement, and unless adherent to the uterus there is quite generally some unoccupied space to be discovered between the uterus and the tumour. The following cases are illustrative:—

Mrs. M, aged twenty-nine years, had been suckling her second child for six months when she was suddenly seized with severe abdominal pain on the left side. The pain continued. When examined some days later the following note was made: "A soft (cystic) elongated body, probably tubal, is felt behind the uterus." The patient had not menstruated since her confinement. The case was watched

for a time and before operation the diagnosis was entered of adherent tumour of the left ovary and tube. Abdominal section showed a torsion blood-cyst of the left Fallopian tube.

Mrs. N, aged thirty-seven years, menstruated regularly until six weeks ago. On March 24th (five weeks after her last menstruation) she was suddenly seized with severe abdominal pain, fainting, and sickness. This occurred at night and the pain has continued ever since. On examination a globular, tender tumour of about the size of a child's head was felt above the pubes on the right side. The uterus was displaced to the left by the tumour; it was of normal size and appeared to be empty. Although displaced by the tumour no direct connexion could be made out between the uterus and the tumour. The alternative diagnosis was made of right ovarian tumour with twisted pedicle or extra-uterine pregnancy in the right Fallopian tube with hæmatocele. Abdominal section showed a black adherent blood tumour of the right ovary with a three times twisted pedicle.

So far we have been considering the diagnosis of extra-uterine pregnancy as associated with various disturbing influences which usually destroy the life of the fœtus and seriously threaten or destroy that of the mother also.

In tubo-abdominal and in later tubo-ligamentary pregnancy both child and mother have escaped or "weathered" these early dangers, and if the child be living the diagnosis is much less complicated. In most cases there is but little doubt of the pregnancy and the diagnosis then mainly resolves itself into a differential one between intra- and extra-uterine pregnancy. When the child has been a long time dead and the history of the pregnancy is no longer recent, the question of any pregnancy may be very doubtful and the diagnosis again may become perplexing and

FIG. 44.

External configuration of abdomen in Case 3.

obscure. When the child is living the ordinary history, symptoms, and external signs of pregnancy are probably present. There is a history of amenorrhœa corresponding to the period of pregnancy with or without some history of transient pain and discharge about the time when the fœtus escaped beyond the limits of the tube. The

FIG. 45.

External configuration of abdomen in Case 33.

patient herself has possibly passed through the troubles and sensations generally incidental to a normal pregnancy—the morning sickness, unusual cravings of appetite, and the period of quickening. The mammary signs, pigmentation of the areola and follicular development round the nipple (never very reliable), are more likely to be present than wanting. There is turgescence and bluish discolouration of the vulva and vagina. The mother is usually very conscious of the movements of the child and if she have experience of former (normal) pregnancies may perhaps complain of its unusual position.

In tubo-abdominal pregnancy during the latter months the fœtus is immediately recognisable on examining the abdomen, sometimes on simple inspection and always on light palpation (Figs. 44 and 45). The fœtus and placenta are probably lateral or zigzag in position, but the fœtus may permit of passive movement into a more central situation. The ease and clearness with which its various parts can be palpated are quite remarkable; these may be felt to be lying immediately beneath the abdominal walls and the mother may bitterly complain of pain from the fœtal movements. A limb can, perhaps, be taken hold of and the beating of the fœtal heart can be heard with unusual clearness. The parts of the pregnancy most liable to be mistaken for each other are the placenta and the head. The placenta being almost certainly attached to the tube should be lower in position. While the hands of the observer are examining the child there is no clear indication of any containing sac alternately expanding and contracting around the fœtus. On vaginal and bimanual examination the uterus may be found displaced to one side of the pelvis, only slightly enlarged and obviously distinct from the child. If this be so the position of the child is certainly extra-uterine and the apparent absence of any covering argues a tubo-abdominal pregnancy rather than a tubo-ligamentary one.

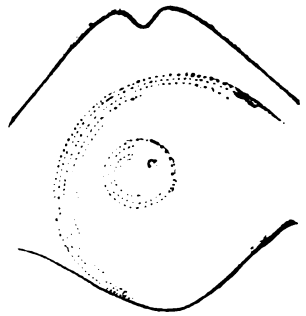
Is the uterus definitely and decidedly distinct from the pregnancy? This is the all-important question, for nearly everything I have described as characterising the abdominal position of the child may be wonderfully simulated by a normal intra-uterine pregnancy when the walls of the uterus are unusually thin. This extraordinary thinness of the uterine walls occasionally encountered with or without "hydramnios" or excess of the amniotic fluid has been noticed by many observers. One of the first to remark it was Dr. Ingleby, in 1834. In its extreme condition it is very curious and needs to be seen in order to be thoroughly believed. The fundus uteri cannot be found apart from the pregnancy, and this should excite the strongest suspicion *against* an extra-uterine position for the child. If the independent existence of the uterus cannot be demonstrated, especial care and patience should be employed in watching, with the hand on the abdomen, for the slightest indication of a uterine contraction. If the loosely-lying limbs of the child do temporarily disappear and give place to the rounded arch, however feeble, of a containing sac, the presumption is in favour of an intra-uterine pregnancy.

In tubo-ligamentary pregnancy, before the child is sufficiently formed to be detected by palpation there may be an opportunity for diagnosing the condition, as in the two cases I mentioned at the beginning of this lecture. From the experience there described it would appear that in the posterior ligamentary variety the tumour of pregnancy may be so centrally situated and the uterus so united to it—probably so spread out on its anterior surface—that early pregnancy within the uterus is very closely simulated. Rectal examination might materially assist the examiner under such conditions and will, I hope, prove of future service in the early detection of this variety. In the later stages of the tubo-ligamentary pregnancy when the child is living many of its features are very comparable to those described as existing in the abdominal variety but are less marked. The tumour of the pregnancy is probably lateral or eccentric. Though contained in a sac, the latter is very likely not of uniform thickness and in some parts the child may seem to be very near the surface and may be more easily palpated than when *in utero*. This especially applies to the anterior or sub-peritoneo-abdominal variety where part of the sac of pregnancy may be between the peritoneal reflexion and the skin. Abdominal *ballottement* of the fœtus is often very marked and the fœtal heart-beats are well heard. Sometimes the fœtal limbs are lying in the pouch of Douglas and are then palpated with great facility (Winter). As the child has been originally formed below the placenta the latter will probably have a higher position than in tubo-abdominal pregnancy and internal hæmorrhage from displacement (with faintness, blanching, and fatal collapse) may arise. The fœtal movements, active and passive (*ballottement*), and the auscultation of the fœtal heart and of the placental

souffle, will testify to the fact of pregnancy, but dependence must be placed on careful vaginal and bimanual examination for the detection of its abnormality. The cervix is displaced and the rest of the uterus is pushed (generally) to one side and downwards below the sac of pregnancy.

The differential diagnosis at this stage consists in the separation of advanced abdominal and tubo-ligamentary pregnancy from — (1) normal intra-uterine pregnancy, (2) pregnancy in one half of a double uterus, and (3) pregnancy in one horn of a bi-cornuate uterus.

1. In tubo-ligamentary pregnancies the uterus is in much closer relation to the pregnancy than in the tubo-abdominal form. It is often intimately incorporated with one side or aspect of the sac as it so often is in other intra-ligamentary tumours when these form. In spite, however, of this the solid thickness of its body traced upwards from below, the undeveloped state of the cervix, and the palpable emptiness of its cavity, all emphasised more strongly the nearer the pregnancy approaches to term, will hardly fail to guide the observer to a right conclusion. If the sound be used to confirm that opinion it must be remembered that the uterus is often greatly stretched by the growth of the pregnancy, but there will be no free movement of the sound within the cavity of the uterus. As already stated, regular contractions and relaxations of the sac are strongly suggestive of an intra-uterine position. Whether these ever occur in a ligamentary sac containing some muscular structure is doubtful. This is a point which requires further observation.



2. Pregnancy in one half of a double uterus is only perplexing to those who have no knowledge of the condition. The double cervix seen through a vaginal speculum will at once suggest the possible explanation of any abnormality and the non-pregnant uterus can be isolated from the pregnant one by passage of the sound.

3. Pregnancy in one horn of a bi-cornuate uterus is more difficult, especially if the non-pregnant horn be considered to be the body and fundus of the uterus. The condition (like the preceding) is a very rare one, but so also is an extra-uterine pregnancy to the ordinary accoucheur. If no serious symptoms are present and labour appears to be proceeding as usual the child in one horn of a bi-cornuate uterus will probably be born without difficulty. In some of these cases, however, there is no perfect communication between the pregnant horn and the cervix, and when this is the case the birth of the child is quite as impossible without operation as it is in true extra-uterine pregnancy.

In all extra-uterine pregnancies which go to term there is a more or less well-marked period of false labour and with this we have certain warnings, opportunities, and signs which should be of special interest to the accoucheur. The latter is usually sent for on the supposition that labour is beginning and it is of very great importance that this opportunity for diagnosis and advice should not be neglected. Whenever the cervix is found to be small and somewhat displaced and to have no proportionate relation to the history and symptoms of a full-term pregnancy the case should be thoroughly investigated and a full examination made. Especially care is necessary that the complaint of the patient be not lightly dismissed as simply a "false alarm." In extra-uterine pregnancy the "pains" are abdominal and are chiefly connected with the movements of the fœtus. They are probably accompanied by some vaginal discharge and sometimes by the expulsion of membrane. The pains last for several days, often preventing sleep. Finally they cease—cease suddenly—and the movements of the child are no longer felt. Soon after the breasts enlarge and temporarily fill with milk, but no encouragement being afforded to its flow the draught soon ceases. All symptoms directly connected with the pregnancy (except the enlargement of the abdomen) permanently subside and the patient either enjoys a moderate amount of health and resumes her usual duties carrying her dead child with her, or septic changes occur within the sac, rigors and fever follow, and the patient drifts into a "typhoid" state from which nothing but the removal of the putrid contents of the sac can rescue her.

This brings us to the consideration of the second division of full-term extra-uterine pregnancy—viz., when the child is dead. In tubo-abdominal pregnancy the child is in all cases so easily distinguished that notwithstanding all movement is lost there is but little real difficulty in the diagnosis. The shape of the abdominal tumour, and especially the detection of the fœtal limbs through the abdominal parietes, combined with the evidence of an empty uterus, will in all cases establish the nature of the case. The differential diagnosis from intra-uterine pregnancy, which before "term" and when the child was living we found to be of first importance, is now (probably) no longer necessary and the diagnosis is correspondingly lightened. But in the tubo-ligamentary pregnancy, and especially in the posterior ligamentary form, the diagnosis is often rendered exceedingly obscure and difficult by the death of the fœtus, the more so when several months have elapsed since its life was ended. Menstruation may have been re-established and the patient does not necessarily volunteer the slightest information which would direct the mind toward the causation of the tumour. There is, of course, no fœtal heart-beat, no fœtal movement, no placental *souffle*, the patient's breasts have lost all indication of a pregnant state, and if septic disturbance has already taken place the patient may be in no condition to answer intelligently the questions of the examining surgeon. There is nothing but the large fixed abdominal tumour, the nature of which may be hidden by the thickness of its walls (Fig. 46). The suspicion of pregnancy,

FIG. 46.

External configuration of the abdomen in Case 4. The inner circle near the umbilicus marks an area of less resistance within which it was possible to palpate the fœtus.

while the tumour was forming, if alluded to, is so common among all women with gradual abdominal enlargement that its significance is very easily unrecognised. No class of case may require more painstaking patience and perserverance in its investigation. Little by little, however, the history of the pregnancy may be gathered. The nine months' slow enlargement of the abdomen, the amenorrhœa, the fœtal movements (?), the spurious labour or something corresponding to it, the history of the breast-signs, all should be inquired after and their presence or absence noted. Sometimes on deep palpation of the tumour one may feel the resisting body of the fœtus after displacement of the fluid which surrounds it—a valuable sign, which can only be simulated by a solid tumour, probably papillomatous or malignant, floating in a cystic cavity. The differential diagnosis under these conditions will be from ovarian tumour—single, suppurating, or malignant. The mimicry of the last condition to extra-uterine pregnancy with retained fœtus may be curiously complete. In one case on which I operated the patient had a large abdominal tumour which had been forming for twelve months. Menstruation had ceased from the first appearance of the tumour. The patient considered herself pregnant and prepared for the birth of the child. The medical man was engaged for the confinement and at the end of nine months some kind of spurious labour (or what was taken for such) undoubtedly took place, but no child was born. When I saw her some three months later she had rapidly emaciated, there was evening pyrexia, and the abdomen was greatly distended by an irregular tumour more marked on one side of the body. On vaginal and bimanual examination the uterus was found to be independent of the tumour and empty, and on palpation in the pouch of Douglas the finger after displacing fluid felt two solid bodies which resembled the feet and ankles of a fœtus at full term. At the operation there was malignant tumour of both ovaries with localised ascites and two movable malignant nodules floating in the pouch of Douglas. In difficult cases the evidence may be insufficient to warrant a certain single diagnosis, but it should be sufficient to offer an alternative selection and to guard the surgeon from any

TABLE OF CASES OF EXTRA UTERINE PREGNANCY.

No.	Age.	Married.	Children	Youngest.	Last menstruation.	Signs.	Symptoms.	Diagnosis.	Remarks.	Medical attendant.	Date of operation.	Place.	Present.	Particulars.	Sequel.
1	38	—	2	12	11 weeks.	Right side tumour.	Pain and emaciation.	—	Marked albuminuria.	Mr. Parratt.	March 7th, 1888.	Women's Hospital, Birmingham.	Dr. S. T. Ricketts (U.S.A.) and Dr. A. Clark.	Large fœtus and placenta (from 3 to 4 months).	Left hospital March 28th; recovery.
2	32	—	4	2	17 weeks.	Tumour on left side and behind uterus.	Pain on left side; irregular bleeding two months, after amenorrhœa two months; in bed four weeks.	Tubal pregnancy.	—	Dr. Lynes.	June 14th, 189 .	Do.	Mr. F. H. Maberly, Dr. Baker, and Dr. Eccles (U.S.A.)	Large unruptured tube containing mole.	Left June 23th; recovery.
3	35	—	4	11	9 months.	Child felt in abdomen; uterus empty; fœtal pulse very audible.	Hæmorrhage and pain after 2 months amenorrhœa (time of rupture).	Abdominal pregnancy.	—	Dr. Lycett.	June 24th, 1890.	Wolverhampton Hospital for Women.	Dr. Lycett, Dr. C. Smith, and Dr. Hubbersty.	Removal of child; removal of placenta.	Left Oct. 4th; recovery.
4	36	6 years.	3	2	12 months.	Large abdominal tumour.	Septic; rigors; pyrexia; in bed for 2 months.	Extra-uterine pregnancy with dead fœtus.	—	Dr. Cook.	Feb. 27th, 1891.	Private hospital.	Dr. L. Phillips and Dr. Robinson (U.S.A.)	Cyst of pregnancy sewn to incision.	Left April 10th, 1891; recovery; subsequent normal pregnancy and good delivery.
5	44	—	4	5	8 weeks.	Tubal tumour behind uterus.	Constant loss for 8 weeks.	Tubal pregnancy.	—	Dr. D. C. Martin.	July 13th, 1891.	Women's Hospital, Birmingham.	Dr. Bull and Dr. Melson.	Right tubal mole, unruptured, in middle portion of tube; abdomen re-opened for obstruction.	Left July 25th; recovery.
6	33	—	1	7	5 weeks.	Boggy mass in pouch of Douglas.	Symptoms of internal bleeding; abdominal pain; pulse 135.	Ruptured tubal pregnancy.	—	Dr. Bernays.	Jan. 29th, 1892.	Patient's home.	Dr. Bernays and Dr. Phillips.	Left tube ruptured, removed; diffuse hæmorrhage.	Recovery.
7	39	Second time for 8 years.	4	13	(?)	Fixed tender cyst behind uterus.	Irregular loss for 3 months.	Ovarian cyst.	—	J. W. T.	April 20th, 1892.	Women's Hospital, Birmingham.	Dr. Melson.	Right tubal pregnancy, with encapsulated hæmatocele (unruptured).	Left May 8th; recovery.
8	26	7 years.	1	6	2 months.	Small painful tumour behind uterus.	Amenorrhœa 5 weeks followed by loss for three weeks; abdominal pain and pain on defecation.	Tubal pregnancy.	—	J. W. T.	July 4th, 1892.	Do.	Dr. Phillips.	Right tubal mole; tube unruptured; hæmatocele partly encapsulated.	Left July 18th; recovery.
9	30	17 years.	6	11	14 weeks.	Tender tumour in pouch of Douglas; uterus retroflexed.	Amenorrhœa 5 weeks followed loss for 9 weeks; abdomen distended and tender; legs drawn up.	Ruptured tubal pregnancy.	Slight albuminuria.	Dr. Holdsworth.	Sept. 15th, 1893.	Do.	Dr. Phillips.	Right tubal pregnancy removed; free hæmorrhage; tube unruptured; rupture of hæmatocele.	Left Oct. 8th; recovery.

10	31	3 years.	2 miscarriages	—	10 weeks.	Mass to right of pubes; pouch of Douglas distended.	Sudden repeated attacks of abdominal pain.	Ruptured tubal pregnancy.	Slight albuminuria.	Mr. H. H. H. Addenbrooke.	Oct. 11th, 1892.	Do.	Dr. Phillips, Dr. Williams, Dr. Edge, Dr. De la Chérois, and Mr. Addenbrooke.	Right broad ligament pregnancy; free bleeding; pulse 156.	Left Nov. 13th; recovery.
11	37	Nearly 11 years.	1	10	9 weeks.	Mass in Douglas's pouch reaching above pubes.	Amenorrhœa 6 weeks followed by irregular loss and pain and latterly pyrexia; temperature from 99° and 101·4° to 104·8° F.	Ruptured tubal pregnancy; hæmatocele.	Took herbs to bring on abortion.	Dr. Fitzpatrick.	Jan. 6th, 1893.	Private hospital.	—	Vaginal section and clearing out; drainage.	Left Jan. 23rd, 1893; recovery.
12	27	4 years.	2; 1 miscarriage.	7½ months.	(?)	Tender hard mass behind uterus.	Sudden abdominal pain 5 weeks before, followed by irregular loss; no amenorrhœa.	Ruptured tubal pregnancy.	—	Mr. Jephcott.	Jan. 19th, 1893.	Do.	Dr. Phillips.	Right tubal pregnancy removed; tube itself unruptured; rupture of hæmatocele.	Left Feb. 3rd; recovery.
13	23	4 years.	0	—	7 weeks.	Fixed tense elongated tumour behind uterus.	Ill 10 weeks with abdominal pain.	Tubal.	—	Dr. T. A. Brown.	June 6th, 1893.	Women's Hospital, Birmingham.	Dr. Phillips, Dr. Martin, Mr. Jordan, and Dr. Collins.	Unruptured mole of left tube removed; hæmatocele.	Left June 27th; recovery.
14	32	14 years (second time for 5 years).	2 (premature).	6	9 weeks.	Mass behind uterus reaching above half way to umbilicus.	Sudden severe abdominal pain 10 days before operation; continuous loss for 9 weeks.	Ruptured tubal pregnancy.	Trace of albuminuria.	Dr. S. S. Dunn.	July 15th, 1893.	Do.	Dr. Phillips, Dr. Martin, Mr. Jordan, and Dr. S. S. Dunn.	Right tubal pregnancy removed; tube itself unruptured, but recent rupture of large hæmatocele about fimbriated end of tube.	Left Aug. 2nd; recovery.
15	25	½ years.	1	5 months.	5 weeks.	Mass to left of pubes and behind uterus, tender, fixed.	Loss for 5 weeks; seized with sudden pain 2 weeks ago; "bent double with it."	Ruptured tubal pregnancy; hæmatocele.	—	Dr. A. Clark.	Jan. 30th, 1894.	Do	Mr. Jordan and Dr. Edge.	Left tubal mole and hæmatocele with peripheral adhesions; mole at outer end of tube; rupture of tube, clot protruding.	Left Feb. 19th, 1894; recovery.
16	32	7 years.	0	0	(?)	Hard mass to right of uterus.	Irregular loss for 3 months.	Myoma.	—	Mr. J. J. Hues.	Feb. 15th, 1894.	Do.	Mr. Jordan and Dr. Martin	Old right tubal pregnancy unruptured.	Left March 1st; recovery.
17	27	5 years.	1	1	5 weeks	Small mass behind uterus; abdomen distended, soft, fluctuating.	Irregular loss for 5 weeks; acute seizure of abdominal pain 6 days before operation; much worse for 12 hours.	Ruptured tubal pregnancy.	Mitral regurgitation; murmur first noticed after operation.	Dr. O. Shaw.	May 12th, 1894 (1.0 A.M.).	Patient's home.	—	Right tube (ruptured) removed; diffuse hæmorrhage.	Recovery; subsequent normal pregnancy; delivery July 8th, 1896.
18	39	6 years	2	3	"Regular."	Large round cyst, reaching above pubes in front of uterus.	"Inflammation 3 years ago"; an acute attack of abdominal pain and sickness 2 weeks ago.	Ovarian cystoma.	—	Dr. Cranstoun.	Sept. 4th, 1894.	Private hospital.	Mr. Jordan.	Right ovarian dermoid; left tubal pregnancy (unsuspected); fœtus well formed.	Left Oct. 5th; recovery.
19	27	½ year.	1 miscarriage 3 months ago.	—	(?)	Large tender mass behind and to left of uterus.	Pain in left side ever since miscarriage; unable to walk or work.	Tubal pregnancy.	—	Mr. Clarkson.	Dec. 1st, 1894.	Do.	Mr. Jordan.	Left tubal pregnancy and hæmatocele; peripheral adhesions; tube probably unruptured; fimbriated end widely opened out.	Left Dec. 19th; recovery.

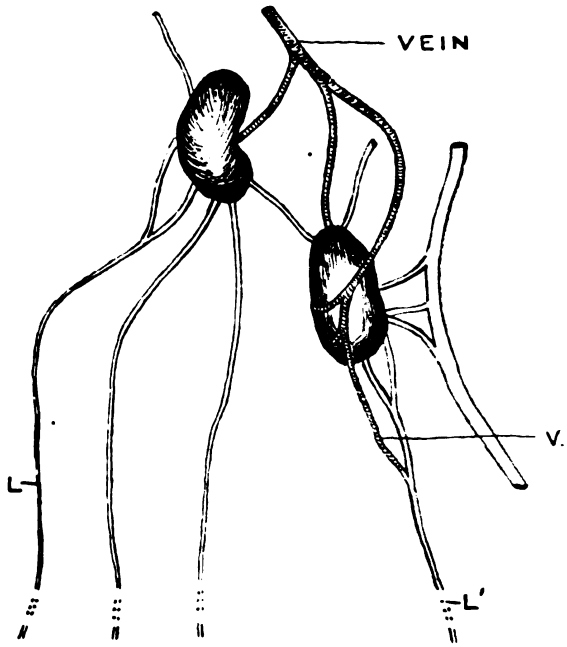
TABLE OF CASES OF EXTRA-UTERINE PREGNANCY—(*Continued.*)

No.	Age	Married.	Children.	Youngest.	Last menstruation.	Signs.	Symptoms.	Diagnosis.	Remarks.	Medical attendant.	Date of operation.	Place.	Present.	Particulars.	Sequel.
20	27	8 years.	3	4	11 weeks.	Mass left, lateral, *in front of* uterus, extending above left groin.	Violent abdominal pain 9 weeks ago; pain ever since preventing sleep.	Tubal pregnancy and hæmatocele.	—	Dr. Purslow.	Dec. 14th. 1894.	Women's Hospital, Birmingham.	Mr. Jordan.	Left tubal pregnancy; mole, hæmatocele; large tube distended throughout with blood and blood clot; fimbriated end very thin but unruptured; bleeding mainly confined by adherent omentum.	Left Jan. 2nd, 1895; recovery.
21	31	11 years.	1	10	14 weeks.	Mass on right side of lower abdomen and behind uterus, tender, fixed.	Abdominal pain, vomiting, and distension.	Tubal pregnancy; hæmatocele.	Some albuminuria and jaundice.	Mr. Greene.	Jan 27th, 1895.	Stratford Hospital.	Mr. Greene, Dr. Nason, and Mr. Lupton.	Right tubal pregnancy and hæmatocele; removal; tube ruptured; 3 months' fœtus well developed.	Left March 18th; recovery.
22	32	13 years.	1	12	14 weeks.	Large hard mass on left side of abdomen above left groin and in pouch of Douglas.	Abdominal pain; in bed 6 weeks; history of 3 falls (two in street).	Tubal pregnancy; hæmatocele.	—	Mr. Clarkson.	March 23rd, 1895.	Women's Hospital, Birmingham.	Mr. Jordan and Dr. Edge.	Right tubal pregnancy; ruptured, and hæmatocele removed.	Left April 16th; recovery.
23	30	10 years.	1; 1 miscarriage 5 years ago.	9	5 weeks.	Boggy mass in Douglas's pouch. Abdomen distended.	Blanching; pulse 150; symptoms of internal bleeding.	Ruptured tubal pregnancy.	—	Dr. Shillito.	July 15th, 1895.	Patient's home.	Mr. Jordan and Dr. Shillito.	Left tubal pregnancy; early rupture near uterus; large vessels; both appendages removed; right ovary cystic.	Recovery.
24	35	—	1	14	6 weeks.	Mass above pubes and behind uterus.	Abdominal pain for 1 month preventing sleep; loss for 6 weeks.	Tubal pregnancy.	—	Mr. Wood.	July 18th, 1895.	Women's Hospital, Birmingham.	Mr. Jordan.	Ruptured broad ligament; hæmatocele cleared out and drained; big hole in ligament.	Left Aug. 17th; recovery.
25	30	½ year.	0	0	4 weeks.	Boggy mass filling pouch of Douglas; abdomen distended.	Symptoms of internal bleeding; blanching; abdominal pain; pulse 120.	Ruptured tubal pregnancy.	—	Dr. Littelton.	Nov. 30th, 1895.	Patient's home.	Mr. Gamgee and Dr. Littelton.	Left tubal pregnancy; early rupture close to uterus; abdomen full of blood.	*Died Dec. 17th.*
26	35	14 years.	2; 1 miscarriage 8 years ago.	12	8 weeks.	Hard, tender mass behind and to right of uterus.	Abdominal pain, worse on sitting; temperature 100° F.	Tubal.	—	Dr. T. A. Brown.	Dec. 3rd, 1895.	Private hospital.	Dr. T. A. Brown and Mr. Jordan.	Broad ligament pregnancy and hæmatocele; vaginal incision as well as abdominal section.	Left Dec. 26th; recovery.
27	42	18 years.	6	7	3 months.	Mass to right of and behind uterus.	Great pain in lower abdomen and pelvis for 6 weeks.	Tubal pregnancy.	—	Dr. Welsh.	Dec. 31st, 1895.	Women's Hospital, Birmingham.	Mr. Jordan.	Right tubal mole and hæmatocele; tube unruptured; typical specimen with rosette of fimbriæ at bottom of hæmatocele.	Left Jan. 20th, 1896; recovery.

28	28	7 years.	2	4¾	8 weeks.	Mass behind and to right of uterus.	Abdominal pain getting worse for 1 month; unable to do anything.	Tubal pregnancy.	—	Dr. A. Clark.	Feb. 1st, 1896.	Do.	Mr. Jordan and Dr. Martin.	Ruptured broad ligament hæmatocele; free blood in abdomen; big hole in ligament to right of uterus; cleaned out and drained.	Left Feb. 14th; recovery.
29	40	19 years.	6; 3 miscarriages, last 6 years ago.	8	Irregular.	Cystic mass behind and to right of uterus; hard lump below this.	Pain in abdomen, worse on walking or defecation.	Right ovarian cystoma.	—	Mr. Addenbrooke.	Feb. 28th, 1896.	Do.	Mr. Jordan and Mr. Savage.	Cyst of right ovary with ruptured pregnancy of right tube; rupture size of a sixpence quite at uterine end.	Left March 24th; recovery.
30	39	15 years.	7	1½	(?)	Large mass behind uterus, not adherent.	Irregular loss for 7 weeks; 5 or 6 attacks of abdominal pain.	Tubal pregnancy and hæmatocele.	Patient suckling up to time of admission.	Mr. J. D. Price	April 22nd, 1896.	Do.	Mr. Jordan and Mr. Price.	Ruptured right tubal pregnancy; hæmatocele with peripheral adhesions; removal.	Left May 8th; recovery.
31	23	3½ years	2	1	10 weeks.	Cystic mass to left of uterus with hard lump at highest part.	Amenorrhœa 5 weeks followed by irregular loss; pain in left side of abdomen and rectum.	Left ovarian cystoma or tubal pregnancy.	—	Mr. Trout.	May 8th, 1896.	Do.	Mr. Jordan.	Cyst of left ovary with tubal pregnancy perched on top; tube unruptured.	Left May 23rd; recovery.
32	27	7 years.	3	1½	4 months.	Hard mass on left side of lower abdomen, one with uterus.	Continuous loss for 4 months; severe abdominal pain for some weeks; acute pain 4 days.	Tubal pregnancy.	—	J. W. T.	Sept. 10th, 1896.	Do.	Mr. Jordan and Dr. Edge.	Early interstitial pregnancy; left cornu of uterus and tube dilated into large blood-sac; ligatured off from the uterus in four sections.	Left Sept. 28th; recovery.
33	27	9 years.	4	4	12 months.	Child felt in abdomen; uterus empty.	Losing for 7 weeks; passage of decidua 5 weeks ago.	Abdominal pregnancy.	—	Mr. Clarkson	Dec. 11th, 1896.	Do.	Mr. Jordan and Dr. Martin.	Child and placenta removed.	Left Jan. 26th, 1897; recovery.
34	36	—	—	—	10 weeks.	Mass in lower abdomen and behind uterus, very tender; distention.	Symptoms of internal bleeding; vomiting, faintness.	Ruptured tubal pregnancy; hæmatocele.	—	Dr. T. A. Brown.	Jan. 22nd, 1897.	Patient's home.	Mr. Jordan and Dr. T. A. Brown.	Left tubal pregnancy; very large mole at extreme outer end of tube; tube probably unruptured; free hæmorrhage into abdomen.	Recovery.
35	37	8 years; 1 year.	1; 2 miscarriages, last 5 months ago.	7	7 weeks.	Left lateral tumour pushing uterus to right; tender, fixed.	Abdominal pain; temperature from 99° to 100° F.; amenorrhœa 5 weeks, followed by irregular loss.	Tubal pregnancy with hæmatocele.	Married twice; 2nd time one year only.	Mr. Tighe.	Feb. 13th, 1897.	Private hospital.	Mr. Jordan and Mr. Tighe.	Left tubal pregnancy with encapsulated hæmatocele; rupture of tube; pregnancy near uterine end.	Left March 7th; recovery.
36	27	9 years.	2	6	10 weeks.	Ill-defined tumour felt above right groin, pushing uterus to left.	Losing for 4 weeks; symptoms as of ordinary miscarriage at first; cervix dilated by medical attendant; severe abdominal pain afterwards.	Right tubal pregnancy.	No history of decidua.	Mr. Clarkson.	Oct. 25th, 1897.	Women's Hospital, Birmingham.	Mr. Jordan.	Tube ruptured; placenta protruding.	Left Nov. 15th; recovery.
37	37	17 years.	6		(?)	Tumour attached to left side of uterus at fundus.	Losing for 7 weeks; sent into hospital as case of uterine cancer.	Myoma.	Laceration and hypertrophy of cervix.	Mr. H. K. Bradbury.	Dec. 15th, 1897.	Do.	Mr. Jordan.	Vaginal section and vaginal hysterectomy; removal of pregnancy; tube unruptured; bleeding from abdominal ostium.	Left Jan. 1st. 1898; recovery.

unpleasant surprises or difficulty after opening the abdomen. The clinical diagnosis of tubo-uterine or interstitial pregnancy is an impossibility. The nearest approach to it which can be made is to recognise that in this form rupture takes place from the second to the fourth month, that this is signalised by diffuse internal bleeding as in the worst cases of early rupture, and that hitherto this has always proved fatal. There is an inter-operative diagnosis—the quick recognition of the pathological condition present—which may be assisted by the consideration already given to the affection itself and by the study of all known specimens. The recognition of the special form of distortion or asymmetry produced in the uterus by its presence is the only point of practical importance. Its bearing on quick operative action will be considered under "Treatment."

(To be concluded.)



A METHOD OF INJECTING THE LYMPHATIC VESSELS.

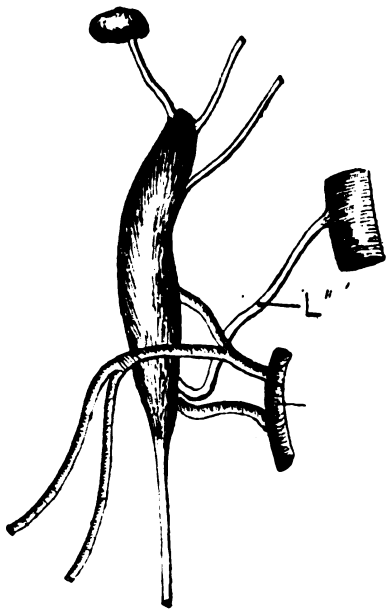
BY CECIL H. LEAF, M.A., M.B. CANTAB., F.R.C.S. ENG.,
DEMONSTRATOR OF ANATOMY AT THE LONDON HOSPITAL.

IN this paper I wish to suggest a method by which the lymphatic vessels of the human subject may be rendered so distinct that they may be dissected out like the arteries and veins. Hitherto nearly all the experiments which have been performed with this object have been made with either mercury or various colouring matters. The great objection to the former, as Sappey long ago pointed out, consists in the fact that if a vessel is accidentally pricked the mercury leaks out and all trace of the vessel quickly disappears. The method by subcutaneous injection of colouring matters cannot be relied upon because it is most difficult to insure the point of even the finest injection syringe passing into a lymphatic vessel; this method, moreover, presupposes an exact knowledge of the course taken by these vessels; but this is just the point which the experimenter wishes to determine. Colouring matters, moreover, are unsatisfactory because they stain the surrounding tissues as well as the vessels. Formalin is the fluid which I have lately used almost exclusively. This was introduced into the London Hospital by Keith as a means of hardening and preserving the relations of the viscera in the human subject. Formalin is the commercial name of a saturated aqueous solution of 40 per cent. of formic aldehyde. For the objects for which it was introduced and for rendering the dissection of the lymphatic vessels possible it is undoubtedly of very great value. The first experiment made with this object was performed nearly two years ago on a collie dog which, on account of its poaching habits, had to be shot. An incision was made into the dorsum of the tongue, into which the rounded nozzle of a syringe was passed; the nozzle was perforated by six or seven small holes; round the nozzle the lips of the wound were secured as tightly as possible. The syringe was filled with Stephens's ordinary blue-black ink, which was then injected. To effect this, however, very considerable pressure had to be used on the piston. On dissecting the sub-maxillary region of this dog several of the lymphatic vessels were found to be well stained and appeared quite distinct as bluish-black threads; some of the sub-maxillary glands were also partially stained. In the next experiment the superficial epidermis of the balls of several of the toes was scraped off and the open mouth of a syringe filled with the ink pressed firmly against the subjacent tissues. The piston was then forced down and the ink slowly disappeared. On dissection two lymphatic vessels were easily traced up to one of the deep inguinal glands which was well stained. From this the lymphatic vessels were further traced to the lumbar glands, three of which were found to be deeply stained. From the toes also two other vessels were traced up to a gland which was found to be lying underneath the gluteus maximus. This, too, was deeply stained by the ink. In both these experiments, therefore, it was found that by using great pressure the lymphatic vessels could be rendered quite distinct. After some time, however, it was noticed that the ink stained the surrounding tissues as well as the vessels. It had apparently percolated through the latter into the former.

Experiments similar to those made on the dog were made on the human subject, but they ended in a complete failure: This was probably due to the fact that the subjects operated on were not perfectly fresh. The idea was nevertheless entertained that it would be quite possible to inject the lymphatic vessels in a cadaver, even if not absolutely fresh, by passing through the vascular system an excessive quantity of formalin under a very high pressure; therefore into both the internal jugular vein and common carotid artery of a subject aged forty-five years 11 gallons of the formalin solution (one part of formalin to seven parts of water) and about 2 pints of spirit were injected from March 24th to April 24th, the object being to use so much pressure that some of the excessive amount of fluid would be bound to find its way into the lymphatic vessels. The right inguinal region of this subject was dissected on April 25th. The glands here were found to be large and very hard and on pulling them from their bed the vessels passing to and from them could be distinctly seen as somewhat semi-transparent whitish cords. Fig. 1 represents some of the superficial

FIG. 1.

Dissection showing two of the superficial inguinal glands with their lymphatic vessels and veins.



inguinal glands and their vessels as seen in dissection. A vessel (L) passing to one of the vertical set of superficial inguinal glands is there shown. This was traced down the thigh for 9 in. Had it been possible to thoroughly dissect out all the other vessels, some of which were larger than this one, they could undoubtedly have been traced very much further down the limb. All the vessels shown in the diagram passing to the superficial inguinal glands were traced down for at least 6 in. The only other parts of this subject which I have yet had an opportunity of dissecting are: (1) the mesentery; and (2) a small portion of the pelvic region. In the former the vessels could fairly easily be traced from the intestinal wall to the nearest set of lymphatic glands. In the latter lymphatic vessels could be seen passing from a gland which lies transversely over the termination of the external iliac artery to end in a group of glands situated close to the bifurcation of the common iliac artery. By this method of injection the lymphatic vessels are probably rendered distinct by two processes. In the first some of the formalin solution undoubtedly passes straight into the lymphatic vessels, the greater part, however, does not, for had it done so these vessels would be found fully distended and the beaded appearance due to the presence of valves quite distinct; this, however, except in the thoracic duct, was not noticeable. In the second process what takes

place is probably as follows. The greater part of the formalin solution escapes into the surrounding subcutaneous tissues. This is proved by finding these tissues bathed in the fluid; this fluid by hardening and drying up the fat in which the vessels are embedded and by hardening the vessels themselves from the outside thus renders them distinct.

Fig. 1 brings out an important fact, and that is, that a communication exists in the inguinal region—at any rate, between some of the lymphatic trunks and the smaller veins. In this dissection the vessel L′ was traced down the thigh for six inches. It had no naked-eye resemblance to a vein; its walls, like the other lymphatic vessels, were white. This vessel terminated by three branches, two of which passed straight into the gland while the other terminated in a small vein which on dissection was found to be a tributary passing into the circumflex iliac vein. Sections were taken of the vein at V and of the vessel L′. In the former the walls were found to be very thick, the various coats distinct and sharply marked off from each other. The vessel on transverse section was quite round while blood was seen in the interior. The thickness of the walls giving the vessel the appearance of an artery was undoubtedly caused by the excessive amount of formalin used for the injection. On examining the vessel L′ under the microscope it was found that the walls were much thinner, that the lumen was oblong (not round), and that the various coats were not nearly so distinct or so well marked off from each other as they were in the vein.

Fig. 2 represents a preparation taken from another sub-

FIG. 2.

ject which had been injected with the usual amount of formalin solution (four pints). For preserving this gland with the lymphatic vessels I am much indebted to Mr. E. J. Wylen of the London Hospital. In this case some of the lymphatic vessels were found unusually distinct. In the diagram the two veins which came from the lymphatic gland were traced to one of the tributaries of the deep external pudic vein. Besides this there was a vessel (L″) also coming from the gland which was found to end in the long saphenous vein. This vessel presented the same naked-eye appearance as the vessel L′ of Fig. 1. It exactly resembled a small thoracic duct. Though the lumen was larger than that of either of the veins, yet the thickness of its walls was only about a third. Several microscopical sections were made. They showed that the various coats were neither so thick nor so sharply defined as was the case in the veins.

The two vessels L′ (in Fig. 1) and L″ (in Fig. 2) are undoubtedly lymphatic vessels. Fig. 1 shows an afferent lymphatic vessel partly terminating in a lymphatic gland and partly terminating in a vein. Fig. 2 shows an efferent lymphatic vessel emptying straight into the long saphenous vein. It is well known that a microscopical distinction is not always possible between a vein and a lymphatic. Hence it might reasonably be inferred that both the vessels shown in this figure were not lymphatics, but veins. In subjects, however, which have been hardened in formalin, especially if this has been injected in large quantities through the veins, a distinction between any but the smallest veins and lymphatics may be made by noticing the following points of difference:—

Naked-eye Appearance.

Veins.	*Lymphatic Vessels.*
1. Veins look blue.	1. Lymphatic vessels look white.
2. On section the walls remain apart; hence	2. The walls collapse quickly on section; hence
3. The lumen is round.	3. The lumen becomes obliterated unless a pin is inserted to keep the walls apart.
4. The walls are thick.	4. The walls are much thinner.

Under the Microscope.

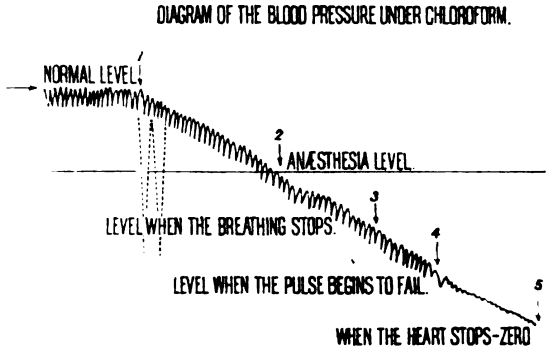
1. Veins usually contain blood.	1. Lymphatic vessels usually do not contain blood.
2. The lumen is round.	2. The lumen is oblong
3. The various coats are well marked.	3. The coats are not so thick or so sharply marked off from each other.

In both figures these distinctions were well marked. For lymphatic vessels which communicate in this way with the veins the term "lymphatic vein" might be used. Whether such communications will be found in other parts of the body subsequent dissections will show. In that part of the mesentery which was dissected there was no trace of it and even in the inguinal region it was not observed to be at all frequent. Sappey long ago came to the conclusion that there was a direct communication between the finest lymphatic capillaries and the vascular system, but that a communication takes place between the larger lymphatic trunks and the veins other than at the termination of the right lymphatic and thoracic duct respectively has not, I believe, yet been observed. If such a communication is shown to be general throughout the body it may help to explain a good many otherwise obscure clinical phenomena.

In conclusion, then, it is (1) quite possible to render the lymphatic vessels sufficiently plain for dissection purposes by the injection of a large quantity of formalin solution; (2) the fresher the subject the greater the probability of success; (3) as much pressure as possible (short of rupturing the heart or any large vessel) must be used; and (4) in the inguinal region, at any rate, and possibly in other parts of the body, a communication exists between the veins and lymphatic vessels.

Wimpole-street, W.

THE PRODUCTION OF CHLOROFORM ANÆSTHESIA.



BY EDWARD LAWRIE, M.B. EDIN.,
SURGEON-LIEUTENANT-COLONEL, I.M.S.; RESIDENCY SURGEON, HYDERABAD, DECCAN.

THE following are the notes of chloroform administration at the Afzulgunj Hospital during April, 1898. The chloroformist for the month was Olivia Correa, a third-year student at the Hyderabad Medical School:—

1. Total number of cases chloroformed during the month, 221.
2. Cases of partial anæsthesia only for brief minor operations, 88.
3. Average age of patients chloroformed, 24 years.
4. Children below the age of five chloroformed, 48.
5. Average time to produce anæsthesia, 3 min. 2 sec.
6. Average time to produce anæsthesia in children under five, 1 min 15 sec.
7. Average time to produce anæsthesia in adults, 3 min. 36 sec.
8. Morphine administered beforehand in cases, 3.
9. Average quantity of chloroform required to produce full anæsthesia, 2·95 drachms.
10. Rate in minims of chloroform applied to the cap per second, 0·96 minim per second.

11. Average total amount of chloroform employed per case, 3 4 drachms.
12. Average duration of operations, 12 min. 13 sec.
13. Cases in which struggling occurred, 50.
14. After effects, vomited, 3.

The chloroformist at the Hyderabad hospitals is as a rule a fourth-year student, but this session we have been obliged to entrust the anæsthesia to third-year students as all our senior students are out on plague duty in the districts. The plan of chloroformisation we employ is that of Syme. Syme's method of giving chloroform consists in keeping the patient's breathing regular under all circumstances; in entirely disregarding the heart and circulation as factors in the administration; in never pushing the inhalation beyond the point where anæsthesia is complete; and in maintaining the narcosis as long as the operation lasts at the "anæsthesia level" (*vide* diagram). The following diagram of the blood-pressure under chloroform shows (1) precisely how Syme's method works in practice; and (2) the effects of abnormal anæsthesia and of overdosing.

EXPLANATION OF THE DIAGRAM OF THE BLOOD-PRESSURE UNDER CHLOROFORM: THE DIAGRAM READS FROM LEFT TO RIGHT.

Part I.—Normal Anæsthesia.

1. The first part of the tracing as far as arrow 1 indicates the normal level of the blood-pressure before the inhalation of chloroform is begun.
2. At arrow 1 the inhalation of chloroform is commenced.
3. Provided there is continuous regular breathing the blood-pressure falls gradually until anæsthesia is complete at 2. The fall of blood-pressure up to this point is due to vaso-motor dilatation and is perfectly harmless.
4. When the point indicated by arrow 2 is reached and anæsthesia is complete, which is known clinically by the cornea becoming insensitive or the breathing stertorous, the inhalation is stopped and only sufficient chloroform is given afterwards to maintain the blood-pressure as nearly as possible at the "anæsthesia level."

Part II.—Abnormal Anæsthesia and Overdosing.

5. The dotted lines in the diagram show what happens when chloroform is given with too little air or in such a manner that the patient's breathing is interfered with. The blood pressure falls irregularly and with sudden deep drops which used to be thought by the Glasgow Committee to be caused by sudden heart failure. Dr. Bomford discovered that these sudden falls are due to nervous agency through the vagus which, when overdosing is threatened, temporarily stops or slows the heart as a safeguard against the over rapid conveyance of the anæsthetic to the brain. Whether they are safeguards or not these irregular falls ought never to be brought about, as they carry the blood-pressure below the "anæsthesia level" and are abnormal. The danger of irregular respiration is that it may lead to the inhalation, or gasping in, of irregular quantities of chloroform and render overdosing imminent.
6. If chloroform is pushed beyond the point where anæsthesia is complete the respiration becomes impeded and the heart begins to fail. At arrow 3 the breathing ceases; the pulse fails at 4; recovery is then almost impossible, and the heart stops at 5.

(The more the air is excluded when chloroform is pushed the more rapid and irregular will be the failure of the heart and circulation. Undoubtedly the pulse will show signs of this, but it can never convey more than second-hand information that the breathing has been interfered with or that the patient has been overdosed, for both of which, clinically or experimentally, the chloroformist is alone responsible.)

Proceeding on Syme's plan the administration of chloroform is never pushed below the "anæsthesia level." It is obvious that the region of danger is not entered or even seriously approached, and that unless Syme's rules are accidentally disregarded no risk whatever from chloroform anæsthesia can ever arise. On the other hand, those who believe that chloroform has a direct action upon the heart must be guided *more or less* by the pulse, which is to them an index of unavoidable danger and necessarily one to be anxiously watched. But the experiments of the Hyderabad Commission and my cross-circulation experiments[1] have long ago proved that chloroform has no direct action on the heart. Accordingly, the moment the circulation is made a principal factor in the inhalation and is watched for effects which can only be produced indirectly through the respiration an appreciable element of peril is introduced which makes the method of administration itself *more or less* homicidal. This must be clearly understood. It is not only that "watching the pulse" distracts some of the chloroformist's attention from the all-important breathing, but it is manifestly useless to watch it at all except as a danger signal and as a danger signal it can only be brought into action by conditions for which the chloroformist is himself responsible, such as abnormal administration with too little air, or overdosing. The measure of heart failure under chloroform is demonstrably the exact measure of the amount of the chloroformist's attention which is withdrawn from the breathing and bestowed upon the pulse; and the diagram proves that if the pulse were to be taken as the sole guide to dosage the administration of chloroform would not only never be free from risk, but would of necessity be uniformly fatal. What is shown so definitely and admirably in the diagram is fully borne out in clinical practice. In Hyderabad chloroform is given by students in strict accordance with Syme's principles, the heart is ignored, and we have no deaths. In England the teaching of anæsthetics is in the hands of professional anæsthetists who "funk" the heart and deaths from chloroform take place, according to Leonard Hill, by the dozen and, according to Roger Williams, no less than once in every 1236 inhalations. The deaths under anæsthetics in England represent an appalling picture of the incapacity of the medical profession as regards the administration of these drugs. This incapacity is altogether due to the absolute want of training of English students in the art of chloroform administration on Syme's principles, which have been established on a scientific basis by the Hyderabad Commission. We at Hyderabad have always said that if students in India can be taught to give chloroform with guaranteed safety, *a fortiori* the splendid men who study in the London medical schools with all their superior advantages can be taught to do the same.

Hyderabad.

A CASE OF RECOVERY AFTER THE INGESTION OF A LARGE DOSE OF STRYCHNINE.

BY CHARLES D. GREEN, M.D. LOND., F.R.C.S. ENG.

SHORTLY before 8 A.M. on Jan. 1st, 1895, I was called to see a man fifty years of age. On my asking him what was the matter he merely replied "poverty" and as some twitching of the hands with a backward jerk of the neck immediately occurred I asked him what he had taken and he said "Battle." I was obliged to return home to get what was necessary, nothing having been said by the messenger who had been sent for me to intimate the probability of poisoning. This occupied about twenty minutes and on my return there were well-marked rigidity of the limbs and retraction of the head and the patient was evidently in considerable distress. He, however, submitted to treatment and apomorphia was at once injected and 20 gr. of zinc sulphate were given by the mouth, followed by 2 dr. of tannic acid in ½ pint of hot water. In about ten minutes he vomited a little. An attempt to pass an œsophagus

[1] Vide THE LANCET, Feb. 11th and July 1st, 1893.

tube provoked such violent spasms that it had to be abandoned. It so happened that Mr. C. A. Ballance and Dr. H. Low had arranged to be at my house that morning at 9 o'clock for the purposes of an operation and on learning the difficulty in which I was placed they both very kindly came to my assistance and Dr. Low soon got the patient fully under the influence of chloroform; severe tetanic spasms occurred during the process, opisthotonos being well marked when the administration was commenced. The œsophagus tube was then passed and the stomach was washed with warm water until no more Prussian blue came away; this process occupied nearly an hour and several gallons of water were required. The stomach was next washed with a quart of warm water into which the juice of a lemon had been squeezed, then with a solution of tannic acid, and finally with plain water. 30 grs. of chloral hydrate dissolved in a little water were then introduced into the stomach and the tube was withdrawn; 0·01 gr. of atropine sulphate was injected subcutaneously. The patient was then left in charge of my colleague Mr. Francis Murphy, who administered a little chloroform at intervals during the next five hours as the tetanic spasms became severe. By 9.30 P.M. the patient was evidently recovering, no severe spasms having occurred for three or four hours though there were twitchings at intervals with general rigidity and retraction of the head. He was slightly delirious. As he became able to swallow, a mixture of ammonium bromide and tincture of belladonna was given. The rigidity of the limbs and the retraction of the head persisted during the next two days, gradually diminishing, and on the morning of Jan. 4th they were no longer noticeable. The patient complained of considerable soreness of the limbs and had some weakness of the right leg, which, however, did not persist, and at the end of a fortnight he was practically well.

It transpired that the patient had taken the entire contents of a sixpenny packet of Battle's vermin-killer, stirred up in a little water, on an empty stomach about two hours before I saw him. The purchase was verified by inspection of the poison sales book at the druggist's shop where it had been made and a similar packet was obtained from the same consignment. An analysis made by Messrs. Corbyn, Stacey, and Co. showed that this packet contained 3 437 grains of strychnine.

I think the above may be taken as fairly representing the dose taken, as, although different samples of Battle's vermin-killer have been found to vary, the difference in composition between two packets in the same consignment is not likely to be great. In any case, the dose taken was large, for a small sample taken from the stomach washings yielded abundant evidence of the presence of strychnine. The recovery after the ingestion of so large a dose, especially as the symptoms of absorption were already pronounced before treatment was commenced, seems to be remarkable. The case appeared almost hopeless. The successful result is entirely due to the valuable help and guidance which happened to be at hand.

Upper Edmonton.

LATENT TUBERCULOSIS OF THE TONSIL.[1]

BY HUGH WALSHAM, M.A., M.D. CANTAB., M.R.C.P. LOND.,

ASSISTANT PHYSICIAN, FORMERLY PATHOLOGIST, TO THE CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST; CLINICAL ASSISTANT TO THE HOSPITAL FOR SICK CHILDREN, GREAT ORMOND STREET.

MY attention was first directed to this subject by an address of Dr. G. Sims Woodhead entitled "The Channels of Infection in Tuberculosis." In this very thoughtful and suggestive paper Dr. Woodhead, after reviewing the various ways in which the tubercle bacillus might conceivably gain entrance into the living organism, sums up as follows: "I am driven to the conclusion that this method of infection of the glands of the neck through the tonsils must be of a comparatively frequent occurrence, especially in children living under insanitary conditions and subjected to various devitalising influences."

On a subject so important I determined to make use of my opportunity as pathologist to the City of London Hospital for Diseases of the Chest to investigate, as far as possible, if this mode of infection of the glands of the neck through the tonsils really took place. I proposed to make a careful histological examination of the tonsils and follicular glands at the base of the tongue of every case of tuberculosis which came before me for post-mortem examination, in the hope that such examination might possibly throw some light on this subject. My investigations, however, were soon directed into a wider channel by a communication of M. Dieulafoy[2] to the Academy of Medicine of Paris, entitled "Latent Tuberculosis of the Three Tonsils." M. Dieulafoy made an experimental investigation to ascertain whether hypertrophy of the tonsils and adenoid vegetations of the pharynx are in any cases of tuberculous nature and, if so, in what proportion. He obtained a number of portions of tonsils and adenoid vegetations which had been removed on account of overgrowth. Hypertrophied tonsils from 21 cases were inoculated into guinea-pigs and 8 of the animals became tuberculous. Adenoid vegetations from 35 cases were inoculated and 7 of the guinea-pigs became tuberculous; thus 1 in 8 of the cases of apparently simple hypertrophy of the tonsils and 1 in 5 of the cases of adenoid vegetations were in reality tuberculous. M. Dieulafoy's communication met with much adverse criticism at the hands of his colleagues in the Academy as he had made no histological examination of the portions of tonsils so injected. It was pointed out that inoculation experiments were open to this objection; that virulent tubercle bacilli might be entangled in the mucus of the tonsillar crypts without these organs being necessarily tuberculous. So in addition to the histological examination of the tonsils removed from the dead subject I set myself the task of examining histologically portions of tonsils removed from the living patient, and here I wish to thank Mr. Bowlby, assistant surgeon to St. Bartholomew's Hospital, for his kind permission for me to examine portions of tonsils and adenoid vegetations removed by him in the throat department of the hospital.

At the outset of an investigation such as this I naturally turned first of all to the classical works of pathology in this country, and here I must admit I met with nothing but disappointment; in fact, the tonsils seem almost to have escaped the scrutiny of English pathologists. Dr. Wilks and Dr. Moxon in their well-known work write as follows: "Occasionally tubercles may be found isolated on the palate, tonsils, and other parts of the mouth, commencing as white spots and then softening until ulcers are formed." Dr. Coats in his "Text-book of Pathology" says tuberculosis of the tonsils occurs chiefly in connexion with that of the epiglottis and tongue. Dr. Osler in his "Text-book of Medicine" says tuberculosis of the tonsils has been recorded in a few cases. Professor Hamilton is the only British pathologist who makes any mention of a possible connexion between tuberculosis of the tonsils and cervical gland enlargement. He says: "It has even been alleged that tuberculous enlargement of the glands of the neck may be caused by absorption of the tubercle bacillus through the tonsils and analogous structures in the neighbourhood." By analogous structures in the neighbourhood I take Professor Hamilton to mean the follicular glands at the base of the tongue and generally the whole adenoid ring surrounding the entrance to the respiratory and digestive tracts. From the text-books of pathology I turned to the post-mortem records of the City of London Hospital for Diseases of the Chest. On carefully going through the post-mortem books from 1854 to the present time I find no mention of the tonsils being affected with tubercle, and yet, as my investigations will show, how often must these organs have been tuberculous. Dr. J. Purves Stewart[3] has published a short paper on the occurrence of giant cells in the tonsils. The case described by Dr. Stewart appeared to be merely one of ordinary chronic enlargement of the tonsils with pharyngeal adenoids associated with post-scarlatinal otorrhœa and enlargement of the cervical glands in a child aged ten years. The tonsils were removed. On a naked-eye examination they differed in no way in their appearance from ordinary chronically

[1] Thesis for the degree of Doctor of Medicine in the University of Cambridge.

[3] Brit. Med. Jour., May 4th, 1895.

enlarged tonsil. On microscopical examination, however, the following appearances were found. Scattered through the substance of the lymphoid tissue were large numbers of tuberculous giant-cell systems, apparently most numerous close beneath the epithelial surface of the tonsil. The giant cells were of the typical multinuclear form characteristic of tubercle surrounded by the usual epitheloid and lymphoid cells. Staining with Niellson and Gram's method failed to demonstrate bacilli in the sections. The pharyngeal adenoids on section were found free from tubercles. Some enlarged cervical glands were subsequently removed from the same patient and these, on microscopical examination, showed definite tuberculosis in various stages of advance, from simple enlargement to caseation.

My subject naturally falls into two principal divisions. Firstly, I shall give the results of my examination of the tonsils, cervical glands, and follicular glands of the tongue in certain cases of tuberculosis which came before me for post-mortem examination and, secondly, I shall give the results of my examination of portions of hypertrophied tonsils and adenoid vegetations removed from the living patient.

Post-mortem cases.—In all the cases I am about to describe, with two exceptions, there was nothing during the life of the patient to call attention to the tonsils. In the majority of the patients the tonsils were atrophied; in only one or two was there anything approaching hypertrophy. There was no complaint of pain or difficulty in swallowing; the cervical glands were not enlarged; in short, there was nothing to call attention to the organ. This being so, I have ventured, following M. Dieulafoy to call this variety of tonsillar tuberculosis "latent." Out of 34 consecutive post-mortem cases I found the tonsils to be more or less tuberculous in 20. I will now give short notes of the cases.

CASE 1.—Post-mortem examination held on Sept. 19th, 1895. A male, aged fifty-two years, had suffered from morbus cordis—aortic and mitral. There was miliary tuberculosis of the lungs and also tuberculous ulceration of the base of the tongue, pharynx, and larynx. Both lungs were stuffed with grey miliary tubercle from the apex to the base. The cervical glands were enlarged and tuberculous. There was extensive ulceration of the ileum. The left tonsil was completely free from any trace of tubercle; the right tonsil was unfortunately lost; expectoration was *nil*.

CASE 2.—Post-mortem examination held on Oct. 10th, 1895. A male, aged thirty-eight years, had suffered from acute miliary tuberculosis. There were caseous suprarenals; no pigmentation was present. Both lungs were stuffed with miliary tubercle from the apex to the base. The larynx and trachea were normal. The cervical glands *nil*. There was tubercle in the kidney and the liver. There was a small deposit of tubercle in one tonsil; the giant cells were ill marked; expectoration was very slight.

CASE 3.—Post-mortem examination held on Oct. 24th, 1895. A female, aged thirteen years, had been affected with chronic pulmonary tuberculosis. The larynx, trachea, and bronchi were normal. The bronchial, cervical, and anterior mediastinal glands were tuberculous. There were numerous old cavities in both lungs. There was a small tuberculous ulcer on the dorsum of the tongue. Caseous tubercle was scattered through the lower ileum. There were half-a-dozen small tuberculous ulcers in the ascending colon. The tonsils were normal in size; the crypts were very wide; the epithelial lining to the crypts was normal; there was epithelial tubercle in both; the giant cells were not marked; expectoration was slight.

CASE 4.—Post-mortem examination held on Oct. 29th, 1895. A male, aged forty-four years, had suffered from pulmonary tuberculosis. There were tuberculous peritonitis and tuberculous ulceration of the pharynx and soft palate. There was much superficial ulceration of the epiglottis. There was a small tuberculous ulcer about 1 in. from the tip of the tongue. Ulceration of the larynx was present. The bronchial and cervical glands were tuberculous. There was a small recent cavity of about the size of a cob-nut at the apex of the right upper lobe of the lung; miliary and caseous tubercle were scattered through the middle and lower lobes; the left lung showed no cavitation; there was fresh grey tubercle scattered through the upper lobe. Both tonsils were almost completely destroyed by tuberculous ulceration; in fact, there was hardly any of the proper adenoid tissue of the organ left; the follicular glands at the base of the tongue were tuberculous; expectoration was slight.

CASE 5.—Post-mortem examination on a male, aged thirty years, who had suffered from acute miliary tuberculosis. The old cavity was surrounded by dense fibrous tissue at the apex of the right upper lobe. The rest of the right lung, as also the left lung, was simply stuffed with grey miliary tubercle. As to the larynx, the right vocal cord was almost completely destroyed by ulceration and the under surface of the epiglottis was extensively ulcerated. The spleen, kidneys, and intestine contained many miliary tubercles. The tonsils were hypertrophied; tubercle was scattered through both.

I think the results of my post-mortem examinations are sufficient to disprove, what is generally held to be true, that the tonsils are very rarely affected by tubercle, for in 20 out of 34 cases examined these glands were found to be tuberculous. Now what is the significance of these miliary tubercles in the tonsils? Is the tonsil primarily affected? Are we to suppose that the tuberculous virus may first gain entrance to the human organism by the way of the tonsil, spreading thence to the cervical and mediastinal glands and so to the thoracic duct, right side of heart, and lung? Or are we to look upon this tonsillar tuberculosis as altogether secondary and, in short, auto-infection from the sputum passing over them? I think both suppositions are true. In support of the first I will take the results of the post-mortem examinations of Cases 1 and 4. In the former case the primary cause of death was the aortic and mitral insufficiency. The tuberculosis was altogether secondary. The tuberculous ulcer at the back of the pharynx was very chronic in its course; in fact, there were appearances of healing at some parts. Microscopically also the sections show the fibroid character of the tubercle. The infection starting thence from the pharynx gradually spread to the cervical glands, which are found post mortem to be tuberculous. From here we may conceive that the bacilli may reach the thoracic duct and the right side of the heart, the pulmonary artery and the lungs. Now what do we find? Exactly what one would expect, a general shower of miliary tubercle all over both lungs. My post-mortem note on the lungs is as follows: "Both lungs are stuffed from the apex to the base with grey miliary tubercle." This case is, I think, clear and conclusive. The old tuberculous ulceration in the fauces and the fresh grey miliary tubercle in the cervical glands and lungs lead one irresistibly to the conclusion that the primary source of infection was in the pharynx. There could be no question here of the pharynx being infected by the passage over it of sputa laden with bacilli, for, as usually happens in these cases of miliary tuberculosis of the lungs, there was no sputum. In the latter case (Case 4) we find tuberculous ulceration of the tonsils and soft palate. The follicular glands at the base of the tongue are tuberculous although no ulceration is present. Cervical and bronchial glands contain tubercle. The condition of the lungs is much the same as in the former case. We find grey miliary tubercle scattered through both lobes of the left lung, a small recent cavity of about the size of a small cob-nut at the apex of the right upper lobe and the middle and lower lobes containing miliary tubercle, some beginning to caseate. Here also I think the evidence that the tonsil was the primary source of infection is conclusive. The faucial ulceration was much older than the tubercle in the lung. True, we have a small recent cavity at the right apex and the tubercle in the right upper lobe had begun to caseate, but I do not think this is evidence against the tonsillar origin of the infection. These are the only two cases in my series in which the tonsil could be regarded as the primary source of infection.

The next of my cases are two of acute miliary tuberculosis (Cases 2 and 5). Both of these cases contained miliary tubercle in the tonsils. In Case 2 both lungs were stuffed with miliary tubercle throughout. The only caseous focus was in the suprarenal capsules. Here at first I was at a complete loss to account for the tonsillar tuberculosis. On reflection I think it can only be explained by supposing the infection to have been conveyed to the tonsil, as it is to the other organs, by the blood-stream; that is, that the tonsil does not receive the infection from the outside but from the blood-current. In this case the tubercles were very sparsely scattered in the organ. Case 5 is a little different. Here the primary source of infection was no doubt the apparently old so-called quiescent cavity at the apex of the right upper lobe. The history appeared to be this: for some unexplained reason this old cavity gave rise to the general dissemination of grey tubercle to tonsils, spleen,

kidneys, and intestines, the tonsils being infected as the other viscera through the blood-stream.

The remaining cases appeared to be instances of auto-infection from the passage of bacilli-laden sputum passing over the tonsils. The adenoid tissue of these organs becomes affected in the same way as the adenoid tissue of the Peyer's patches in the intestine and the lymphoid accumulations in the larynx and tongue.

Tubercle, as it occurs in the tonsil, is generally miliary in character. In some cases the tubercles were very rich in giant cells resembling those found in lymphatic glands; in other cases these cells were absent (epithelioid tubercle). The tubercles vary extremely in number; they may be thickly scattered all through the substance of the tonsil, or one or two may be all that are found after diligent search through many microscopical sections. Bacilli are generally scanty in number, but may be found if diligently searched for.

How do the bacilli gain entrance to the substance of the tonsil? Can they penetrate the normal intact epithelium lining the tonsillar crypts? In some of my cases the epithelial lining was in parts desquamated. But this does not appear to be necessary for the penetration of the bacillus. If the tonsillar crypts be carefully examined, search being made over hundreds of sections, places will be found where there are conical lymphoid accumulations. These lymphoid accumulations completely obscure the epithelium lining the crypts at these points, but the epithelial cells on careful observation are found to be intact. There is no doubt that the lymphoid corpuscles wander from the deeper adenoid tissue of the tonsil to the surface. The bacilli perhaps enter the adenoid tissue of the tonsil at these spots. Here, being destroyed by the phagocytes, their life-history may abruptly come to an end. But if too numerous victory may be theirs and the partially destroyed phagocyte may actually form the nourishing material on which they may live.

What is the connexion between the so-called strumous cervical glands and the tonsils? Are the tonsils the primary place of infection in these cases? Is it possible for the tubercle bacillus to be absorbed through the tonsils and so reach the lymphatic glands of the neck without leaving a trace behind them in the tonsil? I think from my investigations above we are justified in answering the first question in the affirmative and the second in the negative. I think my investigations show that the tonsil is an organ very easily infected with tubercle. It was found to be so 20 times out of 31 cases of acute and chronic tuberculosis.

I come now to the second division of my thesis. I have to state the result of my examination of the tonsils and adenoid vegetations removed from the living patients. Here my investigations have been entirely negative. I have examined microscopically many portions of hypertrophied tonsils and adenoid vegetations without finding any trace of tubercle; other observers, however, have been more fortunate. In addition to the observation of Dr. Purves Stewart referred to above, M. A. Pilliet in 1892 contributed a short note to the Société Anatomique of Paris upon the presence of giant cells in adenoid vegetations of the pharynx, and a very interesting paper was communicated by Dr. M. Lennoyez in 1894 to the Société Médicale des Hôpitaux entitled Tuberculous Adenoid Vegetations of the Naso-Pharynx. The following case appears to me to be so important that I quote it at length. It is from Dr. M. Lennoyez's paper.

A woman, aged thirty-eight years, married, suffered from chronic nasal obstruction since childhood but was otherwise in good health. She came to the hospital complaining of a purulent discharge from the left ear with deafness; apart from this there was nothing pathological. The husband was healthy and there were three healthy children. She presented a characteristic adenoid facies. Adenoid vegetations were diagnosed and removed. One month after the operation her general condition was found to be very unsatisfactory. She had a cough and there were night sweats, loss of appetite, and wasting. On examination there was dulness with prolonged expiration under the right clavicle, and six months later the diagnosis of pulmonary tuberculosis was confirmed. No chest disease was discoverable at the time of the operation.

Now in this case three suppositions are possible—(1) the patient may have been infected at the time of the operation, or (2) there was latent tuberculous disease of the right lung at the time of the operation which developed after, or (3) the adenoids were tuberculous from the first, the operation letting the bacilli into the general circulation. Unfortunately no histological examination of the removed adenoids seems to have been made. The first hypothesis in these latter days of aseptic surgery is not, I think, likely. The second is possible but not probable. The third is most likely. Dr. M. Lennoyez gives a second similar case in a child aged six years. Adenoids were removed. Microscopical examination revealed the presence of giant cells and tubercle bacilli. A third case came under my notice in March, 1896, in a young woman aged seventeen years. There was no family history of tubercle. Adenoid vegetations were removed a year ago. The chest was carefully examined at that time and no physical sign of disease was discovered. The patient's mother was living and was healthy. Her father had died from morbus cordis; she was the only child. She never quite recovered after the operation. Cough, wasting, and night-sweats were marked six months after the operation. On examination the physical signs of a cavity were found at the apex of the right upper lobe. It is possible, of course, that latent chest disease existed at the time of the operation, but there was no evidence of this. Unfortunately no microscopical or bacteriological examination was made of the adenoid vegetations removed. The following conclusions, I think, are justifiable:—(1) that the tonsils instead of being almost immune from tuberculous disease are very frequently affected; (2) that tubercle may be primary in the tonsil; (3) that the tonsils are very frequently affected secondarily in persons suffering from chronic pulmonary tuberculosis; (4) that when the tonsils are tuberculous the cervical glands receiving the lymphatics from these organs are also frequently affected with tubercle; (5) that the follicular glands at the base of the tongue are rarely found tuberculous; and (6) that the tonsils may be affected from without or through the blood stream in acute miliary tuberculosis.

The post-mortem examinations were with one exception made by myself. The tonsils on removal were at once placed in absolute alcohol to harden. When sufficiently hard they were cut with Williams's ether freezing microtome and stained in hæmatoxylin and eosin. In examination for bacilli carbol fuchsine and methylene blue were used.

[On account of the pressure on our space we have been reluctantly compelled to omit such of Dr. Walsham's illustrative cases as are not specifically referred to in the text.]

LITERARY INTELLIGENCE.—Mr. Frank A. Rogers, of 327, Oxford-street, has published an abridged list of important alterations in the British Pharmacopœia, 1898, as compared with the British Pharmacopœia, 1885. It is in a very convenient form, being printed on a card which folds in three, and a copy will be sent to any medical man who may wish to have it.

MEDICAL MAGISTRATE.—Mr. A. E. Davies, M.R.C.S. Eng., of St. Asaph, has been appointed a Justice of the Peace for the county of Flint.

Clinical Notes:

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

NOTE ON A CASE OF RAPID COLLAPSE AND REDEVELOPMENT OF AN OVARIAN CYST.

BY JOHN D. MALCOLM, C.M., F.R.C.S. EDIN.,
SURGEON TO THE SAMARITAN FREE HOSPITAL.

THE subject of the following note suffered from severe attacks of pain in the abdomen at intervals from Aug. 29th, 1895, onwards. On March 1st, 1896, Dr. William Thyne of High Barnet diagnosed an ovarian tumour with occasional twisting of its pedicle. Six days later, before arrangements had been made for the removal of the tumour, the patient had a very severe attack of pain accompanied by uncontrollable vomiting and great increase in the size of the tumour. On the 8th she was removed to the Barnet Cottage Hospital and Dr. W. Thyne removed a tumour of the right ovary which was almost black from occlusion of its vessels caused by twisting of the pedicle. The left ovary appeared healthy. The uterus was enlarged, the patient being in about the sixth week of pregnancy. Convalescence was uninterrupted and a full-time healthy child was delivered by forceps on Oct. 27th, 1896. On Oct. 2nd, 1897, the patient was again seized by pain in the abdomen and she said that she felt exactly as she had done in her previous illness. Dr. W. Thyne and Dr. Andrew Elliot examined her on the 3rd and there was then no doubt that another tumour existed. The Barnet Hospital was closed at that time and the patient was sent to me for treatment at the Samaritan Free Hospital. I saw her with Dr. Elliot on the 12th and there was at that time no palpable tumour. There was a tender place in the pelvis and the seat of the tenderness could be moved about freely. Taking the history of the first tumour into consideration and relying, as I knew I could, on the observations reported to me by Dr. Thyne and Dr. Elliot, I diagnosed a ruptured ovarian tumour and arranged for the patient's admission to hospital a few weeks later. On Nov. 8th I found a pelvic tumour extending nearly half way up to the level of the navel. On the 17th I removed a tumour of the left ovary as large as a cocoanut, consisting of two thin-walled cysts with an hour-glass constriction at their junction and numerous very small cysts close to the attachment of the tumour to the broad ligament. There was no twist of the pedicle. I did not observe anything to show whether the larger cysts which I removed had been ruptured or whether they had developed since my first examination. The facts are, however, that on Oct. 3rd, 1897, there was a considerable tumour and on Oct. 12th there was no palpable tumour and on Nov. 8th there was a pelvic tumour extending nearly half way up to the umbilicus.

The rapid changes in the physical signs in this case seem sufficiently interesting to be noted. It is obvious that such changes might give rise to unjust reflections on the diagnostic skill of the practitioner and perhaps to most serious damage to the professional prospects of a young man.

Portman-street, W.

NOTE ON A CASE OF INTESTINAL OBSTRUCTION DUE TO INDURATION OF THE GREAT OMENTUM.

BY T. ARMSTRONG BOWAS, M.A., M.D., B.C. CANTAB.

A MAN, aged sixty-six years, came under my observation in June, 1895. At that time he was the subject of ulceration of the left leg. The lower half in nearly the whole circumference was a discharging ulcer with three sinuses leading to a thickened tibia. In addition to this lesion he had a scar on the forehead very suggestive of a healed gumma with exfoliation of the outer table of the frontal bone. A nasal intonation of the voice was present without apparent cause in the soft palate or nose. In addition there was a marked condition of knock-knee on the left side with considerable enlargement of the internal condyle of the femur. The case was regarded as one of tertiary syphilis. During the succeeding two years he had occasional attacks of vomiting which easily yielded to treatment, and his leg condition improved but never entirely healed up till just previously to his last illness, when the ulcer was replaced by a firm white scar with cessation of discharge from the sinuses. For some months previously to his death he was subject to constipation. On Dec. 17th, 1897, he commenced to vomit with concomitant pain in the epigastric region. His bowels were relieved by an enema, and nothing was retained by the mouth. Under treatment, however, the stomach became less irritable, and some amount of nourishment was subsequently retained with occasional vomiting. The vomit was not fæcal. On inspection of the abdomen there was nothing abnormal to be noted, but on palpation there was discovered lying across the abdomen from the right lower to the left upper regions an ill-defined fixed resistance, best felt on the left side just above the umbilicus, at which spot the fingers below and to the left could define an edge on a level with a transverse division of the rectus muscle, giving the impression of a tumour, while at no other point could the limits of it be differentiated. There was no fluid in, or distension of, the abdomen. On Dec. 25th, in spite of his illness, he obtained a small portion of currant cake which he retained. No change in condition occurred till ten days later when with renewed vomiting the currants were returned undigested, the vomit having a faintly fæcal odour. As there had been no relief from the bowels for seven days an enema was administered with practically no result. From this date the vomiting was distressing, everything by the mouth being immediately returned, and although fed by nutrient enemata his condition did not improve. On Jan. 11th, 1898, it was obvious that he had peritonitis and death ensued on the following day.

A post-mortem examination revealed the presence of free non-fæcal fluid in the peritoneal cavity, with a few flakes of lymph here and there. The large intestine was empty, the small one contained a little fæcal matter. The ill-defined resistance proved to be the great omentum very much indurated surrounding the transverse colon, the resulting contraction having occurred to such an extent that the lumen of the gut for a length of six inches or more would just admit a fine penholder. The stomach was closely attached to this, but there was no abnormality or disease of it. The pylorus, pancreas, and liver appeared to be natural.

I am indebted to Dr. C. P. White, pathologist to the General Hospital, Birmingham, for examination of the specimen, and he reports: "Microscopical examination shows great increase of fibrous tissue which stains extremely badly, and here and there a few nodules of granulation tissue; the colon wall contains a large excess of fibrous tissue, and there is some hypertrophy of the muscular coat." The absence of evidence of malignant disease after death and the lesions present during life would suggest a syphilitic origin of the induration of the omentum.

Herne Bay.

A CASE OF CHLORODYNE POISONING; RECOVERY

BY D. J. FREEMAN, L.R.C.P., L.R.C.S. IREL.

ON June 1st, 1898, I was called at 2 A.M. to attend a married woman, aged fifty-three years. On entering the room I found that the patient was lying on her back in bed in a comatose condition and breathing stertorously. The pupils were normal but insensible to light. The pulse was hard and wiry, being 80 per minute, and the skin was burning hot, the temperature being 102° F. The teeth were clenched. I was told that she had just had two fits in quick succession and whilst my informant was speaking the patient gave a deep, forced expiration, something like an aura epileptica seemed to pass over her frame, and for a minute or more the body writhed in a convulsive seizure, grinding of the teeth, distortion of the face, and bending of the body to the left side (pleurosthotonos) occurring. Then she relapsed into a state of profound coma, the respirations were inaudible, the pulse was imperceptible at the wrist and for a moment we thought that she was dead. Artificial respiration was tried with partial success. Just then her sister rushed in to say that she had been told that the patient had taken nearly the

whole contents of a ninepenny bottle of chlorodyne—an ounce in quantity—that night on going to bed between 10 and 11 P.M. Cold affusion and other active measures were then employed, with the result that consciousness was restored, though with difficulty, and the patient was enabled to swallow the mustard emetics given. Vomiting soon took place and she slowly recovered, greatly exhausted by her perilous experience.

There is no previous history of fits or epilepsy in this patient's medical record, nor can I find in looking up the literature of chlorodyne poisoning—which is rather meagre, by the way—that convulsions are mentioned as a symptom; stertor, coma, &c., are the usual features. It is also noticeable that so long a period—four hours—should have elapsed between the absorption of the poison in such a large dose and the all but fatal effects. With reference to the amount taken, nearly an ounce, Dr. Stevenson relates a case from THE LANCET (1871) of a young lady who was poisoned by two divided doses—one drachm each—taken at short intervals. He also mentions that Dr. Dowse records an instance of a man who was found insensible on the pavement with an ounce bottle of chlorodyne empty by his side and who subsequently recovered; the poison had no doubt been swallowed but a little time before he was found. No two samples of chlorodyne obtained from separate sources are alike; hence, perhaps, the difference of results, &c., from poisoning by chlorodyne.

SEAMEN'S HOSPITAL, GREENWICH.

A CASE OF ADDISON'S DISEASE, WITH MILIARY TUBERCULOSIS AND OLD PULMONARY TUBERCULOSIS; SYNCOPE; NECROPSY.

(Under the care of Dr. J. ANDERSON.)

THOUGH much recent work has been done on the subject of the suprarenal bodies we are not even yet in a position to explain satisfactorily the symptoms of Addison's disease. The theory that these capsules normally elaborate an internal secretion is supported by many observers, among whom may be mentioned Rolleston in his valuable Goulstonian Lectures at the Royal College of Physicians of London in 1895[1] and Schäfer and Oliver.[2] Schäfer and Oliver have conclusively shown that the internal secretion of the suprarenals has a very powerful action on blood-pressure, causing contraction of all the peripheral arteries. It also acts directly on the heart. It is therefore extremely probable that the great weakness so noticeable in Addison's disease is due to a lack of this secretion. It is more difficult to explain the pigmentation which is generally present, though absent in the case related below. For the notes of the case we are indebted to Mr. A. E. Griffin, house physician.

A boy, aged fourteen years, was admitted into the Seamen's Hospital on Jan. 7th, 1898 It was stated that he was suffering from a pleuritic effusion, possibly an empyema. On admission he was collapsed; the pulse was 130 and barely perceptible and the temperature was 97·6° F. The patient said that he had been laid up in bed for three weeks with cough and expectoration; for the whole of this time he had had gradually increasing pain in the abdomen, with constipation; and daily vomiting had occurred independently of food. He was fair, the skin being clear and pale; he was emaciated and his lips were dry. The tongue was slightly furred, but was red at the edges and at the tip. The chest was of a rickety type, with some "beading." He lay on the right side and was apparently in continual pain, which was referred to the abdomen above the umbilicus; he also complained of pain in the right iliac fossa. The chest was thinly covered, the movements were impaired, and there was retraction at both apices; the percussion note over the lungs was impaired on both sides, front and back. The breath sounds were weak all over. No adventitious sounds were to be heard except over the middle lobe and over the lower part of the right lower lobe where a few fine râles with inspiration were audible; expiration was not prolonged. Vocal resonance and vocal fremitus were indifferent on both sides, but there was no notable difference between the two. The apex beat of the heart was seen and felt in the fifth space in the nipple line, but cardiac dulness was not enlarged upwards or to the right; the sounds were weak but normal; the second sound was accentuated over the pulmonary cartilage. The abdomen was retracted; there was general tenderness especially in the left hypochondrial region. The liver and spleen were not felt; there was no distension, sense of resistance, or dulness. On Jan. 8th the pulse was 120 and very small, the respiration was normal, and the temperature was 99°. The patient complained of great pain under the left costal margin. He had a constipated stool after the enema which was given on admission, but he did not retain the enema on the 8th and there was incontinence of fæces. On the 8th, 9th, and 10th the patient vomited after food, but the abdominal pain gradually ceased and the bowels became constipated; his general condition improved, but his appetite was always poor. On the 15th he vomited twice after breakfast. On that date the tongue was clean and there was no abdominal pain or tenderness. The pulse was still 120 and weak; the physical signs in the lungs had not altered. The bowels were kept open by small doses of castor-oil. On the 18th some abdominal pain referred to the epigastric region was again complained of and he refused food. The temperature continued to be normal. On the evening of the 19th the patient while lying in bed suddenly became cyanosed and dyspnœic. When seen he was in great fear of impending death. The pulse was hardly perceptible and was 144 per minute. He did not react to stimulants (injections of ether and strychnine) and died from cardiac failure ten minutes after the commencement of the attack.

Necropsy.—A post-mortem examination was held on Jan. 20th. Both lungs were found to be firmly bound down by old adhesions with the exception of the right middle and lower lobes, where there were a few recent adhesions which were easily broken down. Over the whole of the left side the pleura was greatly thickened and contained masses of cartilaginous hardness. On section both lungs were seen to be thickly dotted with miliary tubercle, this condition being most marked in the upper lobes. At the base of the left upper lobe, which was somewhat collapsed, there were two small thick-walled cavities, each of the size of a hazel-nut and one containing a cretaceous nodule. The right middle and both lower lobes were congested and œdematous. The bronchial glands were enlarged and pigmented, but there was no caseation. The heart was small; all the cavities were dilated and filled with dark clot. The muscle substance was poor; the valves were normal and there was no pericarditis. There was no excess of fluid in the abdomen and no adhesions were present. The mesenteric glands were enlarged and firm in consistence, but they were not caseated. The liver, kidneys, and spleen were congested. The intestines were injected, but with no signs of tubercle. The capsules of the suprarenal bodies were thickened and bound down firmly to the underlying structure. Each was four times the normal size; they were caseous and contained cretaceous nodules. The brain was normal. On microscopic examination the mesenteric glands showed infiltration of small cells without any giant cells. Sections of the suprarenals showed that the periphery was rich in typical small tubercles, many containing large multi-nucleated giant cells. The medulla of the suprarenal bodies contained caseous material, showing no definite structure under the microscope.

Remarks by Mr. A. E. GRIFFIN.—Dr. Anderson has kindly given me permission to report the above case, which is interesting on account of the fact that there was not the slightest sign of pigmentation on the skin, though the buccal mucous membrane was not examined. I find that Dr. Bramwell[3] points out the value of routine examination of

the mouth in these cases. The physical signs in the lungs gave no evidence of the condition found post-mortem. The important diagnostic signs were extreme asthenia, emaciation, loss of appetite, vomiting with abdominal pain, and small rapid pulse.

ROYAL BUCKINGHAMSHIRE HOSPITAL.

A CASE OF PERFORATION OF THE ILEUM; NECROPSY.

(Under the care of Mr. E. G. WOOLLERTON.)

IT is difficult to give an explanation of the occurrence of the perforation in the following case which would be perfectly satisfactory. It is not quite clear from the report whether the whole intestine was examined at the necropsy. The situation of the perforations is in favour of their being due to the ulceration occurring in typhoid fever, but there seem to have been no other symptoms which would justify such a diagnosis. The previous attacks of abdominal pain and vomiting may have been due to a partial obstruction caused by a peritoneal band, and it is possible that the pressure was sufficient to cause local necrosis of the bowel wall, and so perforation, but though this explanation is possible it is by no means probable. We consider the case worthy of being put on record on account of this great obscurity as to the mode of origin of the perforation. For the notes of the case we are indebted to Mr. Horace Rose, house surgeon.

A woman, aged thirty years, was admitted into the Royal Buckinghamshire Hospital early in the evening of Feb. 25th, 1898, complaining of severe pain in the epigastrium. For several months past the patient had had attacks of "indigestion." Five weeks before admission she had a sharp attack of abdominal pain accompanied by symptoms of indigestion, vomiting, &c. The vomiting continued at intervals up to Feb. 24th, on which day feeling better she ate a hearty meat meal and did her work as usual. Towards the evening the pain in the abdomen returned with severity and the vomiting increased. The bowels were well opened during the day. There was no history of hæmatemesis or melæna.

On admission the patient was obviously in acute pain, the countenance being pale, pinched, and anxious. The pulse was 120, small and wiry but hard. The temperature was 98° F. but soon rose to 100°; she lay on her back with the knees drawn up, the abdomen being swollen and very rigid. There was no superficial tenderness but severe pain ensued on deep pressure being made. The abdomen was tympanitic on percussion and the liver dulness was almost absent, the respiratory movements being short, quick, and costal. Soon after admission the patient was very sick, bringing up greenish bilious fluid. An enema was given and slight fæcal evacuation resulted; a rectal tube was inserted and some flatus passed; she was given a mixture containing bismuth, hydrocyanic acid, and morphia. Although fairly under the influence of morphia she had occasional very severe attacks of pain; she was put on nutrient enemata, but they were not well retained. Two hours later the pulse was 130, the respirations were 40, and the temperature was 97°, her general condition being worse. Turpentine stupes were now applied over the abdomen. She was seen by one of the visiting staff, but her condition was considered to be too bad for operation. Towards night she was becoming more collapsed. Hiccough was frequent and troublesome. Early the next morning the temperature ran up to 108° and the patient died collapsed.

Necropsy.—With the assistance of Dr. Randal Smyth a post-mortem examination was made. The body was well nourished, the heart and lungs being normal. Intense peritonitis was present all over the abdomen; the abdominal cavity contained free gas and about 10 oz. of thick, curdy pus; the intestines were covered with inflammatory lymph in places ⅛ in. thick. The stomach was removed and opened, but was found to be quite normal. On examining the ileum a perforation was found of the size of a threepenny-piece which from without admitted the tip of the little finger; near it but separated by a narrow band of normal tissue was another perforation of about the size of a pin's head. The intestine around the perforations was dark but not gangrenous. When the perforation was first observed the intestinal contents were passing through it into the general peritoneal cavity. The perforations were situated at the edge of the gut farthest from the mesenteric attachment and about 12 in. from the ileo-cæcal valve. There were several old and very tough peritoneal inflammatory bands in the abdomen; the rest of the small intestine was free from ulcers of any kind. The portion of intestine was excised and opened; there were no signs of ulceration at the site of perforation, but there appeared to be some slight constriction of the lumen of the bowel. The uterus and tubes were healthy.

Remarks by Mr. ROSE.—I do not know whether I am right in considering the perforation due to friction from an inflammatory band. It may have been due to embolus, but there was no sign of such condition observable and absolutely no trace of any foreign body. The case is interesting because of its acute onset (the patient being at her usual work the day before admission) and also because of the rapid development of dangerous symptoms no doubt due to the very large size of the perforation. The position of the perforation is peculiar and as far as I can find the literature on isolated perforations of the intestine is decidedly scanty.

Medical Societies.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

Acute Leukæmia.—Influence on Gout of the Mineral Constituents of Vegetables.

A MEETING of the above society was held on June 14th, Mr. BRYANT, the President, being in the chair.

Dr. ROSE BRADFORD and Dr. BATTY SHAW read a paper on Five Cases of Acute Leukæmia. Two cases were observed in 1890, the remaining 3 in 1897. All the patients came under observation for anæmia, causing excessive pallor, weakness, swelling and ulceration of the mucous membrane of the gums, cheeks, or lips, and fever. The anæmia and weakness preceded the affection of the mouth. Most of the cases also presented purpuric hæmorrhages in the skin and in two cases there was some melæna. The cases all ran an acute and fatal course, the maximum duration of the illness being eight weeks. The lymphatic glands were enlarged in all cases, slightly in 4, and considerably in 1. The spleen was slightly enlarged in two cases. The blood showed a great excess of white corpuscles, varying from 1 white to 4 red in Case 1 to 1 white to 43 red in Case 4. Stained films of the blood were made in 3 out of the 5 cases and showed that the excess of white corpuscles was almost entirely due to the presence of great numbers of large lymphocytes. In 2 cases these formed over 90 per cent. of all the white cells present, and in the third case these formed 61·8 per cent., and the small lymphocytes 12·2 per cent, of the total number of white cells. In 2 cases a few myelocytes were present, and in all the polymorpho-nuclear cells were remarkably scanty. Post-mortem examinations were made in 4 cases. Similar cases had been described by Fraenkel, in 1895, as cases of acute leukæmia and called by some writers acute lymphatic leukæmia.—Dr. H. G. TURNEY quoted a similar case which he had had the opportunity of observing in a man, aged forty years, in whom the total duration of the disease was three months. The onset was insidious, attended with shortness of breath; one month after the onset purpuric spots were noticed on the skin and shortly before death the gums became tender and swollen. The examination of the blood showed a proportion of white to red as 1 to 15, the white cells were large lymphocytes, the myelocytes and the polymorpho-nuclear cells being few in number; there were, however, a considerable number of nucleated red cells. The necropsy revealed no enlargement of the lymphatic glands; there were numerous purpuric spots over the serous membranes; the bone marrow was of a plum-red colour; the liver was enlarged and fatty and gave the iron reaction in an extreme degree. Dr. Turney thought that no hard-and-fast line could be drawn between the various types of the disease.—Dr. ROLLESTON considered that it might be difficult to distinguish between acute Hodgkin's disease with a terminal lymphocytosis and some of the cases like Dr. Bradford's; one of the authors' cases might perhaps bear this interpretation. He referred to a case published in conjunction with Dr. Latham in which a case of Hodgkin's disease simulated a mixed leukæmia.—Dr. NORMAN MOORE asked Dr. Bradford

and Dr. Shaw if they could give any explanation of the rapid course of the disease. He had seen two cases following malaria and syphilis acquired in South Africa which had terminated within a year, but had seen no case so rapid as those quoted by Dr. Bradford.—Dr. BRADFORD, in reply, said that he agreed with Dr. Turney as to the difficulty of deciding the nature of these cases from the examination of the blood alone and pointed out that the disease had a characteristic appearance and when once seen was easily recognised and did not resemble acute Hodgkin's disease.

Dr. ARTHUR P. LUFF read a paper on the Influence on Gout of the Mineral Constituents of various Vegetables. He said that in the Goulstonian lectures of last year, whilst discussing the relative effects on the gouty process of animal and vegetable diets, he had stated that, in his opinion, it was of little importance as regards the production of uric acid from proteid matter whether the proteid be of animal or vegetable origin and that the same harm may result from an excessive consumption of either form of proteid. But although animal and vegetable proteids may react alike with regard to the production of uric acid, yet it is well known that different articles of diet exercise a different influence on the precipitation of sodium biurate and on the solution of uratic deposits. In connexion with this subject he had been able to demonstrate that the saline constituents of animal and vegetable foods exercise very different solvent effects on sodium biurate. From the results of these experiments it had appeared probable that if the mineral constituents of vegetables were present in sufficient quantities in the fluids of a gouty person they would not only delay the advent of an attack of gout by increasing the solubility of the biurate present in these fluids but would also, by their increased solvent effects on uratic deposits, facilitate the removal of the latter. Since the delivery of the Goulstonian Lectures he had carried out a long series of experiments on the mineral constituents of all the vegetables in ordinary use and the results of these experiments were embodied in this paper. The objects of this experimental inquiry were: (1) to ascertain the relative efforts exerted by the mineral constituents of various vegetables on the solubility of sodium biurate at the temperature of the human body, and therefore presumably on uratic deposits; and (2) to ascertain the influence, if any, exerted by these constituents in retarding the conversion of the sodium quadriurate contained in the fluids of the body in gout into the biurate. Obviously the elucidation of these points would have a material bearing on the treatment of gout. The method of carrying out the experiments to ascertain the solvent effects exerted by the mineral constituents of vegetables on sodium biurate was the same as that described by him in the Goulstonian lectures last year. The vegetables employed in the experiments were spinach, Brussels-sprouts, potato, asparagus, Savoy cabbage, French beans, lettuce, beet-root, winter cabbage, celery, turnip-tops, turnip, carrot, cauliflower, seakale and green peas. From the results obtained it appears that 0·05 per cent. and over of the mineral constituents of nearly all the vegetables very appreciably increase the solubility of sodium biurate. The solitary exception is in the case of the mineral constituents of green peas, which practically exert no influence whatever on the solubility of the biurate. He next endeavoured to ascertain whether these effects were due to the alkalinity of the vegetable ashes or whether they could be referred to any one saline constituent of the vegetables. The series of tables embodying the results of this part of the investigation demonstrated conclusively that the solvent effect of a vegetable ash on sodium biurate bears no relationship either of a direct or an inverse ratio to the alkalinity of the ash or to the proportions of potassium, sodium, calcium, magnesium, and iron salts present or to the proportions of phosphates, sulphates, and chlorides present. The following examples demonstrated this. The solvent effect on the biurate of the ash of Brussels-sprouts is high while its alkalinity is low; on the other hand, the solvent effect of the ash of celery is low, while its alkalinity is high. The solvent effect of the ash of spinach is high, while the proportion of potassium salts is low; on the other hand, the solvent effect of the ash of turnips is low, while the proportion of potassium salts is high. The solvent effect of the ash of potato is high, while the proportion of sodium salts is low; on the other hand, the solvent effect of the ash of seakale is low, while the proportion of sodium salts is high. Corresponding results were obtained with the calcium, magnesium, and iron salts, and with the phosphates, sulphates, and chlorides present in the vegetable ashes. These results, therefore, show that the solvent effect exerted on sodium biurate by the mineral constituents of vegetables is not due to any one constituent. He next proceeded to ascertain whether an artificially prepared ash of the same composition as the natural ash of one of the vegetables would exercise a similar effect in increasing the solubility of sodium biurate to that possessed by the natural ash. For this method of experimentation he selected the spinach ash, which has the greatest solvent effect on the biurate. An artificial ash was prepared, which was made with the same proportions of potassium, sodium, and calcium, and of sulphates, phosphates, and chlorides as those present in the natural spinach ash, and also of precisely the same degree of alkalinity. The results of the experiments with this artificial product on the biurate showed that it exercised in all proportions a deterrent effect on the solubility of the biurate, whereas the natural ash exercised a marked solvent effect. The only explanation which he could offer of these remarkable results was that in the natural ash there is some combination of the mineral constituents which cannot be artificially imitated, and that upon this natural combination of the salts is dependent the increased solvent effect exerted on the biurate by the mineral constituents of most vegetables. If this view be correct then modern science is but confirming the correctness of the practice of those ancients who employed vegetable ashes in the treatment of gout. Experiments were next undertaken in order to ascertain the effect exerted by the mineral constituents of the various vegetables on the conversion of sodium quadriurate into the biurate. It was well known from the researches of Dr. Bence Jones and of Sir William Roberts that sodium quadriurate, which is the form in which uric acid first appears in the blood in gout, is an unstable body and is gradually converted by combination with the sodium carbonate of the blood into sodium biurate, which latter body, on account of its comparative insolubility, deposits in the tissues and then constitutes the gouty uratic deposit. It is obviously of therapeutical importance to know whether the mineral constituents of any of the vegetables, in addition to exerting an increased solvent effect on the biurate, possess the power of delaying the conversion of the quadriurate into the biurate. The results of the experiments undertaken with this object showed that the mineral constituents of some of the vegetables, notably spinach, Brussels-sprouts, French beans, cabbage, turnip-tops, and turnips, very considerably delayed the conversion of the quadriurate into the biurate. The inference is that if such mineral constituents were present in suitable proportions in the blood of gouty subjects, and if at the same time proper measures were adopted for promoting the excretion of the quadriurate by the kidneys, the elimination of that body might be secured without the occurrence of any precipitation of the biurate into the tissues. The net results of all the experiments indicated that the mineral constituents of most vegetables increase the solubility of sodium biurate, and also in several cases delayed for considerable periods the conversion of the sodium quadriurate into the biurate. On the other hand, the mineral constituents of meat diminish the solubility of the biurate and, as Dr. Luff had shown elsewhere, exercise but little effect in delaying the conversion of the quadriurate into the biurate. He wished it to be clearly understood that he did not attribute the different effects of animal and vegetable diets on gouty subjects to the saline constituents alone. He thought, however, that the results of the experiments clearly showed that it is to the different mineral constituents of animal and vegetable foods and to the different physical effects they exercise on the quadriurate and biurate that one must look for a partial and perhaps a main explanation of the known facts that an excessive diet of the one tends to produce gout and of the other tends to retard it. From the results of these experiments it appeared that certain vegetables stand out prominently with regard to the effect exercised by their mineral constituents in both retarding the conversion of the sodium quadriurate into the biurate and in increasing the solubility of the latter. These vegetables were spinach, Brussels-sprouts, French beans, winter cabbage, Savoy cabbage, turnip-tops, turnips, and celery, and these he considered likely to prove most beneficial to gouty subjects. Of these, in so far as the effects produced by their mineral constituents are concerned, spinach occupies the foremost place,

both as regards inhibiting the decomposition of the quadriurate and increasing the solubility of the biurate. On account of this double beneficial action possessed by vegetable ashes on the chemical portion of the gouty process, it had occurred to him that the free use of a table salt composed of the ashes of certain of the vegetables in place of common salt might prove advantageous to the gouty. He was therefore having different mixtures of the mineral constituents of various vegetables prepared, with which he proposed to experiment in order to ascertain which combination was likely to prove the most efficacious to gouty subjects. He hoped to be able shortly to publish the results of his experiments with these vegetable table salts.—Dr. EWART congratulated Dr. Luff on the excellent results which he had obtained and thought that the practice of using a vegetable diet would prove to be scientifically correct by his researches.—Dr. HAIG thought that Dr. Luff had hardly shown what the salts were which produced this greater solubility of biurate of soda nor had he shown how they acted; he viewed the facts brought forward by Dr. Luff in a somewhat different way; in the ash of the various vegetables examined the constituents might be divided into two groups, those which "make" for solubility and those which "make" for insolubility, and if one takes certain vegetables from the table arranged by Dr. Luff one finds that in spinach the "soluble" preponderate over the "insoluble," whereas in seakale the "insoluble" preponderate over the "soluble"; in cabbage, which occupies an intermediate position, the "soluble" and "insoluble" constituents are more equally balanced. The result obtained is not that of one constituent, but the balance of the whole. He further pointed out that gout was due to the admission of uric acid to the body and not to its solubility in the blood and that although a table salt, as suggested by Dr. Luff, might be used with some advantage he thought it would be no remedy for gout.—Dr. LUFF, in reply, said that he thought Dr. Haig had misunderstood the object of the paper, since he had been dealing with the solubility of sodium biurate and not with that of uric acid.

BRITISH GYNÆCOLOGICAL SOCIETY.

Exhibition of Specimens.—Dysmenorrhœa.

A MEETING of this society was held on June 9th, the President, Dr. MACNAUGHTON-JONES, being in the chair.

Mr. SKENE KEITH showed Ovaries illustrating a Cause of Failure of Apostoli's treatment.

Mr. CHARLES RYALL showed a specimen of Uterine Fibromyoma removed by Abdominal Hysterectomy.

In the discussion on these specimens the PRESIDENT, Dr. GILES, Dr. ROUTH, Dr. BANTOCK, Dr. BEDFORD FENWICK, Dr. HEYWOOD SMITH, Dr. BURLEIGH-ROBINSON, Dr. PURCELL, and Dr. SNOW took part.

Dr. GRANVILLE BANTOCK read a paper resuming the discussion on a former paper on Dysmenorrhœa by Mr. Skene Keith. He recognised three typical forms of anteflexion as follows: (1) that in which the flexion occurs at the junction of the body and cervix, in which the body and cervix are both directed forwards, the former lying upon the bladder and the latter in the axis of the vagina; (2) that in which the body of the uterus may be in fairly normal position, but the cervix is bent forwards, the flexion occurring in the cervical portion; and (3) that in which the anteflexed uterus, the bend being at the internal os, lies on its back in the bottom of Douglas's pouch. He quite agreed with Mr. Keith in the view that in a case of dysmenorrhœa with anteflexion the bend *per se* was not alone the cause of the pain. It was only when congestion, with its resultant thickening of the mucous membrane from simple turgescence, or that change which goes by the name of hyperplasia, supervened, and they were face to face with a potential or actual organic stricture, that pain became a prominent symptom. Mr. Skene Keith, in his paper, had said, "The patient will tell you that she has suffered from pain since she first begun to menstruate." On the contrary, his experience told him that even in an extreme case there was no pain at the beginning of menstruation beyond the backache which is so common in the majority of apparently healthy women, and it was not until one or more years had elapsed that the special pain began, at first in a minor degree, but gradually increasing up to the age of maturity. The exception to this would be found in the case in which the patient happened to be the subject of catarrh when the menses first made their appearance. His explanation of the course of events was as follows. From the very beginning—assuming that there was no catarrh and consequently no congestion—the flexion caused some retardation of the flow with no more pain than the ordinary backache or a sense of weight in the pelvis; the frequent repetition led by degrees to stasis of blood in the organ, in other words to congestion, and pain of special character gradually came on, yet varying from time to time, probably according to variations in the degree of congestion. That there was a retardation of the menstrual flow was clearly shown by the character of the discharged blood—as in all cases of obstructive dysmenorrhœa from stricture, organic or otherwise—and by the fact that in every well-marked case of the kind under discussion the cavity of the uterus was more or less enlarged, half an inch or more. The presence of leucorrhœa was the outward sign of congestion and the menorrhagia often assumed the form of protracted menstruation rather than actual excess, the discharge being usually dark coloured, often treacly, and changing to a dirty brown colour. On four occasions Mr. Keith made use of the term dysmenorrhœa qualified by the adjective "uterine." He would like to know what precise meaning he attached to this qualification. Did he mean that there was a form of dysmenorrhœa other than uterine? Did he accept the doctrine of ovarian dysmenorrhœa, for instance, to say nothing of the various forms enumerated by one of the speakers who had taken part in this discussion? If so he joined issue with him on a very important point and boldly affirmed that there was no such thing as ovarian dysmenorrhœa. It was true that patients often referred much of their pain to the region of one or both ovaries. But if care were taken to analyse these cases it would be found that the seat of the trouble was the uterus, the pain being referred to the ovary, as in hip-joint disease the pain may be referred to the knee. As to treatment he recognised only three rational methods: (1) division of the cervix; (2) the stem pessary; and (3) dilatation. No operation upon the external os could avail anything when the condition to be remedied had its site at the internal os. In regard to pessaries he believed that no vaginal pessary was of any value in the treatment of anteflexion. For dilatation he regarded the method by graduated bougies as being the best. It generally required to be repeated several times at intervals.—Dr. ARTHUR GILES said that his experience was that in many cases of anteflexion dysmenorrhœa existed from the onset of menstruation; but two forms were to be distinguished, that in which the pain had a congestive origin—here it might come on later—and that in which it was associated with neurosis—here it was generally present from the first. In the latter class of case all local treatment was likely to prove unsuccessful. He took exception to the term "obstructive dysmenorrhœa." In these cases the flow was generally scanty, so that the blood could find its way through even a narrowed channel; moreover, if "obstruction" were present an accumulation of blood would occur behind the seat of obstruction and this was never found. He believed the pain to be due partly to painful contractions and partly to compression of the swollen and hypersensitive mucosa. Dudley's operation seemed to him to fulfil the two main indications required: first, permanent abolition of the flexion; and secondly, permanent widening of the canal; but there were cases, probably the neurotic class above mentioned, in which it would not be successful. He believed there were cases of dysmenorrhœa other than those of uterine origin, notably those due to inflammatory pelvic conditions, such as salpingitis, oöphoritis, and cellulitis.—Dr. C. H. F. ROUTH said that dysmenorrhœa might be due to spasmodic contraction situated at the os internum: this could be demonstrated by the constriction of a tent placed in the uterine cavity. The condition might be remedied by anti-spasmodic drugs and by depletory measures such as leeches and division of the os externum; in other cases Greenhalgh's hysterotome answered well, but it had to be carefully used. His own practice was the introduction of a tangle tent wrapped round with cotton wool soaked in carbolic acid. This acted both as an anæsthetic and as an antiseptic. After some dilatation had been secured by this means he introduced the pessary which he had devised for the purpose; this could be worn from six to twelve months.—Dr. BUTLER HOGAN agreed with Dr. Bantock that division of the external os alone was not sufficient. For dilatation he

preferred graduated bougies. He had also had good results from cocaine irrigations.—Dr. HEYWOOD SMITH thought that Dr. Bantock was a little too sweeping in his statements as to the pathology of dysmenorrhœa, for it seemed to him that ovarian dysmenorrhœa was a well-established condition associated especially with cirrhotic ovaries. For treatment dilatation alone often failed; it should be followed by slight bilateral incisions carried through the mucosa and muscularis at the internal os. After dilatation he employed a glass stem pessary, which was clean and non-irritating. Duke's spiral stem also answered very well.

KIDDERMINSTER MEDICAL SOCIETY.

Exhibition of Specimens.—Peritonitis.

A MEETING of this society was held on May 27th, Mr. W. HODGSON MOORE being in the chair.

Mr. J. LIONEL STRETTON showed the following specimens. 1. A Dermoid Tumour of the Ovary removed from a woman aged forty-two years. She had been an in-patient two months previously with caries of the jaw and had never had any abdominal trouble. On opening the abdomen there was a considerable escape of clear amber-coloured fluid—a gallon or more—and the tumour was found adherent to the great omentum, which required ligaturing before removal. The solid portion of the tumour weighed 2 lb. and there was an opening about its centre as if a large cyst had been ruptured. The patient made a satisfactory recovery. Mr. Stretton commented upon the small amount of discomfort associated with the development of the growth. It seemed probable that the escape of fluid into the abdominal cavity first caused sufficient symptoms to attract her attention. 2. A portion of the Stomach and Great Omentum removed from a woman aged fifty-seven years. There was a considerable amount of adhesion and the transverse colon was wounded in removing the growth; this and the large gap in the stomach were closed with Lembert sutures. The amount of stomach removed was about one-third. The patient was very much collapsed. She never recovered from the shock and died eighteen hours afterwards. 3. Fifty-nine Gallstones removed from a woman aged fifty-seven years. She had been ill for four months, the last six weeks in bed, and had lost flesh rapidly. There had been many attacks of colic and she had been deeply jaundiced. The case exemplified the advantage of an exploratory incision. She had lost so much flesh that her attendant thought she had malignant disease, but after the operation she very rapidly improved and was up and about within three weeks. 4. A row of Ingrowing Eyelashes with their Roots removed from a woman aged fifty-two years. She had suffered for many years and had on several occasions had the lashes pulled out at various institutions. A flap of the conjunctiva was dissected up and the whole of the roots and adjacent tissue dissected out in one piece, a couple of catgut sutures bringing the flap into position.

Mr. OLIPHANT read notes of a case of Peritonitis treated with anti-streptococcic serum. The woman was twenty-eight years of age and was admitted with metrorrhagia following an abortion four years previously for which the uterus was curetted on April 20th. Although every precaution was taken she developed an attack of acute peritonitis and became exceedingly ill. Her condition was far too serious for any operative interference and as all other treatment had been tried without benefit and as she seemed to be dying it was decided to give her some of the serum. On May 3rd at 11.30 A.M. 10 c.c. (Institute Pasteur) were injected into her left flank. There was no change in the temperature or pulse but she felt better in the afternoon. On the 4th the dose was repeated. The temperature fell gradually to normal but rose again in the evening; the abdomen was less tender and less distended. On the 5th the dose was repeated. The temperature fell to normal, the abdomen was free from distension, the patient was taking nourishment well and was much brighter. She continued to improve and her temperature remained normal, but there was still pain and tenderness in the left iliac region, so on the 20th an exploratory incision was made. There were a considerable amount of adhesions around the left tube and ovary and a small collection of pus was in the left broad ligament. This was swabbed out and a drain inserted. The patient was now convalescent. Whether the serum saved her life it was impossible to say, but it appeared probable that it caused a cessation of the peritonitic mischief, for these symptoms commenced to abate as soon as it was administered.

Mr. OLIPHANT also related the case of a man, aged fifty-six years, with a Sloughing Gummatous Mass involving the Left Tonsil and Soft Palate. He was admitted under the care of Mr. Hodgson Moore a month previously. The case presented all the appearances of malignant disease and the man denied a specific history, but under large doses of iodide of potassium it was rapidly improving.

Mr. OLIPHANT showed two enlarged Bursæ Patellæ removed from a girl aged eighteen years.

EDINBURGH MEDICO-CHIRURGICAL SOCIETY.

Exhibition of Cases and Specimens.—Rheumatic Myositis in its Acute and Chronic Form.—Operative Treatment of Enlarged Prostate.

THE ninth ordinary meeting of this society was held on June 1st, Dr. JAMES CARMICHAEL being in the chair.

Dr. ALEXANDER BRUCE showed a patient, a woman, aged twenty-five years, who suffered from a Congenital Displacement of the Right Scapula. The condition is very rare. The scapula was much elevated and there was partial ankylosis of the right shoulder-joint, the movements of the arm being very restricted. The right clavicle was much raised and concave forwards throughout its whole length. The trapezius was present and the electrical reactions were normal. The condition came on within a period of three months after birth.

Dr. BRUCE next showed a plaster cast of the entire figure of a man suffering from Achondroplasia. His total height was only a little above 4 ft. and there was marked shortening of the legs, thighs, arms, and forearms. The trunk was also short, but not nearly so shortened in proportion as the limbs. The head was well formed and the intelligence was good and except for the distortion of the limbs he was normal in every other way. The ends of the bones were very much enlarged, especially those of the ankle-joint. The hands were short and broad and the fingers were in the characteristic condition, spread out on either side from a line passing down the division between the third and fourth fingers. A skiagram showed that the bones of the phalanges were very short and that the first phalanges were extraordinarily broadened. The lower end of the radius was very large and the scaphoid was peculiar in shape. The patient was the father of two perfectly healthy children and no other member of his family had any similar complaint.

Dr. NORMAN WALKER showed a child suffering from Lichen Scrofulosorum. Dr. Crocker says that the disease is much more common than is usually believed and is often overlooked. In this case the eruption was chiefly marked on the back. The disease had greatly improved under the local application of cod-liver oil. The second case exhibited was that of a girl under treatment for Frontal Sinus Disease. She also possessed a bald spot on the anterior part of the scalp. This resembled alopecia areata, but the edges were red, raised, and granular. A second spot had formed just above the first, and, beginning as a vesicle, was following a similar course. It seemed to be a case of folliculitis decalvans and a hair from the vicinity showed the presence of cocci.

Dr. ALEXANDER BRUCE showed the following specimens: 1. A case of large Aneurysm of the size of a bean of the Anterior communicating Artery of the Brain. It gave rise to anomalous symptoms during life: intense headache and hysteroid fits, optic neuritis, and slight paresis of the third nerve due to some meningitis. It exerted pressure under the anterior tip of the lateral ventricle and latterly burst into it. The patient died with symptoms pointing to such hæmorrhage. 2. Another Aneurysm on a small branch of the internal carotid which had pressed on the third nerve and led to a sub-dural hæmorrhage. The patient was an old woman who showed signs of an imperfectly developed crossed hemiplegia. The paralysis of the arm remained, while that of the face was transient. There was a variable paralysis of the arm and leg. The pressure had caused oculo-motor paralysis. The aneurysm had then ruptured and blood had escaped over the whole extent of the left hemisphere and hence the paresis. The sub-dural hæmorrhage presented all

the appearances of pachymeningitis hæmorrhagica, but it was adherent to the dura mater and only depressed the brain tissue. The case, Dr. Bruce considered, was almost unique. 3. Specimen from a case of Diabète Bronzé—a condition rare in this country. The skin was darkened and bronzed in character. There was enlargement and cirrhosis of the liver and a great deposit of the aluminate of iron in the nerve cells and fibrous tissue bundles. This deposit was found largely as granules in the spleen and heart. 4. A series of specimens were shown under the microscope illustrating the important part played by Arterial Sclerosis in causing hæmorrhage. Dr. Bruce thought that the occurrence of miliary aneurysm was over-estimated as a cause of hæmorrhage, while the part played by arterio-sclerosis was underestimated. 5. A specimen from a man over seventy years of age admitted to hospital suffering from stupidity and complete right-sided hemiplegia. The symptoms resembled those of an ordinary severe hæmorrhage into the basal ganglia. At the necropsy, however, under the dura mater a cystic semifluid mass was found compressing the brain tissue over the motor areas. It was only slightly adherent to the dura mater and was a partially organised thrombus the origin of which was not apparent as it had no communication with any vessel. It was stripped off quite easily from the brain and dura mater. The symptoms had lasted about three weeks.

Dr. NORMAN WALKER exhibited under the microscope sections of Lupus Erythematosus and of Acne.

Dr. HARVEY LITTLEJOHN showed: 1. The Heart of a Woman who died suddenly while in bed. She had suffered for two years from rather indefinite symptoms. The post-mortem examination showed a large organised clot on the anterior wall of the left ventricle. It was probably an aneurysm of the heart wall due to infarction. The clot was firmly organised and the cardiac muscular wall was gone, leaving only the epicardium and the adherent clot. 2. Specimen of Suicidal Cut Throat from a woman found dead on her kitchen floor by her husband when he came downstairs in the morning; a table-knife lay near her. It resembled a homicidal injury in that the injury was mostly on the right side and the incision was low down in the neck below the thyroid. Both the carotid artery and vein were cut on the right side. 3. Specimen from Ruptured Interstitial Pregnancy. The symptoms resembled those of acute irritant poisoning. 4. Old case of Cut Throat where the man recovered after dividing his epiglottis near the base. The cicatrix of this wound was clearly seen as was also that of the tracheotomy performed lower down. At a later date, however, he was more successful in committing suicide. 5. A specimen showing Cicatrix of an old Tracheotomy Wound. The trachea presented evident signs of constriction.

Mr. A. G. MILLER read a paper entitled Rheumatic Myositis in its Acute and Chronic Form. He noted that the causes of rheumatism were cold, damp, heredity, and barometric influence. The affection was often mistaken for articular rheumatism, especially when the affected muscle overlay a joint. There was pain, swelling, fever and constitutional disturbance to be noted along with this affection. The situation of the pain and swelling was chiefly at the origin and insertion of the muscle. The pain was increased usually by muscular action but not every movement of the muscles caused pain. The swelling, which was little in myositis, was well-marked in arthritis on account of the effusion into the joint. In myositis the effusion into the skin and subcutaneous tissue over the muscle caused a crackling. This was specially well-marked in pleurodynia. The affection usually subsided in a few days. In the chronic form of the disease the stiffness was more or less constant and with this there was muscular wasting. The points to note were (1) that the pain comes on in advance of the weather; (2) that the pain was often associated with a falling barometer but may be with a rising barometer if the wind be from the north or east; (3) the pain may subside when the rain had fairly set in; (4) mists caused advent of attack; (5) the onset of east winds may have the same effect even if there be no mist perceptible; and (6) pain may be conspicuously absent in cold, frosty weather if the air be dry. This was seen well by explorers in the Arctic regions. As regards the treatment nothing could be dogmatised. Of internal remedies the alkalies were good, as were also salicine and its salts. Iodide of potassium was useful in nerve affections, and Mr. Miller had found that a few drops of actea racemosa did great good in lumbago and stiff neck. Local treatment.—Dry heat always relieved the pain. Counter irritation in the shape of rubefaction was useful. The use of blisters was not to be commended, as on account of their pain the joint had to be kept at rest, and a stiff joint might result. Liniments were good if oily or rubefacient, as were also medicated (e.g., alkaline) fomentations. In chronic cases massage had great value, but the movements must be both passive and active. Mr. Miller had no faith in dietetic treatment. If any relief was obtained from the latter he thought there must have been a gouty element in the case. A dry, warm climate was the best for cases of chronic myositis. Mr. Miller was a sufferer from the latter affection and he fully described his own symptoms and the successful treatment adopted. His left shoulder became apparently ankylosed, but this was found to be due merely to muscular action. The hot douche rendered the arm freely moveable for the time, but the effect was transient. Much more benefit was obtained from the practice of movements which caused pain. Mr. Miller found voluntary muscular exercise to be even more useful than passive ones and specially those which caused pain. Any excessive movement was harmful, however. He noted a point not previously mentioned and that was that the affected joint felt cold to the touch. The conclusions he arrived at were: (1) that cases of myositis may be mistaken for arthritis and treated by rest, and this was harmful to cases of true joint inflammation as tending to ankylosis; (2) cases of apparent ankylosis from adhesions may be due to muscular contraction; and (3) cimicifuga racemosa was beneficial in rheumatic myositis.—Mr. JOSEPH BELL and Dr. CRAIG made some remarks on the paper.

Mr. ALEXIS THOMSON read a paper on Operative Treatment of Enlarged Prostate. He excluded from consideration those cases of successful catheter life where the term of life was not appreciably shortened. It was the critical cases with which surgeons had to deal, where catheter life had failed and complications had arisen which might end in fatal illness. The old procedure was to tide over the critical period by tying in a catheter or performing careful catheterisation twice or thrice daily; or, again, the bladder might be drained from the perineum or from above the pubis. The latter was not, however, always practicable, and a bladder fistula was not at any rate an ideal result. The methods available then were: 1. Either the destroying or dividing the prostatic tissue by means of a galvano-cautery. Bottini had used this method in about 80 cases with only 2 deaths. Much experience was, however, required to work with such an instrument in the dark and the method had not found favour in that country. 2. Suprapubic prostatectomy (McGill). This was feasible and advisable where there was a middle lobe projecting into the bladder. In certain cases the result was ideal. In one case operated on by Mr. Thomson two and a half years ago the patient was now well and had normal micturition. He had been enabled to pass several small calculi since the operation. 3. Double castration. Mr. Thomson had performed this operation in four cases of men advanced in life (from sixty-seven to seventy-six years of age); nearly all had retention. Every one had improved since the castration. The first case was done two and a half years ago and he had now normal micturition and the prostate was below the normal size. The second patient, operated on about the same time, used the catheter only once in the twenty-four hours. The third case was done about two years since and he only required now to use a catheter when he had retained his urine for a long time. In this case also the prostate had atrophied until it was below the normal in size. The last was the worst case and happened in a man aged seventy-six years. The operation was performed seven months ago and now he used the catheter twice a day only and painlessly. In several cases the contractile power of the bladder had greatly improved and instead of there being only a dribbling stream the flow was good. In all cases the general health had improved. One man had flushings and sweatings (like those of the climacteric) but in none was there any diminution in their mental or bodily vigour. All now enjoyed good rest at night and none regretted the loss of their testicles. 4. Vasectomy. Mr. Thomson had performed this operation once when he resected part of the vas deferens on one side. The patient was a man, aged seventy-five years, who had suffered for several years. Suprapubic drainage had to be performed later and the patient relied on this now. The conclusions arrived at were that in critical cases prostatectomy was to be

performed as it is comparatively safe. In other and unsuitable cases, however, castration seemed to be the best.—Mr. JOSEPH BELL agreed entirely with what Mr. Thomson had said. He had had no experience in vasectomy, however. Patients cannot always be persuaded to undergo a double castration and will as a rule only submit to this operation when very ill. Mr. Bell had found that rest in bed, careful diet, and regular catheterisation were very useful in improving matters in many cases and so tiding over the crisis. He had also found large doses of ergot and strychnine (as originated by Mr. A. G. Miller) to do great good, especially when the prostate was soft and boggy. He had noted the peculiar mental condition, melancholia and irritability, seen after castration.—Mr. A. G. MILLER, Mr. COTTERILL, Mr. SHAW MCLAREN, and Mr. WALLACE also took part in the discussion.

ROYAL ACADEMY OF MEDICINE IN IRELAND.

SECTION OF SURGERY.

Gastric Ulcer.

A MEETING of this section was held on May 13th, Sir WILLIAM THOMSON, the President, being in the chair.

Mr. JOHN CAMPBELL gave the history of a case of Perforating Gastric Ulcer successfully treated by operation. The patient was a widow, aged thirty-five years. The thickness of the abdominal walls rendered a long incision necessary and it was accordingly extended from 1½ in. below the ensiform process to 1 in. below the navel. The perforation was as large as a threepenny-piece and was near the lesser curvature of the stomach, about 1 in. from the pylorus. The opening was plugged with gauze and the stomach area was packed round with towels which had been recently boiled. The edges of the opening were then trimmed with scissors and the raw edges were brought together by a continuous suture of fine silk, including the whole thickness of the stomach wall. Over this about a dozen interrupted Lembert sutures were placed and over all a piece of small omentum was tacked down by a continuous suture. The abdomen was cleaned by gauze sponges. A gauze drain was inserted in the upper angle of the wound, reaching well over towards the spleen, where the gastric contents had spread most freely. The lower three-fourths of the wound was closed by interrupted silkworm-gut sutures. Owing to the distension great difficulty was experienced in getting the abdominal walls to meet over the bowels. Iodoform dressings were applied. A copious enema given after operation proved very effective in relieving thirst. Nutrition was kept up for five days by enemata. Then feeding by the mouth was cautiously commenced, water being given first, then animal extracts, and then milk. The gauze drain was removed on the fifth day and the stitches on the fourteenth day. The abdomen was not flushed out because it was thought that the stomach contents had not spread far beyond the gastric region and that flushing might only disseminate them still further. Therefore sponging and drainage were relied on. The patient is now well and has been free from pain since the operation.—Dr. CRAIG, Mr. MYLES, Mr. FRAZER, and others discussed the case.

SECTION OF MEDICINE.

Membranous Colitis.—Dissecting Aneurysm.

A MEETING of this section was held on May 20th, Sir G. F. DUFFEY, the President, being in the chair.

Dr. W. R. DAWSON read notes on a case of Membranous Colitis. A man, about forty-two years of age, some three years ago became subject to habitual constipation which has since persisted. About a year later he began to observe shreds and patches of membrane in the fæces, and these appearances have been present ever since, but with aggravations at intervals of two or three months. At such times pieces of membrane came away in rather large quantities, mostly after the fæces, and there are some dyspeptic symptoms also, but no pain in defecation or on abdominal pressure. There is little or no general discomfort and the patient's health, spirits, and nutrition are excellent. The membranes are of varying size and appear to consist entirely of mucus, embedding large numbers of degenerated cells, mostly epithelial. The treatment is purely general, the bowels being kept open by enemata rather than purgatives, and there has been, on the whole, some improvement.—Dr. WALLACE BEATTY said that he had met with a somewhat similar case. The patient was a man in good health except that he was continually passing large quantities of membranous material from the bowels, associated with very obstinate constipation. He was twenty-seven years of age and had been under observation for many years. All kinds of remedies were tried without benefit. He was then placed on milk diet and cod-liver oil and he still continues the diet and is doing very well and able to continue his work and passes very little membrane. Such cases were very intractable and prolonged unirritating diet was the best treatment.—The PRESIDENT and Mr. DOYLE also discussed the case.

Dr. J. B. COLEMAN read the notes of a case of Dissecting Aneurysm. The patient was a man, sixty-five years of age, who whilst at work was suddenly seized with a violent pain extending from his lumbar region into his chest and felt faint, but did not lose consciousness. Within a quarter of an hour his lower extremities were completely paralysed. He had a "lead line" on his gums, well-marked arcus senilis, atheromatous arteries, hypertrophied heart, high-tensioned pulse, and the aortic second sound accentuated; his urine contained 2 per cent. albumin and a few hyaline and granular casts. Next day he was able to move his legs freely. On the following morning he was able to walk a few steps. He died suddenly, about fifty-two hours after the onset of the symptoms. The post-mortem examination showed the right pleural cavity to be filled with blood; the heart was large, there being hypertrophy of the left ventricle. A dissecting aneurysm extended from the arch at the level of the innominate artery and terminated in the left femoral artery an inch below Poupart's ligament. A large mass of freshly coagulated blood was effused between the tissues at the level of the arch and in the upper part of the descending thoracic aorta. From the abdominal aorta through the left common iliac, external iliac, and femoral artery the coats of the vessels were separated by a thin layer of coagulum, but no palpable thickening of the arteries was so produced. The intense pain at the onset was due to the primary rupture and separation of the coats of the aorta by the blood. The paraplegia was caused by the interference with the arterial supply to the lumbar cord, partly from thrombosis, partly from rupture of the origin of the lumbar arteries. The sudden death ensued on the rupture of the external wall of the aneurysm and the consequent escape of blood into the right pleura.—Dr. FINNY and Dr. KNOTT made some remarks on the case.

BOMBAY MEDICAL AND PHYSICAL SOCIETY.

Plague in Cutch Mandvi and Hubli.—A Plague Congress.

AN adjourned meeting of this society was held in the University Hall on April 15th, Dr. EDULJI NASHIRVANJI being in the chair.

Brigade-Surgeon-Lieutenant-Colonel J. S. WILKINS gave a concise account of the work done during the epidemic at Cutch Mandvi last year. Plague broke out there about February, 1897. The town is walled and about a mile square in area. It contains 40,000 inhabitants in ordinary times, but only about half that number when the speaker arrived there on April 27th. Six hospitals were formed for the various sects and the work of disinfecting and cleaning was carried out by 200 coolies sent from Bombay. The only exits from the town were gateways in the high walls, and of these all except two were kept closed, so that it was easy to trace the houses where deaths had occurred, as the bodies had to be taken through one of these gates. The daily average mortality for the first week in May, when the work commenced, was 121, and a weekly decrease in the mortality of 20 took place till the normal death-rate of 5 was reached in the last week in June. As many persons as possible were removed outside the city and in course of time most of the inhabitants were camped outside. The gates were again opened to all the people and the city allowed to be reoccupied about the end of June.

Surgeon-Captain M. A. T. COLLIS gave an account of the Plague History of Hubli, in continuation of the one formerly

read by Surgeon-Captain C. H. L. Meyer, an abstract of which appeared in THE LANCET of April 2nd, page 936. There were only 3 deaths from plague in the town in February and 7 in March. He called attention to the difficulty of diagnosing the disease with certainty and said that at least 60 per cent. of plague cases cannot be diagnosed without post-mortem and bacteriological examination.

Dr. THOMAS BLANEY then made the following motion, which was seconded by Dr. N. N. KATRAK, and adopted after a discussion:—

That a congress of the profession be held in Bombay in December next under the patronage of Government to consider the most appropriate means of dealing with plague epidemics in Indian cities, towns and villages.

Reviews and Notices of Books.

Tropical Diseases: A Manual of the Diseases of Warm Climates. By PATRICK MANSON, M.D., LL D. Aberd., F.R C.P. Lond.; Lecturer on Tropical Diseases at St. George's Hospital and Charing-cross Hospital Medical Schools; Medical Adviser to the Colonial Office and Crown Agents for the Colonies. With 2 Coloured Plates and 88 Illustrations. London, Paris, New York, and Melbourne: Cassell and Co., Limited. 1898. Price 10*s.* 6*d.*

BROADLY speaking, there are two ways of studying tropical diseases. One is that of the epidemiologist, who deals with them on a large scale, considers their geographical ranges, collates all the facts, the natural phenomena and sequence of events in relation to any given epidemic, and compares them with those of similar epidemics which have prevailed at other times or elsewhere or with other epidemics of a different nature in order to trace out their points of similarity or dissimilarity and to discover, if possible, whether any harmonious relation exists between them, in other words, the existence of any natural law to which they can be relegated. The other method is that of the clinical and local inquirer whose observations consist in the exhaustive and intelligent study of details mainly conducted along inductive and experimental roads of inquiry and aided by the microscope, test tube, and all the instruments and appliances which modern science can lend to his investigations. These methods are the supplement and complement of one another and both are necessary. But as the latter is obviously the more exact and sure, inasmuch as the observations can be concentrated on any and every given point in detail and subjected to physical science tests, so it has proved the most fruitful of results. Bacteriological researches have of late, as everyone knows, been keenly pursued in the investigation of disease in addition to those of a clinical and pathological nature, and the student of medicine has nowadays to be something of a naturalist in order to qualify him for inquiring into the nature of disease-causes. The more or less vague medical hypotheses about the existence and influence of vitalised agents as disease germs, which were the product of the speculative philosophy of some of our more sagacious and keen-sighted predecessors, have given way to, and been replaced by, doctrines founded upon the securer basis of scientific investigation. Notwithstanding that a certain amount of hasty generalisation and false inference was inevitable under the circumstances, there can be no doubt about the remarkable advances which have been made by recent discoveries in this respect, or about the trend of scientific opinion in regard to the very important part which biological investigations are bound to play in the future progress of medical and sanitary science.

Fresh from the perusal of Dr. Patrick Manson's Manual we have no difficulty in giving our opinion in regard to it. It is a good book, conceived and written in a scientific spirit and well up to date, and—not to omit in these utilitarian days a practical view of its merits—it strikes us as sound and judicious in regard to the general dietetic and therapeutical treatment of the maladies which it describes. The volume, which is of handy size and admirably illustrated, consists of upwards of 600 pages. The author tells us in his preface that it makes no pretension to being a complete treatise or anything more than an introduction to the important department of medicine of which it treats, but seeing that Dr. Manson has had long practical experience of the diseases of hot climates and has himself very successfully contributed to the elucidation of some of them we have no doubt that the hope he expresses that the work may prove of practical service will be realised. We have given our opinion in general terms of the impression derived from our perusal of this work because it would be impossible within reasonable limits of space to analyse and pass in review its contents. The introductory chapter deals with the Etiology of Tropical Diseases and is well worth reading as indicating the nature and spirit as well as the standpoint from which the subjects are regarded and handled. Section I. deals with fevers and very naturally Chapter I. starts with Malaria and the Malarial Parasite discovered by Laveran in 1880—the Plasmodium Malariæ, to the presence and proliferation of which parasite in the blood the condition which is known as malarial disease is ascribed. The principal reasons for this belief are briefly set forth, followed by an excellent descriptive account of the morphology and histology of the parasite considered in connexion with the intra-corporeal or human, its extra-corporeal, and its latent phases. So much has been written of late years on this subject that those of our readers who are interested in it are probably well acquainted with the facts, and there is therefore no need to dwell, even were it possible, at any length upon them. The subject is very carefully worked out by the author and the ingenious view suggested by him regarding the part played by the mosquito as the extra-corporeal host of the plasmodium, together with the various morphological changes which have been microscopically observed in the parasite, are clearly described and explained with the aid of excellent illustrations. The book is, as we have already pointed out, capitally illustrated throughout. The author, while setting forth the grounds on which he regards the mosquito hypothesis as a plausible and probable explanation of many facts connected with the history of malarial infection, is careful to state that he does not maintain that it has yet been thoroughly proved, but he nevertheless thinks that every effort should be made to establish or confute it. It will meanwhile prove a source of great satisfaction to Dr. Manson to find that Professor Koch in the interesting address he has just delivered at Berlin has taken up the same view and attributes the spread of malaria to the propagation of blood parasites by mosquitoes. The two will not, however, we think, be found to be conterminous, for although there may possibly be no malarious places or stations where there are not mosquitoes, there are mosquitoes in places where there is no malaria—no ague. Chapters II., III., IV., and V. deal with the classification and description of the malarial parasites and their associated fevers, to which is appended a useful tabular statement, modified from Mannaberg, of the characteristics of the various parasites; the morbid anatomy and pathology, in which the course of fever and periodicity in malaria and the theory of periodicity are considered; malarial cachexia and a brief chapter on the Etiology of Malaria. Chapter VI. discusses diagnosis and treatment in a way which seems to us to be clear and judicious. Yellow fever, bubonic plague, dengue, Mediterranean fever, kala-azar, tropical typhoid, heat stroke, and unclassed fevers are also considered in this section of the volume. The chapters on heat-stroke (heat exhaustion, sun-traumatism and siriasis) and on unclassed fevers in the tropics are interesting. There still remains

a good deal to be achieved in these directions, especially in regard to unclassed climatic fevers, before we can be said to have any precise scientific knowledge concerning them. In his remarks on siriasis—a term adopted by Dr. Sambon—Dr. Manson alludes to Dr. Sambon's assertion that the disease is a germ disease, like yellow fever or dengue, and, like these, is caused by some organism which demands for its development a high atmospheric temperature and certain, as yet unknown, local conditions. The chapter on Cholera enters fully into its bacteriology and discusses it very impartially and well. Dysentery, Sprue (Psilosis), Abscess of the Liver, Leprosy, are also carefully considered. The chapters on Beri-beri and Filariasis are especially full and good.

Ethnological Studies among the North-West Central Queensland Aborigines. By WALTER E. ROTH, B.A. Oxon., M.R.C.S. Eng., L.R.C.P. Lond. With 438 Illustrations. Brisbane: by Authority, Edmund Gregory, Government Printer, William-street. London: Queensland Agent-General's Office, Westminster Chambers, 1, Victoria-street. 1897.

THIS work, issued under the authority of the Government of Queensland, is one of the most remarkable which has issued from the press. Its author, who has since 1894 held the office of surgeon to the Boulia, Cloncurry, and Normanton Hospitals, has spared no pains or trouble to make himself intimately conversant with the language, manners, and customs of the aboriginal tribes which still exist in no small number in the North-West Central districts of Queensland. He has performed his task with a completeness which is worthy of all praise, and by pen and pencil has contrived to present an account which may well be taken as a model of well-ordered and profound ethnological research. We confess to be amazed at the wealth of detail which is to be found in these pages, and no small merit of the work is the thoroughly scientific manner in which it has been planned and executed. The first four chapters are devoted to language, first the spoken language, which is remarkably fully expounded and its grammar as elaborately discussed as in the most classical treatise of modern tongues. Mr. Roth has achieved much in mastering these tongues, and the examples which he gives of various grammatical phrases and expressions together with the vocabularies fill many pages. Of more general interest perhaps is the description of sign-language, which has apparently attained a pitch of perfection which could hardly have been imagined. This chapter is illustrated by several plates comprising no fewer than 213 separate illustrations, each conveying graphically the distinctive signs and their meanings. This section alone would form a monograph and might well have occupied all the time at Mr. Roth's disposal. However, these chapters are but introductory to the real subject matter of the book, which includes, as the titles of the ensuing chapters indicate, all the customs of the tribes. Thus we find first, in the "Search for Food," full descriptions of the edible vegetables and crops in the districts of Boulia, Cloncurry, and Leichardt-Selwyn; then the various animal foods, from ants and crayfish and molluscs to fish, emus and other birds of all kinds, the opossum, kangaroo, &c.—descriptions being given of the means adopted to catch or snare these animals. "Pituri" is the product of a shrub which is prepared in "quids" for chewing and is as much desired by the aboriginals as alcohol is by Europeans. Domestic implements and utensils, "dilly-bags," grindstones, fire-sticks, &c., are then described, and the huts and shelters. The subject of personal ornamentation and decoration is concerned mainly with modes of dressing the hair, the wearing of head fillets or feathers, piercing the nose and ears, evulsion of the teeth—the two central upper incisors—a practice which is dying out, in connexion with which is the interesting fact that in none of the languages of the district are there any *th*, *v*, *f*, or *s* sounds which require these teeth for their proper enunciation. Necklaces, armlets, chest ornaments, waist-girdles, and aprons made of human hair or "opossum string," phallocrypts of pearl-shells or "opossum string," are only worn on occasions of festivity and at "corroborees"—the ordinary custom being absolute nudity. Painting and feathering of the body are also in the main restricted to festive occasions or warfare. Here is described the practice of mutilations on the trunk and limbs, or "flash-marks," the raised cicatrices of incisions made transversely across the chest and abdomen, and occasionally on the back. Mr. Roth describes how these scars are formed. An interesting account follows of the "corroborees," or dancing and singing festivals, which usually last from sunset to sunrise and may be repeated for three or four nights. They constitute the primitive form of dramatic art and are prepared for by elaborate "dressing" and "decoration." The audience join in the singing and a full account is given by the author of one such performance of the "Molonga set" of corroborees which lasted over five nights, each night's performance being different. "Molonga" is apparently an evil spirit who would revenge himself in characteristic fashion were the corroboree not properly executed. Mr. Roth gives examples of some of the current fables in the Boulia district, the first of which we may quote.

The Water-hen and the Emu.

"An emu was hatching her eggs in close proximity to a small water-hen who was also engaged in the same interesting occupation. By-and-by both birds proceeded to walk along the grass for something to eat and in the evening returned to their respective nests. The same thing happened next day. But on the following morning the water-hen got up somewhat earlier than usual and went her way. The emu happening to see her neighbour's eggs said, 'Hullo! Big fellow eggs all same like mine; me take him,' and, shifting from her own nest, sat upon them. As the afternoon drew on the water-hen returned home, and when she saw the emu appropriating her eggs began growling, but being so much smaller a bird could not use force to turn her away. So she built a large fire and threw all the ashes over her opponent, who thus got all her feathers burned. In retaliation the emu threw her antagonist into the flames and burnt her legs for her, which resulted in their turning red.'

The games in which these natives indulge comprise the "return" boomerang, the "throwing-stick," the "whirler," games of ball and skipping-rope, "hunt the eye" (the primitive form of "hunt the slipper" of civilisation), which with "hide and seek" prove that in their pastimes these aborigines have much in common with our children. Travel for the object of barter introduces us to simple commerce and the curious custom of message-sticks, which take the place of letters and are used to carry orders at a distance for articles required. A chapter is devoted to fighting and weapons, and another to disease, accident, and death. Here we find superstition in full play, the pointing of the "death-bone" by the doctor or medicine man being held to be the common cause for calamities of this sort. It would be impossible to do justice to this chapter by any attempted summary of its contents which embrace the remedies and practices employed in treatment of diseases and accidents, some of the remedies being sufficiently disgusting. There would seem to be but few plants used for medicinal purposes, whilst a favourite remedy for diarrhœa is "clay pills." The rites of burial are described and the chapter closes with reference to the practice of cannibalism—not yet, although gradually becoming, obsolete. Rain-making is still in vogue in some districts, when special "corroborees" for the purpose are held.

The final chapter of the work, entitled "Ethnopornography," is not suitable for perusal by the general lay reader. It contains full details of the barbarous ceremonials

by which the youth of both sexes are in the separate tribes initiated into sexual life. The chapter contains other details concerning marriage, pregnancy, and labour, which may be contrasted with the customs obtaining amongst other aboriginal tribes. In conclusion, we may say that we think that Mr. Roth's researches will remain as a faithful record of savage life and an important addition to ethnological science.

JOURNALS AND REVIEWS.

The Veterinary Journal and Annals of Comparative Pathology. Edited by Principal WILLIAMS, F.R.S.E., F.R.C.V.S. April and May, 1898. London: Baillière, Tindall, and Cox.—The *Veterinary Journal* for April consists chiefly of proceedings of veterinary medical societies, and some of the papers contributed to these societies are of considerable interest. The original papers comprise articles on Infectious Pneumonia of Sheep, by W. R. Davis, New Veterinary College; A Case of Malignant Adenoma of the Stomach of the Horse, by R. B. Freeman, F.R.C.V.S.; Tumours in the Lateral Ventricles of a Horse, by A. M. Munro, M.R.C.V.S.; and a couple of cases of Tetanus—one in a cow recorded by R. Connochie, and two in horses by W. L. Gascoyne. An exceedingly interesting discussion at the Central Veterinary Medical Society on Mallein Reaction is here reported in full and is well worth careful perusal. The meetings of the other societies are fully reported, but their principal interest is for veterinary surgeons. A number of reprinted articles on Rinderpest, Bacteriological Researches on Certain Diseases connected with Public Health Work by Professor Delépine, Notes of News, and extracts from foreign journals complete this number. In the May number are several special articles—On Diseases of the Ear in Cats, by Henry Gray, M.R.C.V.S., a number of cases of Impaction, of Rupture of the Œsophagus in a Horse, of Dermoid Cyst of the Testicle, a case of Fractured Pastern, and one of Vomiting in the Horse due to a Mesenteric Embolus. An interesting discussion on the question—Is Tuberculosis Hereditary?—was opened at the Scottish Metropolitan Veterinary Medical Society by Professor Lauchlan Young, who comes to the conclusion that tuberculosis is disseminated in this country more through infection than hereditarily. Professor Young certainly brings forward a number of statistics collected from various sources to show that heredity plays very little part in the dissemination of tuberculosis amongst cattle. Principal Williams agreed that a sharp distinction should be drawn between what was hereditary and what was congenital, and he pointed out that the tubercle bacillus is comparatively rarely found in young animals, and especially in young cattle, and when it is found it is usually associated with tuberculosis of the brain.

The Veterinarian: A Monthly Journal of Veterinary Science. Edited by Professor METTAM. London: Adlard and Son.—In the April and May numbers of the *Veterinarian* Professor Cossar Ewart continues his articles on Hybrids with an account of Zebra Hybrids with Observations on the Relationships of the Zebras. He has now collected a very large amount of most important evidence which should be of very great value not only to those who take an interest in horses but to those who study telegony in any of its branches. In the April number Mr. Walter Heape of Trinity College, Cambridge, contributes an article on Artificial Insemination of Mares which will be of some interest to horse breeders. An article on Tuberculosis and Tuberculin, by Geo. R. Kinnell, M.R.C.V.S. Medfield, Mass., U.S.A., gives the results of a considerable number of experiments, from which it is concluded that by the judicious use of tuberculin tuberculosis can be eradicated from any herd of cows. It is here maintained that tuberculosis is not an hereditary disease and that so far as calves are concerned the danger to them from the use of the milk from tuberculous cows, though slight, is by far the most important. It is also held that, given an infected building, it is possible at comparatively small cost to render it entirely free from infection and a safe place in which to keep stock, so far, at any rate, as tuberculosis is concerned. In the May number the original communications are Notes on the Madrid Congress of Hygiene and Demography, by Mr. J. A. W. Dollar; a continuation of Professor Cossar Ewart's paper; a Note on Ghotiva or Ghotu in Buffaloes, by Veterinary-Captain H. T. Pease, F.Z.S., Principal Veterinary College, Lahore; on Picric Acid as a Wound Dressing, by the same author; and a note on the Presence in the Blood of Free Granules derived from Leucocytes, by A. E. Mettam, B.Sc., M.R.C.V.S. In both of these numbers there are in addition a number of clinical cases, editorial observations, and exceedingly good reviews of the veterinary literature for the month; notes on current topics, including observations on tuberculin and mallein, and reports of veterinary medical societies. The reviews and abstracts in these numbers are of more than average interest and fully maintain the high character of the *Veterinarian* for this class of work.

The Phonographic Record for June contains one of Sir W. R. Gowers's lucid unravellings of a problem in the diagnosis of cerebral disease showing how the presence of paralysis of the sixth nerve, amid signs of a general morbid process, enabled the existence of growth near the middle line in the upper two-thirds of the pons to be established. A useful paper on Extra-genital Chancres in Children by Dr. Deanesley, notes of a case of Spina Bifida by Dr. A. Hill Joseph, an account of a Neurotic Woman by Dr. Atchley, a concluding instalment of the humorous papers headed the Light Side of Medicine, and a reference to the health of the *doyen* of reporters (Mr. T. A. Reed) complete the number.

The English Illustrated Magazine for June contains a most interesting paper by Mrs. (Janet) Ross upon the Confraternity of the Misericordia at Florence. The confraternity, as is well known, is an ambulance guild the members of which work from pure love. In the words of their regulations, "they shall practise works of mercy and charity; especially shall they bury the poor and miserable dead without retribution or guerdon, doing this solely for the love of Jesus Christ, who suffered death and passion for the love of us." Nearly every class of society is represented in this noble body of workers, from the highest almost to the lowest, and their services in the various epidemics of plague and, to come down to later times, in the cholera epidemic of 1855 were beyond praise. Something of the sort is badly wanted in our overgrown London, more especially as regards the burial of the "poor and miserable dead." The horror with which a "parish funeral" is regarded, and rightly so, by the poor is well known. Differences of nationality, of climate, and of social customs will have to be allowed for, but surely it would be possible to start some kind of body, call it a guild, or a brotherhood, or a society, or anything, so long as its members would and could do the same merciful deeds as the Brethren of the Misericordia.

THE MARSHALL MEMORIAL FUND.—It has been decided that the memorial to the late Dr. Henry Marshall shall take the form of an exhibition or substantial money prize to be given yearly for the encouragement of medical students at the Bristol General Hospital and also that a tablet shall be placed in the Bristol Cathedral in his memory. Messrs. Stuckey's Banking Company, Bristol, will receive subscriptions for the fund.

Analytical Records
FROM
THE LANCET LABORATORY.

(1) SANOSE; AND (2) SANOSE BISCUITS.
(A. AND M. ZIMMERMANN, 9 AND 10, ST. MARY-AT-HILL, E.C.)

THE fact that albumose occurs in milk and exerts a favourable influence in regard to the digestibility of the milk-proteids has led to the preparation of "sanose," which consists of 80 per cent. casein and 20 per cent. albumose. According to our analysis this statement is calculated upon the total amount of organic matter, since we found 9·96 per cent. moisture and 3 10 per cent. mineral matter. Sanose is a white powder without perceptible taste. With water it forms a milky fluid which on careful filtration gives the characteristic reactions of albumose but not peptone. Sanose must therefore rank high in the scale of nutrients and, being practically neutral in character, it affords a means of administering a powerful, because easily digested, food without drawbacks in regard either to taste or smell or other physical peculiarity. The compound is evidently prepared with the greatest care and may be regarded as a valuable milk derivative of an easily assimilable kind in accordance with physiological inquiry. Sanose may obviously be added to other foods with advantage. We have also examined Sanose biscuits. They are crisp and of good flavour, but rather sweet. Sanose biscuits will be valuable in the event of a specially rich nitrogenous food being indicated.

TURTLE SOUP.
(V. BENOIST, 36, PICCADILLY, W.)

The turtle is said to combine the nutritive properties and qualities of fish, flesh, and fowl, and doubtless the soup is a powerful nutrient because its gelatinous contents are easy of digestion and therefore of assimilation. Two preparations have been submitted to us by Mr. Benoist: (1) a soup containing pieces of turtle, and (2) a consommé (clear). We found that both preparations were free from preservatives and on further examination the results were quite satisfactory. The soup evinced an excellent and delicate flavour, due in a large measure to the fact that the turtles are specially selected and killed for the purpose. The fresh soup can be supplied at any time, arrangements having been specially made with this end in view.

SPECIAL BRANDIES ("GRANDE FINE CHAMPAGNE").
(B. LEON CROIZET, ST. MÊME, COGNAC. AGENTS, COSSART, GORDON AND CO., 75, MARK-LANE, E.C.)

We have examined four types of the brandies shipped by the above "viticulteur" (Croizet, Cognac) and the following are the results:—Cognac (one star): alcohol by weight 38·50 per cent., by volume 45·71 per cent., equal to proof spirit 80·11 per cent.; extractives, 1·26 per cent.; mineral matter, 0·11 per cent., acidity reckoned as acetic acid, 0·32 per cent.; alcohol in volatile ethers, 0·06 per litre. Cognac (two star): alcohol by weight 39·30 per cent., by volume 46·59 per cent., equal to proof spirit 81 64 per cent.; mineral matter, *nil;* extractives, 1·29 per cent.; acidity reckoned as acetic acid, 0 032 per cent.; alcohol in volatile ethers, 0·064 per litre. Cognac (three star): alcohol by weight 38·78 per cent., by volume 46·02 per cent., equal to proof spirit 80·64 per cent.; extractives, 1 58 per cent.; mineral matter, *nil;* acidity reckoned as acetic acid, 0·038 per cent.; alcohol in volatile ethers, 0 082 per litre. Cognac (V.S.O.P.): alcohol by weight 38·78 per cent., by volume 46·02 per cent., equal to proof spirit 80 64 per cent.; extractives, 1·58 per cent.; mineral matter, *nil;* acidity reckoned as acetic acid, 0·038 per cent.; alcohol in volatile ethers, 0 152 per litre. The interesting feature in these results is the increasing amount of volatile ethers *pari passu* with, as we think, the age of the spirit. The last on the list, V.S.O.P., is a pure mellow spirit with an unquestionable history. It is a well-matured grape spirit, smooth to the taste and possessing a fragrant ethereal aroma characteristic of real Cognac. In regard to alcoholic strength there was very little difference between the samples examined. Of extractives the V.S.O.P. contained the highest proportion—a fact which corroborates the opinion that it is the oldest and longest matured specimen. The other samples were good and genuine and free from rawness or crudity of character. For medicinal purposes only that spirit presenting such satisfactory characteristics should be employed.

OATMEAL COCOA.
(THE "SERVUS" CO., 65 AND 66, BASINGHALL-STREET, E.C.)

From the dietetic point of view we are inclined to regard the addition of oatmeal in a special way to cocoa as a suitable and satisfactory expedient, since the oatmeal supplies what cocoa lacks and *vice versâ*. Cocoa, for example, is essentially, though not exclusively, a stimulant on account of the presence of definite alkaloids. Oatmeal, on the other hand, contains no stimulating principle but is highly nutritive, not only on account of its richness in nitrogenous constituents but also by reason of the excellent proportion of carbohydrates, fat, and mineral matters which it contains. The preparation before us consists of pure cocoa with no admixture of any kind except that of specially-selected oatmeal. The mineral matter amounted to 5 per cent. and gave abundant evidence of the presence of phosphates, derived in great measure from the oatmeal. In accordance with the indications of analysis the preparation should possess a peculiar food value, not belonging to the constituents separately but embodied in the combination described.

TROPON.
(THE TROPON AGENCY, 2, FOWKES-BUILDINGS, E.C.)

Tropon is a form of albumin and albumin is regarded by physiologists as being able alone to support the vital processes and the only alimentary substance which can do so. Albumin, however, is not suitable for administration alone, since probably in excessive quantities it would escape assimilation and lead to waste. It is therefore best presented as an alimentary substance diluted, so to speak, with carbohydrates and fat. Tropon is a brittle brown powder which on analysis gives the following results: albumin, 88·04 per cent.; moisture, 10·66 per cent.; mineral matter, 1·3 per cent. Calculating on the proportion of nitrogen which it contains it should prove the cheapest food possible, but it should be borne in mind that the actual value of foods is a question not only of chemistry but more particularly of physiology. The price of tropon is two shillings per pound. It is practically tasteless and almost insoluble in cold water. On preparing a solution in boiling water and cooling the resulting liquid it was found readily to dissolve under the digestive action of pepsin extract.

(1) SPECIAL INVALID PORT; AND (2) OLD LIQUEUR WHISKY
(J. KEITH, 84 AND 86, CADZOW-STREET, HAMILTON, N.B.)

The sample of port wine gave on analysis the following results: extractives, 8 65 per cent.; sugar, 6 25 per cent.; mineral matter, 0 18 per cent.; alcohol, by weight 18·54 per cent., by volume 22 73 per cent., proof spirit 39·84 per cent. The wine was of excellent character, having a pleasant fruity taste and aroma. It is a genuine and generous wine well adapted for use by invalids. It is derived from the 1884 and 1888 vintages and has therefore matured for over ten years. The wine certainly possesses quality and is moderately priced at 36*s*. The whisky gave the following results on analysis: alcohol, by weight 40·90 per cent., by volume 48·32 per cent., equal to proof spirit

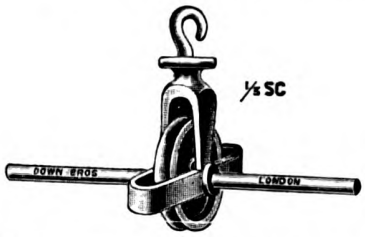
84 68 per cent.; extractives, 0 36 per cent.; and acidity reckoned as acetic acid, 0 03 per cent. The whisky is said to have been kept in bond from ten to thirteen years and its character in regard especially to taste and aroma is quite consistent with this statement. It is a thoroughly matured spirit and free from any suggestion of the presence of the more complex and harmful alcohols. From the complete results of our examination we believe the spirit to be derived only from malt and which is subsequently matured by storage.

BONNIE BABY FOOD.

(MOSELEY AND CO., HEELEY MILL, SHEFFIELD.)

On examination this proved to be a highly cooked cereal food yielding a large proportion of soluble carbohydrates on treatment with cold water. Its composition does not call for any particular remark except that in the course of preparation it is rendered more soluble and more digestible. Under the microscope the cereal selected was plainly indicated. The mineral contents are somewhat low, amounting to 0 77 per cent.

TABLE JELLIES.



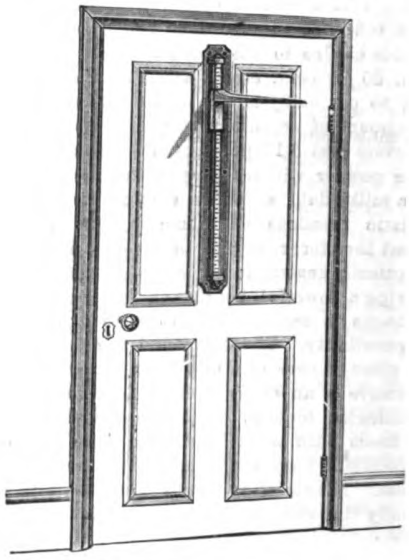
(S. CHIVERS AND SONS, HISTON, CAMBRIDGE.)

The convenience of being able to prepare jellies quickly from slabs of pure prepared gelatin is obvious. What is now a matter of a few minutes in culinary preparations was at one time a matter of hours. We have examined the specimens of table jellies before us both practically and analytically. Following the directions given an excellent jelly is quickly obtained possessing a flavour of a quite natural character. The composition of the preparations was obvious on analysis. A small proportion of mineral matter was yielded on complete incineration of the specimens. The residue consisted of phosphates. We could find no objectionable ingredients in the composition of the jellies, the materials, inclusive of colouring and flavouring agents, being free from reproach.

New Inventions.

A PULLEY FOR CASES OF EXTENSION.

I HAVE devised a pulley, shown in the accompanying illustration, for making weight extension on children lying in cots in cases of hip disease, fractured femur, osteotomy, &c. The pulley is suspended by a chain attached to the hook on it and passing over the top bar of the foot of the cot. In this way the height can be exactly adjusted. The transverse



rod on which the pulley revolves rests against two adjacent vertical bars of the cot and is kept very steady when the weight is hung on the cord passing over the pulley. I find the pulley simple and easily adjusted; there are no screws or other parts about it which can possibly get out of order. Several of them are in constant use here and they prove satisfactory. The pulley has been made for me by Messrs. Down Brothers of London.

A. J. RODOCANACHI, M.D. Lond.

District Infirmary, Ashton-under-Lyne.

A NEW APPARATUS FOR MEASURING THE HEIGHT OF PATIENTS.

THE accompanying illustration represents a new apparatus for measuring the height of patients, introduced by Messrs. Maw, Son, and Thompson of Aldersgate-street, and already described in THE LANCET of April 23rd (p. 1125). The horizontal bar which rests on the person's head indicates his height on a scale of feet and inches attached to a polished

walnut-wood panel about 3 ft. 6 in. in length. This panel may be fastened by screws or otherwise to the consulting room door, as shown in the illustration. The vertical rod on which the horizontal bar slides is mounted on revolving brackets, so that the bar when not in use may be turned to one side out of the way flat against the door. The heights which may be measured extend from 4 ft. to 7 ft. The price is one guinea.

A POCKET MEDICINE CASE.

MESSRS. JOHN BELL AND CO. of Oxford-street send us a specimen of a small medicine case which they are supplying for the use of patients travelling under the orders of a medical man and who are out of reach of ordinary sources of drug supply. The cases are made of white metal, and they contain five metal-capped bottles of tablets and measure about 4 in. by 3½ in. The sample before us is fitted with phenacetin, diarrhœa, antibilious, quinine, and antacid tablets. The bottles, however, can be filled with drugs according to the selection of any medical man.

DENTAL HOSPITAL OF LONDON, LEICESTER-SQUARE.—A donation of £250 has been contributed to this hospital by the trustees of Smith's (Kensington estate) charity.

BRISTOL BOARD OF GUARDIANS.—At the meeting of the Bristol Board of Guardians held on June 10th it was decided to increase the nursing staff at the Stapleton Workhouse. This will give each day nurse 30 patients and each night nurse 90 patients; at present each nurse is responsible for nearly double this number of cases.—At the same meeting Mr. George Metcalfe, M.D., B.S. (Durham), L.R.C.P. Lond., M.R.C.S Eng., surgeon to the Newcastle Throat and Ear Hospital, was selected by the guardians for the new appointment as resident medical officer to the Eastville Workhouse. There were 39 candidates for the post. The salary is £250 per annum, with an allowance of £30 for a residence.

THE LANCET.

LONDON: SATURDAY, JUNE 18, 1898.

THE value of trustworthy vital statistics as an incentive to sanitary well-being and progress is now increasingly appreciated, and the necessity of approximately accurate estimates of population as a basis for these statistics is also fully recognised. Unfortunately, however, there are almost insuperable difficulties in satisfactorily estimating town populations in intercensal years under the present conditions of a decennial Census. As we are now again approaching the close of another Census decennium it is most desirable that this statistical difficulty should be fully and carefully considered by all those who have the sanitary progress of the country at heart, in order that measures may be taken when the next Census Act is passed to provide for a more frequent enumeration of town populations, at any rate, and for more trustworthy estimates of population in intercensal years. Towards the close of each Census decennium the Registrar-General is the object of more or less opprobrium on account of the obvious failure in a large number of cases of the hypothetical method of estimating populations on the assumption that the rate of increase observed between the last two censuses has been maintained since the last Census. It is easy to denounce this method as unsatisfactory, but it is not so easy to suggest one which would on the average give more trustworthy results without provision for more frequent enumerations of the population, which unfortunately the Registrar-General has no power to enact.

Fully recognising, as we do, the importance of this matter, we are glad to observe that Dr. HOPE, the medical officer of health of Liverpool, has devoted considerable attention to it in his report for 1897, although we do not entirely agree with him as to the conclusiveness of his arguments in support of the assertion that the present population of Liverpool is largely in excess of the Registrar-General's hypothetical estimate. The movement of population within the city of Liverpool is, however, full of statistical interest and is most usefully illustrative of the difficulties which the Registrar-General experiences in his necessary attempt to construct intercensal estimates of population, without which his calculation and publication of marriage-, birth-, and death-rates would necessarily have to be abandoned. The population enumerated within the area of the city of Liverpool previously to its recent extension increased from 82,295 in 1801 to 517,987 in 1891. The most rapid rate of increase within this area occurred in the two Census decennia 1821–31 and 1831–41, when it was respectively equal to 45·8 and 42·0 per cent.; the rate of increase steadily declined in subsequent decennia to 11·1 and 12·0 per cent. in 1861–71 and 1871–81, while between 1881 and 1891 the population actually declined by 6·2 per cent. This recorded decrease of population in Liverpool was, however, somewhat deceptive and was due to that centrifugal diffusion of population which is in operation in all large towns. The population of Liverpool did not really decline between 1881 and 1891, but a large portion of that population migrated outside the artificial municipal boundaries. The result of this change from an increase of 12 per cent. in 1871–81 to a decrease of 6 per cent. in 1881–91 was an over-estimate by the Registrar-General of the population of the city which at the end of the Census period amounted in round numbers to 100 000! It should, however, be stated that the Registrar-General, fully aware of the failure of the hypothetical method in this case, applied to the municipal authorities of the city for assistance in the revision of his estimate, suggesting that he should be furnished with a return showing the number of inhabited houses on the rate-books of the city in 1881 and in 1886, in order that an estimate of population based upon the number of inhabited houses might be substituted for that estimated upon the hypothesis of a constant rate of increase during twenty years. The town council of Liverpool did not respond, however, to this suggestion and the Registrar-General's estimate of population could not therefore be amended. Now, however, the medical officer of health and the town council consider that the Registrar-General's hypothesis understates the present population of Liverpool and desire a revision of the estimate, and it will be useful to consider the trustworthiness of the grounds on which this conclusion is based, and also what means exist for the calculation of a more approximate estimate.

We have referred to the fact that the enumerated population of Liverpool city showed an actual decline of 34,521 between 1881 and 1891; the boundaries of the city were, however, extended in 1894 and within the extended area the enumerated population, instead of declining, showed an increase of 5608, or rather less than 1 per cent., during the intercensal period 1881–91. Thus, even in Greater Liverpool the population was practically stationary during these ten years, but Dr. HOPE advises his sanitary authority that a far more rapid rate of increase of population has set in since 1891. It will be well to refer to some of the grounds on which Dr. HOPE bases his assertion that the present population of the city is under-estimated and that "the growth of the city from this cause (house-building) appears to be as rapid as that of the other great cities." A table is given in Dr. HOPE'S report which shows the *estimated* number of houses in Greater Liverpool in each of the seven years 1891–97. Without discussing the varied forms of estimate adopted in different parts of the city for the purpose of this table, we may point out that if we accept these estimates as approximately accurate and assume that the population of the city has increased at the same rate as the houses, the estimate of population for the middle of 1897 would, it is true, be somewhat raised, but so slightly raised as to reduce the calculated birth- and death-rates by only one-eightieth part. In fact, this table of estimated total houses suggests no serious error in the Registrar-General's estimate. Then it is stated, on the evidence of a return made by the city police, that the number of "unoccupied" houses, which was recorded at the Census in 1891 as 17,399, does not now exceed 5327. It is clear that if 12,000 houses

in Liverpool which were uninhabited in 1891 are each now inhabited by an average of 5·7 persons, which was the average at the last Census, this would signify an increase of between 60,000 and 70,000 to the population. Such a change, however, is simply incredible, and the fallacy is probably due to the different interpretation of the term "unoccupied" house by the Census and police enumerators respectively. The Census term is "uninhabited," and under this heading are classed all houses in which no person slept on the Census night, and thus necessarily are included a very large number of "occupied" and duly rated houses. Now it would be absolutely impossible for a policeman on his beat to decide accurately by outside inspection whether a house had or had not anyone sleeping in it on any given night. Any comparison of this police return of "unoccupied houses" with the Census return of "uninhabited house" must therefore necessarily yield fallacious results which would not be eliminated by Dr. HOPE'S assertion that the Census return is as liable to error as the police return, the point being that the basis of the two inquiries appears to have been radically different. Dr. HOPE'S third point is that the calculated birth-rate in Liverpool is higher than that of any other city of the United Kingdom at all approaching it in size, and therefore suggests an under-estimate of population. He sees no reason why the birth-rate of Liverpool should be higher, for example, than the birth-rate in London, Birmingham, Bristol, or Leeds, and adds, "most likely it is not." Dr. HOPE appears to have lost sight of the fact that this excess in the Liverpool birth-rate is nothing new and that it has been maintained during a long series of years, as is shown in a table in his recent report. It may be noted that the birth-rate in the old city during the three years 1890-91-92, taking the Census year as the middle of the period, was equal to 34·4 per 1000, and the rate in 1897 in Greater Liverpool, calculated on the estimate of which Dr. HOPE complains, is 34 6, which scarcely supports the assertion of the inaccuracy of the official estimate. Lastly, it is pointed out that the excess of births over deaths in Liverpool since the last Census in 1891 amounts to about 39,000, or nearly 6000 per annum, while on the basis of the rate of increase between 1881 and 1891 the Registrar-General assumes that the annual increase of the population of Greater Liverpool does not exceed 600. It should, however, be remembered that between 1881 and 1891 the recorded births in the old city of Liverpool exceeded the recorded deaths by more than 50,000, whereas the enumerated population of the city showed an actual decline of 34,500, signifying that during the ten years more than 80,000 persons overflowed the artificial boundaries of the city. Greater Liverpool is probably far more self-contained than the old city, but every year the workers in towns, under the influence of improving and cheapened travelling facilities, live farther afield, and Dr. HOPE would hardly assert that there is not even now a considerable migration of Liverpool residents beyond its extended boundaries still in progress.

While we find ourselves unable to agree with Dr. HOPE that his statistics afford conclusive evidence that the present population of Liverpool is to any considerable extent under-estimated, we most entirely endorse his claim of urgency for a quinquennial Census, at any rate in all large towns. Liverpool statistics were, it is true, seriously vitiated during the last half of the intercensal period 1881-91 by a fallacious estimate of its population, but Dr. HOPE seems disposed to exaggerate the probable error of estimate at the present time. London, through what is a political accident, now has the advantage of a quinquennial Census combined with a statutory annual return of inhabited houses on the local rate-books made upon an increasingly uniform basis. The sanitary authorities of all large towns should bring combined Parliamentary influence to bear upon the Government to secure the extension of this advantage to other urban districts when the Census Bill for 1901 is under discussion. This is a matter of most serious import to the health-progress of the nation.

UNDER the heading "Public Schools and Food" there appeared a year or two ago in a weekly journal (now extinct) a somewhat severe indictment of the manner in which boys are fed at many of the English public schools. The article, as was to be expected, drew forth more than one strong disclaimer from public school-masters, but our own view is that there was a good deal of ground for the strictures it contained. No one can deny that in many directions our public schools have improved enormously during the past twenty years. The brutalities of the old *régime* have largely passed away, and, indeed, there are some people who fear that there is a danger of our falling into the opposite extreme and of tempering the wind somewhat indiscreetly to lambs that are not shorn. Still, the move was in the right direction. Again, in all matters connected with sanitation the great advance which has been made throughout England during this generation has left its mark even upon such conservative institutions as our great schools. In the planning of new buildings more consideration is paid to matters of health, while old buildings have in many cases been largely remodelled internally so as to bring them more into accord with what is now considered desirable. This is all as it should be and we are glad to be able to admit that our great public schools have done their duty in these respects. It is somewhat remarkable, then, that while so many important improvements have been carried out the system on which public school boys are fed remains in many important respects almost barbarous.

The "tuck-shop" and the "hamper" remain a source on which our sons while at school rely for their food, and the boy who, through the mistaken policy of his parents, finds himself cut off from these methods of supplementing his regular diet may suffer from insufficient nourishment. We are very far from saying that this is the case in all our public schools or even universally in any one of them. Much will depend upon the particular boarding-house in which a boy finds himself, and in some schools—not necessarily the most expensive schools, we may add—the general level among all the houses in this respect is higher than in others. But our view is decidedly that in certain of our great schools the food supplied to the boys is, if sufficient in quantity, often sadly lacking in nourishing quality, and we believe that most

old public school boys will agree with us on this point. And as long as the "tuck-shop" and the "hamper from home" may be relied upon to make up for any deficiencies in the fare provided it is hardly wonderful if house-masters at times do not pay sufficient attention to the food supplied to their pupils. The system, in fact, is a vicious one and until it is modified it is hard to see how any permanent improvement can be secured. It is curious that in this respect English private schools are, as a whole, considerably in advance of the great public schools. No doubt this is partly due to the fact that their numbers are more manageable. No public school head-master can be expected to keep a watchful eye upon the food supplied to 500 boys scattered through a score of boarding houses, whereas in a private school of 50 boys or less a single responsible head can easily control even these details. It is, perhaps, because of this that many private school-masters have taken the obvious step of forbidding all supplementary supplies of food from the boys' homes whatsoever, whereas at our public schools such a reform is, we believe, not yet dreamed of. A private school head-master realises that his income depends upon his pupils being properly fed as well as properly taught, whereas a public school head-master, with his multitude of pupils, some of whom he hardly knows by sight, is apt to have his attention engrossed with larger matters of administration and leaves his house-masters to feed their boarders as they please. The house-master, not being a professional caterer but merely an average University graduate with a large family, allows the "hamper" system to go on because it saves him trouble and money or because it does not occur to him to think about it one way or the other. And, indeed, he would be more than human if he set his face against a system which prevailed in all the houses round about him in the face of the opposition which would assuredly meet him from the unthinking youths whom he designed to benefit. But it may be urged that there is no particular harm in boys being supplied with food from home to supplement the ordinary school fare so long as the parents, who, after all, pay the school bills, do not protest; but this is a shallow view. In the first place, it takes no account of the boys—and there must always be some two or three in every house—whose parents are unable or unwilling to provide this supplementary food. And, far more important than this, there is the objection that this supplementary food is often of an unsatisfactory character from the point of view of nourishment and is necessarily a very imperfect substitute for a wholesome regimen properly thought out by the house-master and his housekeeper and regularly supplied. The biscuits of Reading and the jam and potted meat of the Charing-cross-road, though excellent in their way, do not represent the last word that may be said on hygienic feeding for growing boys, and even plum cake, the *pièce de résistance* of hampers, makes a poor substitute for dinner. And, unhappily, such is the nature of youth, the plum cake is apt to be eaten and the dinner left so long as the hamper lasts out, even though little serious fault might be found with the dinner by a reasonably hungry adult.

The great fault of the "hamper" system is that it tends to relieve school-masters of the necessity of providing sufficient nourishing and palatable food for their pupils. And there is really no reason, judging by the scale of fees at public schools, why they should be so relieved. Nor, indeed, judging from these, is there any fair reason why the eternal bread-and-butter of the public school tea-table should not be supplemented on certain days of the week with the jam or the cake to which schoolboys are so devoted. The extra expense to the house-master would be small. Boys only indulge to excess in these dainties because they so seldom have a chance of indulging in them at all. But if this be a counsel of perfection it should at least be possible for masters to make sure that the bread-and-butter itself is of good quality and not unpalatable. We are under the impression that this is not always the case. It is possible to support life on bread-and-butter at breakfast and at tea even for growing youths provided the bread and the butter are good.

AT a time such as the present, when with the advent of summer vegetation is bursting forth and clothing the earth with its rich green mantle, there is a temptation to speculate as to what may be happening in nature to those minute forms of vegetable life which are so intimately associated with certain diseases; to wonder whether they, too, like the vegetation which we see around us, are undergoing growth and development in their natural habitats, wherever these may be. What the behaviour outside the animal body of these micro-organisms may be at any given time is a question which we are not in a position to answer. Our knowledge as to these matters is but slight and we can for the most part only guess at what has been the activity of any given micro-organisms by the effect which at any given time of the year they manifest upon the human species. If, however, we accept provisionally the seasonal mortality of certain diseases as an index of the activity in this country of those lowly forms of vegetable life with which the diseases in question are probably associated, we find ourselves, after an examination of the seasonal curves of disease mortality, guided to the conclusion that there is but little evidence to support a view that the summer growth of vegetation as it manifests itself to us is accompanied by any great multiplication on the part of pathogenic micro-organisms. Indeed, if for the moment we may measure by mortality the seasonal prevalence in London of such diseases as small-pox, whooping-cough, enteric fever, diphtheria, scarlet fever, and measles, we shall find that it is only in the two last-named that there is at the present time any sign of increased activity.

Are we, however, justified in assuming that enhanced reproductiveness of micro-organisms is the only factor concerned with seasonal prevalence of disease? and are we not bound to take into consideration questions of increased power of receptivity or of diminished resistance on the part of the human host? As to these powers of receptivity or resistance apart from questions of acquired immunity and of the age distribution of any given disease we know but little, and it may be that we shall in the future have to unlearn something of that which we think we already know. The popular and very commonly accepted opinion that a person in a low state of general health is more likely to contract infection than is one in robust health can hardly be held to rest upon a very sure foundation, although there are certain

experiments which would seem to point in that direction. There is, too, probably but little doubt that the reception of the virus of enteric fever or of diphtheria is more likely in presence of a disturbed condition of the intestinal or faucial walls than in those in whom these structures are quite sound; but, on the other hand, due consideration must be given to instances, sufficiently numerous, where persons, after a long holiday and apparently in the best of health, fall victims to conditions which they resisted successfully when much run down. Unfortunately the sciences of meteorology and bacteriology cannot be said to assist us very much in our endeavours to explain the seasonal prevalence of disease. Major H. E. RAWSON has lately shown, as described in our columns,[1] that the anticyclonic systems of the atmosphere over Europe regularly undergo extensive changes of position according to the time of year, but the statistics of disease incidence do not appear to exhibit corresponding variations. The teachings of BUCHAN and MITCHELL as well as of others have clearly demonstrated the fact that the mortality from certain diseases varies more or less markedly with seasonal changes, and we know, too, how, apart from actual changes in the seasons, excessive cold, heat, or dampness may augment the mortality in certain directions. Still, from the standpoint of meteorology we are as yet little beyond the threshold, and bacteriology cannot be held to have cast much light upon this question of disease prevalence. In this latter connexion, however, reference has to be made to certain experiments conducted last year by Dr. JOHN ROBERTSON, the present medical officer of health of Sheffield. They are of considerable interest partly by virtue of the fact that they were conducted under conditions which were as far as possible natural, and partly because the results of the experiments were valuable in themselves and suggest lines for future workers in the same subjects. Three patches of soil situated in a field near St. Helen's were sown with dilute broth culture of enteric fever organisms and the growth of the organisms was carefully observed from time to time. It was found that during June, July, and August, while the weather was dry and there was abundant sunshine, the organisms grew and flourished, and similarly during September and October, when the weather was wet and dull, the organisms were plentiful. In November, however, they began rapidly to diminish and by the 20th of that month their presence was not detectable. These very interesting experiments point so far as they go to the probability that the prevalence of enteric fever in this country may be preceded and partly accompanied by an active multiplication of the bacillus in the soil. There is, of course, need that the experiments should be repeated and confirmed by other observers, but the results so far obtained would seem to be in accordance with reasonable expectations. They are, too, somewhat parallel to the provisional conclusions at which the late Dr. BALLARD arrived as the result of his historical researches into the behaviour of autumnal diarrhœa. Indeed, these two diseases—enteric fever and diarrhœa—may well be studied in conjunction with one another, more especially as it seems in the highest degree probable that at certain times prevalence of both these diseases may be due to the growth in the soil of the organisms which may be held to be peculiar to each. With regard, however, to diarrhœa and to such diseases as have not yet been definitely established to be due to any specific organism the outlook from an experimental standpoint is less favourable than is the case with enteric fever; and furthermore, when a new specific organism is discovered and isolated we have still to find the medium in which it will flourish in a condition akin to that which obtains in nature. In the meantime we may doubtless learn much by a continued study of such diseases as enteric fever, cholera, and diphtheria.

Annotations.

"Ne quid nimis."

HOSPITAL HERESIES IN BIRMINGHAM.

A YEAR or so ago we commented on some remarkable views which prevail among the workmen of Birmingham and which have their origin in the substantial contributions which they make towards the support of the hospitals. These contributions are supposed to be voluntary, but, according to a speaker in a recent discussion on the subject by the Trades Council, "in many of the factories and workshops the subscriptions are not made voluntarily but are stopped out of the wages." This is not satisfactory—such gifts should be entirely voluntary. We are, it is to be hoped, a long way off the municipalisation of hospitals. Meantime let us preserve the hospitals from the gifts of all who do not give gracefully and willingly—we must not say charitably, for in the advanced views of Birmingham this word is taboo. The one and only thing which, according to the Scripture, is never to fail is to be dismissed in the city of Birmingham as something discredited, and when the proud workman of that place goes to the hospital to have a fracture set, or an obscure disease diagnosed, or a strangulated hernia dealt with, he is to go as one who has paid for all which can be done for him in the way of skill or comfort, the said payment consisting in the payment of a few shillings a year. The services which we specially associate with a hospital, whether medical or nursing—to say nothing of boarding—are such as are to be adequately paid for only in large sums of money, in fees of anything up to a thousand guineas. We need not say that in these remarks we are meaning no disrespect to the substantial contributions of the workmen of Birmingham. We have no such feeling, but quite the contrary. What we are surprised at and disapprove is the theory that they claim the hospital treatment as a matter of right, and to exercise a predominant influence in the administration of the hospitals on the score of such donations. We do not believe that the honest unsophisticated workman of Birmingham or Leeds really holds any such absurd views or thinks that he has discharged a mere commercial debt when for such services he contributes a few shillings a year, not a farthing of which goes to the profession, to which perhaps he owes his life or limb or eye, or that of his wife or child. Such views are manufactured for him by others who ought to know better and who do know that the voluntary hospital system of this country has been created and maintained in the past chiefly by the wealth of those who have had no direct benefits from it and who only share the indirect benefits with the working classes, who practically monopolise the direct advantages. Let it be admitted that in Birmingham the case is altered

by the handsome contributions of the workmen. We agree that these entitle the contributors to a voice in the administration. But we deny that such contributions entitle them to alter the whole conception of the hospital system as essentially a charitable one, in which the chief workers are not paid. If such an alteration is to be made it must be with the consent of the medical profession whose work at present is practically gratuitous. Moreover, the portion of the profession which does hospital work is a mere fraction of the whole. The *doctrinaires* of Birmingham who lead or mislead the working men speak of the claim of working men who subscribe to hospitals and dispensaries to be attended in such institutions as *of right*, without reference to the nature of their diseases. The claim is absurd and would, if pushed, bring the hospitals to bankruptcy and those who use them into a sort of pauperism.

LONDON UNIVERSITY COMMISSION BILL.

THE promoters of the movement for the formation of a Teaching University in London are to be congratulated on having scored a distinct success on Tuesday last. The Bill for the appointment of a statutory Commission passed the second reading without a division, notwithstanding the opposition of Sir John Lubbock and some graduates of the University. The opposition to the Bill was of the most trifling nature and no new argument was brought forward, so after the speech of Mr. Haldane, who has taken a large amount of trouble in trying to settle the question, there was no doubt of the success of the Bill. It is to be hoped that it will quickly pass through the committee stage, so that the statutory Commission may soon get to work. London has waited long enough for a university which shall preside over its teaching and consolidate the various institutions engaged in higher education. The medical schools and the scientific colleges have greatly suffered from the want of resident teachers, who ought to have a distinct position in directing the studies of the pupils who desire to obtain degrees. Such a position is given to them in the Scotch and provincial universities, and such they will obtain under the present Bill if it becomes law. We cannot see why country graduates should decide on the needs of educational London and are pleased that the House of Commons has assessed the recent voting of Convocation in favour of Mr. Fletcher Moulton at its true value. The use of a veto by a slight majority vote of Convocation has been purely obstructive and the graduates will be deprived of this power in future as the members of the Universities of Oxford and Cambridge have already been deprived of it.

THE MEDICAL EXPERT AID COMMITTEE.

"THE individual withers and the world is more and more." Nothing can be done in these degenerate days without a society or at least a committee. The last new-fangled organisation is the Medical Expert Aid Committee. Strange to say there is only one medical name on this committee—that of Dr. Hugh Woods. The objects are (1) to enable persons of limited means to obtain expert medical advice; and (2) to discourage the abuse of hospitals. Let us confess at once great sympathy with the objects of the committee. No person, and especially no medical practitioner, can fail to be struck with the painful difficulty of getting expert opinions for those of modest circumstances, and especially of getting surgical work done for them, except at prohibitive prices which suggest or compel application to a hospital. The general practitioner has to accommodate his charges to the means of his patient. The fashionable or successful consultant probably does so to an extent which we do not know, but there is certainly a want of some arrangement or understanding upon which the general practitioner who first becomes cognisant of most of such cases could apply for a similar accommodation. It must also be remembered, to the credit of the consultant, that he spends an enormous number of hours in the hospital doing gratuitous work. Still there is room for a little more accommodation in fees to the humbler classes of patients. A private consultation at the consultant's house with the ordinary attendant present is a very different thing from the five minutes in the out-patient department of a hospital. We do not think with the committee that half-guinea fees should be introduced. But it would be sometimes an advantage if a consultation for a guinea could be procured easily where in the opinion of the medical attendant the patient could not afford more. We are well aware that some of our most eminent consultants are most kind in this way, but the rule of high fees has lately been such as to drive thousands to hospitals. Still, we are unwilling to admit that the intervention of a society or even a committee is needed for this purpose. The ventilation of the subject will suffice to remind our consultants of the number of persons who by a little accommodation on their part will be kept from losing their independence as private patients and drifting into a form of hospital pauperism. We give the committee every credit for their objects, but we are persuaded that these objects will be better attained by candid and friendly communications from general practitioners to their consulting brethren. We feel assured that our best consultants would hesitate to put themselves into the hands of practically a lay committee, while they will cheerfully coöperate with general practitioners for the objects set forth in the circular of the committee.

THE FEEBLE-MINDED.

PROVISION has been made in various directions for the different imbecile, idiot, and insane classes of the community and there are numerous organisations to help the weaker vessels of society who need the aid of charity. But until quite recently it was not adequately recognised that there exists a large class of feeble-minded persons who form not only a danger to themselves but to the community. These persons form what are known as "borderland" cases. They are not imbecile, they are not insane, yet they do not possess the necessary standard of intellect either to maintain themselves or to hold their own against others in the battle of life. When met with among the wealthier classes they are a constant source of anxiety to their friends and when met with, as they are so widely, amongst the lower classes they constitute a great source of pauperism, crime and immorality. Within the last few years public attention has been aroused to these facts and a Royal Commission was appointed a year or two ago to investigate the matter. Three years ago the National Association for Promoting the Welfare of the Feeble-minded was started, and this association has a strong and special claim on public support, not only for the benefit of the individuals concerned, but also with the view to eradicate the danger to the public welfare. Something has already been done for children of this description. Special classes have been formed for them in the London School Board, where instruction adapted to their standard of intellect is provided, and a few training homes for girls have been opened in various parts of England. It is when such children leave school and are expected to earn their own living that the great difficulty arises. They can only perform unskilled work, and that slowly and badly, and for the most part they

need constant supervision. They can rarely earn enough to maintain themselves and their mental and moral weakness exposes them to many temptations. The boys become tramps and loafers, while the girls are constantly in and out of the workhouse. A meeting of the association referred to was held at Stafford House on June 10th, where the various facts which we have mentioned were discussed and proposals were moved by Lord Herschell, Sir James Crichton Browne, Sir Douglas Galton, Mrs. Garrett Anderson, Sir U. Kay-Shuttleworth, Mrs. Barnett, and others. In March, 1897, the association opened a home for girls at Shepherd's Bush, where they are received and taught house- and laundry-work, needlework, &c. The idea is to make them so happy and comfortable that it is not necessary to apply for special legal powers to forcibly detain them, and hitherto the efforts of the association have been rewarded with success at a very moderate expenditure. The cost is reckoned at 10*s.* a week—7*s.* supplied either by the guardians or by the friends and 3*s.* by the charitable public. In this way, as some of the speakers pointed out, a contribution of 3*s.* a week, or £8 a year, will maintain one individual. During the year the home has received several girls who appeared hopelessly incapable and yet who, under the combined mental and physical training of the home, have improved so much that there is good hope of their becoming useful, self-supporting members of society. Special provision is still required for girls who have fallen into vice by reason of their weakness of intellect rather than from vice. With the exception of a home near Birmingham there is no such refuge for girls. A home for boys has been instituted near Braintree, in Essex, where they are taught gardening, poultry-rearing, and basket-making. We are glad to find that this important question has become the object of organised effort and the association has our best wishes for its success. The office of the association, 49, Victoria-street, S.W., was opened in September, 1897, and some idea may be derived of the necessity of such an organisation from the fact that during the year ended March, 1898, 4610 letters and post-cards have been sent out and 287 applications for admission to the homes (176 women and girls and 111 men and boys) have been received and considered.

PAROXYSMAL HÆMOGLOBINURIA COMBINED WITH URTICARIA "A FRIGORE."

AT the meeting of the Société Médicale des Hôpitaux held on Feb. 18th M. Lucien Roques presented a very exceptional and interesting case. A man, aged thirty-three years, in good health, had suffered for three years from paroxysmal hæmoglobinuria. The attacks were always produced by exposure to cold, to which he was extremely susceptible. A momentary draught or merely getting out of bed would produce one. They were accompanied, especially when intense, by an icteric tint of the skin. The case showed a peculiar phenomenon which has not been previously described. If a portion of the skin was exposed to cold for a short time (a minute or half a minute was sufficient) by any means — for example, by the ether spray or by the application of ice or of a metallic body — a pruriginous urticarial wheal surrounded by a rosy band appeared in two or three minutes. It attained its maximum in four or five minutes and disappeared in ten or fifteen minutes, leaving a yellow patch of œdema which lasted for two hours. When the œdema passed away there still remained a yellowish tint which persisted for about twenty-four hours. The patient for some months had noticed occasionally that the parts of his body exposed to cold became swollen. Apart from this effect of cold dermographia could not be produced. M. Roques endeavoured without effect to produce the phenomenon in a number of cases of nervous diseases including hysterical and organic affections of which some presented already vaso-motor disorders. He also failed in several patients who were the subjects of dermographia. The existence of urticaria *a frigore* in a small number of cases of paroxysmal hæmoglobinuria has been described but not the phenomenon in question, which is in fact factitious urticaria *a frigore*. In THE LANCET of July 26th and Aug. 2nd, 1879, Dr. Stephen Mackenzie published the case of a child, aged four and a half years, the subject of paroxysmal hæmoglobinuria, who under the influence of cold was attacked with shivering, generally accompanied by an eruption of large patches of urticaria. Several writers have studied the relations of dermographia to cold. Mesnet found in one case that the application of ice hindered the appearance of the wheals, and Gull, Michelson, and Féré obtained similar results. The phenomenon described by M. Roques is therefore dissociated from ordinary dermographia. The yellow colouration of the wheals was evidently due to local transudation of hæmoglobin. The case, therefore, is evidence in favour of the view that paroxysmal hæmoglobinuria is due to the setting free of hæmoglobin in the blood-vessels—a direct effect, no doubt, of cold on the red corpuscles. The paroxysmal hæmoglobinuria arises from special susceptibility of the blood to cold and the urticaria from special susceptibility of the vaso-motor system. These susceptibilities appear to be independent and are only exceptionally combined in the same individual with the results described.

THE BATTLE OF ATBARA.

GENERAL RUSSELL recently put several questions to the Under-Secretary for War in the House of Commons regarding the hospital equipment and the medical and sick transport arrangements provided for the British brigade at the battle of Atbara. General Russell's series of questions covered a wide range, for he asked whether the medical department were not insufficiently supplied with anæsthetics for the performance of operations on that battle-field; whether the litters for the conveyance of the wounded were not unprovided with sunshades; whether no apparatus for the application of the Roentgen rays was carried with the army in the field; whether there were no light ambulances attached to the cavalry in Egypt; and, lastly, whether any complaints had been made of the hospital arrangements for the reception, accommodation, and nursing of the sick and wounded officers at Cairo after the campaign. Mr. Brodrick's replies to these questions were, on the whole, satisfactory. He was able to confute the statement regarding the insufficiency of anæsthetics, to show that the nursing staff was ample and that the War Office had received no suggestion whatever of any inattention in this respect, that the hospital wards at the Citadel Hospital, Cairo (as everybody who has seen them must admit), are large and lofty and afford ample cubic space and superficial area, and that every attention was paid to the wounded after the recent action. There were no British cavalry employed at the reconnaissance referred to by General Russell and the arrangements for the cavalry who were present rested with the Sirdar. Mr. Brodrick admitted that the litters were unprovided with folding hoods as a protection from the sun and that steps have been taken to supply the defect. As regards the Roentgen ray apparatus, he pointed out the difficulties attending its adaptation to field service, but said that two sets of such apparatus had been sent to Egypt and would, as far as possible, be adapted for service in the field. He added, however, that the senior medical officer, after having gone very carefully over all the cases, was unable to trace any instance in which the apparatus would have been specially useful or that a single

life would have been spared by its use. We may say that we have heard no mention of any want of anæsthetics on the part of medical officers, which would have been the case had it been the fact. If it is intended to imply that there was any complaint regarding the medical services we may say that, on the contrary, everything we have heard was strongly in favour of the medical officers and of their hard and unremitting work. The only regret was that there were too few of them. Whether the authorities cut down the hospital and other equipment provided on the occasion to too great an extent we cannot say. It was alleged on some previous occasion that our Egyptian campaigns are conducted on a too severely economical scale, and we should have been glad if the Under Secretary for War had expressed himself more definitely in this respect. We are not among those who think that it is always practicable to provide for every single requirement or contingency on field service, but we do very emphatically hold that whatever is possible should be done and that if for financial or military reasons it is not done the responsibility should not rest with the medical branch of the service.

TWO INTERESTING DINNERS.

QUITE recently there have been held two interesting dinners in London—namely, the annual dinner of the Army Medical Staff and the annual dinner of the Indian Medical Service. Brief reports of the proceedings will be found in subsequent pages, from which it will be seen that in both departments great satisfaction was expressed at the promised reforms in the Army Medical Staff, it being generally believed that Lord Lansdowne has solved by his timely concession a problem which had puzzled and irritated many well-meaning people for a long time. Surgeon-Major-General Jameson, presiding over the dinner of the Army Medical Staff, tendered the thanks of the department, of which he is the Director-General, for the new warrant; while Sir Joseph Fayrer, presiding over the Indian medical officers, expressed the gratitude of that department for the promised changes which he said would in all probability extend to their service. Sir Joseph Fayrer used weighty words, which we have pleasure in printing for our readers' information, as he repudiated the idea that the army medical officer wants to ignore his own duties and interfere with those of other departments in seeking to obtain unquestioned and unquestionable military rank. By the way, if any man's words should have practical weight upon such a point, Sir Joseph Fayrer is that man, for he has served in the Medical Services of the Navy and Army, as well as that of India, with which his name is so intimately associated.

POOR-LAW MEDICAL OFFICERS' ASSOCIATION.

THE members of the Poor-law Medical Officers' Association and guests lunched together at the Trocadero Restaurant on June 14th. The chair was taken by Dr. R. Farquharson, M.P., who has recently been elected President of the association. After luncheon the honorary secretary, Mr. Arthur Greenwood, read the report of the work of the past year, in which were mentioned numerous instances of the oppressive manner in which some Poor-law medical officers are treated and of the benefit resulting in many of these cases from the action of the association. In one instance a board of guardians had compelled their medical officer to agree to make no claim under the superannuation scheme, but the association brought the matter before the Local Government Board, who informed the guardians that no such agreement with their medical officer would be binding. The treasurer, Dr. Gayton, said that at present the association had £54 in hand. Mr. Balding (of Royston), the chairman of the council, said that it would be difficult to over-estimate the value of the association, for the cases of oppression of the medical officers by boards of guardians were very numerous and very important. Dr. Farquharson said he would be most happy to assist by his influence in Parliament all the endeavours of the association to obtain a better status for the Poor-law medical officer. Several other speakers pointed out the very urgent need of reform which exists in many matters connected with the medical aspect of the administration of the Poor-law, and it was urged that much good might be done by working in union with the Poor-Law Officers' Association. The Shamrock Quartette gave a very agreeable selection of music during the luncheon.

THE NEW FELLOWS OF THE ROYAL SOCIETY.

TWO members of the medical profession—Dr. William Osler and Dr. Edward Waymouth Reid—have become Fellows of the Royal Society at the recent elections and we tender our congratulations to them. Dr. Osler, Professor of Medicine at Baltimore and physician to the Johns Hopkins Hospital, is no less known for his valuable practical researches in cardiac pathology than for his excellent and popular treatise on medicine. Dr. Reid, Professor of Physiology at University College, Dundee, has done much suggestive original work in all branches of physiology.

THE SEPTIC TANK SYSTEM OF SEWAGE TREATMENT.

THE steps now being taken at Exeter mark an epoch in the history of dealing with sewage. We understand that the Local Government Board have signified their sanction to a loan for carrying out the septic tank system on a scale applying to the whole of the sewage of the city. The system now passes, therefore, from the experimental to the practical stage and the progress of the undertaking will be watched with the greatest interest by all who are anxious for sanitary progress. Should success attend the scheme thus applied on a large scale—and judging from what has already been achieved there is no reason for anticipating any contrary result—a very striking instance will be afforded of the great value of studying nature's methods of purification. Indeed, the treatment of sewage is rapidly passing from the domain of chemistry to that of biology and it is probable that precipitation processes and other chemical methods will be relinquished ere long in favour of natural processes. Natural oxidation and precipitation by bacterial agencies is a gigantic phenomenon of everyday occurrence and it is only by a careful study into the conditions under which countless and ubiquitous micro-organisms will favourably work that such a satisfactory solution of a long vexed problem has been brought within measurable distance of attainment.

BACTERIOLOGICAL LABORATORIES AND THE PLAGUE.

WHEN the recent outbreak of plague occurred at Calcutta it was a matter of obvious importance that the exact nature of the disease should be determined with the least practicable delay. Happily for the Government of Bengal the services of M. Haffkine were available and he was able to report, as the result of a bacteriological examination, that the outbreak was due to true bubonic plague. We have heard a great deal about the establishment of bacteriological institutes or laboratories in India; now here was an occasion in which a bacteriological laboratory in Bengal would have been of the greatest use, and we are glad to notice that the *Englishman* of Calcutta has called attention to the subject. It cannot be said that among the number of medical officers of the Indian Medical Service there are not several who are both competent and willing to undertake this special work, and the sooner a

properly equipped institution is established the better. There is probably no place in the world where bacteriological researches are more required to be employed in the investigation of disease-causes than in India, not only in the interest of scientific medicine, but as a matter of State policy. A really good staff of men with the requisite scientific training should be specially selected for the purpose of conducting these inquiries, and as they will probably find ample work in carrying on their investigations their duties should be confined to them. The Government of Bengal recommended the adoption of inoculation with M. Haffkine's prophylactic virus as a voluntary preventive measure and held out as an inducement to people to undergo it that they and their families would be exempted from the liability to segregation. The statistical results of inoculation, whilst they cannot be accepted as conclusive, are favourable and promising, but the subject is one of much difficulty and a good deal has still to be done before the practical value of the inoculations can be regarded as established.

THE VACCINATION BILL.

As will be seen by our report in another column the Vaccination Bill is progressing well in grand committee. Mr. Carlile proposed to make the period within which children should be vaccinated six months from birth instead of twelve months, this amendment being recommended by the British Medical Association and the Jenner Society. Sir Walter Foster and Sir William Priestley supported the amendment, which was agreed to. The honorary secretary of the Jenner Society, Dr. F. T. Bond, has placed in our hands a copy of the amendments which the committee of the society are suggesting for the consideration of the grand committee. They are sixteen in number and all sensible, dealing for the most part with points in the Bill which have elicited expressions of dissatisfaction in well-informed quarters. The first is the one that has already been accepted. But the proposal contained in the fourteenth amendment is quite new to us and is a particularly wise one. The amendment runs as follows:—

New Section.—"Any local authority may incur reasonable expense in the diffusion of information as to the reasons why vaccination of children is required by the State and of literature generally illustrative of the advantage of vaccination."

There is no doubt that if the Government or sanitary authorities in any quantity had thought it worth while to show one tithe of the literary activity which has been displayed by the opponents of vaccination the anti-vaccination agitation would never have attained to its present height. It would be an excellent thing if parents who can now read in the lay press all sorts of so-called reasons why they should dread vaccination for their children could have easy access to the arguments showing the great advantage which accrues from the protective process.

OBLITERATIVE PERICARDITIS A CAUSE OF HEPATIC ENLARGEMENT AND ASCITES.

OBLITERATIVE pericarditis is not generally known as a cause of enlarged liver and ascites. As the symptoms of the former are not definite and the patient only comes under treatment for the latter a diagnosis of hepatic cirrhosis is made and the primary disease is only recognised at the necropsy. In the *Boston Medical and Surgical Journal* of May 19th, 1898, Dr. R. C. Cabot has published the following case. An emaciated boy, aged eighteen years, was admitted to hospital. Six years ago his liver was said to be enlarged, and four years ago he noticed swelling of his abdomen. Occasionally the feet have been swollen. The liver was much enlarged and reached from the fourth rib to a hand's breadth below the navel; it was apparently smooth and its edge was easily felt. There were considerable ascites and effusion in the left pleura. The heart did not appear to be displaced. The apex sounds were loudest in the fourth space. There was constant orthopnœa. The abdomen was tapped three times and the chest once. About four quarts were obtained each time from the former cavity and two from the latter. There was never any pain. The patient died at the end of eight weeks from pulmonary œdema and exhaustion. A necropsy showed complete obliteration of the pericardium by firm adhesions, the heart normal in size and the muscular substance not altered, the left lung retracted, airless, and covered with adhesions, the right lung compressed, much fluid in both pleuræ, and an enlarged nutmeg liver. The diagnosis of these cases, as stated, is difficult. In every case of obscure hepatic enlargement, especially in young persons, the heart should be examined for evidence of pericarditis. As the pericarditis is mostly tuberculous, evidence of tuberculosis in other parts will be of some value.

A GREAT MASONIC MEETING.

So many members of the medical profession are Freemasons (indeed, there are, we imagine, very few "lodges" which do not include at least one medical practitioner in the lists of their members) and the association of the profession with Freemasonry has from the earliest times been so close[1] that we think the very remarkable meeting which was held at the Albert Hall on Friday evening, June 10th, should not pass unrecorded in the columns of THE LANCET. The occasion was the centenary festival of the Royal Masonic Institution for Boys and the chair was occupied by a distinguished (if purely honorary) Fellow of the Royal College of Physicians of London—H.R.H. the Prince of Wales, Grand Master of English Freemasons. The institution was founded in 1798, under the name of the "Institution for Clothing and Educating the Sons of Indigent Freemasons," by the United Mariners' Lodge, and in 1817 a similar institution, established by Surgeon (afterwards Sir) F. C. Daniel and other members of a lodge which is now known as the Royal Naval Lodge, was amalgamated with the original charity. From these beginnings gradually grew the Royal Masonic Institution for Boys which is now situated at Wood Green; it is, however, intended, as a memorial of the centenary of the institution, to erect new schools at Bushey, Herts, the requirements having outgrown the existing buildings at Wood Green. A suitable site has been purchased and it is expected that the work on the buildings will be commenced in the autumn. But for these purposes funds were needed. With the name of Freemasonry charity is, we believe, indissolubly linked and the Freemasons proved true to their name and their traditions. At the conclusion of the dinner it was announced by the Prince of Wales that the total realised by the stewards' lists and other contributions amounted to the noble sum of £134,000—a record collection. There were 3898 stewards, some 2500 of whom were present at the dinner, and together with the ladies who witnessed the scene from the galleries and others there must have been at least 5000 persons in the vast and splendid building, the spectacle presented being as brilliant as it was unusual.

THE REWARDS FOR PLAGUE WORK.

A propos of the rewards conferred by the German Government upon the members of the German Commission sent out to Bombay last year to investigate and report upon the plague—a duty which occupied them some three months in

[1] Vide "The Medical Profession and Freemasonry," THE LANCET, Jan. 26th, 1895.

that city—the *Times of India* calls attention to the dimensions of the work carried on at Bombay and to the untiring energy displayed by the Indian Medical Service and profession in connexion with the epidemic. What is to be the scale of recognition which the Government of India will apply to these medical workers in the plague campaign? Two members of the German Commission, Dr. Gaffky and Dr. Pfeiffer, have received an honorarium of 15,000 marks each and Dr. Stricker and Dr. Dieudonne 9000 marks each. The two first-named receive, in addition, the Order of the Red Eagle of the second class and the others the same Order of the third class. All this is quite as it should be. But now let us turn to the work carried on locally—in Bombay itself. Taking the second epidemic alone the *Times of India* says in the case of the Arthur-road hospital (at which we may say, *en passant*, that Dr. Choksey did very hard and excellent work) that in the nine months ending March 31st over 4000 patients have been treated there, nearly half of whom were plague patients, and of the remainder over 900 were cases of relapsing fever and over 200 cases of cholera, while another 900 were cases of general disease. From October, 1896, to date nearly 3400 plague cases have been treated in this hospital, besides over 1100 cases of relapsing fever. The great plague hospital at Poona, managed in the first instance by Surgeon-Major Barry and in the second epidemic by Surgeon-Captain Lloyd Jones, comes nearest to this in the magnitude of its operations and in the burden of the work thrown upon the officers in charge.

POISONOUS ICE-CREAM.

ICE-CREAM is still sold in the streets without apparently any sort of legislative control as to the wholesomeness of the stuff which has such a peculiar charm and powerful attraction for so many juveniles. And where the difficulty lies in ensuring the use of none but wholesome materials in the manufacture of ices we utterly fail to see. Practically the manufacture is confined to a squalid quarter near Hatton-garden, the manufacturers being mostly Italians. Surely this place could be daily inspected in regard to sanitary environment and a sharp look-out kept on the quality of the eggs, sugar, &c., without adding very seriously to the present duties of our health authorities. Then why not license the ice-cream man, who under the present *régime* may cause an immense amount of mischief, leaving disease and death in his train, and yet no satisfactory means of identifying him and tracing him to his probably filthy den. Twenty years ago we described in these columns how loathsome was the condition of the tenements occupied by ice-cream mongers, pollution of the frozen mixture with human excreta being ocularly demonstrated with hideous certainty. In spite of all this, illness and deaths are still reported, and it is not surprising that these are traceable not to any well-defined metallic poison, but to an obscure product derived most probably from a putrefactive process. The Home Secretary's attention should be given to the matter.

GOUTY PHLEBITIS IN THE SCROTAL REGION.

SINCE the publication of Sir James Paget's classica work gouty phlebitis in the lower extremities has been wel, known. But the unusual site of the disease in a case communicated recently to the Société Médicale des Hôpitaux by Dr. Le Gendre rendered the diagnosis difficult and even erroneous. A man, aged thirty years, was seized with violent pain at the root of the scrotum after having stood for many hours every day at the trial of M. Zola. The skin of the affected region was quite normal, but a flabby cord about 3 cm. or 4 cm. in length and mobile could be felt. The temperature was 100·7° F. The patient had previously exhibited gouty manifestations—nephritic colic, epistaxis, and arthritis of the great toe. His father and brother were gouty. The diagnosis of gouty phlebitis was therefore made and it was supposed that the long periods of standing, by favouring venous stasis, had helped to localise the attack in the venous system of the scrotum. A distinguished surgeon, however, diagnosed inflammation of Cowper's gland. The tumefaction became indolent and modified in shape; it formed an ovoid, hard mass about the size of a small almond, with an elongated pedicle, which became lost in the direction of the perineum. At this time another consultant diagnosed fibroma probably growing from the corpus cavernosum. At the end of twenty days the tumour commenced to diminish. An attack of gout in the right foot occurred one evening and the tumour rapidly disappeared, leaving a thickened varicose vein running towards the obturator foramen. Resolution was soon complete. Such rapid absorption does not occur in thrombosis with a well-formed clot; the exudation was therefore probably the result of periphlebitis.

THE METROPOLITAN HOSPITAL SUNDAY FUND.

UP to yesterday (Thursday) at noon the subscriptions to the Metropolitan Hospital Sunday Fund amounted to £14,000. Among the principal contributions to this total may be instanced the collections made at St. Michael, Chester-square (£1258), at Christ Church, Lancaster-gate (£1367 4*s.*), and at All Saints, Ennismore-gardens (£480 2*s.* 4*d.*). The total on the corresponding date of last year was £17,000, but it will be remembered that Hospital Sunday last year was also the Sunday before the Jubilee, so that the churches were crowded.

AN ILL-MANNERED VESTRYMAN.

THE *South London Press* of May 28th contains a report of a heated discussion which took place at a full meeting of the Vestry of St. George's, Southwark, upon the condition of the crypt of St. George's Church. We do not intend, at any rate just now, to go into any details of a technical character concerning the analyses of the air of that church. Whatever the chairman of the vestry may think, decomposing corpses are not pleasant accessories to the furnishing of places of public resort. It is probable that the crypt will be cleared out soon, while it is certain that at some time or other, if not soon, the funds will have to be found to remove a source of danger to the worshippers at St. George's Church. But what calls for immediate attention is the behaviour at the meeting of Mr. Haynes, the chairman of the St. George's Vestry, if he is correctly reported in the *South London Press*. One gentleman, who had been for thirteen years churchwarden, was told by Mr. Haynes that his "sensational statements made for some motive or other were scandalous and dishonest," while to Dr. Waldo, the medical officer of health of St. George's, Mr. Haynes gave the lie direct. The latter incident is, we hope, without precedent in the records of local administration. It might be expected that the other members of the vestry would make Mr. Haynes feel that if he differs in opinion from the medical officer it is necessary that he should express his dissent in proper language and according to the decent methods which prevail among Englishmen in the conduct of their public affairs. But this expectation is doomed to disappointment. The *South London Press* of June 11th contains a report of another meeting of the vestry when the matter of the crypt came up for further discussion. At this meeting Mr. Haynes deliberately repeated his offensive conduct, justifying his words by some conversation which he said

that he had had with a third party (not present), and we are surprised to learn from the same source that his "statement was loudly cheered."

A SPECIAL meeting of the Council of the Charity Organisation Society will be held on Monday, June 20th, at 4.30 P.M., at the theatre of the Royal United Service Institution, Whitehall, S.W., when papers will be read by Mr. Clinton Dent on the Proposed Arrangements for Out-patients at the New Belgrave Hospital for Children, and by Mr. W. H. Kesteven on the General Practitioner and Out-patient Departments. The chair will be taken by Sir Joshua Fitch, LL.D., and members of the medical profession have been specially invited to take part in the discussion.

THE French Surgical Association will hold its twelfth Congress at the Faculty of Medicine, Paris, from Oct. 17th to 22nd. The subjects for discussion will include nephrotomy and the treatment of goitre (not exophthalmic). Intending readers of papers should communicate before Aug. 15th with the general secretary, M. Lucien Picqué, 8, Rue de l'Isly, Paris.

THE new physiological laboratories at University College, Liverpool, the magnificent gift to the College of the Rev. S. A. Thompson Yates, will be opened on Oct. 8th, Lord Lister performing the opening ceremony. It is stated that the Victoria University will take advantage of Lord Lister's visit to Liverpool to confer upon him the honorary degree of Doctor of Science.

WE learn from the Home Office that the report of the Petroleum Committee has not yet been presented for consideration by the members. So far the document drawn up by Mr. Jesse Collings is private and confidential and all statements which have appeared in the daily press about its contents "are purely speculative."

THE classification and rules for intending exhibitors at the Paris Exhibition of 1900, together with forms of application for space, can be obtained by applying to the Secretary of the Royal Commission, Paris Exhibition 1900, St. Stephen's House, Westminster, S.W.

THE Hospital Reform Association is making arrangements to hold a meeting in Edinburgh on Tuesday, uly 26th, when the subject for discussion will be: The Hospital System in Scotland and Provident Dispensaries: their Use and Abuse.

SIR WILLIAM TURNER, President of the General Medical Council, received the honorary degree of LL.D. of Cambridge University on Wednesday last, in company with the President of the Royal Academy, the Master of the Rolls, Sir Henry Irving, and other distinguished persons.

HER MAJESTY THE QUEEN has forwarded a donation of 25 guineas to the Committee of the Royal Ear Hospital towards the fund now being raised for the new building. Her Majesty has been patron of this hospital since 1841.

THE Merchant Taylors' Company have contributed £1000 to the Prince of Wales's Hospital Fund and promise to repeat this amount for the next two years.

THE treasurer of St. Thomas's Hospital has received a donation of £1000 from "G. R." to endow a medical bed.

THE Freedom of the City of Edinburgh was conferred on Lord Lister and Lord Wolseley on Wednesday last.

THE BRITISH PHARMACOPŒIA.

V.[1]

THE ADDITIONS—(*continued*).

Salol.—As mentioned in our last article the value of this drug lies in its power of passing through the stomach unchanged. Owing to the acidity of the gastric contents, and upon coming into contact with the alkaline secretions pouring into the duodenum, it splits up into its constituents—phenol and salicylic acid. Ewald and Sievers utilised this substance in a most ingenious way for estimating the amount of time which the food takes in a given case to pass from the stomach to the small intestine. A long series of experiments demonstrated that the normal period for the splitting up of salol in the intestine amounted to from 47 to 75 minutes. The period was lengthened to 90 minutes after a meal of purely animal food washed down with acidulated water and it was shortened to 20 minutes by a meal of fruit, meat, and vegetables. These observers employed the drug as a test for the motor sufficiency of the stomach; as soon as the salol was split up its conversion product, *salicyluric* acid, began to appear in the urine. 15 gr. of the drug in cachet or capsule are administered during digestion and in normal conditions of the motor activity of the stomach the acid should be capable of detection in the urine in about one hour by the addition of neutral ferric chloride solution which strikes a violet colour. For all practical purposes at the bedside it is only necessary to dip a piece of white blotting paper into the renal secretion and upon this to let fall a drop of neutral ferric chloride solution when the margins of the drop or splash on the paper will at once show a violet tinge. In this way a fairly accurate idea may be obtained of the length of time required for the passage of food out of the stomach. Huber improved upon the method by determining the period at which the elimination of salicyluric acid was completed. In health the acid was all excreted in about twenty-four hours, but in dilatation of the stomach and in atony of the muscular coats the acid may be detected for thirty or forty hours after the administration of a single dose of 15 gr. of salol. In this way some idea may be also gained of the quality of the pancreatic secretion. In full doses the drug will reduce the temperature in fevers and numerous physicians have testified to its value in acute rheumatism, where its results have been favourably contrasted with those obtained by salicylates. In sciatica, various forms of neuralgia, and in migraine it sometimes succeeds when the new analgesics have failed. Recently it has been recommended as a remedy for general scleroderma and cases have been reported as cured under full doses. In fine powder salol may be sprinkled over wounds and ulcers or dusted upon chancres as a substitute for iodoform, but as it contains nearly 40 per cent. of phenol the danger of its absorption in dangerous amount is possible. It is thus evident how numerous are the indications and how many-sided are the actions of this new addition to the 1898 British Pharmacopœia.

Spiritus Anisi.—This new preparation takes the place of the old essence of anise, and in the previous article dealing with the omissions of the Pharmacopœia we pointed out some objections to its admission, chiefly on the ground of the amount of strong alcohol contained in its maximum dose in the case of very young infants. Its strength is 1 in 10, and the dose is given as from 5 to 20 minims, an amount quite inadequate to relieve the colicky pains of intestinal indigestion.

Strychninæ Hydrochloridum.—This salt takes the place of strychnine in the liquor, though the pure alkaloid is still official. Its introduction is only of pharmaceutical interest, as its actions and dose (from $\frac{1}{60}$ to $\frac{1}{15}$ gr.) are identical with those of the alkaloid, but it possesses the advantage of being more soluble. Strychnine is very sparingly soluble in water, hence in the old liquor diluted hydrochloric acid was added to assist solution by converting it into the hydrochloride. The newly-introduced salt is soluble in 35 parts of water and the liquor now contains no free acid and hence can be used

[1] Articles I., II., III., and IV. were published in THE LANCET of April 16th and 23rd and May 7th and 28th, 1898, respectively.

for hypodermic injection with advantage, as this preparation is undoubtedly a remedy of great value in urgent cases of cardiac failure when administered hypodermically in doses of 5 minims—i.e., ½ grain.

Suppositoria Acidi Carbolici.—Each of these contain 1 gr. of phenol and they are introduced as a method for obtaining the local antiseptic, anæsthetic, or analgesic action of the drug in various painful conditions of the anus, as in ulcer, fissure, hæmorrhoids, &c.

Suppositoria Belladonnæ.—Each contains ⅛₀ gr. of the alkaloids of belladonna root and they are introduced for their local action in similar conditions to those in which the previous preparation is indicated. Their value is, however, less obvious, but they may be useful in bladder troubles, especially in incontinence in adults. They are made with the alcoholic extract which is a standardised preparation.

Syrupus Aromaticus is a flavouring syrup without any therapeutic virtue; it contains tincture of orange, cinnamon water and simple syrup and will prove an agreeable vehicle for many nauseous or bitter drugs.

Syrupus Calcii Lactophosphatis.—This syrup affords an agreeable and efficacious method of administering lime salts in phthisis, rickets and many wasting diseases. It is not necessary to remind the physician that it possesses none of the virtues of free phosphorus and that the value of lime salts in rickets is denied by many competent observers; nevertheless, where the restorative effects of calcium are indicated this preparation may be used in teaspoonful doses with marked advantage.

Syrupus Cascaræ Aromaticus is an agreeable and elegant preparation containing in 20 oz., 8 oz. liquid extract of cascara, 2 cz. tincture of orange, 1 oz. alcohol, 3 cz. cinnamon water and 6 oz. syrup. Its dose is from half a teaspoonful to two teaspoonfuls. Its admission to the British Pharmacopœia supplies a distinct want, as hitherto the objection to the bitter and nauseous taste of the drug necessitated the use of capsules of the liquid extract, which were very satisfactory to the fastidious patient, but which did not permit of that graduation and change of dosage which is the secret in the successful treatment of *chronic* constipation.

Syrupus Codeinæ.—This is a simple solution of the phosphate of codeine in sugar and water and will be useful in allaying the hacking cough of early phthisis. Codeine acts as a sedative to the respiratory centre in the same manner as morphine acts, but it does not alter the secretion and render it adhesive to the same extent that this alkaloid does. Remedies of this class should not be prescribed where the bronchial secretion is profuse; their value lies in their power of checking or preventing *unnecessary* coughing. The dose of the syrup is from ½ to 2 fluid drachms—i.e., from ⅛ to ½ gr. We would suggest that the minimum dose should be seldom exceeded. Of course, the preparation cannot be employed in the treatment of diabetes owing to the amount of sugar contained in it.

Syrupus Ferri Phosphatis cum Quinina et Strychnina.—This is now the official representative of Easton's syrup. The original formula appeared in the fifth edition of Aitken's "Practice of Medicine," and ever since the syrup has been extensively employed as a bitter tonic and restorative. Martindale modified the original formula, the British Pharmacopœia Committee adopted it, and now the British Pharmacopœia has with a slight change accepted it. Martindale's recipe contained 120 gr. phosphate of quinine, whilst the British Pharmacopœia directs 130 gr. of the sulphate to be used; otherwise the formulæ are identical. Each drachm contains 1 gr. anhydrous ferrous phosphate, ¼ gr. quinine sulphate, and ₃₀ gr. strychnine, and the dose is from ½ to 1 fluid drachm.

Syrupus Glucosi.—This, like the aromatic syrup, and we might almost say like the following preparation, is only of pharmaceutical interest, being a mere sweetening agent, consisting of 1 oz. of the liquid glucose of commerce mixed with 2 oz. of syrup. The British Pharmacopœia revisers have devoted considerable attention to agents for sweetening and flavouring. They might with great advantage have made way for these by rejecting some of the older syrups which are worthless—viz., syrupus hemidesmi.

Syrupus Pruni Virginianæ.—Though the Virginian prune bark possesses bitter tonic and astringent qualities, and is even credited with cardiac sedative properties, it nevertheless will be chiefly used for its pleasant almond-like flavour for sweetening cough mixtures when used in the form of the syrup.

Terebenum.—The introduction of this drug into the British Pharmacopœia has been received with mingled feelings. In the opinion of not a few it seems to have outlived its good reputation of some years ago when it was reported upon so favourably by Dr. Murrell as a remedy for winter cough. It is upon the whole doubtful if it will be able to hold its official position at the next or some subsequent revision. It nevertheless is of some value as an expectorant, especially in the bronchitis associated with emphysema. The dose is from 5 to 15 minims and it is best given in capsules or on sugar owing to its turpentine-like taste and odour.

Thyroideum Siccum and Liquor Thyroidei.—The use of thyroid gland substance marks one of the most eventful epochs in therapeutics. The brilliancy of the discovery and the striking nature of the results have produced such an impression upon the minds of workers in original research that we have become inundated with a host of agents which are not creditable to scientific medicine at the end of the nineteenth century. Thus there are preparations of dried uterus, prostate, lymphatic glands, kidney, liver, mammary glands, lung, &c., vaunted for nearly every disease.

The discovery that myxœdema was produced by the absence of the thyroid secretion and the proof that a similar condition followed after the total removal of the thyroid gland in man and monkeys prepared the way for the administration of this remedy in myxœdema after many failures of grafting and transplanting experiments. Those who have not seen the results obtainable by thyroid extract in conditions following disease of the thyroid gland can hardly realise the nature and importance of this agent. After a few weeks' administration of from 5 gr. to 10 gr. daily of dry thyroid to a myxœdematous patient the metabolism of the body increases markedly the body weight falling as the appetite and consumption of food increase and the temperature rises; the facial expression begins to change towards the normal and the mental slowness and weakness rapidly pass off. Sometimes in a few months the patient so changes that recognition by old friends becomes difficult. Luxuriant growth of hair sometimes may be noticed upon a scalp which was before like polished ivory. To obtain these results small doses suffice and the common error is to administer the agent in dangerously large doses, for thyroid substance is an active poison if administered recklessly. Probably after a very decided effect is produced upon the myxœdematous condition the daily administration of 1 gr. of the dry British Pharmacopœia powder may be found quite sufficient. When the patient has been brought to the normal possibly this dose once or twice a week may be found sufficient to maintain the healthy standard. As regards dosage, however, no rule can be laid down; the practitioner should be guided by the results and the body-weight affords a fair test; the drug should be diminished or suspended when the loss of weight becomes obvious and probably it will be found necessary to maintain its regular administration in small amounts as long as the patient lives.

When it was found that sporadic cretinism was simply a form of congenital myxœdema the dwarfed idiot became the subject for thyroid medication and the results obtained were startling. Children who had ceased to grow in stature for years rapidly responded to the remedy and the mental condition brightened as the body developed. The liquor represents in every minim the one-hundredth part of a sheep's thyroid gland and it may be given in doses of from 5 to 15 minims. The revisers are to be congratulated that they did not render official any of the so-called active principles of the gland, as iodothyrin and thyrocol, which we believe at one stage of the revision was contemplated. There is no proof that the iodine-containing substance extracted from the gland is as efficacious as the dried tissue, whilst there is every reason to believe that it only contains a portion of the restorative needed. Thyroid feeding has been recommended as an agent for the cure of obesity and there is no doubt that it is highly efficacious in reducing the body weight, but it must be pushed slowly and the treatment should be suspended for intervals of a few weeks and the condition of the heart must be closely watched. Various skin diseases have been successfully treated by this new agent and quite a number of successes have been reported in psoriasis. It has been found also to possess galactogogue properties and it is claimed for it that it checks uterine hæmorrhage and assists the growth of bone in cases of ununited fractures, &c. It was at first vaunted as a cure for exophthalmic goitre, and cases were published which now appear to require elucidation, as it is a well-recognised fact

that in this disease the agent is positively dangerous and we believe it should never be administered. Exophthalmic goitre is probably the result of an abnormal activity in the gland and the symptoms bear some resemblance to those produced by large doses of the dried thyroid substance. If so the danger of supplementing the already increased thyroid secretion which is being poured into the circulation is obvious and deaths have been reported from the use of this agent in this diseased condition. Thymus gland has sometimes been found to lessen the exophthalmos and quiet the heart.

THE ROYAL COMMISSION ON THE METROPOLITAN WATER-SUPPLY.

THE twenty-fourth sitting of the Royal Commissioners was held on June 6th, at the Guildhall, Westminster, the official home of the Middlesex County Council. With the exception of the Right Hon. J. W. Mellor and Mr. Cripps all the Commissioners were present, but Sir George Barclay Bruce did not sit after the interval for luncheon.

The whole sitting was occupied by the examination of Sir ALEXANDER BINNIE, engineer to the London County Council, and the first part of the time was occupied in hearing his evidence with regard to the partition among the outside county authorities of those portions of the water undertakings which supply the districts beyond the administrative county of London. In the case of Kent he suggested that London should buy the water in bulk. In the case of Hertfordshire the witness believed that the wells at present in existence took almost all the water which could be obtained from the districts in which they were situated and that therefore no future increase could be expected from that source. An agreement with the Hertfordshire authorities might be made by which it was arranged that a fixed amount of water only should be taken from that county for the use of London. The witness did not know how far this proposal would meet the objections of the Hertfordshire County Council to the present proposals of that body.

In answer to the CHAIRMAN the witness said that the London County Council would have to buy the whole of the undertaking of the New River Company and that they might arrange not to draw any more water than is at present taken by the company. In considering the case of Essex there were two chief factors—the supply to the county borough of West Ham and that to the scattered outlying rural districts.

The CHAIRMAN said that he understood that the representatives of Essex wished to have the control of their own supplies and the witness admitted that in Hertfordshire and Essex there was a growing suburban population and that in Essex the growth was very rapid. In Hertfordshire, however, the growth was less rapid.

Sir JOHN DORRINGTON asked the witness whether he knew that the supply to Barnet was at present insufficient for the requirements of the district. The witness replied that he did not know that this was the case and that Barnet was outside the "purview" of the London water companies.

Mr. PEMBER, Q.C., said that the Barnet people had a water company of their own and that he might say that they were looking out for an increase of supply.

In answer to Major-General SCOTT the witness said that his proposals for the re-arrangement of the supplies for the districts beyond the jurisdiction of the London County Council would not be economical. The arrangements involved waste of energy. The most economical way of supplying the outside districts would be for them to take the water in bulk.

The CHAIRMAN suggested that the proposed arrangements for division of the present undertakings between London and the outlying districts were so "impracticable, inconvenient, and expensive," that in case of purchase by the London County Council the outlying authorities would be forced to take the water in bulk. The witness said that the best method would be for them to take it in bulk.

Mr. PEMBER, Q.C., examined the witness on behalf of some of the water companies. The first part of his examination was directed to show the enormous increase which was taking place in the population in the outlying districts. During the last sixteen years the population of Croydon had doubled. What provision did the witness propose should be made for future possible increase? A well at Addington belonging to the Croydon Corporation supplied 2,000,000 gallons daily, but by an arrangement made between the Croydon Corporation and the Kent Water Company the former were prevented from taking more than that amount. The witness said that it was proposed to give the outlying authorities 20 per cent. more than they had at present, but beyond this no provision for their increasing wants was proposed.

Mr. PEMBER asked the witness whether with regard to the arrangements for the transfer of part of the water undertakings to Surrey he had considered in detail the questions of the pumping arrangements and of the filter-beds, and presented some points for his consideration. The witness said that with regard to water which was to be supplied through the works now owned by the Lambeth company a dam might be built across the reservoir to divide the water intended for the use of Surrey from the water which was to be reserved for London.

With regard to the supply from the Coombe reservoir counsel stated that three engines were used for pumping the water there and asked the witness whether he thought it would be convenient that the engines used by the Surrey authorities and those used by the London authorities should be not only situated in the same house but have a common supply of steam? Was it likely that servants working for the London County Council and those working for the county of Surrey would at all times work harmoniously together under such conditions? In the case of the Lambeth station at Brixton-hill counsel pointed out that there was one coal store and the witness suggested that part of it might be cut off for the use of the Surrey authorities. In the case of the supply coming from the Selhurst reservoir counsel pointed out that under the arrangement proposed by the witness the supplies from that reservoir would go into the districts of four different local authorities. He pointed out also that in the case of Seething Wells there was only one filtered water well and asked whether the witness thought that the arrangements with regard to sand washing and filtration could be harmoniously carried on by the servants of two different authorities. Workmen were not "angels." Under the proposed arrangements Norwood reservoir would supply the districts of Croydon, London, Surrey, and Kent. How was this reservoir to be partitioned amongst these four authorities? Counsel also asked the witness whether he knew that Norwood reservoir supplied parts of Surrey which the Selhurst reservoir could not supply.

With regard to the Southwark and Vauxhall Company Mr. PEMBER pointed out that the 12 in. main which the witness suggested should be given over to the county of Surrey did not exist; there was no 12 in. main from Richmond to Hampton.

Mr. POPE, Q.C., on commencing his cross-examination suggested that the engineering difficulties were so considerable and that the cost would be so great that a division of the existing works between London and the outlying authorities could not be economically carried out, and he asked the witness whether the question did not really resolve itself into whether the authorities should or should not be supplied with water in bulk. The witness said that there were really three courses open—(1) that the supply should go on as at present; or (2) that the water should be brought from London in bulk by the outlying districts and that they should take over the pipes which now exist in their districts; or (3) that there should be a partition of which the details should be arranged by arbitration.

Mr. LEWIS COWARD, on behalf of the Kent Water Company, quoted an opinion given by the chairman of the Kent County Council to the effect that they wished to prevent the London County Council from taking their water from them. The Kent Company differed from the others in the fact that they had no storage reservoirs and no arrangements for filtration. Of the London district supplied by the Kent Company sixteen miles, roughly speaking, were at present built over and thirteen square miles were not built on. The area of the Kent Company had been extended throughout the county at the instance of, and by the Parliamentary assistance of, the various local authorities whose districts the company supplied.

Lord ROBERT CECIL, on behalf of the Hertfordshire County Council, asked how the people at present supplied with water by the New River Company would fare in the case of purchase of the company by the London County Council, and if the people of Hertfordshire were supplied in

bulk with water by the London authorities who would arrange the price the people of Hertfordshire would have to pay. The witness said that the London County Council proposed to buy the New River Company and to take the water. The people in Hertfordshire at present supplied could either buy the water back in bulk or be supplied as they are at present.

Mr. FREEMAN, Q.C., re-examined the witness on behalf of the London County Council and long extracts were read from the Balfour Report and from other sources with a view to prove that the Staines reservoir scheme as recommended by Lord Balfour's Commission and originally suggested by Messrs. Hunter and Fraser was intended for the storage of water for six metropolitan water companies and that all water taken from the Thames ought to be stored in those reservoirs and that the present intakes of the metropolitan water companies ought not to be used.

In answer to Major-General SCOTT the witness said that the great objection to the Thames water was that no less than 20,000,000 gallons of clarified sewage were poured into the river and at some periods this amounted to no less than 5 per cent. of the total flow of the river.

Major-General SCOTT suggested that in summer occasionally sewage effluents did not really exist; the whole of the water was evaporated.

Sir JOHN DORRINGTON asked how far the sewage could be traced from Crossness up the Thames and the witness said that formerly it could be traced as far as London Bridge. There was, however, a certain amount of increase in the chlorides in the water as far as Hammersmith.

At the conclusion of his evidence Sir ALEXANDER BINNIE summed up his reasons in favour of going to Wales for the future water-supply of London.

The twenty-fifth sitting of the Royal Commissioners took place at the Guildhall, Westminster, on June 13th. The whole of the time was occupied by the examination of Mr. R. M. Littler, Q.C., chairman of the County Council of Middlesex.

Mr. LITTLER said that the County Council of Middlesex is not in the least a political body and that it represents people of all shades of opinion. He gave in detail the facts making it of importance to Middlesex that the greatest economy should be exercised. The population of the administrative county of Middlesex, according to the Census of 1891, was, he said, 559,392. At the present time it is over 740,000. The area of the district is nearly 233 square miles. The rateable value in 1891 was £3,180,633. The districts in which the most rapid extension of water-supply is taking place are Tottenham, Edmonton, Southgate, Hornsey, and the western districts of the county, which are supplied by the West Middlesex and the Grand Junction Waterworks Companies. The water-supply of Middlesex is derived from four of the metropolitan water companies and there are in addition a number of supplies given by private companies and by urban district councils. The East London Waterworks Company supplies at Tottenham a population of over 5000; the Grand Junction Waterworks Company supplies Acton, Brentford, Ealing, Hampton, Hampton Wick, Hanwell, Heston, Isleworth, Twickenham, and Teddington—a population of over 147,000; the New River Company supplies Edmonton, parts of Enfield and Tottenham, Hornsey, Southgate, South Hornsey, and Wood Green—a population of 180,000. The West Middlesex Waterworks Company supplies Chiswick, Hendon, and Willesden—a population of over 130,000. The parts of Middlesex not supplied by the metropolitan companies are supplied from the waterworks of local authorities and by companies whose districts do not extend to London. The Enfield Urban District Council supplies a population of 34,600; Tottenham Urban District Council a population of 56,977; and Uxbridge Urban District Council a population of 8636. At Barnet a population of over 20,000 is supplied by a local gas and water company. The Colne Water Company supplies a population of 23,660 in Middlesex and gives also supplies in Hertfordshire; the South-West Suburban Water Company supplies in Middlesex a population of 37,100 and gives supplies also in the county of Surrey. The Rickmansworth and Uxbridge Valley Water Company supplies a population of 15,350. The Central Middlesex Water Company is a small undertaking and supplies a population of 747. The figures given are those of the population of 1896, since which date considerable increase has taken place in some of the districts. The witness, as chairman of the Middlesex County Council, said he had been in communication with most of the urban and rural authorities in connexion with the water-supply. Two conferences had been held with representatives of district councils, the first in February, 1895, and the second in January of the present year. At the first conference the following resolution had been passed:—

That the representatives of the district councils in the county of Middlesex now present agree that their interests may be safely entrusted to the County Council of Middlesex as regards the course to be adopted in dealing in Parliament with the several Waterworks Bills being promoted by the London County Council and that the district councils be recommended to present petitions to both Houses in opposition to the Bills as co-petitioners with the county council.

The following resolution, which represents the opinion of all the local authorities in Middlesex, was passed at the meeting held on Jan. 26th, 1898:—

That this conference, having considered the resolution passed by the conference in 1895, approves of the past policy of the County Council of Middlesex and is of opinion that the interests of the district councils should be left in the hands of the council as representing the whole county before the Royal Commission.

The Parliamentary Committee of the Middlesex County Council made a report on the London Water Commission Bill (1891) and on the Metropolis Water-supply Bill (1891). These resolutions were made on the supposition that purchase of the water companies by some public body would take place. The resolutions were as follows:—

1. That the interests of the county require that in any dealing with the question of the London water-supply as it affects Middlesex provision should be made against: (*a*) the sinking of any new wells in the county; (*b*) the deepening of any existing wells in the county.
2. That provision should be made for limiting the abstraction of water for the London or any other external supply from Middlesex.
3. That no scheme will be acceptable to Middlesex which does not provide: (*a*) for no further water being abstracted from the Middlesex area; (*b*) for the independent control by Middlesex from the beginning of (*a*) the sources of supply for Middlesex; (*b*) the supply service; (*c*) the absolute non-interference with Middlesex either as to rating or otherwise.

The County Council of Middlesex have re-confirmed the position they then took up in case purchase should be decided on. At the present time the County Council of Middlesex and the councils of several urban and rural districts in the county strongly object to any outside authority having control of the water-supply in any part of the administrative county of Middlesex or to having power to levy rates in the county. The witness objected to purchase, partly because he believed that if a water trust were formed the county of Middlesex would not be sufficiently represented.

The CHAIRMAN asked the witness whether he would object to purchase of the companies by a water trust on which representatives should be sent from the Metropolitan counties, the Thames Conservancy, the Local Government Board, &c., and the witness said that control of the water by such a board would be less objectionable than that by the London County Council. Purchase of the water companies by the State would be still less objectionable. The witness, however, thought that purchase of the water companies' undertakings was not desirable.

In answer to Mr. DE BOCK PORTER the witness said that he did not see any great injustice in the fact that prices charged for water varied in different parts of London. The circumstances of rating were always taken into account in fixing rents.

In answer to the CHAIRMAN the witness said that the Middlesex County Council had received complaints with regard to the water-supply at Willesden. The attention of the companies had been called to the matter by the council and it had been remedied.

In answer to Mr. CRIPPS, Q.C., the witness said that he did not approve of Sir John Lubbock's proposal that water consumers should be directly represented on the boards of directors of the water companies. In his opinion it would weaken the control which the public already exercised over the companies and the power of the new directors would not be great as they would always be in a minority.

Mr. BAGGALLAY, Q.C., on behalf of the water companies, asked some further questions on this point. The witness said that in the case of the Indian railways to which Sir John Lubbock had referred the dividends were guaranteed by the East India Company, that that company had in some cases paid part of the original outlay of the undertaking, that the company had a reversionary interest in the property, and that they had in many cases given the land on which the railways were built.

At the conclusion of the sitting Mr. CRIPPS, Q.C., told Mr. Baggallay that the Commissioners would be glad to

understand what position the water companies took up with regard to the inquiry. Were the companies in favour of control or of purchase or did they wish to be left alone?

MR. BAGGALLAY said that the water companies were opposed to purchase and they did not think much further control was necessary; they were on their defence.

The next meeting of the Commissioners will take place on Monday, June 20th.

THE ANNUAL DINNER OF THE ARMY MEDICAL STAFF.

THE officers of the Army Medical Staff held their annual dinner at the Whitehall Rooms of the Hôtel Métropole on Monday evening last. The attendance was very good—in fact, well beyond the average, notwithstanding the calls made upon the services of army medical officers by the campaigns in India and Egypt. Moreover, the recent concession of the claims of the service to become, as a Royal Army Medical Corps with definite military titles and rank, an integral portion of the army and not a mere appendix, announced by Lord Lansdowne in his speech at the banquet given to the medical profession by the Lord Mayor at the Mansion House on May 4th, infused into the meeting a spirit of enthusiasm pleasant and most satisfactory to witness. At this dinner it has been the custom of recent years strictly to dispense with after-dinner oratory, but at this particular juncture Surgeon-Major-General JAMESON, C.B., the Director-General, wisely, indeed perhaps unavoidably, departed from tradition, and after giving the health of Her Majesty the Queen (which toast, of course, is never omitted) again rose and said that on this special occasion he must depart from their usual custom and congratulate them on the new warrant which was about to be issued and on the fact that they were at length to become an actual part of, and not merely attached to, the army. He added that their thanks were sincerely due to Lord Lansdowne for his statesmanlike grasp of the situation and for his willing recognition of their just claims. He also pointed out that, although it might not be so well-known to many of them, they were also much indebted to Lord Haliburton, as they were to General Sir Evelyn Wood, who was prominent in acknowledging their right to army rank and title in a Royal corps. He then referred to the services rendered by the Royal College of Surgeons of England, the Royal College of Physicians of London, and the sister Colleges of Scotland and Ireland, the British Medical Association (especially referring to the work so admirably carried out by a sub-committee of its Parliamentary Bills Committee under the chairmanship of Dr. W. Gordon of Exeter), the medical press, and the medical profession generally.

Surgeon-Major-General J. B. HAMILTON, in a few well-chosen words proposed the health of the Director-General, emphasising the great value of the influence of Surgeon-Major-General Jameson in securing the desired concessions—reforms for which he (Surgeon-Major-General Hamilton) had himself worked for thirty-nine years, and which he was glad to see granted during the tenure of office of the present Director-General. The toast of "The Guests" was proposed by Sir J. H. KER INNES, K.C.B., and responded to by Sir SAMUEL WILKS, President of the Royal College of Physicians of London, Sir WILLIAM MACCORMAC, President of the Royal College of Surgeons of England, and Dr. GORDON. Space will not permit us to give the various speeches at any length. Suffice it to say that they were without exception terse, to the point, and of a congratulatory nature. If any dissatisfaction exists amongst army medical officers with the proposed new warrant (which we understand will soon be issued) it was not proclaimed at the very successful and pleasant reunion which we thus imperfectly record. A word of acknowledgment is due to the services of Brigade-Surgeon-Lieutenant-Colonel J. Hector, who acted as hon. secretary of the dinner.

The following officers and guests were present:—*Surgeon-Major-Generals* J. Jameson, C.B. (in the chair), A. F. Bradshaw, C.B., Sir C. A. Gordon, K.C.B., J. B. Hamilton, Sir J. H. Ker Innes, K.C.B., H. S. Muir, W. Nash, T. F. O'Dwyer, A. F. Preston, J. B. C. Reade, C.B., P. B. Smith, W. Taylor, J. Warren, and W. M. Webb. *Surgeon-Colonels* H. Comerford, O. Codrington, W. G. Don, J. H. Jeffcoat, J. Maturin, F. W. Moore, J. L. Notter, T. O'Farrell, F. B. Scott, C.M.G., W. Sly, W. F. Stevenson, and F. H. Welsh. *Brigade-Surgeon-Lieutenant-Colonels* W. B. Allin, J. F. Beattie, H. M. Blennerhassett, C.M.G., J. A. Clery, W. Donovan, J. D. Edge, R. Exham, T. J. Gallwey, C.B., W. L. Gubbins, W. Johnston, W. Keir, H. Mackinnon, D.S.O., J. Martin, H. J. O'Brien, C. F. Pollock, J. Powell, S. K. Ray, W. Temple, V.C., and W. J. Wilson. *Surgeon-Lieutenant-Colonels* J. A. Anderson, R. T. Beamish, U. J. Bourke, W. L. Chester, A. Doig, W. C. Gasteen, H. Grier, J. Hector, R. D. Hodson, G. A. Hughes, H. Jagoe, G. T. Langridge, T. Ligertwood, C. Mackinnon, W. F. Ruttledge, B. W. Somerville-Large, J. Tidbury, and T. Wright. *Surgeon-Majors* W. Babtie, C. R. Bartlett, J. Battersby, W. G. Bedford, W. C. Beevor, R. P. Bond, H. Carr, Sir J. R. A. Clark, Bart., A. B. Cottell, J. G. Crofts, W. Dick, H. P. Elkington, J. J. Falvey, C. E. Faunce, R. I. D. Hackett, R. G. Hanley, F. A. Harris, A. P. Hart, J. G. Harwood, R. P. Hetherington, G. D. Hunter, D.S.O., H. E. R. James, R. Jennings, F. J. Lambkin, T. B. Maclean, W. S. Macpherson, W. J. Macnamara, T. A. Marsh, A. J. Moberley, A. H. Morgan, A. Morphew, R. E. Morse, W. H. Murray, E. North, T. J. O'Donnell, G. Sylvester, H. N. Thompson, D. Wardrop, E. M. Wilson, C.M.G., and B. T. Zimmerman. *Surgeon-Captains* T. B. Beach, A. P. Blenkinsop, T. H. F. Clarkson, J. G. Deacon, H. E. Dowse, H. N. Dunn, C. Garner, C. W. R. Healey, M. L. Hughes, J. C. Jameson, O. R. A. Julian, R. E. Kelly, W. B. Leishman, J. MacCarthy, C. J. MacDonald, S. G. Moores, F. J. Morgan, H. J. Parry, C. S. Spong, and H. C. Thurston. *Guests:* the President of the Royal College of Physicians, the President of the Royal College of Surgeons, the Senior Officer Militia Medical Staff Corps, Mr. Vesey Holt, Dr. William Gordon (of Exeter), Mr. Thomas Wakley, jun. (joint editor of THE LANCET), and Dr. Dawson Williams (editor of the *British Medical Journal*).

The Director-General of the Medical Department of the Royal Navy, the President of the Indian Medical Board, and the Honorary Commandant of the Volunteer Medical Staff Corps also accepted invitations but were prevented from being present.

THE ANNUAL DINNER OF THE INDIAN MEDICAL SERVICE.

THE second annual dinner of the officers of the Indian Medical Service was held on Thursday, June 9th, at the Café Monico, Surgeon-General Sir Joseph Fayrer, Bart., K.C.S.I., F.R.S., being in the chair. As will be seen from the list given below a large number of members of the service and guests were present. It is probable, however, that the gathering would have been still larger but for the fact that, except in the case of those invalided (few of whom were well enough to put in an appearance), furlough from India is closed owing to famine, plague, and war, and as a necessary consequence very few officers on the active list were able to be present. Moreover, the "Delhi" dinner and the College of Surgeons dinner being unfortunately held on the same evening, Field-Marshal Sir Donald Stewart, the respective Presidents of the Royal College of Physicians of London, of the Royal College of Surgeons of England, and of the Royal Medical and Chirurgical Society, and other guests were prevented from attending. Surgeon-General Sir Alexander Christison, Bart., and Surgeon-General Sir Benjamin Simpson, K.C.I.E., who had intended to be present, found themselves at the last moment unavoidably detained.

After the toasts of "The Queen" and "The Royal Family" had been proposed from the chair and loyally honoured the toast of "The Sister Services" was eloquently given by Surgeon-General A. C. C. DE RENZY and responded to by Surgeon-Major-General JAMESON, C.B., Director-General of the Army Medical Department, in a very interesting speech with which we hope to deal at greater length in an early issue.

Surgeon-Major-General JAMESON then proposed the toast of the evening, "The Indian Medical Service."

Sir JOSEPH FAYRER, on behalf of the Indian Medical Service, thanked the Director-General for the kind things he had said about that service, and also for having done him the honour of associating his name with the toast. It was a source of gratification to the Indian Medical Service to have been so spoken of by the Director-General, who had so eloquently referred to their work. He was glad to see that there was such a good attendance at this dinner and that the hopes expressed at the last one that it might be so had been realised, and he trusted that it would continue, for he felt satisfied that this reunion of the older with the younger members was for the interests of the service and would conduce to the prestige and *esprit de corps* which were so desirable. On behalf of his brother officers he accepted all that the Director-General had said, for tradition and history testified to its truth. He had on a former occasion expressed a hope that some one would undertake to write a history of the Indian Medical Department from its foundation and he still hoped that this would be done, for they had a right to be proud of a service which had always been so varied in its character. They knew how intimately it had been associated with the foundation and progress of the Indian Empire and how much it had done to harmonise differences and to reconcile Eastern to Western rule and that it had originated and developed several important departments of the State. They had pride also in remembering that though its members had not been undistinguished as surgeons and physicians, in pure science, in philology, and in diplomacy and administration such men as Falconer, Roxburgh, Cleghorn, H. H. Wilson, Aloys Sprenger, Gabriel Broughton, McNeil, Robertson, and many others in different departments of science had conferred a lustre and character upon the Indian Medical Service which were peculiarly its own. It was needless for him to refer to their great sanitary and medical work, for it was well known to all and was associated with such names as those of Annesley, Twining, Ranald Martin, and others who were still carrying it on and whose researches at present into the remoter causes of disease offer hope of the solution of many difficult problems hitherto not satisfactorily explained. He would not weary them, did his memory allow him, by recapitulating a host of distinguished names such as he presented to them at the last meeting. Whatever might be in store for the Indian Medical Service in its present combined aspect there could be no doubt that its members justly regarded it with pride and affection and aspired not only to sustain its ancient prestige but to maintain that standard at its highest pitch in the future.

The toast of "The Guests" was cordially given by Deputy-Surgeon-General Sir JOSEPH EWART and responded to by Sir R. DOUGLAS POWELL, Bart., M.D., and Dr. SANSOM, President of the Medical Society of London.

Sir J. FAYRER subsequently made a few remarks with reference to the proposed changes in the character of the medical service and said that whilst desiring to express their gratitude to the Director-General and to the other authorities at whose instigation and by whose efforts these changes were effected, and which would in all probability extend to the Indian Medical Service, and expressing his conviction that the alterations made must conduce to the benefit of all concerned, he desired most emphatically to repudiate the idea that the medical officers in any sense wished to ignore their own special duties or to interfere with those of other departments. There was no desire on their part to substitute purely military titles for professional ones, but it was necessary that if they were to form part, as they must inevitably do, of a military system where they have control and command and a position of responsibility and authority to maintain, where they wear the insignia of soldiers and are subject to military discipline and law, they must necessarily have such rank, such titles, such authority, and such position as would enable them to carry on their duties with efficiency. As military officers—and they were proud to think that as medical they were military officers — they could accept no subordinate or inferior position. The old ideas which might have come down from feudal times have long since disappeared; the medical officer in social position, in education, in responsibility, holds just as important a place as does any member of the so-called combatant branch and is an essential part of the army. The distinction between combatant and so-called non-combatant is a well-marked one, and has its special significance in the service more than might at first sight appear, but upon what grounds the latter term is applied to the medical service it is impossible to comprehend. Every campaign, every military expedition bears witness to its absurdity. The changes which are about to be inaugurated will no doubt remedy some of these defects, and though something is still wanting, it would be most ungracious not to accept what has been given in a proper spirit. It is recognised that the Medical Department is an integral portion of the army, that medical officers are not merely glorified camp followers, that they have duties to perform which from the constitution of the army require them to have authority. There is only one recognised authority in the army and that is military rank and title. Relative and comparative rank are without meaning. It is well to discard also the idea, much proclaimed but of little validity, that military titles of colonel, captain, and so on can only be held by the so-called fighting soldiers, the fact being that they merely signify rank held by an officer in any particular department in the army. He concluded by saying that he hoped the concessions made would be received in a proper spirit of gratitude and that out of it all would come benefit alike to the service and to all concerned.

A few impromptu words in praise of the comparatively large numbers of members of the medical services who have won that most distinguished decoration the Victoria Cross were acknowledged by Surgeon-Major J. CRIMMIN, V.C., with a brevity and modesty becoming a medical hero.

The proceedings of a very enjoyable evening were brought to a close with expressions of thanks to Sir Joseph Fayrer for presiding and to Surgeon-Lieutenant-Colonel Freyer for the trouble he had taken in carrying out all the details necessary to ensure the success of the meeting. We venture to offer to him also our own congratulations.

The following is a list of the officers and their guests who were present: *Surgeon-Generals* W. H. Adley, J. Cunningham, C.S.I., A. C. C. De Renzy, Sir Joseph Fayrer, Bart., K.C.S.I., F.R.S. (in the chair), W. Pearl, G. H. Ray, and P. W. Sutherland. *Surgeon-Major-Generals* W. R. Hooper, C.S.I., and W. R. Rice, C.S.I. *Deputy Surgeon-Generals* Sir J. Ewart, J. C. Penny, B. Williamson, and W. A. S. Wynne. *Surgeon-Colonels* W. Cates, C. Costello, D. E. Hughes, A. Porter, and W. H. Roberts. *Bridage-Surgeons* J. E. I. Aitchison, C.I.E., J. Barter, E. F. Drake-Brockman, G. Grant, R. Gray, I. B. Lyon, C.I.E., C. W. MacRury, G. Massy, G. D. Riddell, J. B. Scriven, T. G. Skardon, and G. S. Sutherland. *Surgeon-Lieutenant-Colonels* D. Baker, D. F. Barry, J. W. Clarkson, P. J. Freyer, J. O'Neil, A. J. Sturmer, and A. H. Williams. *Surgeon-Majors* P. F. Bellew, W. Caldwell, J. Crimmin, V.C., A. M. Crofts, T. Duka, D. F. Dymott, A. S. Faulkner, G. M. Giles, W. Harvey, J. Ince, A. W. D. Leahy, C. P. Lukis, R. W. S. Lyons, C. Manifold, and M. O'Dwyer. *Surgeon-Captains* D. C. Johnston and H. W. G. Macleod. *Surgeon-Lieutenant* E. L. Perry. *Guests:* Sir Richard Douglas Powell, Bart.; Surgeon-Major-General Jameson, C.B. (Director-General, Army Medical Department), Dr. Sansom (President of the Medical Society of London), Mr. Austin Low, Mr. Thomas Wakley, jun. (joint editor of THE LANCET), Dr. Dawson Williams (editor of the *British Medical Journal*), and Mr. Percy Dunn (editor of the *Medical Press and Circular*).

ROYAL COLLEGE OF SURGEONS OF ENGLAND.

AN ordinary meeting of the Council was held on June 9th, the President, Sir WILLIAM MACCORMAC, Bart., being in the chair.

As recommended by the committee appointed for the purpose it was resolved that Fellows of the College should be entitled to wear a special gown on all ceremonial occasions. The gown is to be a black stuff gown with crimson satin facings of a regulation shape and shade of crimson. A specimen Fellow's gown, made by Messrs. Ede and Son of Chancery-lane, was submitted to the Council. It was further resolved that Fellows of the College who are also graduates of any University may use the gowns representing their degrees on the occasions when the Fellow's gown would otherwise be worn.

The following report from the Laboratories' Committee was approved:—

1. *The work on diphtheria for the Metropolitan Asylums Board.*—The preparation of antitoxic serum. The director reported that the new stables have been completed and taken over and that they are admirably suited for the purpose for which they are required. Since March 4th 6000 doses of antitoxic serum, each containing 2000 units, for the treatment of diphtheria in the hospitals of the Metropolitan Asylums Board have been supplied and all the demands fully met. During this period 12,000,000 units have been supplied, against an average of 12,252,000 for the preceding two quarters. During this period the average strength of the antitoxin has been so far raised that it has been possible to send out the 2000 units in quantities of from 6·5 to 7·5 c.c.

2. *Researches in connexion with the grant from the Goldsmiths' Company.*—Dr. T. G. Brodie and Dr. Cartwright Wood have continued their investigations and have obtained some most satisfactory results. In fulfilment of one of the conditions of the grant from the Goldsmiths' Company, that antitoxin should, if possible, be supplied for use amongst the poorer classes of the community, the director has continued the supply of antitoxic serum to various general and children's hospitals in London during the past quarter, as well as to certain medical practitioners for cases fulfilling the necessary conditions.

The following examiners were appointed:—

Elementary Biology.—Peyton T. B. Beale, Frederick Gymer Parsons, Thomas William Shore, and Thomas George Stevens.

Anatomy under the Examining Board.—Stanley Boyd, William Bruce Clarke, George Henry Makins, and Arthur Robinson.

Physiology under the Examining Board.—John Rose Bradford, Leonard Erskine Hill, and Walter George Spencer.

Anatomy for the Fellowship.—William Frederick Haslam, James Ernest Lane, Charles Barrett Lockwood, and Frederick Gymer Parsons.

Physiology for the Fellowship.—Thomas Grigor Brodie, D'Arcy Power, Ernest Henry Starling, and William Henry Thompson.

Midwifery under the Examining Board.—William Radford Dakin, Arthur Hamilton Nicholson Lewers, Amand Routh, and Herbert Ritchie Spencer.

Public Health.—Part I., Arthur Pearson Luff; Part II., Edward Seaton.

A letter was read from Mr. R. B. Anderson, stating that he intends to take proceedings to establish his right and that of all Fellows and Members to exercise the franchise conferred on them by the Medical Acts for the purpose of choosing a member of the General Medical Council, and asking whether the Council will treat such proceedings as a friendly suit and pay the costs of both sides with the College funds. It was resolved that Mr. Anderson should be informed that the Council are not prepared to accede to the propositions made by him in his letter.

The PRESIDENT reported that he had accepted on behalf of the Council an oil portrait, by Benjamin Robert Haydon, of Thomas Alcock, M.R.C.S. Eng., father of the late Sir Rutherford Alcock, K.C.B., presented to the College by Lady Alcock.—The best thanks of the Council were voted to Lady Alcock for her present.

The PRESIDENT stated that the vacancy on the Court of Examiners occasioned by the expiration of Mr. R. J. Godlee's period of office on July 7th next, and the vacancy on the Board of Examiners in Dental Surgery occasioned by the expiration on the same date of Mr. J. H. Mummery's period of office, would be filled up at the quarterly meeting of the Council on July 14th. The President also stated that Mr. Godlee and Mr. Mummery were candidates for re-election.

THE BRITISH BALNEOLOGICAL AND CLIMATOLOGICAL SOCIETY.

THE annual conversazione of this society was held on June 8th, at Limmer's Hotel, Conduit-street, W., Dr. W. V. SNOW presided, and an address was delivered by Dr. G. Vivian Poore.

Dr. POORE said the subject on which he proposed to make some remarks, the Circumstances which Influence or tend to Influence the Effectiveness of Climatic Treatment, was one of importance to the general physician. Medical education should be practical and the knowledge obtained from books should be supplemented in other ways. This especially applied to the question of climatic treatment. Every day he regretted that he had never been to the tropics or to any of our southern colonies. He felt constantly that his knowledge of these places obtained from reading was not the same thing as the knowledge which residence would give. The first circumstance which influenced for good climatic treatment was the degree of practical knowledge possessed by the prescriber. Climatic treatment was often prescribed by people who had never visited the climate, and the prescription was made more or less in ignorance. Again, it was not sufficient to prescribe climate in a wide sense, as, say, the climate of the South of France or of Canada. Accurate local knowledge was equally important. As an example, if we went into a garden with a wall running east and west we should find on the south side, perhaps, warmth and sunshine and ripe peaches, and hear the hum of insects; but if we went to the north side of the same wall we should find it in shadow with a chilling atmosphere, hard pears and unripe cherries, and fustiness coming from the dank and damp earth. When we remembered that these two climates were only 9 in. apart we should see that attention to detail was very important. The physician should, then, have local as well as general knowledge in prescribing. Personally he (Dr. Poore) was very particular never to recommend a place unless he had been there. One of the good things which this society would bring about was the furnishing of accurate details about the various climates. Failure to accommodate the recommendations of the physician to the convenience of the patient was another point which should be considered, as was also the adaptability of the patient to his surroundings. To send a fashionable patient to a dull place or a dull person to a fashionable place was not much good. We should remember that "The labour we delight in physics pain." Overcrowding was another point which should be considered. Directly a place became famous it ran this risk and as the place became popular it deteriorated in its health-giving properties. The house in which the patient resided should also receive attention. When we sent a person abroad in the winter we should remember that he would probably spend twice as much time indoors as out of doors, and if the house should be unwholesome the good done in the open air would be counteracted by the harm done in the house. Modern hotels were not the place for the permanent residence of chronic invalids. Proper ventilation could not be obtained in them as at present constructed. An hotel for a chronic invalid should be constructed on the plan of an infectious hospital, but this did not mean that it should resemble an institution. It was getting very much the custom now to build separate cottages for invalids around some central common rooms. The colleges at the Universities of Oxford and Cambridge formed excellent models for hotels. A little more money should be spent on the land and a little less on decorations which prevented adequate cleaning and harboured dust. Inadequate food was another thing which should be considered. The food was often inadequate; it ought to be abundant, simple, and wholesome. Then it was very undesirable that people should be herded together too much, and this especially applied to the phthisical. Dr. Poore here gave an account of his residence for some time in a "cure-house" for tuberculosis, and showed how depressing it was to the patient to see others come down to breakfast without appetite and play with their food and also to listen to the conversation, which was equally depressing. Perhaps the most important duty of a physician prescribing climatic treatment was the selection of a medical man to take charge of the patient while abroad. In this country it was easy enough to form some opinion of the medical man's qualifications by means of the directory, &c., but in foreign countries it was exceedingly difficult. Health resorts abroad, too, were the happy hunting grounds of irregular practitioners of every kind. This touched the question of reciprocity in medical practice and it was unfortunately true that increased opposition was being made to the residence of English practitioners in foreign places. Even if this question of reciprocity were not settled with tolerable advantage to English practitioners it would do nothing but good in the end, for it would simply lead to the development of our home and colonial health resorts. The British Empire contained every description of climate. Egypt was being utilised, South Africa was beginning to be heard of, and we should probably very soon hear of Canadian health resorts. This little opposition on the part of the

foreigner then would do us nothing else but good. To sum up, there was the want of knowledge, especially local knowledge, on the part of the person prescribing the treatment, the want of means to really adequately carry out the advice given, the failure to adapt the place to the patient or the patient to the place, overcrowding, the ill-construction of hotels or similar establishments and the crowding of many people in one house, sometimes inadequate feeding, the herding of people together and the standing of the medical man into whose care the patient was entrusted.

During the evening there was an exhibition of Meteorological Instruments by Messrs. NEGRETTI and ZAMBRA and Dr. W. S. HEDLEY showed a Stereoscope for exhibiting x ray pictures in relief. Music and refreshment added to the enjoyment of the conversazione.

Public Health and Poor Law.

LOCAL GOVERNMENT DEPARTMENT.

REPORTS OF MEDICAL OFFICERS OF HEALTH.

Exeter Urban District.—Until quite recently the condition of Exeter *quâ* sanitation was practically unknown save to the few officials immediately concerned with it. The medical officer of health is not under the provisions of the Order of the Local Government Board and hence he has not submitted an annual report. Certain visits of Local Government Board Inspectors seem, however, to have had a good effect and Exeter is now falling into line and taking the position which its population of 38,000 justifies. Its sanitary administration is, however, somewhat unique. The medical officer of health, who received for several years but £25 per annum, together with £50 for part attendance at the isolation hospital, has recently been paid an additional £50 for making an annual report. It has, however, to be noted that out of this latter sum he has to pay £20 to the inspector of nuisances for his share in the annual report. Much, however, of the work is done by the district medical officers, each of whom, under the title of assistant medical officer of health and with a salary of £75, supervises the sanitary condition of his Poor-law district and attends in turn at the isolation hospital. None of these gentlemen possessed at the time of Dr. Fletcher's inspection of the district the diploma of public health and it may be that the appointment of a whole time officer would have its advantages. There does not seem about the sanitary administration of Exeter that centralisation of matters in one medical officer of health which is so highly desirable. Dr. John Woodman speaks highly of the "septic tank" method of sewage disposal which was introduced by Mr. Donald Cameron, the Exeter surveyor, and which has been in operation for the sewage of a small portion of the city for a considerable time. Dr. Woodman has little doubt but that the Royal Commission on Sewage Disposal under the chairmanship of Lord Iddesleigh, who, by the way, resides near Exeter, will report favourably on the scheme. The water-supply of the city is derived from the Exe, into which above the intake there passes certain treated and untreated sewage. Under these circumstances it is matter for congratulation that an improvement in the plant for filtration is to be effected.

Surrey County District.—The annual report of this administrative county appears, as usual, early, and Dr. Edward Seaton, the medical officer of health, is to be congratulated on being able to issue the volume so soon. There are obvious advantages in the appearance of a report of this class at a time when the events to which it relates are fresh in men's minds, provided, that is, that the report does not suffer curtailment as a result of speedy issue. The volume before us, which runs to 70 pages, contains not only the annual report properly so called but also—and indeed no small portion of the pamphlet is occupied thereby—a report of a conference on water-supply which was held on March 21st of this year, and some remarks by Dr. Seaton on certain biological methods of sewage disposal. The administrative county of Surrey has, many persons will probably learn with surprise, a population of not yet half a million. Its general death-rate during 1897 was but 12·2 per 1000, the rates for the urban and rural districts being nearly identical. The infantile mortality of the rural districts was 100, and in the urban district 119, per 1000 registered births; the zymotic death-rate was 1·29 per 1000. This, the statistical, portion of the report is not as full as is perhaps desirable in a county report—for instance, we look in vain for the population of each district in the county and for the separate rates for diseases such as scarlet fever and diphtheria. This fact rather detracts from the value of the report for reference purposes, and it would be useful if in his next annual report Dr. Seaton could see his way to repair the omission; otherwise we fear an interesting series of figures will be interrupted. In previous reports Dr. Seaton has entered more fully into the statistics of the county and has furnished the usual Table A together with a summary of the notification returns, referring to Table A both in the index and in the text. An interesting part of the volume before us is that which relates to the conference of medical officers of health to which reference has already been made. There would seem to be very fair promise that before long progress may be made in the direction of a better control of the water-supplies in the administrative county. The resolutions which were passed at the meeting had reference to such matters as the necessity for the periodical examination of, and report upon, the water-supplies, the examination in certain cases to be made by the district and county officials in conjunction; to the desirability of every district council being possessed of accurate information as to the sources of supply of every house in the district, and to the importance of water-softening processes being applied where necessary. It is to be hoped that these expressions of opinion elicited by Dr. Seaton upon these elementary but nevertheless highly essential points may soon have an outcome in practice. With respect to the prevalence of enteric fever in the county a map is furnished, constructed after the manner of those which appear in the last report of the medical officer of the Local Government Board, showing the incidence of enteric fever (a three years' average only) on the several districts of the county; but, as Dr. Seaton himself observes, three years is too short a period for any reliable deductions. Dr. Seaton's explanation to his sanitary committee of biological methods of sewage purification should prove useful to them and to others.

West Lancashire Rural District.—Dr. Herbert Peck furnishes in his current annual report a plan of the existing and proposed water mains within this district. A plan of this description cannot fail to be of value in connexion with inquiries relative to water-borne disease and it is well that it should be easily accessible for reference. The mains laid down during 1896–97 are distinguished from those previously laid. It would have added to the utility of the map could the position of the hydrants have been shown.

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

In thirty-three of the largest English towns 6982 births and 3643 deaths were registered during the week ending June 11th. The annual rate of mortality in these towns, which had increased in the three preceding weeks from 16·4 to 16·8 per 1000, further rose last week to 16·9. In London the rate was 16·3 per 1000, while it averaged 17·3 in the thirty-two provincial towns. The lowest rates in these towns were 8·4 in Croydon, 10·3 in Norwich, 11·1 in Brighton, and 12·2 in Hull; the highest rates were 20·3 in Manchester, 20·4 in Liverpool, 23·6 in Sunderland, and 24·1 in Newcastle-upon-Tyne. The 3643 deaths included 380 which were referred to the principal zymotic diseases, against 400 and 389 in the two preceding weeks; of these, 131 resulted from measles, 103 from whooping-cough, 57 from diarrhœa, 42 from diphtheria, 27 from scarlet fever, and 20 from "fever" (principally enteric). No death from any of these diseases was recorded last week in Croydon or in Burnley; in the other towns they caused the lowest death-rates in Portsmouth, Swansea, and Bolton, and the highest rates in Liverpool, Manchester, Salford, and Gateshead. The greatest mortality from measles occurred in Bradford, Salford, and Newcastle-upon-Tyne; from scarlet fever in Gateshead; and from whooping-cough in Salford, Gateshead, and Newcastle-upon-Tyne. The mortality from "fever" showed no marked excess in any of the large towns. The 42 deaths from diphtheria

included 23 in London, 3 in Cardiff, 3 in Birmingham, and 2 each in West Ham, Sheffield, and Hull. No fatal case of small-pox was registered last week in any of the thirty-three large towns, and only one case of small-pox was under treatment in the Metropolitan Asylums Hospitals on Saturday last, June 11th. The number of scarlet fever patients in these hospitals and in the London Fever Hospital on the same date was 2169, against 2241, 2195, and 2207 on the three preceding Saturdays; 206 new cases were admitted during the week, against 223, 256, and 220 in the three preceding weeks. The deaths referred to diseases of the respiratory organs in London, which had been 216 and 226 in the two preceding weeks, declined to 212 last week, and were 32 below the corrected average. The causes of 34, or 0·9 per cent., of the deaths in the thirty-three towns were not certified either by a registered medical practitioner or by a coroner. All the causes of death were duly certified in West Ham, Leicester, Nottingham, Manchester, Leeds, and in fourteen other smaller towns; the largest proportions of uncertified deaths were registered in Birmingham, Liverpool, and Bradford.

HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in the eight Scotch towns, which had increased in the four preceding weeks from 19·8 to 23·0 per 1000, declined again to 21·3 during the week ending June 11th, but exceeded by 4·4 per 1000 the mean rate during the same period in the thirty-three large English towns. The rates in the eight Scotch towns ranged from 11·6 in Leith and 13·3 in Aberdeen to 23·3 in Glasgow and 24·0 in Dundee. The 642 deaths in these towns included 43 which were referred to whooping-cough, 42 to measles, 18 to diarrhœa, 8 to "fever," 4 to scarlet fever, and 1 to diphtheria. In all, 116 deaths resulted from these principal zymotic diseases, against 91 and 112 in the two preceding weeks. These 116 deaths were equal to an annual rate of 3·8 per 1000, which was 2·0 above the mean rate last week from the same diseases in the thirty-three large English towns. The fatal cases of whooping-cough, which had been 31 and 43 in the two preceding weeks, were again 43 last week, and included 27 in Glasgow, 7 in Paisley, and 4 in Dundee. The deaths from measles, which had increased from 27 to 34 in the three preceding weeks, further rose to 42 last week, of which 19 occurred in Glasgow, 13 in Dundee, 5 in Edinburgh, and 3 in Paisley. The deaths referred to different forms of "fever," which had been 13 and 6 in the two preceding weeks, rose again to 8 last week, of which 4 occurred in Glasgow. The deaths from diseases of the respiratory organs in these towns, which had been 125 and 133 in the two preceding weeks, declined to 109 last week, and were within one of the number in the corresponding period of last year. The causes of 33, or more than 5 per cent., of the deaths in these eight towns last week were not certified.

HEALTH OF DUBLIN.

The death-rate in Dublin, which had declined in the three preceding weeks from 24·0 to 19·7 per 1000, rose again to 25·1 during the week ending June 11th. During the four weeks ending on Saturday last the death-rate in the city has averaged 23·0 per 1000, the rate during the same period being 16·0 in London and 20·6 in Edinburgh. The 168 deaths registered in Dublin during the week under notice showed an increase of 36 upon the number in the preceding week, and included 4 which were referred to the principal zymotic diseases, against 14 and 10 in the two preceding weeks; of these, 2 resulted from whooping-cough, 1 from "fever," and 1 from diarrhœa, and not one from small-pox, measles, scarlet fever, or diphtheria. These 4 deaths were equal to an annual rate of 0·6 per 1000, the zymotic death-rate during the same period being 2·1 in London and 2·6 in Edinburgh. The deaths referred to whooping-cough, which had increased from 1 to 5 in the three preceding weeks, fell again to 2 last week. The mortality from "fever" showed a further decline from that recorded in recent weeks. The 168 deaths in Dublin last week included 27 of infants under one year of age and 52 of persons aged upwards of sixty years; the deaths both of infants and of elderly persons exceeded those recorded in the preceding week. Six inquest cases and 2 deaths from violence were registered; and 70, or more than a third, of the deaths occurred in public institutions. The causes of 6, or nearly 4 per cent., of the deaths in the city last week were not certified.

VITAL STATISTICS OF LONDON DURING MAY, 1898.

In the accompanying table will be found summarised complete statistics relating to sickness and mortality during May in each of the forty-three sanitary areas of London. With regard to the notified cases of infectious diseases in the metropolis last month, it appears that the number of persons reported to be suffering from one or other of the nine diseases specified in the table was equal to 7·2 per 1000 of the population, estimated at 4,504,766 persons in the middle of this year. In the three preceding months the rates had been 7·8, 7·4, and 7·1 per 1000 respectively. No notifiable case of infectious disease was recorded during May in St. Olave Southwark; in the other sanitary areas they caused the lowest rates in St. Marylebone, St. Pancras, St. Giles, St. Martin-in-the-Fields, Strand, Holborn, Woolwich, and Plumstead; and the highest rates in Fulham, Chelsea, Hampstead, Hackney, City of London, St. George-in-the-East, Newington, and Battersea. Only 1 case of small-pox was notified in London during May, against 3 and 4 in the two preceding months; this case occurred in Bermondsey sanitary area. No small-pox patients were under treatment during last month in any of the Metropolitan Asylums Hospitals. The prevalence of scarlet fever in London almost corresponded with that recorded in the preceding month; among the various sanitary areas this disease showed the highest proportional prevalence in Fulham, Hampstead, Stoke Newington, Hackney, Clerkenwell, St. George Southwark, Newington, and Battersea. The Metropolitan Asylums Hospitals contained 2147 scarlet fever patients at the end of May, against 2640, 2358, and 2270 at the end of the three preceding months; the weekly admissions averaged 223, against 214, 208, and 218 in the three preceding months. The prevalence of diphtheria in London during May showed an increase upon that recorded in the preceding month; this disease was proportionately most prevalent in Chelsea, Westminster, Hackney, St. Luke, St. Saviour Southwark, and Lewisham sanitary areas. There were 917 diphtheria patients under treatment in the Metropolitan Asylums Hospitals at the end of May, against 1042, 1009, and 923 at the end of the three preceding months; the weekly admissions averaged 134, against 140, 129, and 111 in the three preceding months. The prevalence of enteric fever in London during May showed a further marked decline from that recorded in recent months; among the various sanitary areas this disease showed the highest proportional prevalence in St. Martin-in-the-Fields and St. George-in-the-East. The Metropolitan Asylums Hospitals contained 54 enteric fever patients at the end of May, against 84, 64, and 59 at the end of the three preceding months; the weekly admissions averaged 8, against 12 in each of the two preceding months. Erysipelas was proportionally most prevalent in Hackney, St. Luke, Bethnal Green, Whitechapel, and Rotherhithe sanitary areas. The 12 cases of puerperal fever notified in London during May showed a marked decline from those recorded in any recent month, and included 2 in Whitechapel and 2 in Wandsworth sanitary areas.

The mortality statistics in the table relate to the deaths of persons actually belonging to the various sanitary areas of the metropolis, the deaths occurring in the institutions of London having been distributed among the various sanitary areas in which the patients had previously resided. During the four weeks ending Saturday, May 28th, the deaths of 5419 persons belonging to London were registered, equal to an annual rate of 15·7 per 1000, against 21·4, 20·8, and 18·1 in the three preceding months. The lowest death-rates in the various sanitary areas were 9·4 in Hampstead, 12·7 in Battersea, 12·8 in Stoke Newington, 13·2 in Hackney, 13·3 in Camberwell, and 13·5 in St. James Westminster; the highest rates were 20·8 in Holborn, 21·1 in City of London and in Woolwich, 21·3 in St. George-in-the-East and in St. George Southwark, 21·8 in Strand, 23·2 in St. Luke, and 26·6 in St. Olave Southwark. During the four weeks of May 745 deaths were referred to the principal zymotic diseases in London; of these, 329 resulted from measles, 204 from whooping-cough, 104 from diphtheria, 47 from diarrhœa, 43 from scarlet fever, 18 from enteric fever, and not one either from small-pox, typhus, or any ill-defined form of continued fever. These 745 deaths were equal to an annual rate of 2·2 per

* Including 21 cases of membranous croup.

† Including deaths from membranous croup.

1000; no fatal case of any of these diseases was registered during the month under notice in St. Martin-in-the-Fields; in the other sanitary areas they caused the lowest death-rates in St. George Hanover-square, St. James Westminster, Hampstead, Stoke Newington, Strand, City of London, and Newington; and the highest rates in Chelsea, St. Marylebone, St. Luke, Limehouse, St. Saviour Southwark, St. Olave Southwark, and Plumstead. The 329 fatal cases of measles were 37 above the corrected average number in the corresponding periods of the ten preceding years; this disease showed the highest proportional fatality in Chelsea, Marylebone, St. Giles, Holborn, Limehouse, Rotherhithe, and Plumstead sanitary areas. The 43 deaths from scarlet fever were 23 below the corrected average number; the mortality from this disease was highest in Shoreditch and St. George Southwark sanitary areas. The 104 fatal cases of diphtheria were 39 below the corrected average number; among the various sanitary areas this disease showed the highest proportional fatality in Chelsea, Hampstead, St. Luke, Poplar, and Lewisham. The 204 deaths from whooping-cough were 39 below the corrected average number; the mortality from this disease was highest in Fulham, Bethnal Green, Mile End Old Town, St. Saviour Southwark, and St. Olave Southwark sanitary areas. The 18 fatal cases of enteric fever were 17 below the corrected average number; the mortality from this disease last month showed no marked excess in any of the sanitary areas. The 47 deaths from diarrhœa were 16 below the corrected average. In conclusion, it may be stated that the aggregate mortality in London last month from these principal zymotic diseases was 12 per cent. below the average, the deaths from each of the diseases except measles being below the average.

Infant mortality in London, measured by the proportion of deaths of children under one year of age to registered births, was last month equal to 127 per 1000. Among the various sanitary areas the lowest rates of infant mortality were recorded in St. George Hanover-square, Hampstead, St. Martin-in-the-Fields, Whitechapel, Newington, and Plumstead; and the highest rates in Chelsea, Clerkenwell, Limehouse, St. Saviour Southwark, St. Olave Southwark, Rotherhithe, and Lee.

THE SERVICES.

NAVAL MEDICAL SERVICE.

STAFF-SURGEON FRANCIS AUSTEN JEANS has been promoted to the rank of Fleet-Surgeon in Her Majesty's Fleet.

ARMY MEDICAL STAFF.

Surgeon-Lieutenant O'Gorman is transferred from Aldershot to Dublin for duty. Surgeon-Major Forman is posted to the Station Hospital, Western Heights, Dover, for duty. Surgeon-Major Pike has assumed Medical Charge of the District Staff, Army Pay Department, Fire Brigade, Military Police, Model School, women and children, and Hospital for Soldiers' Wives, Aldershot. Surgeon-Major McCormack and Surgeon-Captain Kelly hold themselves in readiness for service in Egypt next month. Surgeon-Captain Beach has joined at Woolwich for duty. Surgeon-Captain Thomson is held in readiness for service in Egypt.

INDIA AND THE INDIAN MEDICAL SERVICES.

Surgeon-Captain Hore (Bengal) is appointed to officiate as Residency Surgeon in the Persian Gulf until further orders. Surgeon-Captain Stevens is appointed Resident Medical Officer of the Medical College Hospital at Calcutta, and is also appointed to act as Professor of Physiology, Medical College Hospital, Calcutta, during the absence on furlough of Brigade-Surgeon-Lieutenant-Colonel D. D. Cunningham, C.I.E.

ARMY MEDICAL RESERVE OF OFFICERS.

Surgeon-Captain J. W. T. Gilbert to be Surgeon-Major.

VOLUNTEER CORPS.

Rifle: 5th (the Hay Tor) Volunteer Battalion the Devonshire Regiment: Surgeon-Lieutenant W. H. Webb to be Surgeon-Captain. 1st (Brecknockshire) Volunteer Battalion the South Wales Borderers: The surname of the medical officer hitherto described as Brigade-Surgeon-Lieutenant-Colonel Shrimpshire is Skrimshire. 2nd (Berwickshire) Volunteer Battalion the King's Own Scottish Borderers: Surgeon-Lieutenant J. McWatt, M.B. Edin., resigns his commission. 6th Volunteer Battalion, the Manchester Regiment: Surgeon-Major T. Fort to be Surgeon-Lieutenant-Colonel.

THE SPANISH-AMERICAN WAR.

We said quite recently that the war was fast approaching its most critical stage and that everything depended upon the nature of the measures adopted at the present time whether it was soon to be within measurable distance of its end or not. There has since then been much to chronicle, but there is the same perplexing difficulty in trying to separate fact from fiction or mere rumour in the intelligence which has been received. The exaggerated accounts, too, of the fighting, when compared with the results, are often ludicrous. We think the following may, however, be taken as representing a fairly reliable, or highly probable, view of the position. Admiral Cervera's fleet is at Santiago. Lieutenant Hobson, belonging to the Construction Department of the United States Navy, and his crew on board the *Merrimac*, by a very bold and daring act of bravery executed with rare skill and coolness, have succeeded in sinking that vessel pretty fairly athwart the throat of the channel to the harbour—in other words, the Spanish fleet is "bottled up" there. We are glad to notice that the Americans have fully recognised, by the way, the chivalric generosity displayed by Admiral Cervera on the occasion in question, which may hereafter prove very useful to Spain when the terms of peace have to be settled. A large invading force is reported to have left America for Cuba for the capture of Santiago. It seems certain, moreover, that Santiago has been again bombarded by the American fleet. In the Philippines it is alleged that the insurgents have nearly surrounded Manila and have on several occasions defeated the Spanish troops in their encounters with them. As regards the Cadiz squadron the news is as conflicting and contradictory as it was a short time ago in regard to Admiral Cervera's fleet, but it is most probable that the Cadiz fleet is still there or somewhere in the vicinity. The most curious thing about the war, which was long foreseen as probable, is that neither side was prepared for it and that Spain in particular seems to have done little or nothing with the forces—naval or military—at her disposal. The description of the hospital arrangements at Key West (published in the *Standard* of June 7th from its special correspondent with the army at Tampa) does not give a favourable account of them. The choice of Key West was no doubt forced upon the Americans from its geographical position, but it is in most respects a very unsuitable climate and locality for the accommodation of sick and wounded soldiers, and much remains to be done before even the best that can be practically made of it has been attained. According to the descriptions that have been given of the United States hospital ship *Solace*, commissioned with Admiral Sampson's fleet, it must be a very fine floating hospital. It flies a Geneva Cross flag and carries no arms or weapons of war. It has a number of launches for rescuing the crews of vessels sunk in action. The equipment of the *Solace* is very elaborate and complete: lifts, ice-making machinery, operating rooms, pharmacy, means of disinfection, and all the latest surgical and scientific appliances. The medical and nursing staff on board is upon an ample scale.

APOTHECARIES IN THE FRENCH ARMY.

The new Cadre of the French Army Medical Service provides for 115 apothecaries, in addition to the 1457 medical officers whose grading was recently mentioned in this column.[1] The apothecaries are graded as follows: Inspector, 1; principal apothecaries of the first and second class, 4 and 5 respectively; apothecary-majors of the first and second class, 30 and 45 respectively; assistant apothecary-majors of the first and second class, 20 and 10 respectively. The next examination for admission to the service, whether as medical officer or apothecary, is to take place next December. All candidates must be born or naturalised Frenchmen, not less than twenty-six years of age, and possessing diplomas as doctors of medicine or first-class apothecaries. They must also produce certificates of aptitude for military service granted by officers of not lower rank than surgeon-major, and be prepared to sign an agreement to serve with the colours for at least six years after gaining their first step.

A MEDICAL HERO.

The Cross of the Legion of Honour has been conferred upon Dr. Abbatucci, a French naval surgeon, for gallant conduct under circumstances which recall the brave conduct in the New Zealand war of two officers of the Army Medical

[1] THE LANCET, May 7th, 1898, p. 1283.

Department — Surgeon-General Mouat, V.C., and the late Surgeon-General (afterwards Director-General) Mackinnon.[2] The description of Dr. Abbatucci's exploit in the *Journal Officiel* runs as follows: "In the affair at Diagouron (Soudan) he not only distinguished himself by attending to the wounded under fire, but also took a prominent part in repelling the enemy, with his own hands keeping up a well-directed rifle fire in order to encourage by his example a section of *tirailleurs*, and subsequently doing gunner's duty for an officer of artillery whose men for the most part were *hors de combat*."

THE COMMANDER-IN-CHIEF.

The rumour that Lord Wolseley had been offered the appointment of the Governor-Generalship of Canada and that he might possibly be induced to accept a less arduous post than that which he at present holds seems to have obtained some credence. Nothing definite is really known, however, as to the truth or otherwise of this rumour. It is very naturally surmised that in case of Lord Wolseley's retirement he would be succeeded in his present post by Lord Roberts and that the Duke of Connaught would command the Forces in Ireland and Sir Redvers Buller would take over the Aldershot command. It was also rumoured some time ago that Lord Wolseley's health was not so good as it has hitherto always been. We should be sorry if this were so, but from his lordship's frequent appearances in public of late it certainly would not seem to be the case.

THE PARKES MEMORIAL PRIZE.

This prize, which was founded in memory of the late Professor Parkes, is awarded triennially and consists of 75 guineas in money and a bronze medal. The competition is open to all medical officers of the Army, Navy, and Indian services of executive rank on full pay. The assessors, Dr. Arthur Ransome, Dr. James Niven, and Professor Sheridan Delépine, have awarded the prize this year to Surgeon-Captain Fred. Smith of the Army Medical Staff, while stating that Staff-Surgeon W. W. Pugh, R.N., and Surgeon-Lieutenant-Colonel Andrew Duncan, I.M.S., contributed essays of great merit. The subject of Surgeon-Captain Smith's prize essay was "The Etiology, Prevalence, and Prevention of Diphtheria."

ROYAL VICTORIA HOSPITAL, NETLEY.

The under-mentioned officers, who since passing through the School at Aldershot have been serving in the Surgical Division of the Royal Victoria Hospital, Netley, are ordered to hold themselves in readiness to proceed to Egypt: Surgeon-Lieutenant P. McKessack, M.B. Aberd., and Surgeon-Lieutenant J. McD. McCarthy. The number of patients in the Royal Victoria Hospital is now reduced to about 650.

DEATHS IN THE SERVICES.

Brigade-Surgeon-Lieutenant-Colonel William Alexander Barren, on June 8th, in his 49th year. He served with the Bombay Sappers and Miners in the Afghan War of 1880 and was in medical charge of the 4th Bombay Native Infantry (medal). He also took part in the Burmese Expedition of 1886–88 (medal with two clasps).

[2] See THE LANCET, Nov. 20th, 1897, p. 1349.

MEDICAL GUILD AT CARDIFF. — At a recent meeting of members of the medical profession in Cardiff it was decided to establish a medical guild similar to the one existing at Manchester.

THE CHEMISTS' EXHIBITION, 1898.—This exhibition, now an annual event, has become deservedly popular, having developed into a well-arranged display of interesting exhibits so large as to need the commodious area afforded by the Agricultural Hall. We noticed that all the leading and conspicuously enterprising firms were represented and most of them found excellent materials in the manifold drugs, chemical preparations, &c., to form a decidedly artistic and attractive exhibition. Pharmacy was chiefly in evidence, but not exclusively, as instanced in the assortment of sanitary appliances, food and food products, photographic requisites and new developments, dental apparatus, and a great variety of advertising devices. In short, the exhibition is a success and receives support from the most reputable quarters. Last year some 25,580 persons attended and there is every reason for believing that this year that number will be largely exceeded.

Correspondence.

"Audi alteram partem."

THE ST. NEOTS CASE OF POISONING BY STRYCHNINE: AN INSTRUCTIVE CASE.

To the Editors of THE LANCET.

SIRS,—May I invite attention to one very instructive point in the history of this case? No one who has made a study of forensic medicine can fail to concur in the admirable summing up of Mr. Justice Hawkins or in your leading article on the case. But the point which it is especially desirable to emphasise is the bearing upon experimental science. The first point in the trial was to establish the fact that the victim died by poisoning and by what poison. How was this fundamental point proved? Dr. Thomas Stevenson, scientific analyst to the Home Office, stated first that he found strychnine in all the organs he removed from the body. He arrived at the conclusion that death was due to poison by means of the approved chemical tests, and also by *physiological tests — i.e., he gave some of the poison to animals.* What will the anti-vivisection bigots say to this application of experimental science to the aid of justice? Of course, it is hopeless folly to reason with minds possessed of one idea. But a case of this kind deserves special record for the benefit of mankind and the sound administration of justice. But this is not all. The enormous quantity of strychnine administered in this case defied successful treatment. Experiment, however, has proved that poisoning by such a dose of strychnine as would be sufficient to kill may be successfully treated. I have always looked back upon my work with Marshall Hall as one of the most fortunate and instructive events in my career. I assisted him in the following experiments. A frog was poisoned by subcutaneous injection of strychnine. If left in a state of perfect quiescence no convulsion occurred and it recovered. But another frog treated with the same dose suffered attacks of convulsion by simply shaking the table on which it rested or by irritating the skin and the repeated provocation of convulsive fits ended in its death.

Now what is the practical lesson dictated by this experiment? It teaches how to treat convulsion. Absolute rest is the first condition. Observing this rule, I have several times rescued women suffering from albuminuric convulsions by close watching and making them inhale chloroform or nitrite of amyl on the first sign of approaching convulsion. The recurrence of convulsive fits is a main factor in causing the death. The repeated shocks to the nervous centres exhaust and paralyse the nervous power. Avoid these shocks and the first cause of the nervous distress may be eliminated. I have had one striking example of this truth in a case of poisoning by strychnine. An officer in the army given to the free use of alcohol and repudiating heel-taps, swallowed in one draught a bottle of physic containing one grain of strychnine. The direction was to take a sixth part twice a day. He was seized with violent characteristic convulsions. Fortunately I was at hand. I immediately put him under chloroform and put him under the care of an assistant, who assiduously watched him, making him inhale the anæsthetic whenever nervous disturbance threatened. This was continued for the whole night. Next day the poison had been eliminated and he recovered. Here, then, is clear evidence of the value of experimental physiology in the saving of human life. Is the sacrifice of a frog to be regarded as sinful when applied to the saving of human life? What can be said for the sportsman who shoots a bird for mere sport or for the butcher who kills a sheep to find us food?

I am, Sirs, yours faithfully,

June 13th, 1898. ROBERT BARNES.

"GENU RECURVATUM."

To the Editors of THE LANCET.

SIRS,—Dr. Taylor's case of genu recurvatum (described in THE LANCET of June 11th) with delayed development of the patellæ is instructive as showing the tendency to spontaneous cure which this deformity so often evinces. Even extreme cases may recover practically without treatment.

For instance in Hilton's case,[1] the patient who had first walked on the condyles of her femurs with the legs directed horizontally forward and usually fell asleep sucking one of her own big toes, recovery was complete at the age of twenty-seven years. No doubt the cure in this case would have been much hastened by proper treatment by splints and massage. The immediate cause of the deformity appears to be deficient development of the tendon of the quadriceps extensor. Whether this is primary or secondary to malposition *in utero* is, like the etiology of the often accompanying club-foot, a disputed question and one which does not much affect treatment. Dr. Taylor and others have noted deficiency of liquor amnii, but on the other hand, hydramnios has often been recorded in such cases. Genu recurvatum is almost invariably present in cases of absence of patella, on which I wrote in THE LANCET of Sept. 25th, 1897. The treatment which I adopted and then described in your columns has generally proved successful in the hands of others as well as myself. It consists in promoting flexion by manipulations and splints and in preventing the recurrence of hyperextension by the latter means. The development of the tendon and of the patella may be encouraged by massage of the front of the knee and thigh. Whether such means would have been successful in such an exceptional case as that described by Mr. Sheild may well be doubted. Probably section of the tendon and capsule as practised by Mr. Edmund Owen would have been necessary.

It seems likely that this and some other deformities of the knees are much less rare than has been generally supposed and that they have either been overlooked when slight or else were not formerly thought worth recording. Thus as regards absence of the patella, a year ago, when my paper was written, I was only able to find records of 42 cases, but since that time I have collected notes of five more cases from contemporary medical journals.

I am, Sirs, yours faithfully,

Seymour-street, W., June 11th, 1898. E. MUIRHEAD LITTLE.

A QUESTION OF DIAGNOSIS.

To the Editors of THE LANCET.

SIRS,—Recently I was called to see some cases where there was doubt as to the true nature of the disease. There were four children all of whom had sore-throat and one a rash somewhat like a scarlet fever rash but more dusky than it usually appears in that disease. On inspecting the throats I found a limited amount of exudation membrane, but one child had croupous breathing and running at the nostrils. The temperature was not above 102° F. I considered all the cases to be diphtheritic. The practitioner who called me in—a gentleman of much experience—was of the same opinion and as the patients were all in one small room which was shared by other members of the family he sent the necessary notifications direct to the hospital to ensure their early removal, the town-hall being by that time closed for the day. Receiving notice that the medical officer at the hospital had notified these cases as scarlet fever I saw our medical officer of health and told him that I still looked upon them as cases of diphtheria. He told me that one child had since died, the cause of death being given as scarlet fever and "septic" sore-throat, but he could give me no information as to the means which had been taken at the hospital to verify this diagnosis. It has occurred to me that it would be well if in connexion with the sanitary department of every important district there could be facilities afforded for making cultivations of membranes, &c., so that points of such vital importance might be cleared up without delay. In connexion with this matter and while still in doubt as to the most important part of the case my notification certificates were returned to me with a note solemnly calling my attention to the fact that I had omitted to fill in the blanks to show whether Mary and John respectively were male or female! I am, Sirs, yours faithfully,

Kensington, June 8th, 1898. ALFRED E. BARRETT.

AN URGENT CASE.

To the Editors of THE LANCET.

SIRS,—We venture to bring a pitiable case to the notice of the medical profession. Mr. James McGregor Laing, a surgeon in the employment of the Coolie Emigration Service, died in Calcutta on July 6th, 1889, leaving a widow and four children, a girl and three boys, totally unprovided for. Assisted by friends the widow took a boarding-house in Bayswater, but eventually failed to make ends meet. For the last few months she has lived in a small office in 16, Colville-road, W., a tiny place, without fireplace of any kind. The rent of this has been paid up to the end of this month by some generous Freemasons. She has tried to get dressmaking work and has not succeeded in doing so. Since her failure she has had grants of £10 and £12 from the British Medical Benevolent Fund, £10 from Grand Lodge, and small amounts from other Masonic lodges. Her children's ages are: the girl fourteen years, the boys twelve, eleven, and nine. The girl is at school, by the kindness of the teachers obtaining tuition without charge. The eldest boy has been elected into the Masonic School but is too ignorant to be admitted, the second is a candidate for Epsom. The boys go to the Westbourne Park Schools at present, helped to do so by the clergy of All Saints, Notting-hill. For a long time the providing of food for these hungry young mouths has been an intense anxiety to the mother; indeed, there actually has not been a sufficient supply of proper nourishment. Mrs. Laing will have to leave her present abode at the end of this month as she has no money to pay the rent.

We can personally guarantee the urgency of this poor lady and are desirous of placing her in a small shop to enable her to gain a living for herself and her children. We strongly recommend the case to the generous consideration of your readers. We shall be glad to receive any subscriptions or offers of help on Mrs. Laing's behalf.

We are, Sirs, yours faithfully,

J. PICKETT, M.D. St. And.,
26, Colville-square, W.
REGINALD HARTLEY, M.D. Durh.,
68, Porchester-terrace, W.

June 10th, 1898.

THE CATHOLICITY OF THE METROPOLITAN HOSPITAL SUNDAY FUND.

To the Editors of THE LANCET.

SIRS,—Referring to your special supplement circulated in the churches on Hospital Sunday, which is an excellent *résumé* of the position of medical charities, I beg to call your attention to the following statement in the closing sentence of the paragraph on the Prince of Wales's Hospital Fund: "The objects of *each* fund are the same." You may not be aware of the fact that dispensaries and other medical charities are *entirely excluded* from any benefit from the Prince of Wales's Hospital Fund; only hospitals *pure and simple* get grants. The Sunday and Saturday Funds benefit all medical institutions that are willing to conform to certain regulations made by the committee of the funds. I am a director of, and much interested in, the Marylebone Dispensary, 77, Welbeck-street, W., and regret to find that this institution is excluded from any benefit from the Prince of Wales's Fund, *not* being a hospital. I am certain we are losers by this new fund, as subscribers to it, in many cases I know, thought we would get our share at the Marylebone Dispensary and have therefore not given as formerly.

In the interest of charity I think this point ought to be clearly stated in favour of the Sunday Fund as distinct from the Prince of Wales's Fund in all future appeals.

I am, Sirs, yours faithfully,

GEORGE CUNNINGHAM.

Junior Athenæum Club, Piccadilly, W., June 13th, 1898.

THE COMING ELECTION TO THE COUNCIL OF THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

To the Editors of THE LANCET.

SIRS,—As the election for the Council of the College of Surgeons is approaching it seems reasonable that the electors should know the opinions of those for whom they are to vote. It has been urged that it is undignified for candidates for the Council to canvass for support on account of any special line of policy, as the selection depends rather on their professional eminence. Against this I would say that professional eminence by no means implies sound medical policy, as recent meetings of the General Medical Council have very clearly shown, nor do candidates for any other responsible position expect to be elected without some

[1] Lectures on Rest and Pain, THE LANCET, vol. ii., 1862, p. 497.

general indication of the line of policy which they intend to pursue. The Council of the College of Surgeons is far too much under the control of the large London schools, and until this domination is broken there will be no reasonable reform. It is no sufficient guarantee of the fitness of a candidate for the Council that he is a junior member of a London hospital and may find employment on the examining board of the College. As to the existing members, they have remained silent when they should have protested and it is time that things were a little improved. The Government of the day is expected to defend its actions in terms which its outside constituents can understand and it is inconceivable that any elected body except the College of Surgeons' Council should treat its electors in the contemptuous manner which this body has always assumed. As some points on which I would be glad to hear the opinion of candidates I may mention the following: the defence of the rights of Fellows and Members of the College, the performance of the ethical parts of its duties, and the restitution to the corporation of its lawful right to elect a representative on the General Medical Council.

I am, Sirs, yours faithfully,

June 14th, 1898. F.R.C.S.

A CASE OF SEPARATION OF THE LOWER EPIPHYSIS OF THE FIBULA.

To the Editors of THE LANCET.

SIRS,—On June 13th I was called to a boy who had fallen from a horizontal bar. I found a compound separation of the lower fibular epiphysis. Diagnosis was easy owing to the compound nature of the injury. The separation was through the cartilaginous zone. The foot was inverted. The lower end of the diaphysis protruded and its skin covering was tightly tucked in for a good inch beneath it. A single case only is on record in Mr. Pick's book on fractures, which makes the present one worth mentioning.

I am, Sirs, yours faithfully,

J. E. S. BARNETT, F.R.C.S. Eng.

Kingston-hill, June 14th, 1898.

"THE ALLEGED DEARTH OF QUALIFIED ASSISTANTS."

To the Editors of THE LANCET.

SIRS,—Probably the individual experience of medical practitioners as to the working of the regulations of the General Medical Council *re* unqualified assistants would be of some interest and may be of some use in gauging the far-reaching consequences of such action. In my district the effect so far has been that a stimulus has been given to the practice of midwifery by midwives and to unqualified practice on the part of chemists and herbalists. I am myself unable to obtain the services of a qualified assistant either by advertisement or through an agent, and as the services of an unqualified assistant are no longer available for midwifery work I am placed at a serious disadvantage in my competition with the midwives who have largely increased in numbers in my district. And the point I wish to emphasise is that one at least of them to my knowledge is taking pupils to enable her to get through her work. I should like to suggest that it is a great hardship to qualified medical men that we are not allowed to take midwifery pupils in the same way.

I am, Sirs, yours faithfully,

Bethnal-green, June 9th, 1898. A MEDICAL PRACTITIONER.

To the Editors of THE LANCET.

SIRS,—If it is generally true, as "A General Medical Practitioner" states, that there is now a great dearth of qualified assistants I think it is a fact on which the whole medical profession is to be congratulated and for which the General Medical Council should be heartily thanked. It proves that the sad state of congestion of a few years back was due not to the existence of too many qualified men but to the unfair competition of unqualified assistants, who were paid starvation wages and did work for which it is only reasonable to suppose they were unfitted while their employers took the fees. Why should a man undertake more work than he can perform and pay another to do part of it for him? The custom in the medical profession now is for one man who happens to be the senior in the town or district to take all the appointments he can, often at an absurd remuneration, and hire an assistant to do the work. While the assistant was unqualified it was simply a fraud on the public, and even now it is a dog-in-the-manger method of preventing any other man from making a living unless he is willing to become a paid servant liable to dismissal at the whim of his employer. I believe the whole profession would gain in every way if there were no more assistants, except as probationers with a view to partnership, and no man undertook more than he could perform. The well-established practitioner would then think twice before he took a Poor-law or club appointment at a price that would not pay for good drugs, and the public would gradually learn that if they want experienced men they must pay for them. The vicious system of keeping out another man at any price would be knocked on the head and your correspondent would find more reasonable fees a better protection against "the wolf" than any number of underpaid assistants.—I am, Sirs, yours faithfully,

June 11th, 1898. ANOTHER G.P.

TANGIER AS A HEALTH RESORT.

(FROM A SPECIAL CORRESPONDENT.)

FROM Cadiz I sailed for Tangier and thence to Gibraltar. My stay in Tangier was of short duration and I have not much to add to what I wrote concerning this place in the year 1887.[1] The climate, needless to say, remains the same. The prevailing winds are sea winds, the north-west, west, and south-west being from the Atlantic and more suitable to British constitutions than the Mediterranean winds which, with the land winds, alone prevail on the French and Italian Riviera health resorts. The only land wind at Tangier is from the due south and the heat and unpleasantness of this wind are mitigated because it has to pass over the eternal snow of the Atlas mountains before it can reach the town and neighbourhood. Also there is not so great a change of temperature at sunset as on the Riviera but, on the other hand, the atmosphere is more damp. The description I gave when last writing on this subject of the vegetation clearly proved the climatic advantages enjoyed at Tangier and the beneficial effects of the atmosphere were set forth by evidence collected at the hospitals and from the local practitioners. But, above all, Tangier stands out pre-eminent as the nearest and the safest place where a complete change can be enjoyed. The dread of European interference is so great that all crime is most rigorously dealt with, so that the visitor or patient is as safe at Tangier as in any part of Europe and yet the change is complete.

In 1887 I wrote that at Tangier there were "no regular roads, no carriages, no railways, no inland post, no municipality, no rates and taxes for Europeans to pay, no standing army or drilled troops, no daily newspaper, no public opinion, but, under the capitulations, thirteen Christian and one Mahomedan constitutions having the force of law." To-day the position of affairs has been somewhat modified, and this picture is no longer accurate in all its details. First of all a municipality has now been created. It originated some nine years ago in a voluntary association of European subscribers. This self-created constituency elected its representatives and contributed the necessary funds. The first work done was the repaving of those portions of the town where the Europeans reside. Then, with a view to opening out for building purposes the highlands or plateau to the west of the town known as the Marchand, a good carriage road was built from the town to this outlying, well-exposed, and healthy district. It is true that there are not yet any carriages, but the good road makes it easier to take up provisions and to ride backwards and forwards. This road is 7 metres wide and has proper supports. Then a main system of drainage was built outside the town which discharges through pipes into the sea at low-water level. The foreign ministers or consuls preside over the meetings of the municipality, which has acquired such influence that it has been able to obtain from the Sultan of Morocco the permission to control the slaughter-houses, and the charge made for the slaughtering of cattle has now become a source of municipal revenue. Efforts are being made to

[1] See THE LANCET, May 7th, 1887.

obtain a similar control over the markets, but this is opposed by the Spanish Embassy, for the Moor who has the concession for the markets from the Sultan is under Spanish protection. This summer it is proposed to pave the larger "soko" or market outside the town, so that the natives who bring up cattle shall no longer have to sleep on the mud and manure of this picturesque but very filthy place. With regard to medical services, the municipality keeps anti-diphtheritic serum in stock and has made arrangements for the gratuitous treatment of all sufferers. Then, when there were some cases of cholera at Tangier in 1895 a soup kitchen was organised by the ladies of the town, with Mrs. Ion Perdicaris as the lady president. A bazaar was held which brought in £400, and this is a very large sum for so small a town. The natives were not only supplied with soup but with clothes, seed, &c. These charitable efforts were not merely useful in relieving distress but they helped to prevent the spread of the epidemic. There are likewise religious and medical missions and recently an effort has been made to establish a chair for teaching surgery to the native Moors. Thus it will be seen that some progress has been achieved and that European methods have been introduced in spite of the resistance and conservative instincts of the Moors. A jealous vigilance, however, should be exercised lest all the special charm and attractiveness of Tangier be improved out of existence.

It is from the psychological point of view that Tangier is to be especially recommended for the treatment of certain diseases. A sojourn in that town ensures a complete change to the eye and to the mind. Everything is—or rather was—different from what the dweller in a western European city is accustomed to see and hear. The dress, features, customs of the Moors and other native populations, the appearance of their houses and streets, their means of transit, the pack saddles, the mules, the camels, the absence of conveyances on wheels, and of the ordinary rules which govern and regulate a town—all this seems so strange, so interesting and picturesque, that it provides the complete mental diversion and rest which prove so often highly beneficial to patients suffering from the strain of our overwrought civilisation. Unfortunately, Tangier is losing these most interesting and useful characteristics. A large number of commonplace, ugly Spanish houses have been built on the Marchand, and on the opposite side of the town outside the old walls there is an entire street of Spanish cottages and houses. Formerly, the beach was reached on this side by clambering down in the bed of the moat under the grey walls and battlements which defended the city. It was a rough but romantic walk. Now we find a paved, ugly, commonplace Spanish street. It is not worth while to take the slightest trouble to see such an inartistic thoroughfare. Then, again, a European hotel has been built in the centre of the town, spoiling by its shapelessness and utter absence of appropriateness or of artistic sense the Moorish and picturesque aspect of the main street. If this sort of improvement continues travellers will abandon Tangier and will frequent Tetuan or some other place as yet undesecrated by the ugliness of European progress. A European town will always be better built and more handsome in Europe than in the midst of a Moorish community in Africa. If people travel all the way to Morocco it is to see Moorish architecture and buildings and not bad reproductions of what they have left behind them in Europe. Nor will it tend to strengthen the cause of sanitary reform if the fact that some ameliorations have been introduced in the drainage or the markets of Tangier means that the beauty of the place is to be destroyed. The modern changes alluded to above will not alter the climatic advantages of Tangier, but they will do away with its special attractiveness as a town more Oriental in appearance than Constantinople. It will no longer be, as at present, a veritable haven for artists and a place where the invalid may combine the advantages of a change of climate with a complete change of surroundings. As yet the mischief has not gone too far, but it must not go any farther. There is no reason why new houses should not be built in keeping with the style and with the genius of the country, particularly as the small European houses which are springing up in all directions are not only utterly devoid of artistic taste and in complete discord with the surroundings but are also very unsuitable to the climate. With an artist of such repute and skill as Mr. Ion Perdicaris acting as one of the leading members of the Tangier municipality it should be possible to check the present tendency to spoil the beauty of the town.

Tangier.

LIVERPOOL.

(FROM OUR OWN CORRESPONDENT.)

Hospital for Women, Shaw-street.

DR. E. T. DAVIES, who has been an honorary assistant medical officer at the Shaw-street hospital since its formation in 1883, has sent in his resignation to the committee. Owing to the resignations of Dr. Davies and Dr. Smart and to the promotion of Dr. Gemmell to the senior staff the junior posts are all vacant. I understand that a radical change will be made in the *personnel* of the junior staff and I am also informed that the committee contemplate the appointment of a non-resident stipendiary medical officer who will perform the duties of an assistant medical officer and will also act as anæsthetist. These changes appear to carry the approval of the medical staff and probably are about to take place on their initiative.

Hospital Saturday Fund: Annual Street Collection.

The annual street collection by ladies on behalf of the local hospitals took place on Saturday, June 11th. Last year the amount collected in a similar way reached the total of £623. As far as is at present known the amount collected on Saturday has exceeded £690.

The Stanley Hospital: Anonymous Munificence.

An anonymous donor has presented through the Lord Mayor of Liverpool the sum of £2000 for the extensions contemplated by the committee of the Stanley Hospital. The Lord Mayor suggests that this generous gift should be utilised for the erection of the south wing of the hospital. By this means accommodation would be made for 60 beds and the overcrowding in the administrative block would be also relieved, while at the same time the capacity of the institution would be increased to 100 beds or more.

Workmen's Compensation Act, 1897: Appointment of Medical Referee.

The Home Secretary has appointed Mr. George G. Hamilton, F.R.C.S. Eng., medical referee under the Workmen's Compensation Act for the Liverpool County-court Circuit. The remuneration will be at the rate of 2 guineas for a first examination and report and 1 guinea for a further report on the same case. Three guineas will be paid for attendance at the county-court or other place to be arranged at the request of the judge. Additional fees will be paid for mileage when the distance exceeds two miles, at the rate of 5*s.* per mile. No fee under 1 guinea will be offered for any subsequent reference to a case under dispute. Mr. Hamilton was formerly honorary surgeon to the Liverpool Northern Hospital and is now assistant surgeon to the Liverpool Royal Infirmary. The practical surgical experience gained at those hospitals ought to be a sufficient guarantee of the competence of Mr. Hamilton for the duties of this most delicate and responsible post. The position is one which will require the exercise of a calm judgment and a mind unbiased and free from any taint of prejudice.

Bootle Town Council: A Medical Officer of Health's Claim.

The Bootle Council have decided to recoup Mr. James Pearson, their medical officer of health, for a portion of the expenses incurred by him owing to his recent illness, alleged to have been due to his inspection of certain foul privies in the borough. The sum of 50 guineas (which does not represent the total loss sustained by Mr. Pearson) was voted by the Council to their medical officer; at the same time they did not admit their legal liability in the matter.

June 14th.

SCOTLAND.

(FROM OUR OWN CORRESPONDENTS.)

Edinburgh University.

A REPRESENTATION was recently submitted to the Senatus of the University of Edinburgh by British practitioners of medicine in Italy requesting that the University should take steps to prevent if possible the passing of a law to prevent medical men with British qualifications from practising in Italy. The Senatus prepared a memorial in support of the existing conditions under which British graduates in medicine practise in Italy. This was submitted by the Scottish Office to the Foreign Office, from which a communication

has now been received to the effect that it has "been decided not to alter the existing law relative to foreign doctors in Italy," a decision which is in all respects satisfactory to many graduates of Edinburgh.

Faculty of Physicians and Surgeons, Glasgow.

At the June meeting of the Fellows Lord Lister was unanimously elected an honorary Fellow of the Faculty. The connexion of Lord Lister with the Glasgow school extends back to 1860, when he was appointed Professor of Surgery in the University and at that time he became an ordinary Fellow of the Faculty. It was in the Glasgow Royal Infirmary that the clinical basis of the modern practice of antiseptic surgery was laid and the recent action of the Faculty is a proclamation of their desire to do honour to one whose name they are proud to record upon their roll.

University College, Dundee.

A meeting of the council of the College was held on June 8th, when the Principal intimated that the Secretary for Scotland had paid over to the University of St. Andrews the grant for the year and all the arrears consigned to him by the Scottish University Commissioners. It is therefore probable that the appointments to the chairs necessary to complete the Medical School at Dundee will be made at an early date, in time to allow a full curriculum to be offered in the next winter session. The election to the new chairs is in the power of the University Court of St. Andrews. By the will of the late Mr. David Myles, C.A., the sum of £10.000 has been bequeathed to the College and £1000 to the Royal Infirmary, Dundee.

West of Scotland Consumptive Homes.

An anonymous donor has informed Mr. Quarrier that he is prepared to build the second block of the hospital for phthisical patients at Bridge of Weir, near Glasgow, at a cost of about £8000. The first of the hospitals has recently been opened. Whilst a policy which leaves so much responsibility in the hands of one man must always be open to criticism there can only be on the part of the profession a very earnest desire to see successfully in operation a scheme in which there appears to be so large a promise of practical good.

Medical Appointments.

Mr. J. F. Stevenson has been elected casualty surgeon to the St. Rollox police district, Glasgow, vice Dr. Glaister, resigned. At a recent meeting of the Glasgow City Parish Council the chairman referred in sympathetic terms to the death of Dr. Robert Orr, who had been one of the parochial medical officers for more than thirty years. Dr. Frederick Dittmar was elected to fill the vacancy.

June 15th.

IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

Death of Dr. Thomas Fitzpatrick of Dublin.

A VERY highly esteemed citizen of Dublin died on June 9th in the person of Dr. Thomas Fitzpatrick of Baggot-street. Dr. Fitzpatrick was in his ninety-second year, having graduated as M.D. of the University of Edinburgh in 1833, and become a Fellow of the Royal College of Physicians of Ireland in 1860. He was born in the county Meath in the early part of the century and was the eldest son of an eminent physician who practised there. As a medical student he had Graves and Stokes for his teachers and earned from them any prizes or distinctions in their power to bestow. He was engaged in practice in Dublin for nearly fifty years and was always highly trusted and respected. Any honours which the medical profession could offer him were at his disposal, but his habits were retiring and unostentatious. He was, however, elected not long ago to the list of Honorary Fellows of the Royal College of Physicians of Ireland of which he had been for so long a Fellow. Dr. Fitzpatrick's family were highly distinguished, his eldest surviving son being the present Sir Denis Fitzpatrick, lately Lieutenant-Governor of the Punjaub and now member of the Indian Council in London. The deceased physician's funeral was one of the most largely attended which has taken place in Ireland for many years.

Cork-street Fever Hospital, Dublin.

The managing committee of this hospital met in their board room on June 9th. The registrar reported that the admissions towards the end of May showed a considerable falling off, such as also took place during the corresponding period of last year, on both occasions the reduction being caused by the lessened prevalence of scarlet fever. Several cases of diphtheria were admitted, that dangerous affection having recently become more frequent in Dublin. Cases of enteric fever and of pneumonia were less frequent, while only one case of measles occurred. One case of typhus fever was admitted from a house which contributed several last year.

The Water-supply of Newtownards.

Dr. Clibborn, Local Government Board inspector, reports that the water-supply of Newtownards consists principally of pumps under circumstances which in the majority of cases must have unsatisfactory results. The sewerage is far from good, consisting principally of old flood sewers for county purposes and never meant for common sewers. He says that the sanitary authority should take into consideration in the first instance the providing of a good and sufficient supply of water for Newtownards. He points out that wells in towns must be liable to contamination from surface water drains and leakage from badly constructed sewers.

Portrush as a Health Resort.

The medical officer of health of Portrush, Dr. Martin, reports that the waterworks are in a satisfactory condition and the water free from pollution by sewage. The sewers have been very largely examined during the past winter and made right where defective, and during the past twelve months there have been no deaths from zymotic disease. The health of the town has been and is very good. This satisfactory report, presented to the monthly meeting of the Portrush Town Commissioners on June 7th, shows that this favourite seaside and golfing resort is in a most healthy condition.

The Belfast District Lunatic Asylum.

At the monthly meeting of the governors, held on June 13th, it was reported that a creamery had been fitted up at Purdysburn by which the institution was supplied with butter and milk without any additional cost or increase to the staff. There are 985 patients on the registers of the institution and Dr. Walter Smith, late Demonstrator of Anatomy at Queen's College, Belfast, has been appointed assistant medical superintendent, in succession to Mr. S. Graham, resigned.

Belfast Workhouse.

Mr. Agnew, the Local Government Board Inspector, in his report just issued, has drawn the attention of the ratepayers very markedly to the Belfast Workhouse. It would appear that owing to a reduction by the guardians of the rate estimate there will be an apparent deficit of £13,000 on March 25th, 1899, when the financial year ends, assuming that the grants in aid of local taxation are equal to those of last year. The guardians have increased their debt to the Belfast Bank for building purposes and other workhouse improvements by £4000 since the last report, so that the loans are now £23,000. But next year the guardians, when the new Local Government Board comes into force, will cease to be a rating authority; the corporation then as a county council will be vested with the sole power of making and collecting all the rates. Hence the only way by which the guardians can get out of their difficulty is to issue a supplementary rate to meet this threatened deficit. Further, Mr. Agnew says that the main infirmary building is overcrowded and in many of the wards there is insufficient cubic space for the sick. There is a want of lavatory and bathing accommodation for the healthy and infirm women, and the quality of the beef, as inspected by Mr. Agnew on two occasions in succession, was unsatisfactory. There is still a great scarcity of water in several portions of the workhouse. In the chief infirmary and in the convalescent wards the staff of nurses is insufficient both by night and by day, and of the 43 nurses only 5 are trained; of the remainder the large majority have only a few months' service. Mr. Agnew thinks that the nursing staff should be increased by the addition of 12 trained nurses and a few probationers. In the fever hospital the increase in the nursing staff has not been in proportion to the increased number of patients and 18 pauper inmates are employed more or less as attendants upon the sick, which is in violation of the Local Government Board's sealed order of Sept. 11th, 1897. Mr. Agnew recommends the guardians to appoint new attendants. At an inquiry held in the workhouse on June 2nd in reference to the discharge of an infant from the union infirmary who died some hours afterwards

at the residence of the parents Mr. Robert Hall, one of the visiting medical officers, stated that in his opinion the medical staff—by which he meant the resident and visiting medical officers—was not sufficient and with this view Mr. A. McConnell (another visiting medical officer) concurred. The guardians have appointed a sub-committee to consider Mr. Agnew's report and the public are awaiting their reply.

June 15th.

PARIS.

(FROM OUR OWN CORRESPONDENT.)

Formation of a Joint between the Humerus and the Clavicle.

AT the meeting of the Academy of Sciences held on May 31st M. Ollier presented a report on the formation of articulations between bones which are in the normal condition independent of each other, the necessity for so doing having arisen from the natural articulations of such bones having been irretrievably destroyed. M. Ollier has succeeded in making joints possessing both strength and freedom of motion between bones which are not under ordinary conditions directly connected with one another. In thus reuniting the bones it is possible to preserve not only the tissues which form the junction but also all that remains of the muscles which moved the original joint and, in fact, to form a new joint (*néarthrose*) surrounded by muscles sufficiently powerful for active exertion. M. Ollier reported the case of a man who was in his forty-eighth year in 1893 and who had received a gunshot wound in the shoulder in 1870. The wound healed after seven months but opened again in 1883. Successive resections were made for the purpose of checking the suppuration, the head of the humerus being removed in 1884, a portion of the scapula in 1885, and the remainder of this bone in 1890. The suppuration stopped, but the arm was powerless and tended to fall lower and lower from the clavicle, to which it was attached (and that only in front) by some muscular bundles which were not strong enough to raise it. In 1893 M. Ollier fixed the humerus to the clavicle and surrounded the approximated ends of the two bones with what remained of the scapular muscles, which eventually, the deltoid especially, acted powerfully on the new joint. After the operation the patient had no need of artificial supports and used his arm for every purpose required. For instance, he could put it on the top of his head, on his right shoulder, behind him on the back of his right thigh, and could also fold his arms—movements which were impossible for him before the operation.

Carpus Curvus.

At the meeting of the Academy of Medicine held on June 7th M. Pierre Delbet showed casts of a deformity of the wrist. The hand retained its normal shape, but was displaced as a whole, giving the appearance of a dislocation of the wrist forwards. On the posterior aspect of the wrist there was a remarkable prominence of the head of the ulna, which had evidently lost its normal attachment to the cuneiform bone. On the radial side the arrangement of parts was quite different, for instead of there being a projecting part there was an unbroken gradual slope from the forearm to the wrist. The thickness of the wrist was less on this side; the articular surface of the radius was not accessible as was that of the ulna, neither had it lost its connexions with the scaphoid and semilunar bones, but it was curved forwards. M. Delbet thought that the curving of the radius was the first stage in the train of symptoms and that this bone drew the carpus after it, giving rise to the dislocation of the cuneiform bone from the ulna. Straightening of the radius by osteotomy immediately reduced the dislocation of the ulna. As the lesion is in its way identical with genu valgum M. Delbet proposes to call it carpus curvus. When the deformity is very marked the indication is to perform osteotomy, as was done in the case just described; the deformity and the functional disability which accompanies it are thereby completely removed.

Superficial Area of the Human Body.

At the meeting of the Society of Biology held on June 4th MM. Bergonié and Sigalas stated that they had made measurements for the purpose of ascertaining the area of the surface of the human body. They first estimated the differences of area which might exist between a given plane surface and the same surface after it has been forced to assume an irregular form. Starting from this experiment they covered one half of a body with strips of sticking-plaister cut to a known size. The result for the surface of the body was 16206 square decimetres (17·4 sq. ft.). The figures obtained by M. Bouchard are about one-tenth higher than this.

Agglutination of Löffler's Bacilli.

At the same meeting of the Society of Biology M. Nicolas gave a demonstration showing that agglutination is produced when serum from a horse immunised against diphtheria is added to bouillon cultures of Löffler's bacillus. This reaction, however, is not constant but varies according to the bacilli employed, the serum being the same. It occurs in about half the cases. There is probably some biological condition which will account for the differences which have been observed in the production of the phenomena.

The Responsibility of Medical Experts.

Public attention is once more directed to the case of Dr. Méloche whom the *tribunal civil* of St. Nazaire last year ordered to pay 1000 francs (£40) damages to a woman accused of abortion. Dr. Méloche, who was the expert entrusted with the duty of examining the accused, believed that in all probability abortion had recently occurred. The woman's refusal to answer certain questions and her contradictory statements induced him to make a guarded diagnosis and three days afterwards she was delivered of a five months' fœtus; she had been arrested after his report was presented, but was immediately released, and believing that his mistake carried with it responsibility for her arrest she brought an action for damages against him. The court in giving judgment against Dr. Méloche blamed him for not having made a chemical examination of the blood, entering thereby into scientific questions its imperfect knowledge of which led to absurd expressions of opinion. This judgment was reversed by the Appeal Court on several grounds. Firstly, because the medical man in question had acted with all necessary prudence and had only given an opinion that there was a great probability of abortion having occurred. Secondly, this judgment, by affirming the responsibility of medical experts, would render their action impossible for the future. The medical expert is fallible. When he is consulted by a magistrate it is his duty to give a candid opinion and it is for the magistrate to obtain further information by reference to another expert if the report of the first one leaves him in uncertainty. An expert who, like Dr. Méloche, describes an offence as being highly probable could not be responsible for the conclusions which the magistrate, irresponsible himself, draws from the medical man's undecided opinion. Under these circumstances the case came before the Appeal Court of Rennes on May 26th and judgment was delivered on June 3rd reversing the judgment of the *tribunal civil* and declaring that Dr. Méloche had acted prudently in not giving a positive opinion in a difficult case and in not committing himself to more than the probability of the condition referred to. Furthermore, it could not be said that the opinion given by Dr. Méloche was the immediate cause of the arrest. This belongs to the province of the magistrate and consequently the medical expert cannot be held responsible for it.

June 14th.

EGYPT.

(FROM OUR OWN CORRESPONDENT.)

Imported Plague at Moses's Wells.

THE ill-fated steamer *Mehallah* is still in quarantine and likely to remain so for some time to come. It is still unknown how she contracted plague and her crew continue to asseverate that no one of them had any communication whatever with Jeddah or even Ras el Aswed, while the only remaining port, Suakin, is still declared to be quite free of plague. After the original case of the stoker of this vessel, who had undoubted plague, suspicion fell upon one of the seamen with enlarged glands, but his case was soon certified as not being plague. Now, the Egyptian doctor of this same steamer, who originally failed to diagnose the stoker's case, has not only contracted plague but has actually died from it. These are the first known instances of plague on

Egyptian territory since 1844—more than half a century ago. The earliest symptoms of the medical officer did not appear until 18 days after the stoker was removed from the ship and 11 days after the case of the suspected individual. This therefore looks as if the doctor had caught the disease from something on board the vessel itself, in spite of its having been disinfected and attempts being made to kill all the rats on board. How does one disinfect the bilge water and all the interior economy of a large steamer? Where do steamer rats live and how does one get at them to kill them? These questions are just now of the highest importance and it must not be forgotten that in many of the most recent epidemics plague has appeared among the rats of a community about the same time as it has attacked the earliest human beings. The details of the doctor's case are as follow. It is quite certain that he was well on May 21st and had no enlarged gland when he was medically inspected on that day. The patient stated that he felt perfectly well until noon on May 22nd, when he began to feel very ill and sent for Dr. Mazaraki, one of the quarantine officials, who found a temperature of 104·9° F., a pulse of 150, and a swollen and painful left femoral gland of about the size of a pea. The patient stated that the swelling of the gland was the result of an injury to his knee, but no trace of this injury could be discovered. He was at once taken ashore and isolated in hospital. Later in the day his temperature rose to 105·1° and he had some rigors, while the following day he became delirious and prostrate with stinking breath. On the 24th the urine became albuminous for the first time, the spleen was enlarged, he had many rigors, and the original gland increased in size and in tenderness. In spite of devoted treatment on the part of Dr. Hodgson, Dr. Lochelongue, and Dr. Mazaraki the unfortunate man died on the early morning of the 27th, less than five days after the onset of the symptoms. His end may have been hastened by the presence of lupus and another constitutional disease. It is fortunate that both the cases so far have been of the bubonic type and not septicæmic or pneumonic, which are obviously more infectious varieties. The Egyptian pilgrims are now undergoing twelve days' quarantine at Tor, which will be succeeded by five days' extra inspection at Ras Mallap, before they are allowed to set foot in Egypt. For the first time a thorough inspection of the women pilgrims is to be made and Miss Cutler, an English midwife and nurse, has been specially sent to Tor to superintend the native women searchers.

Fevers in Egyptian Prisons.

At the spring of the year typhus and relapsing fevers always make their appearance in any crowded and very insanitary community, and as most of the Egyptian prisons, owing to poverty and carelessness of the Government, contain all the predisposing factors for promoting such diseases, they have for some years attained an unfortunate notoriety, even in Egypt. During the late spring months the following prisons have suffered from relapsing fever, in some cases complicated with typhus fever also: Tourah, Hod el Marsoud, and Zaptieh, all three being in Cairo; Ghizeh, Alexandria, Damanhour, Tantah, Benisouef, Zagazig, Kap el Zayet and Tel el Baroud. The only casualty among the medical officers is the much-regretted death of Dr. S. G. Kartulis from typhus fever at Alexandria, on April 27th. The published statistics for the month of March alone give 415 cases of these fevers in prisons with as many as 30 deaths. The number of deaths would probably have been greater had not Dr. Wilson temporarily placed himself at the service of the prisons department. He instituted satisfactory rules as regards hygiene, baths, food, and work which no doubt put an end to the various epidemics early in May. As a consequence of these outbreaks all over the country Coles Pasha has obtained leave to strengthen his administration by the new appointment of Dr. Parker, lately of the Eastern Fever Hospital, Homerton, London, as chief medical officer. The various natives now serving under him are quite ignorant of sanitation and preventive medicine, having been mostly educated in the prehistoric days, but none of them are too old to learn new ways. £13,000 were granted last year for building new prisons and £20,000 are to be spent this year, and every effort is being made to lessen the number of unnecessary prisoners. The prison department was one of the earliest of English reforms here in 1883, but it has of late years been pushed aside by more pressing claims.

AUSTRALIA.

(FROM OUR OWN CORRESPONDENT.)

Infectious Disease in Victoria.

TYPHOID fever still continues very prevalent in Victoria. At the meeting of the Board of Health held on April 20th the number of cases reported for the preceding fortnight was stated to be 475, with 40 deaths. Diphtheria is also prevalent, 62 cases with 8 deaths having been reported for the same period. Measles is epidemic and the schools are more than half emptied in consequence. The Government have at last granted a site for an infectious diseases hospital for the metropolis. At a meeting of the committee of the projected hospital held on April 19th a letter was read from the Chief Secretary stating that the Government would allow the hospital to be erected on a block 15 acres in extent in the ground reserved for the Yarra Bend Lunatic Asylum, provided that small-pox patients would not be admitted and that arrangements would be made for the adequate drainage of the block. The Government has also promised to give £2500 towards the erection of the buildings. It is to be hoped no delay will now take place, as the need of such an institution becomes daily more manifest, and also for proper ambulance arrangements. Quite recently public indignation was roused by a case in which a child dying from diphtheria could not obtain admission at a children's hospital. The father tried the Melbourne Hospital, but it was full. Next day he went to the hospital and was told that he could bring the child in. Then no ambulance could be obtained and the father carried the patient in his arms to the hospital, where the child soon afterwards died. At present the Health Act throws the responsibility of providing ambulances for infectious cases on the local authorities. These, however, with a very few exceptions, do not provide them owing to the expense and it is suggested that an ambulance should be kept at the hospital and maintained conjointly by the municipalities.

Health of Melbourne.

Dr. Jamieson, officer of health for the city of Melbourne, has just presented his report for the year 1897. The general mortality of the city was 13·6 per 1000, and the infant mortality was 119 per 1000 births. The mortality from typhoid fever was 2·85 per 10,000. Dr. Jamieson states that:

> The chief cause of infant mortality here, as in most parts of the world, is the prevalence of diarrhœal diseases, and that varies very markedly with the season of the year. This is very clearly shown by the fact that in all Melbourne the deaths of infants under one year numbered no fewer than 316 in December, as compared with 67 in October. The high summer temperature acts chiefly in causing easy deterioration of milk, which forms the staple food of infants artificially reared. Attention to the milk-supply is manifestly of the greatest importance in this connexion, and there has been distinct improvement in that respect of late years. The chief causes of death, other than the epidemics, which really occasion a small percentage of the total mortality, were: Tuberculosis, with 151 deaths; diarrhœal diseases, 110; pulmonary diseases (other than consumption), 95; diseases of the heart and great vessels, 86; nervous diseases, 84; renal system diseases, 75; and cancer, 32. The deaths from tuberculosis in all its forms were the same in number as last year, and with further close supervision of the meat- and milk-supply and other general sanitary improvements we may hope soon to see a steady diminution in the fatality. Though the typhoid mortality was at a comparatively low level all over Melbourne in 1897, it is unsatisfactory to find that it remains considerably higher than in the cities and towns of Great Britain. I doubt if there is any reasonable explanation to be found except in the fact that Melbourne over almost the whole of its area has still nothing better than surface drainage, and a pan system of nightsoil disposal.

A White Leper in Melbourne.

The Health Act in Victoria is very stringent in its provisions against leprosy. About six weeks ago a Russian Jew came to Melbourne from Western Australia to seek medical advice. Mr. Noyes discovered that he was suffering from leprosy. When the case was reported to the Board of Health the man was informed that he could not remain in Victoria except in isolation at the leper station. He was, however, permitted to leave the colony. He has been seven years in Australia, but is believed to have contracted the disease twenty years ago. At present there is only one leper in Victoria. He is an European and is segregated.

A New Medical Society.

The medical practitioners of Bendigo, Victoria, have established a local medical society as a branch of the Medical Society of Victoria. Mr. O. Penfold has been elected President and has delivered an opening address in which he expressed gratification at the formation of the society and

enlarged on the benefits to be gained from its existence. He also expressed the hope that the Bendigo Hospital would soon be recognised for clinical teaching by the university and that a children's hospital would be established in Bendigo.

Melbourne Hospital for Sick Children.

On April 20th was laid the foundation stone of the new buildings for the Children's Hospital, Melbourne. The ceremony was performed by three little children in the presence of the acting governor. Plans have been prepared for a completely new hospital at a cost of £60,000, but for the present the committee intend to expend only £16,000 upon a new out-patients' department, comprising a waiting hall and eight surgeons' rooms and examinations rooms, a kitchen block, steam laundry and disinfection plant, and a mortuary. Since the foundation of the institution in 1870 it has accommodated 14,007 in-patients and 559,267 out-patients have attended. In one week there have been as many as 1544 attendances of out-patients.

Sydney Hospital for Sick Children.

On April 18th the annual meeting of the Sydney Hospital for Sick Children was held, Lady Hampden presiding. The annual report stated that 516 in-patients had been treated during the year and 2860 out-patients. The medical report said that as much good work had been done as could be expected in the present buildings. The out-patient attendance had considerably increased, and there was little doubt but that this department was abused. The uniformity in the reduced death-rate from diphtheria since the introduction of the antitoxin treatment was very gratifying. The vacancies on the honorary staff were filled by the election of Dr. E. J. Jenkins and Dr. Chisholm, and to the two new positions on the out-patient staff Dr. E. H. Binney and Dr. G. H. Abbott were elected.

Allegations Against the Surgical Staff of Melbourne Hospital.

At the meeting of the committee of the Melbourne Hospital held on April 12th, the house committee brought up a report on the subject of admissions to the surgical wards, stating that the rules as to admissions had not been observed and recommending that in future a register be kept of surgical patients waiting for admission and they be admitted in the order in which they appear on the register. The report was adopted.

Deaths under Chloroform.

An elderly woman died recently at the Melbourne Hospital whilst chloroform was being administered. At the inquest the pathologist to the hospital stated that in his opinion the system of giving anæsthetics at the hospital was wrong and that the students were not properly taught. The cause of death was partly asphyxia and partly disease of the heart. Some apparently conflicting opinions were given by the surgeon who was about to operate and the anæsthetist to the hospital as to whether an anæsthetic should have been administered supposing the condition of the heart could have been ascertained during life. The anæsthetist said that the students did not avail themselves of his instruction because it was not compulsory.—An inquest was held at Sydney on April 18th concerning the death of a woman, aged thirty-eight years, who died while under the influence of chloroform administered for a dental operation. She had appeared to be perfectly healthy. Only a small amount of chloroform had been administered when a sudden spasm occurred and the pulse stopped.

Action against a Druggist.

At the Melbourne county-court on April 25th an action was brought against a druggist for £175 damages for negligence in dispensing a medicine from a written prescription. The prescription, it was alleged, was for a teaspoonful of cascara, and the druggist in writing out the label wrongly put one tablespoonful. The overdose it was alleged produced severe results, demanding surgical interference. The defence denied the mistake, but stated that if a mistake had been made the sufferings arose from the disease for which the prescription was ordered and were not produced by the prescription. Medical evidence was called for both sides and the jury found for the defendant.

Women as Resident and Honorary Medical Officers.

At the annual election of resident medical officers to the Melbourne Hospital Miss Violet May Plummer, M.B., was among those appointed. At the Sydney Hospital for Sick Children the board has passed a resolution that women were eligible for the position of honorary medical officers. This is the first hospital in the colonies which has made women eligible for honorary positions on the staff, although no one has yet been appointed.

May 4th.

Obituary.

HENRY LEE, F.R.C.S. ENG.,

CONSULTING SURGEON TO ST. GEORGE'S HOSPITAL.

MR. HENRY LEE, F.R.C.S. Eng., senior consulting surgeon to St. George's Hospital and Honorary Fellow of King's College, London, died at his residence, 61, Queensborough-terrace, Hyde-park, on Saturday, June 11th, at the age of eighty-one years. Mr. Lee was the youngest son of Captain Pincke Lee of Woolley Firs, Maidenhead Thicket, and was born in 1817. In 1833 he commenced his professional studies at King's College and in 1834 entered as a pupil at St. George's Hospital. He became a Member of the Royal College of Surgeons of England in 1839 and a Fellow in 1844. In 1861 he was elected assistant surgeon to St. George's Hospital, prior to which he had filled the office of surgeon to out-patients at the King's College Hospital. He became full surgeon to St. George's Hospital in 1863 and retired with the rank of consulting surgeon in 1878. For a period he also filled the office of Lecturer in Pathology and Surgery to the Royal College of Surgeons of England, and was elected a member of the Council in 1870. He was also consulting surgeon to Queen Charlotte's Lying-in Hospital and to the Lock Hospital.

Mr. Lee was a sound, able, and original surgeon, his methods being always marked by great independence of thought and judgment and by singular fertility of resource. Though never a rapid or brilliant operator he was both a bold and a successful one, his success being largely due to a scrupulous attention to the details of after treatment—a thing which was far rarer in his day than at present. As a teacher Mr. Lee was painstaking, solid, and thorough. His was not the eloquence which shone in the lecture theatre so much as the power of clear demonstration of minute facts which appealed more especially to the senior students and most of all to his house surgeons, whose office was a greatly coveted one while he was on the staff of St. George's Hospital.

The following estimate of Mr. Henry Lee's surgical work is from the pen of his colleague, Mr. Holmes:—

"I have been favoured by the editors of THE LANCET with a request that I would give its readers an estimate of Mr. Lee's surgical work; and I look on it as a duty which I owe to the memory of an old and valued colleague and friend to try to do this, however imperfect my estimate may be. Henry Lee's surgical work must be looked at from three points of view—as a pathologist, a syphilographer, and a practical surgeon. I have put pathology first because it was the foundation of all which he accomplished in his after career. Nearly his first essay in pathology was an attempt to put the knowledge of the condition called phlebitis — then much misunderstood — on a sounder basis. Possibly he went too far in arguing that the obstructing material in the veins is not in any case secreted by their lining membrane, but at any rate his paper (in vol. XXXV. of the Transactions of the Royal Medical and Chirurgical Society) showed that sometimes it is not: and the paper had the great merit of calling attention to the large part which coagulation of the blood plays in many cases of so-called 'phlebitis' and it no doubt assisted in the production of a more correct understanding of the many conditions which were comprised under that name. His life-long researches on syphilis had also their foundation in sound pathological inquiry, meaning by pathology not morbid anatomy only (as the word is too often misused to mean), but the science of disease, founded on the histories of cases, on the symptoms of disease in the living and on its products in the dead body; and, I may add (especially in connexion with syphilis), on experiment, for some of the most valuable parts of Mr. Lee's writings on syphilis concern the results of inoculation. In dealing with syphilis Mr. Lee seems to me to be equally meritorious as

a pathologist and as a practical surgeon. In the former capacity he shows more clearly than any other writer whom I have consulted the great and essential difference between the local and constitutional forms of syphilis; and as a practical surgeon he gives, I think, the clearest and the wisest directions when and how to use mercury, which, when all is said and done, is the only known treatment in the constitutional form of the disease; and he, more clearly than any, or at any rate most, authors, traces the natural history of the disease when left to run its course uncontrolled, avoiding the erroneous and exaggerated estimate of the destructive power of syphilis into which John Hunter was betrayed. I do not say that Mr. Lee was entirely free from the besetting sin of specialists of seeing their speciality in every dubious case that falls in their way, but I do say that he was more free from it than almost any specialist that I have met with and that his writings on what he had made, or what had become, his speciality are a model of wide information, correct reasoning, and sound practical wisdom. But Mr. Lee was too great a man to remain merely a pathologist and a specialist in venereal diseases. His bent was towards practical surgery and he had a genuine pleasure in its operative branch. These tastes had little room for exercise at King's College Hospital, where Mr. Lee's subordinate position and Sir W. Fergusson's brilliant talents as an operator kept him in the background: and it was therefore with equal satisfaction on both sides that Mr. Lee and his old teachers and fellow students found themselves colleagues on the surgical staff of St. George's Hospital, where though he was only an assistant he was allowed by the kindness of his seniors to do practically what he pleased in selecting cases to be under his own care and to perform any operations which might be sanctioned by a consultation. And he used this liberty freely during the two years he remained assistant surgeon. Mr. H. C. Johnson's death in 1863 brought him on to the full staff and he could then not only carry out his own views still more freely but also expound them to the students in the wards and in the clinical theatre, and in this clinical teaching he excelled. It would be the exaggeration of a friend writing directly after his subject's decease to say that he was a great surgeon, but he was an admirable officer in a hospital school, keenly interested in his duties and unwearied in their discharge, ingenious and resourceful in the many exigencies of surgery, zealous in the instruction of the students, cordial in his intercourse with his colleagues, and, above all, solicitous for the welfare of his patients. His published works have stood the test of time and criticism. The chief are his treatise on Practical Pathology, his Lectures on Syphilis at the Royal College of Surgeons of England, and his treatise on Venereal Diseases in the "System of Surgery," which I edited. None of these books either are obsolete or are likely to become so, and I believe that I am giving utterance to the common opinion of surgeons in saying that in his own province he was unrivalled. This is high praise indeed for a man whose labours extend through half a century of constant change and progress, but I believe it is thoroughly well deserved. He was the last of the St. George's surgeons of the direct school of Brodie and far from the least distinguished of them. His colleagues and pupils there will long keep his name in honour."

Mr. Lee retained his vigour, both of body and mind, to an unusually late period, and it was only a few years ago that he retired at length from active practice and gave up his house in Savile-row. He was a man of strong character, of courage, and determination, but of a most kindly heart and genial disposition and was always regarded with great affection by his old pupils at St. George's Hospital. During his long professional career it may be said that he made many attached friends and no enemies. He was twice married and his second wife survives him as do daughters by both marriages.

THE LATIN-AMERICAN SCIENTIFIC CONGRESS.

(FROM A CORRESPONDENT.)

THE first Scientific Congress which has ever been held in South America, organised by the *Sociedad Cientifica* of Buenos Ayres, was opened in that city on April 11th, 1898. The members numbered about 600 and included delegates and visitors from every republic in South America and also several delegates from Mexico, so that the organisers have every reason to be proud of the success which has attended this the first effort to collect together men of science and learning from the continent of South America. In point of numbers the Argentine Republic heads the list with over 300 members, then follow Chili, Uruguay, Brazil, Paraguay, Peru, Ecuador, Mexico, &c.

The Congress was divided into seven sections, as follows: (1) Exact Sciences—(*a*) Pure and Applied Mathematics and (*b*) Astronomy, Topography, and Land Surveying; (2) Engineering Sciences, Civil and Military, including Architecture; (3) Physical and Chemical Sciences; (4) Natural Sciences, including Biology, Geology, and Palæontology; (5) Medical Sciences; (6) Anthropology; and (7) Sociology. But the first and second sections, the third and fourth sections, and the sixth and seventh sections were taken together, so that the Congress actually met in four sections.

The Medical Sciences section being that which will more particularly interest your readers I append a *résumé* of the several meetings, with a list of the principal papers read. It will be seen that many of the subjects discussed were of local interest chiefly, but some are of universal interest, such as Leprosy, Tuberculosis, Vaccination and Small-pox, Infectious and Contagious Diseases in Relation to Sanitary Works, Subsoil Drainage and Changes in Atmospheric Pressure, Inoculation in Carbuncle and the Preparation of Anti-carbuncular Serum, the Microbiology and Therapeutics of Whooping-cough, the X Rays in Surgery, Suicide and Mental Diseases, and Gonococcus—its Toxin and Serum, &c.

The President of the Medical Sciences Section was Dr. R. Wernicke, the secretary was Dr. Araoz Alfaro, and the meetings took place every afternoon from 2 to 7 P.M. The attendance was good and the members were fairly representative, the discussion being carried on chiefly by the younger professors and teachers in the medical faculty and schools.

Vaccination and Small-pox.

Papers were read by Dr. DIAZ (Buenos Ayres) and Dr. MURILLO (Chili). Historical evidence showed that small-pox has always been a terribly destructive scourge in these countries, whole tribes of aborigines being destroyed in the last and preceding centuries. Chili has now the most complete and effective system of vaccination on this continent, with a central board in Santiago and branch offices and vaccinators and inspectors all over the country. Glycerine extract of animal vaccine (calf) is almost universally used and in the Argentine Republic calf vaccine has been for some years exclusively used. But the organisation of the Vaccination Department is not nearly so complete in the Argentine as in Chili, there being at present no special and independent board. In Chili last year £10,000 were spent on the vaccination service, and 38,000 slides of vaccine were distributed; in the Argentine Republic over 1,200,000 slides were distributed free of cost. The mortality has notably decreased in Chili and the River Plate and is now insignificant, in fact almost *nil*, in Montevideo. It may be noted here that compulsory notification is applied in the Argentine Republic to small-pox, measles, scarlet fever, diphtheria, typhoid and typhus fevers, cholera, yellow fever, puerperal fever, and tuberculosis, and that a staff of official disinfectors is at the disposal of the public day and night.

Leprosy.

Dr. SOMMER (Buenos Ayres) and Dr. CANABAL (Montevideo) pointed out the relation of leprosy to the low-lying and swampy districts on the borders of our great rivers, where also the mean temperature is highest, notably Corrientes, where there are probably now over 200 lepers. The disease has been slowly but surely making headway in the Argentine. The tuberculous form is most prevalent, although the analgesic has been observed. The spread of the disease was said to be undoubtedly due to contagion. As regards etiology, Dr. Sommer suggested that mosquitoes and other insects might possibly convey the poison, but he was not prepared with experiments to prove it. This idea was combated by several speakers. The meeting resolved that the resolutions of the Berlin Conference (October, 1897) should be adopted for this country.

Tuberculosis in the Argentine.

Dr. GACHE showed that the death-rate from this disease was now from 7 to 8 per cent. of all deaths in Buenos Ayres and from 3 to 5 per cent. in the northern provinces, such as Mendoza, Catamarca, and Salta. The rate had notably decreased of late years. The inoculation with tuberculin was now compulsory with regard to all the cows of all the

dairies of the city and in 1897 over 1700 cows were inoculated, of which some 22 per cent. gave the reaction.

Dr. J. T. R. DAVISON, in an interesting paper on the Effect of Earth Removal and Atmospheric Pressure on Various Diseases pointed out that since 1889, when the surface drainage of the city of Buenos Ayres was finally completed, the prevalence of tuberculosis had decreased considerably, and he showed charts which proved that previously to 1874, when the sanitary works were first commenced, tuberculosis, typhoid fever, cholera, and diphtheria were far more prevalent and more fatal than they are now. He was also of opinion that when subsoil drainage was carried out, as he hoped it would soon be, there would be a still greater reduction in the prevalence of these diseases.

Microbiology and Therapeutics of Whooping-cough.

Dr. MONCORVO, jun., of Rio Janeiro, said that the micrococcus of whooping-cough is found alone or in chains; it grows best in peptonised agar-agar, giving a result in from twenty-two to twenty-eight hours of innumerable small, bright spots; in four days the evolution is completed. Inoculations in 50 animals of different species gave characteristic attacks of whooping-cough in 48. The toxin has no effect on the red corpuscles of the blood; hence its action is on the mucous membrane of the larynx. Dr. Moncorvo found that a 10 or 15 per cent. solution of citric acid applied locally to the larynx was the best remedy and he employed lemonade as a prophylactic. In these countries lemon juice is a favourite and old-established remedy in throat diseases, being especially useful in follicular tonsillitis.

Infantile Gastro-enteritis in Buenos Ayres.

Dr. A. ALFARO gave an interesting summary of the causes and death-rate of infantile diarrhœa, which showed that during the last ten years the certified death-rate from gastro-enteritis up to two years of age amounted to 32 per cent. of the general death-rate. In his own clinique at the San Roque Hospital of 1103 children applying for treatment 382 suffered from gastro-enteritis. The death-rate is lowest during the winter months, June, July, and August, but begins to rise in November, attaining its maximum—50 per cent.—usually in March, the fag end of the summer. Dr. Alfari's statistics showed in a marked manner the influence of the infants' diet, for of his 382 cases only 7 were at the breast and carefully nursed; 71 were also at the breast but badly nursed and under unfavourable hygienic surroundings; 129 were on artificial (cows', asses', goats') milk diet; and 175 were on mixed diet, such as milk, farinaceous materials, &c. Milk may be perfectly sterilised, but septic organisms get in through the rubber teats, and by the mother's and nurse's hands, &c. The prophylactic measures adopted included: (1) special regulations for the wet nurse; (2) properly organised "crèches" where infants can be accommodated and fed; (3) the establishment of special farms under municipal control; and (4) an arrangement that the ordinary dairies should supply a "special" milk for children, as in Denmark, Germany, &c.

The Gonococcus: its Toxin and Serum.

Dr. JULIO MENDEZ gave the following conclusions as the result of his investigations. 1. In 64 cases of blenorrhagia he found the gonococcus in 27. 2. The gonococcus is easily cultivated in the ordinary media. 3. The toxin put in contact with the healthy human urethra for from five to fifteen minutes produced in an hour irritation and heat about the neck of the bladder and in from 24 to 36 hours characteristic blenorrhœa. 4. Serum prepared from immunised dogs has strong antitoxin properties and retards the death of control animals. 5. The gonococcus is never found in blenorrhœa or blenorrhagic arthritis of more than 4 or 5 days' standing.

The Use of Expressed Juice of Maize.

Dr. LLOBET drew attention to the great alimentary value of the expressed juice or extract of young and tender maize. It has the advantage over wheat in that it contains a much larger proportion of fats; proteids and salts (which give it decided diuretic properties) are also in good proportion. He proposed to call this preparation "vegetable milk."

The Study of the Specialities.

The following motion (literally translated) was passed unanimously at one of the meetings of the Medical Sciences section: "It is strongly recommended to medical students not to commence the study of specialities until their general medical curriculum is completed, as such studies are likely to be very prejudicial to the obtaining of complete clinical knowledge in general medicine."

Medical News.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The following gentlemen having previously passed the necessary examinations, and having conformed to the by-laws and regulations, have been admitted Fellows of the College in order of seniority as Member, in accordance with the provisions of the by-laws, viz.:—

Roll, Grahame Winfield, B.A., M.B. and B.C.Camb., L.R.C.P. Lond., Cambridge University, St. Thomas's and St. Bartholomew's Hospital, Jan. 29th, 1886.
Wright, Dudley D'Auvergne, L.R.C.P. Lond., University College Hospital and Vienna University, Aug. 2nd, 1888.
Tilley, Herbert, M.D., B.S. Lond., L.R.C.P. Lond., University College Hospital, July 28th, 1890.
Frazer, John Ernest Sullivan, L.R.C.P. Lond., St. Bartholomew's Hospital, July 30th, 1891.
Clarkson, George Aylwin, L.R.C.P. Lond., St. George's Hospital, Feb. 8th, 1894.
Cochrane, Archer William Ross, M.B. Lond., L.R.C.P. Lond. (Surgeon-Lieutenant I.M.S. Bengal), St. Bartholomew's Hospital, Nov. 8th, 1894.
Collard, Frederick Stuartson, L.R.C.P. Lond., St. George's Hospital, Nov. 8th, 1894.
Prain, John Leay, L.R.C.P. Lond., St. Thomas's Hospital, Nov. 8th, 1894.
Toye, Edwin Josiah, M.B., B.S. Lond., L.R.C.P. Lond., St. Bartholomew's Hospital, May 9th, 1896.
Cooke, Arthur, M.A., M.B., B.Ch. Oxon., L.R.C.P. Lond., Oxford University and London Hospital, Nov. 14th, 1896.
Tod, Hunter Finlay, M.A., M.B., B.C. Camb., L.R.C.P. Lond., Cambridge University and London Hospital, Feb. 13th, 1896.
Benson, John Robinson, L.R.C.P. Lond., King's College Hospital, May 14th, 1896.
Briggs, John Arthur Oswald, M.B. Lond., L.R.C.P. Lond., St. Bartholomew's Hospital, May 14th, 1896.
Leicester, John Cyril Holdich, B.Sc., M.D. Lond., L.R.C.P. Lond., University College Hospital, May 14th, 1896.
Price, Henry James, L.R.C.P. Lond., University College Hospital and St. Bartholomew's Hospital, May 14th, 1896.
Godson, Alfred Henry, L.R.C.P. Lond., B.A., M.B., B.C. Camb., Cambridge University and Guy's Hospital, May 4th, 1898.
Mésiné, Hormasji Manekji, L.M. & S. Bombay, Grant Medical College Bombay, and St. Bartholomew's Hospital (not a Member).

One other gentleman passed, but not having attained the legal age of twenty-five years will receive his diploma at a future meeting of the Council; and 20 were referred, 15 for six months and 5 for one year.

UNIVERSITY OF CAMBRIDGE.—On June 9th the following medical and surgical degrees were conferred:—

Doctor of Medicine.—John Nachbar, B.A., Clare; Edmund Towers Fison, M.A., Corpus; Arthur Martin Mitchell, M.A., Queen's; Herbert William James Marks (also B.C.), M.A., Jesus; and Lewis Gwillim Davies, B.A., unattached.
Bachelor of Medicine and Bachelor of Surgery.—Robert Hamilton Bell, B.A., and the Hon. George Hepburn-Scott, B.A., Trinity; Henry Lonsdale Gregory, B.A., St. John's; Thomas Henry Brown, B.A., Pembroke; Percy Levick, B.A., Jesus; Barnard Roworth Turner, B.A., Emmanuel; and Alan Baldrey Green, M.A., Downing.

The Vice-Chancellor announces benefactions to the amount of over £6000, the greater number for the new medical and law schools.

THE VICTORIA UNIVERSITY.—At a meeting of the University Council held at Manchester on June 9th the following candidates were declared deserving of the degree of M.D.:—

W. C. Brown, Owens College; *F. J. H. Coutts, Owens College; J. S. Dockray, Owens College; and *F. C. Moore, Owens College.

* Awarded gold medal.

THE BRITISH ORTHOPÆDIC SOCIETY.—A meeting of this society was held in the board room of the Royal Mineral Water Hospital, Bath, on May 14th, Mr. Keetley being in the chair.—Mr. William Thomas showed a Shoe for the Treatment of Talipes and Mr. Pagan Lowe showed a Boot for Flat-feet which he had found useful in rheumatic and traumatic cases.—Mr. C. T. Griffiths opened a discussion on Rheumatoid Arthritis from a Surgical Standpoint and came to the conclusion that operative interference should be more often resorted to when osteophytes were present and the mushroom-shaped ends of the bones had become obtrusively evident.—The Chairman related various cases in which he had with advantage removed bony and cartilaginous prominences from the articular surfaces of chronic rheumatoid joints, substituting depressions. Ankylosis, he stated, had not followed.—Dr. Wohlmann produced a Cast showing Typical Rheumatoid Arthritis, which disease was, he said, quite distinct from rheumatism, gout, and osteo-arthritis. He deprecated early surgical interference other than aspiration.—Mr. Tubby thought that the disease was due to lesion of the central nervous system and held that surgical interference was only justifiable in the final stage.—

Mr. W. Thomas, Mr. Pagan Lowe, Mr. Jackson Clarke, Mr. Noble Smith, and Dr. Melsome also spoke.—A vote of thanks to the Governors of the hospital for allowing the use of the room closed the proceedings.

THE REGISTRATION OF MIDWIVES.—The annual general meeting of the Association for Promoting the Compulsory Registration of Midwives was held on June 9th at 3 Grosvenor-place. Lady Balfour of Burleigh, President of the association, took the chair and speeches were made by Mr. Heywood Johnstone, M.P., Dr. Annie McCall, Dr. Cullingworth, and others. Mr. Heywood Johnstone, in moving the adoption of the report said he feared there was no prospect of the Compulsory Registration Bill being read a second time during the present session. Interest in the subject had, however, increased very much during the past twelve months and that interest was rapidly growing. The report was adopted.

FREEMASONRY.—*The Rahere Lodge, No. 2546:* The installation meeting of this lodge was held in the great hall of St. Bartholomew's Hospital on Tuesday, June 14th, at 5 P.M., Bro. W. J. Walsham, W.M., being in the chair. Bros. Cecil Christopherson, P. V. Dodd, and H. Hind were elected joining members, and Messrs. W. J. C. Keats, E. W. Brewerton, and Harold Burrows were initiated into Freemasonry. Bro. Walsham then installed Bro. T. G. A. Burns as Worshipful Master for the ensuing year. The report of the Audit Committee was received and adopted. A vote of 12 guineas was confirmed to constitute the Lodge a permanent member of the correspondence circle of the Quatuor Coronati Lodge No. 2076. Bros. West, Gilbertson, and Cross were appointed members of the Standing Committee. The brethren afterwards dined together at the Trocadero Restaurant.

UNFOUNDED CHARGE AGAINST A MEDICAL MAN.—At the meeting of the Helston (Cornwall) Board of Guardians held on June 11th Mr. W. Wearne, M.R.C.S. Eng., L.S.A., the medical officer of the First District of the Helston Union, appeared to answer a charge of neglecting a male pauper. It was alleged that although the man several times visited Mr. Wearne he was unable to see him except on one occasion, when Mr. Wearne told him he had to see an urgent case. Mr. Wearne stated that he did not know the man had visited him until he saw the complaints in the papers and added that the man had since told him that he was sorry for what had taken place before the guardians, that he was made to go there and did not know what he was wanted for, and that he had nothing in the world against the medical man. After discussion the guardians passed a resolution entirely exonerating the medical officer from any blame and regretting that a member of the board should have brought such a groundless charge.

DIPHTHERIA IN LONDON.—The amount of diphtheria recorded in London in the four weeks ended on May 21st showed a slight increase upon that chronicled in the like period ended on April 23rd and thus caused a break in the decline of the disease which set in during the four-weekly period ended on March 26th. In the four weeks to Feb. 26th there had been 939 notified cases, in the succeeding similar period 813 cases, and in the four weeks to April 23rd a still further fall to 729. The period ended on May 21st witnessed 763 notified attacks. In the April period all the sanitary areas of London had been invaded, two of them had each upwards of 50 cases, and the weekly average for the period was 182; while in the May period one district escaped invasion, other 3 had only 4 cases in all, and but one area had more than 50 attacks. Still the weekly average was 191. But if the May period thus exceeded April in the amount of diphtheria, such was by no means the case as regards mortality from the disease. The deaths in the April period had been week by week 45, 29, 34, and 31, a total of 139, and a weekly average of 35, while the case mortality had been 19·1 per cent. But in May the weekly numbers of deaths were 39, 27, 20, and 21, or 107 in all, yielding a weekly average of 27, and a case mortality of only 15·3 per cent. Even more striking was the fall in mortality in the Outer Ring; in April the weekly numbers totalled to 65, an average of 16; in May they were only 14, 13, 10, and 8 respectively, a weekly average of 11 and 45 in all. Thus the amount of diphtheria was more than maintained in London in the May period as compared with April, while both in the county and in the suburban areas the mortality showed sensible decrease. In the week ended May 28th the deaths from diphtheria in London fell from 31 to 27 and were as many as 9 below the corrected decennial average for the corresponding weeks of 1888–97. Battersea was credited with three of the deaths and all 27 were in young persons aged under twenty years, two only being of infants, and 15 of children under five years of age. In the Outer Ring the deaths from diphtheria rose to 14, of which 6 occurred in West Ham, 4 in Edmonton, and two in Kingston registration districts. In the next week, ended June 4th, the deaths registered in London rose to 30, but were still 5 below the corrected decennial rate. 5 occurred in Hackney, and 3 in Islington, in Bethnal Green, and in Camberwell sanitary areas. None of the deaths were of infants, but 22 were of children in the first quinquenniad of life, and only one occurred of a person aged over twenty years. In the Outer Ring the deaths were 10 in number, there being 3 in Edmonton, 2 in West Ham, and 2 in Croydon registration districts. Last week the registered deaths from the disease in London fell to 23, being 12 below the corrected decennial average. The deaths, though few, were scattered over a wide area and were all, save one, of young persons aged under twenty years, only 1 being of an infant and 12 in all of children under five years of age. In the Outer Ring there were registered 11 deaths from the disease, including 3 in Dartford and 3 in West Ham registration districts. Hence, in London at any rate, there is seemingly some factor at work which is sensibly diminishing the mortality from diphtheria.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

'London University Commission Bill.

THIS measure having passed all its stages in the House of Lords is now in the House of Commons, where on Tuesday, June 14th, after a long and interesting debate, it was read a second time and referred to the Grand Committee on Law. Mr. George Harwood, seconded by Mr. Yoxall, moved the rejection of the Bill but did not press the motion to a division.

The Sick and Wounded in the Soudan.

General Russell has given notice that on an early date he proposes in reference to the recent operations in the Soudan to move "that in the opinion of this House it is the duty of Her Majesty's Government to take immediate steps to ensure that due provision is made for the care of the sick and wounded during the remainder of the campaign."

Poisons Bill.

In the House of Lords on Monday, June 13th, the Duke of Devonshire formally introduced "a Bill for regulating the sale of certain poisonous substances."

HOUSE OF COMMONS.

THURSDAY, JUNE 9TH.

Medical Arrangements in the Soudan.

General Russell asked the Under-Secretary of State for War whether the Medical Department attached to the British brigade at the battle of Atbara were insufficiently provided with chloroform or anæsthetics for the performance of operations on the battle-field, and if so what was the cause of such an omission; and whether a court of inquiry would be ordered to inquire into the circumstances.—Mr. Brodrick replied: The field medical equipment of each regimental unit, bearer company, and field hospital of the British brigade was fully equipped with chloroform and anæsthetics in accordance with the regulations, and there was an ample reserve at Wady Halfa. There is no reason to suppose there was any deficiency at the battle of Atbara.—General Russell asked whether there were no light ambulances attached to the cavalry in Egypt, and whether the only way of carrying the wounded after the cavalry reconnaissance before the battle of Atbara was by tying them on to gun limbers; and if so whether steps would be taken in future to have more attention paid to the medical arrangements.—Mr. Brodrick: No British cavalry were employed in the reconnaissance referred to. The medical arrangements for the cavalry who were present rested with the Sirdar.—General Russell asked whether the litters for the conveyance of wounded after the battle of Atbara were unprovided with sunshades such as were always attached to litters in hot climates, and, if so, if he would state the cause of this omission; and, whether any steps had been taken to ensure proper litters being provided for the wounded in future.—Mr. Brodrick: The stretchers hitherto provided for the British Army have not been fitted with covers. A supply of stretchers with folding hoods is, as I have already stated in the House, on its way to Egypt. The wounded at the battle of Atbara were carefully placed in the shade and only removed after dark.—General Russell asked whether no apparatus for the application of the Roentgen rays was carried with the field army during the recent operations in Egypt, whether there was every reason to believe that some lives of wounded officers and men might have been saved had these appliances been available, and whether in future the Government would take steps to prevent any question of economy in transport interfering with every precaution being taken to save valuable lives.—Mr. Brodrick: The Roentgen ray apparatus, which is a very recent invention, is very difficult to adapt for field service and was not carried with the field army in the recent operations. From the returns the medical authorities do not consider there was a single case in which

life could have been saved by the use of the apparatus. Two sets are now in Egypt and one more will be sent out shortly. Two have been adapted as far as possible for field service and one is for use in the base hospital.—Sir James Fergusson asked whether 400 men were not wounded by bullets, and whether the apparatus would not have been most useful in locating the bullets.—Mr. Brodrick: The senior medical officer has gone carefully into the cases and has been unable to trace any single case in which the apparatus would have been specially useful or in which an operation would have been carried out more successfully by the use of the rays.—General Russell asked the Under Secretary whether complaints had reached him that the medical arrangements for the reception of the wounded British officers at Cairo after the recent campaign were insufficient and unsatisfactory; that seven wounded officers were put into one small ward; and that the nursing staff was entirely inadequate; and whether the Government would order a searching inquiry to be made into this matter.—Mr. Brodrick: The ward in the Citadel Hospital, Cairo, in which the seven wounded officers were placed, is large and lofty and the cubic space and superficial area ample. The nursing staff consisted of five female nurses and over sixty men of the Medical Staff Corps, all of whom are trained as nurses. Every attention is being paid to the men wounded in the recent action.—General Russell: Is the right hon. gentleman aware that there was only one female nurse told off to attend to the officers?—Mr. Brodrick: I think my hon. and gallant friend is in error. What happened was that the superintendent nurse desired to wait on the wounded officers herself and for that reason the wounded officers got the idea that there was only one nurse able to attend upon them. No inquiry is needed. The staff of nurses is ample.

Petroleum Oil Accidents.

Mr. Ascroft asked the Home Secretary whether he was aware that since May 17th last there had been no less than three deaths in the metropolis and numerous fires caused by the use of dangerous low flash petroleum oil, and whether the Government intended to deal with the question and introduce a Bill at the earliest possible moment.—Sir M. White Ridley said in reply that no legislative proposals could be made until the report of the Select Committee on Petroleum had been received.

Rules for Dangerous Employments.

Mr. Tennant asked the Attorney-General whether it was in the power of the Secretary of State to make rules prohibiting the employment of any class of persons in a process certified by him to be dangerous or injurious to health, under Section 8 of the Factory and Workshop Act, 1891, as amended by Section 23 of the Act of 1895.—The Attorney-General said in reply: The Secretary of State has no power to make rules as suggested by the question. Rules can be proposed by the Secretary of State or the Chief Inspector, as the case may be, but they can only be established either by consent of the occupier of each factory or by arbitration.

Habitual Inebriates Bill.

After a short debate in which Sir M. White Ridley, Sir Walter Foster, Sir Charles Cameron, Dr. Farquharson and others took part, this bill was read a second time and referred to the Grand Committee on Law. The Home Secretary undertook to extend the operation of the bill to Ireland.

FRIDAY, JUNE 10TH.

Boots for the Soldiers in the Soudan.

Mr. Powell Williams, in reply to a question by Captain Bagot, said that boots made in strict accordance with the specifications sent home by the Sirdar will be issued to the British troops for the campaign in the Soudan.

The War Office and Artificial Limbs.

Sir Edward Hill asked the Under Secretary of State for War whether there was any ground for the allegation that soldiers who have had the misfortune to lose an arm or a leg in the service of the country were allowed to leave hospital without being furnished with an artificial limb; and, if so, whether he would take steps to cause the present regulations to be reconsidered.—Mr. Brodrick replied: Artificial limbs have hitherto been supplied to soldiers at the discretion of the Commissioners of Chelsea Hospital. Lord Lansdowne, however, considers that in every case where persons have lost a limb in the service of their country an artificial limb should be furnished at the public expense and a regulation will be issued on the subject.

MONDAY, JUNE 13TH.

Imported Milk.

Mr. Heywood Johnstone asked the Under Secretary of State for Foreign Affairs if any further report had been received from Mr. Gurney, Her Britannic Majesty's consul at Cherbourg, with regard to the import of fresh milk from that district by Messrs. Lepont and Son, and as to the nature of the antiseptic said to be employed by them to preserve the milk; and if any such information had been received when would it be published.—Mr. Curzon replied that a further report from Mr. Gurney had been received and had been communicated to the Board of Agriculture and the Local Government Board. The whole was not suitable for publication, but the more important parts would be published in the *Board of Trade Journal*.

Summer Clothing for the London Police.

Mr. Heywood Johnstone asked the Home Secretary whether summer clothing would be issued to the Metropolitan Police during the present month and if some lighter form of helmet or headgear could be issued to those on duty indoors.—Sir M. White Ridley replied that summer clothing had already been issued and taken into wear. New helmets, which were about 3oz. lighter than the old pattern, and the lightest it was possible to get consistently with being serviceable, were issued last year.

TUESDAY, JUNE 14TH.

The Treatment of Sick Soldiers

Captain Norton asked the Under Secretary of State for War whether it had been brought to his notice that one of the causes of the large number of old soldiers now to be found in workhouse infirmaries was due to the fact that until quite recently convalescent soldiers discharged from military hospitals had either to reside with their relatives or to return to full duty, with the result that they were not infrequently speedily back in hospital again, and that soldiers dying from incurable diseases had perforce to leave the hospitals; and whether he would consider the advisability of establishing convalescent homes where soldiers might be sent from the military hospitals, seeing that in the long run considerable economy would be effected and the efficiency of the Army increased.—Mr. Brodrick: The Secretary of State is not prepared to admit the premisses in the hon. Member's question. In certain cases sick soldiers are granted sick furlough for the purpose of residing with their friends when it is thought that the change will do them good, but otherwise they remain in hospital till cured. Soldiers suffering from incurable disease are not discharged from hospital unless it be at their own request or at the desire of their friends. There are convalescent hospitals at several stations in India, also at Malta, Ceylon, Hong-Kong, and Cyprus, while at home there is one at Eastbourne to which patients whose convalescence is not fully established may be sent.

Yellow Phosphorus in the Match Trade.

Mr. Steadman asked the Home Secretary whether his attention had been called to the Statement by Mr. Talbot, medical officer of health for Bow—viz., that he had visited the works of Bryant and May and was of opinion that unless the use of yellow phosphorus was prohibited these cases would continually occur. Under these circumstances would he bring forward an amendment to the Factory Acts having for its object the prohibition of the use of yellow phosphorus in the manufacture of matches, and would he prosecute either Bryant and May or their medical officer in consequence of the death of one of their workmen, Cornelius Lean.—Sir M. White Ridley, in reply, said that he had been informed by the District Board of Works that the medical officer had made a report to this effect and he (the Home Secretary) had asked for a copy of the report; without seeing that he could not, of course, judge of the value of his opinion. The whole subject of the use of yellow phosphorus was being thoroughly considered and active inquiries were being carried out in all directions. As far as the case of Lean was concerned he was informed that there were no grounds for instituting a prosecution for manslaughter. Messrs. Bryant and May and their medical man failed to notify the case, but there was no ground for thinking that their failure to do so was the cause of Lean's death.

Lead Poisoning in the Potteries.

Mr. Tennant asked the Home Secretary whether he had received any reports of the recent deaths from lead poisoning from the certifying surgeon for the Potteries District, and, if so, whether he would lay them upon the table.—Sir M. White Ridley replied: The hon. Member no doubt knows that the certifying surgeon has to report upon all cases of lead poisoning reported to him and not only the cases in which death occurs. His reports go to the superintendent inspector—in this case at Birmingham. I have not yet received all the reports and therefore I cannot give an answer at the present time.

THE VACCINATION BILL.

PROCEEDINGS IN GRAND COMMITTEE.

The Grand Committee of the House of Commons on Law met on Tuesday, June 14th, with Sir Henry Campbell-Bannerman in the chair, and began the consideration of the Vaccination Bill promoted by the Government.

Mr. Chaplin, President of the Local Government Board, took charge of the Bill, having beside him Sir Hugh Owen, Permanent Secretary of the Board, and Sir Richard Thorne, Principal Medical Officer of the Board.

Mr. Channing opened the proceedings by moving to insert at the beginning of the first clause words limiting the operation of the Bill to three years. He did so, he said, because he considered the measure to be experimental in character. Among other things it upset one of the vital recommendations of the Royal Commission which devoted seven years to the study of vaccination and took an enormous amount of evidence. The Royal Commission recommended that compulsion should be substantially done away with, but this measure reinstated compulsion and did so upon a distinct plea—the plea being the discovery of a form of lymph free from the risks and dangers which the Royal Commissioners found themselves compelled to recognise as associated with the present system of vaccination. As to this calf lymph he did not think that it had been absolutely ascertained to be free from risk. On the contrary there was credible evidence to the effect that it produced serious disorders in children and even caused death, and he used this as an argument why this Bill should be regarded as an experiment and limited in its operation.

Mr. Chaplin submitted that the speech of the hon. Member was appropriate to the second reading but not to the committee stage of the Bill. As to the merits of calf lymph he would only say that his study of the question led him to a totally different conclusion from that of the hon. Member, while as to the proposal that the operation of the Bill should be limited to three years he could not for a moment think of accepting it.

Sir Charles Dalrymple, one of the members of the Vaccination Commission, said he was at a loss to understand what Mr. Channing meant in his references to the report of that body. It was true they had made a very long report and that this Bill was a very short one, but in the Bill there were two recommendations of the Royal Commission—the extension of the age and the domiciliary visits—to which he attached very great importance. This proposal he regarded as one of the first lines of attack upon the Bill and he hoped the committee would reject it.

Sir Charles Dilke said he was in favour of the Bill, but all the same he thought it an experiment and as such it should be limited in its operation in the way proposed.

Mr. Monk took the view that to limit the operation of the Bill would be fatal to its success and increase the excitement in the public mind over the vaccination question.

Mr. Thomas Bayley insisted that glycerinated calf lymph was an experiment and that it was only right that the subject of its use should be reconsidered at the end of three years.

Mr. Logan said he was opposed to the Bill altogether and therefore could not approve of its being in operation even for three years. The people he represented in this matter were people who had conscientious objections to vaccination.

Sir Walter Foster intimated that he was prepared to vote for limitation of the period of operation.

Mr. J. Brigg thought that limitation would be calculated to overcome the feeling of opposition to the Bill.

Mr. Pickersgill declared himself an out-and-out opponent of the Bill

and desirous to defeat it. He insisted that if the Bill were passed in its present form it would not be the end but the beginning of public controversy and excitement.

After some further debate the vote was taken, when Mr. Channing's proposal was defeated by 21 to 14 votes.

The committee then proceeded to the consideration of Clause 1 which in the Bill as introduced was in the following terms, viz.:—"The period within which the parent or other person having the custody of a child shall cause the child to be vaccinated shall be *twelve months* from the birth of the child instead of the period of three months mentioned in Section 16 of the Vaccination Act of 1867, and so much of that section as requires the child to be taken to a public vaccinator to be vaccinated shall be repealed. The public vaccinator of the district shall, if the parent or other person having the custody of a child so requires, visit the home of the child for the purpose of vaccinating the child. If a child is not vaccinated within *nine months* after its birth, the public vaccinator of the district shall visit the home of the child, and shall offer to vaccinate the child with glycerinated calf lymph."

Mr. Carlile moved to substitute six months for twelve as the period from birth within which the vaccination was to take place. If his amendment were adopted he said it would make the law in England uniform with that in Scotland, it would reduce the difficulty of tracing removals, and it would get the vaccination over before the child began to move about and ran the risk of having the wound scratched and irritated.

Sir Walter Foster said that the difficulty of tracing removals was a serious business and made him prefer six months to twelve.

Sir William Priestley supported the amendment. He felt certain, he said, that between six months and twelve a great many of the children would be lost sight of. He further saw no reason why there should not be uniformity between Scotland and England in this matter. A great many people had residences in both countries, and it seemed an anomaly that in the one country there should be vaccination under six months, and in the other under twelve months. Another consideration was that between the age of six months and twelve months a great many infantile ailments came in, and it was most desirable that the vaccination should be over before they appeared. After six months a child left its mother's arms and began to move about, and there was great risk of the vesicles being broken and irritation caused. At present a great number of children now escaped vaccination. In 1893 out of 914,000 there were 133,000 unaccounted for by vaccination; in 1894 out of 889,000 there were 156,000; and in 1895 out of 921,000 there were 175,000, and if they extended the period for vaccination he felt certain that there would be a still further default in vaccination.

Mr. Chaplin said he could not hold out against this pressure of opinion and would accordingly accept the amendment.

The amendment was put from the chair and at once adopted by the committee.

Mr. Sydney Gedge moved to insert in the clause: "Every parent or other person having the custody of a child who shall take it or cause it to be taken to the public vaccinator within the said period of twelve months to be vaccinated, or shall within such period as aforesaid cause it to be vaccinated by some other medical practitioner shall be entitled to the sum of 1*s*. The public vaccinator or other medical practitioner who has vaccinated the child shall pay to such person as aforesaid the sum of 1*s*., and shall be repaid the same by the sanitary authority, and every such medical practitioner other than the public vaccinator shall also be paid a fee of 2*s*. 6*d*. in respect of each child vaccinated by him upon his sending to the sanitary authority a certificate that the child has been vaccinated and 1*s*. paid as aforesaid. The Local Government Board may prescribe a form for the purpose of certificate to be sent in pursuance of this section, and if such form be so prescribed it shall be used in all cases to which it applies. The sanitary authority shall gratuitously supply forms of certificates to any medical practitioner residing or practising in their district who applies for the same, and shall pay to every medical practitioner for each certificate a fee of 2*s*. 6*d*., and also the sum of 1*s*. so paid by him as aforesaid." The hon. Member expressed his confidence that this amendment would get over nine-tenths of the conscientious objections to vaccination.

Mr. Chaplin intimated that he could not accept the amendment, though he admitted it would give him a most powerful weapon against the anti-vaccinator.

Mr. Bayley suggested that the hon. Member should not stop at a shilling but give a larger bribe.

Sir Walter Foster scouted the idea that people with conscientious objections were to be bought over in this fashion.

Mr. Steadman spoke of the amendment as an insult to the working classes of England.

After some further debate the amendment was negatived without a division.

Sir Walter Foster then moved to add at the end of the first Subsection of the clause: Where a child is by this Act required to be vaccinated within a certain time (hereinafter called the appointed time) the parent or person having the custody of the child may, not less than two months before the expiration of the appointed time, make in the prescribed form a statutory declaration of conscientious objection to the vaccination of the child, and if the statutory declaration is within seven days after its date delivered to the registrar of births for the district in which the child resides the registrar shall register the same, and shall, if required, deliver to the parent or other person making the declaration a certificate of such registration and shall also send a copy of the certificate to the public vaccinator of that district, and thereupon an order shall not be made or proceedings taken with reference to the non-vaccination within that appointed time of the child mentioned in the certificate. The parent or other person registering a statutory declaration under this section shall, if he requires a certificate of such registration, pay to the registrar the prescribed fee for a certificate of registration." This amendment, Sir Walter Foster said, was based on the report of the Royal Commission and would, he thought, help to mitigate the feeling of irritation which existed in the country and would do away with the vaccination martyr. His aim was to save vaccination from discredit and make it general and effective. The medical press, he said, was prepared nowadays to accept a suggestion of this kind because they saw in it a likelihood of efficient vaccination and the possibility of a system of revaccination.

The amendment was under discussion when the committee adjourned on Friday, June 17th.

FRIDAY (24th).—LONDON POST-GRADUATE COURSE.—King's College 3 to 5 P.M., Dr. Wilkinson: Tetanus, Rabies, and Cholera.

Notes, Short Comments, and Answers to Correspondents.

EDITORIAL NOTICE.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITORS," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.

Lectures, original articles, and reports should be written on one side of the paper only, AND, WHEN ACCOMPANIED BY BLOCKS, IT IS REQUESTED THAT THE NAME OF THE AUTHOR, AND IF POSSIBLE OF THE ARTICLE, SHOULD BE WRITTEN ON THE BLOCKS TO FACILITATE IDENTIFICATION.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers, not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET *should be addressed "To the Manager."*

We cannot undertake to return MSS. not used.

MANAGER'S NOTICE TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423, Strand, W.C., are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect.

The rates of subscriptions, post free, either from THE LANCET Offices or from Agents, are:—

FOR THE UNITED KINGDOM.		TO THE COLONIES AND ABROAD.	
One year	£1 12 6	One Year	£1 14 8
Six Months	0 16 3	Six Months	0 17 4
Three Months	0 8 2	Three Months	0 8 8

Subscriptions (which may commence at any time) are payable in advance.

HOME-NURSING OF PAUPER PATIENTS.

AT a meeting of the Loughborough Board of Guardians held on June 7th, Mr. P. Phelps, a medical member of the board, brought forward the question of the nursing of the out-door sick poor of the union. The system at present in use is that the relieving officer employs any one who is willing to undertake the work, entirely without reference to her knowledge or suitability. He argued that the sick poor ought to be attended to quite as well outside the workhouse as inside, but it was impossible to expect proper nursing for 1s. 6d. a week, the sum paid in one particular case which Mr. Phelps described, and he moved that the board should provide a properly qualified nurse to attend on the sick poor of the union. The chairman remarked that the matter had been brought before the board several times and the decision come to was that they could not support the Queen's Nursing Association. After a discussion the motion was lost by a considerable majority.

TOUTING OPTICIANS.

WHEN does a practitioner accept the services of a tout? The question is not always an easy one. For example, a patient goes to an optician to have her eyeglasses repaired and he recommends her, without being asked, not to see her own medical man but to consult another practitioner in the same town, who sees the patient and does not communicate with her medical man. The consultant is blamed by the practitioner, but he admits no offence and has been informed that any optician whose advice is asked by a customer is justified in giving the advice which he thinks best for the customer. Clearly the medical profession has no power of stopping the mouths of opticians, except through the agency of those gentlemen who are by their recommendations placed in the somewhat delicate position of taking the patient of another medical man. It is alleged by the aggrieved practitioner that the optician's advice was not asked. At any rate it was given, it was acted on and for this occasion the patient was transferred. We are not disposed to blame the consultant too much. But he should, we think, give the friendly optician a hint against volunteering advice to the patients of other medical men, and when he is so consulted by those whom he has reason to know are the patients of another practitioner he might put himself in friendly communication with the practitioner. There is nothing in which the courtesy of the profession is more shown than when one of its members does his best to neutralise the officious patronage of indiscreet friends.

"THE LATE ARTHUR JEFFARES BARLOW."

To the Editors of THE LANCET.

SIRS,—Please acknowledge in THE LANCET the enclosed sums on behalf of this fund. I am, Sirs, yours faithfully,

179, Hither-green, Lewisham, June 13th, 1898. R. H. CAPPER.

HOLY WATER AND INFECTION.

A CORRESPONDENT writing to the *English Churchman* points out the danger of infection from holy water, and relates what he saw at Milan Cathedral a little more than a month ago: "At the entrance of the cathedral," he says, "is a basin containing holy water, around which I saw a group consisting of a poor man, a Sister of Mercy, and probably his mother or wife. The poor man, suffering from a terrible affliction of the eyes, was having his bandages taken off, dipped in the water, and readjusted with many invocations." He concludes: "Oh, for faithful, earnest men who, before it is too late, would sound a warning voice against the spread of such rank superstition and physically dangerous error!" and we heartily join with him in his plea.

A QUESTION OF FEES IN A CORONER'S COURT.

To the Editors of THE LANCET.

SIRS,—The following short account of a recent inquiry at a coroner's court presided over by a legal gentleman may be of interest to some of my medical *confrères*. Briefly the facts are as follows. I was called to a case one morning and when I arrived about noon I found a child aged sixteen months in a state of profound collapse and passing loose stools mixed with blood. I was informed that the child had been quite well up to that morning. There was no evidence of intussusception. I informed the mother of the child that the condition was very serious and might prove fatal. I saw the child again about 3 P.M., when the collapse was more profound, and the child died about 5 P.M. At the inquiry which was held the mother gave evidence that a considerable quantity of blood followed a rectal examination that I made, and that when some brandy and barley-water which I had ordered were given the child immediately passed into convulsions and died in that state. I gave in my evidence that the child was in a state of collapse when first seen and had not shown signs of convulsions, that I made a rectal examination to try to determine the existence or not of intussusception, that the examination made carefully could not produce bleeding, and that as a matter of fact the same blood-stained matter came away from the bowel after the examination as before, and that a post-mortem examination was desirable to determine the cause of death. The coroner entered minutely into the question of rectal examination, discussed in detail the doses of brandy I had thought fit to prescribe, and informed the jury that he considered that a very grave imputation had been made on me, and discussed the matter in such a way as to make it plain to the jury that he considered it quite possible that I had seriously injured the child by the rectal examination, and that I might have sent the child into fits by giving it the brandy. It was determined to postpone the inquiry until a post-mortem examination had been made, the examination to be made not by me but by the police-surgeon, and I was ordered personally by the coroner to be present at the examination of the body and to appear at the adjourned inquest. The examination disclosed acute inflammation of the whole of the large intestin

and also a tuberculous condition of the abdominal glands and the verdict was given accordingly after the police-surgeon had been subjected to close examination by the coroner on the subject of rectal examinations and the dosage of brandy; but the coroner refused me a fee for attendance at the post-mortem examination, although I had been expressly ordered by him to attend, on the ground that charges had been made against me and that he ordered me to attend in my own interests. Now, Sirs, I have been many years in practice, and have attended many inquests, but I am a new-comer in this town, and it is a new experience for me to come into contact with a coroner so ignorant of ordinary medical procedure as to allow a charge to be bolstered up against a qualified medical man upon such a frivolous basis, and I consider that as I was instructed to attend at the post-mortem examination I am entitled to a fee for the same. I should be glad to know your opinion in the matter. I am, Sirs, yours faithfully,

June 7th, 1898. M.D. EDIN.

*** Our correspondent has our sympathy, for he has not received pleasant treatment, but we doubt if he could justify a claim for a fee. Circumstances were made to wear an appearance which would have necessitated his presence at the post-mortem examination whether he was ordered to be there or not. In every walk of life a man may have to defend himself against imputations which can be shown to be quite unjust and to do so at personal inconvenience and loss. The coroner being a lawyer had not the necessary knowledge to understand the child's condition, but that, though regrettable, was not his fault.—ED. L.

NURSING INSTITUTIONS AND THEIR CHARGES.

To the Editors of THE LANCET.

SIRS,—It may be of some interest to many of my *confrères* to know my experience of nursing institutions. Recently my wife contracted typhoid fever and I employed nurses from the Hanover Institute, the charges per week for each nurse, besides extras, being £3 3*s*. Being under the impression that some reduction was usually made to medical men and their wives, I wrote to ask if any reduction could be made in my case, and received a negative reply. I then wrote to another institution, the London Association of Nurses, asking if any reduction was made to the medical profession and received the following answer: "We do try to make a reduction in the nurses' fees when sent to a medical man" and "would be pleased to reserve you a nurse suitable for a typhoid case whose fee would be £1 11*s*. 6*d*. per week." I have no doubt other institutions do the same except the one in question. I think it my duty to make it known, as this must be a serious matter for many a struggling practitioner.

I am, Sirs, yours faithfully,

Balham, S.W., June 15th, 1898. LEWIS JONES, M.D. Dub.

*** Medical men are generally asked to attend nurses gratis or at greatly reduced fees. We believe they invariably accede to the request, so that we think it quite reasonable that a nursing institute should be prepared to make corresponding reductions to medical men.—ED. L.

ETIQUETTE FOR THE ANÆSTHETIST.

To the Editors of THE LANCET.

SIRS,—Would you kindly give me your opinion on the following case. A lady who has been under the care of a chiropodist for several months for ingrowing toe-nail decides under his advice to have the nail removed, which he agrees to do in the presence of a qualified man who gives chloroform. Is the medical man justified in giving the anæsthetic? and should anything happen at the operation or afterwards does the chiropodist render himself or his employer liable to legal proceedings? I am, Sirs, yours faithfully,

June 11th, 1898. J. D. B.

*** A medical man should not give an anæsthetic for a chiropodist. An anæsthetist's attention should be devoted to giving the anæsthetic: his presence in the room does not make him responsible for any details of an operation. If he were to assume legal responsibility for a chiropodist's manœuvres he would be guilty of covering and would be removed from the Medical Register.

VESALIUS.

A FREQUENT correspondent writes:—"An American medical journal some time last year published an article on Vesalius, with facsimile reproductions of 'The Lesson of Anatomy,' by J. Van Calcar, which forms the title-page, and a portrait of Vesalius from his treatise of anatomy, as well as other engravings. I should be much obliged if you or any of your readers could give me the name of the author of the articles as well as that of the journal and its date."

AN IMPROVED MACHINE FOR MOVING BEDS IN THE SICK-ROOM.

FROM Mr. Hermann Blass, of 155, Camden-road, N.W., we have received a pamphlet describing an improved form of bed-carriage. In construction it is similar to some machines already in use and is simply a skeleton iron frame on rubber castors. It is placed under the bed and by means of a lever the bed is raised from the floor while being supported by the framework of the machine. The advantages claimed for the invention are (1) easy manipulation by one person of ordinary strength; (2) rapidity of action without shock or vibration; (3) the ease with which a patient can be transferred from one floor to another; (4) the placing of a bed in a good light quickly for the purposes of operation, &c.; and (5) the facility with which a ward or room can be disinfected and cleaned. Mr. Gustav Allzeit of Koenigsberg, Germany, is the inventor of the bed-carriage.

ARTIFICIAL LIMBS FOR WOUNDED SOLDIERS.

MESSRS. ARNOLD AND SONS of West Smithfield have received orders to supply the artificial limbs specially ordered by Her Majesty the Queen for the soldiers recently wounded in action, and we are informed that the Queen herself has expressed a wish that these artificial limbs shall be of the best construction.

Subscriber.—Our correspondent does not say if the man's wages will be continued during his illness. A man on such wages cannot afford remuneration in any way adequate to the services he has received. Unless he is insured against accident or has a sum laid by for such emergencies we do not see how he is to pay more than two guineas. Our correspondent is advised not to send his bill in for a less sum even if he have to take less.

Portlade.—We cannot say for certain that the General Medical Council would adjudge the action as "an infamous one in professional respects," but they might take that view and we believe they would. It would anyhow be an unfortunate thing for a medical man to do and one which, if it became known to his fellow practitioners, would damage him irretrievably in their eyes.

N. M. O.—We have thought it wiser not to print our correspondent's query as the case might be recognised. The medical officer of health would be wrong to report the matter to the guardians, but if it comes otherwise to their ken he must answer their inquiries. He runs no risk in doing so, as in the face of the death certificate there can be no doubt about the facts.

H. A. F. is right to safeguard his interests. The patient has a month in which to find another attendant if the reasonable request cannot be acceded to, so that our correspondent's conduct cannot possibly be construed as inhuman. The people are clearly not in a position to ask for or to expect credit.

Nitro-monas has not our experience or the advertisement would not come on him as such a shock. We cannot notice the case if only because while he mentions the name and address of the offending practitioner he withholds from us similar information with regard to himself.

J. A. R.—Public Health Laboratory Work, by Henry R. Kenwood, M.B. Edin., D.P.H. Second edition. London: H. K. Lewis. Price 10*s*. 6*d*. For further information our correspondent should consult the Students' Number of THE LANCET, Aug. 21st, 1897.

Memo.—No. Mr. Alfred Haviland's maps showing the distribution of cancer in the United Kingdom combined with geological knowledge give grounds for theorising.

Epsom.—We see no reason to depart from our rule, which is apparently known to our correspondent. The family medical man will be able to give all necessary help.

M.R.C.S. Eng.—The Report of THE LANCET Analytical and Sanitary Commission on Dangerous Paraffin Lamps appeared in THE LANCET of Jan. 4th, 1896.

Rally will find all the information he requires given with detail in the various Students' Numbers of THE LANCET.

ERRATUM.—Mr. H. Gold, the inventor of the window-cleaner's chair recently noticed in THE LANCET, writes from 31, Great Eastern-street, to say that the price of the chair is 5*s*. 6*d*., not 4*s*. 6*d*. as stated.

COMMUNICATIONS not noticed in our present issue will receive attention in our next.

During the week marked copies of the following newspapers have been received: *Newcastle Chronicle, Western Mail, Louth Times, Grantham Journal, Hereford Times, Manx Sun, Penrith Observer, East Anglian Daily Times, Sun, Times of India, Pioneer Mail, Glasgow Herald, Derby Telegraph, Scotsman, Citizen, Hull News, Bath Chronicle, Wigan Examiner, Sheffield Telegraph, Eastern Morning News, Leeds Mercury, Builder, South Wales Daily News, Dundee Advertiser, Birmingham Gazette, Bedford Observer, Malton Gazette, Mid Devon Times, Leicester Post, Sussex Daily News, Lincoln Gazette, Hampstead Express, Blackburn Standard, Architect, Driffield Observer, Lynn Advertiser, Essex Telegraph, Manchester Guardian, Bristol Mercury, Forfar Herald, Yorkshire Post, Brighton Gazette, Kentish Mercury, Indian Mirror, Hastings and St. Leonards News, Local Government Chronicle, Reading Mercury, Mining Journal, Pontypool Free Press, City Press, Hertfordshire Mercury, Hackney Expresss, Hove Echo, Nottingham Daily Express, Wheels, Kentish Observer, Weekly Free Press and Aberdeen Herald, Devon and Exeter Gazette, Surrey Advertiser, China Mail, Hong-Kong Weekly Press, Birmingham Daily Post, Irish Times, Nottingham City News, Liverpool Daily Post, Northern Daily Telegraph, Brighton Herald, Westminster Budget, West Middlesex Herald, Preston Guardian, Norwich Mercury, &c., &c.*

Communications, Letters, &c., have been received from—

The Croonian Lectures

ON

THE CHEMICAL PRODUCTS OF PATHOGENIC BACTERIA CONSIDERED WITH SPECIAL REFERENCE TO ENTERIC FEVER.

Delivered before the Royal College of Physicians of London on June 14th, 16th, 21st, and 23rd, 1898,

BY SIDNEY MARTIN, M.D. LOND., F.R.S.,

FELLOW OF THE COLLEGE; PROFESSOR OF PATHOLOGY, UNIVERSITY COLLEGE; AND ASSISTANT PHYSICIAN TO UNIVERSITY COLLEGE HOSPITAL AND TO THE HOSPITAL FOR CONSUMPTION, BROMPTON.

LECTURE II.[1]

Delivered on June 16th.

MR. PRESIDENT AND GENTLEMEN,—We now pass to the consideration of the investigation more recently made on the chemical products of the typhoid bacillus, of the bacillus coli communis, and of a form allied to these—viz., the bacillus enteritidis of Gärtner. These three micro-organisms are in culture closely allied to each other. They all grow in broth, forming a cloudiness and a sediment, not commonly a scum on the surface, although this is present sometimes in cultures of the bacillus coli. The growth on agar is very similiar in all three forms, being more fluorescent with the bacillus coli than with the other two forms. On gelatin they grow without producing any liquefaction of the medium. Their differences are as follows: in glucose-gelatin and glucose-agar the bacillus coli and Gärtner's bacillus form numerous bubbles of gas, while the typhoid bacillus, although it grows copiously, produces no bubbles. The bubbles are due to the formation of gas from the sugar present. On potato the bacillus coli gives a copious, yellowish brown growth, the Gärtner's bacillus a slightly coloured, and the typhoid bacillus gives a filmy, almost transparent, growth. Milk is coagulated by the bacillus coli, but is not coagulated by the typhoid bacillus or by Gärtner's bacillus. Indol is formed in a broth culture by the bacillus coli, not at all by the typhoid bacillus, and only a slight indol reaction can be obtained, and that not constantly, in cultures of the Gärtner's bacillus. Some varieties of the bacillus coli do not appear to form indol. These cultural characteristics are slight, but are sufficient for the purpose of diagnosis, inasmuch as the bacillus coli can always be distinguished from the other two by the gas it forms in glucose gelatin, by its coagulation of milk and by the indol it produces, whereas Gärtner's bacillus is distinguished from the typhoid bacillus by the fact that it forms gas in glucose gelatin. In any of the media the growth of the bacillus coli and of Gärtner's bacillus is much more copious than that of the typhoid bacillus. The bacillus coli is further distinguished from the typhoid bacillus by not giving the "serum reaction" with the blood of a typhoid fever patient or with typhoid "antitoxic serum." Dr. Durham states that Gärtner's bacillus sometimes gives a sedimenting reaction with typhoid blood or serum. All these organisms are flagellated, the typhoid bacillus containing the most numerous flagella, the bacillus coli the smallest number, and Gärtner's bacillus being intermediate. The close similarity in vegetative properties of these three micro-organisms rendered it advisable that they should be investigated together. They probably play very different rôles in the production of disease. The typhoid bacillus is the cause of enteric fever, the bacillus coli plays a great part in the production of peritoneal lesions proceeding from the intestine and inflammatory conditions connected with the pelvic and other abdominal organs, and Gärtner's bacillus was originally found in the body of a man who had been poisoned by beef which also contained the bacillus. Dr. H. E. Durham thinks that it may be the cause of some cases of food poisoning. Both the typhoid bacillus and Gärtner's bacillus may therefore be considered as micro-organisms chiefly infecting the intestinal tract and the bacillus coli, though it is not known to produce any gross lesion in the intestinal tract, is a natural habitant in that region and may aid in intestinal infections.

THE TYPHOID BACILLUS.

The typhoid bacillus is found in enteric fever in the intestinal lesions, in the mesentery glands, and in the spleen. It is present in some cases in the motions of typhoid fever patients and also in the urine, and has been occasionally found in the liver and in the blood. It is also present in some of the abscesses of remote parts which may be observed in the course of typhoid fever or during its convalescence. It is most readily separated from the spleen and in the following manner: after the spleen has been removed wholly from the body it is washed on the surface with boiling distilled water, followed by absolute alcohol. It is then incised with a sterilised knife. By means of a sterile platinum rod inserted into the substance of the spleen inoculation of broth tubes or the surface of agar plates is made, and within twenty-four hours there is a copious growth of the typhoid bacillus.

Another method is to remove a small portion of the splenic pulp by means of sterile instruments and place it in 200 c.c. of sterile distilled water in a flask which is incubated for twenty-four hours. The liquid is then brushed over the surface of agar plates and in twenty-four hours a copious growth of the typhoid bacillus is obtained. I have examined four spleens in this manner—one from the Middlesex Hospital, kindly sent me by Mr. Fardon; one from St. Thomas's Hospital, sent by Dr. Hawkins; one from Homerton Hospital, sent by Dr. Goodall; and one from University College Hospital, from a case under the care of Dr. Ringer. With the exception of one case all gave a pure and abundant culture of the typhoid bacillus. The exception showed a great preponderance of colonies of the typhoid bacillus on the agar plate, but one or two colonies appeared rather different from the others, being more opaque and fluorescent. These were separated and proved to be the bacillus coli. All the remaining colonies, as well as those from the other three cases, gave all the typical reactions of the typhoid bacillus, including the serum reaction (Widal's). The presence of this pathogenic organism in pure culture in the spleen and its invariable presence is one of the arguments in favour of the typhoid bacillus being the cause of enteric fever.

Increase of virulence of the bacillus.—In the investigation of the products of a pathogenic bacterium it is not of much value working with non-virulent cultures. None of the ordinary cultures of the typhoid bacillus obtainable in laboratories will kill an animal. I obtained cultures from various laboratories in England and found them all incapable of causing death. Although, as will appear, the action of the chemical products of these non-virulent forms are of some significance, yet much progress was not made until a virulent culture was obtained. Chantemesse and Widal[2] rendered the typhoid bacillus virulent by injecting 4 c.c. of a broth culture under the skin of the guinea-pig and at the same time injecting into the peritoneal cavity from 8 to 10 c.c. of the sterilised chemical products of the streptococcus. The animal died and the typhoid bacillus was found in the blood, in the organs, and in the peritoneal cavity. A culture was made from this in broth and used for a second experiment of a like character, using rather less of the streptococcus products. When proceeding in this way it was found that less and less of the streptococcus products could be used, the animal still dying, until finally it was found that the culture of the typhoid bacillus obtained could in subcutaneous doses of ¾ c.c. kill the animal without the aid of the streptococcus products. Similar results have been obtained by using the products of the bacillus coli or of the bacillus prodigiosus instead of the streptococcus products. I attempted this method, using the bacillus coli products, but found that although the virulence of the bacillus was undoubtedly increased, yet I could not obtain it in a virulent enough condition to cause death of itself. I obtained, however, an extremely virulent typhoid bacillus by utilising cultures made from the spleen of one of the cases examined.

The virulence of the typhoid bacillus as obtained direct from the spleen after death or during the course of the disease varies somewhat. In one of the cases a small amount of splenic pulp was ground up with salt solution and 2 c.c. of this mixture were injected into the peritoneal cavity of a guinea-pig. Death occurred in the course of eight days, and a pure growth of the bacillus was obtained from the peritoneum, but not from the blood of the heart or the

[1] Lecture I. was published in THE LANCET of June 18th, 1898.

[2] Annales de l'Institut Pasteur, vol. vi., p. 755, 1892.

spleen. From another case a small quantity of a similar mixture was injected into two guinea-pigs and both died in under twenty-four hours, and a pure growth of the bacillus was obtained from the peritoneal cavity and from the blood of the heart. The first of these cases was used for obtaining a virulent bacillus. 4 c.c. of a four-day-old culture of the splenic pulp in broth were injected into the peritoneal cavity of a guinea-pig; death occurred in under twenty-four hours. There was slight effusion into the peritoneal cavity, from which a pure culture of the bacillus was obtained. ½ c.c. of this effusion was injected into the peritoneal cavity, of another guinea-pig. Death occurred in under twenty-four hours, and in the subsequent procedure the effusion from the peritoneal cavity of one guinea-pig was injected into the peritoneum of another, death occurring in the twenty-four hours. At the eleventh successive inoculation $\frac{3}{10}$ c.c. of the peritoneal effusion killed the guinea-pig in two days. At the thirteenth inoculation $\frac{1}{10}$ c.c. diluted in salt solution killed in less than twenty-four hours, and at the sixteenth inoculation half a platinum loopful of a twenty-four-hour-old agar culture injected into the peritoneal cavity killed a guinea-pig in under twenty-four hours.

During the course of these inoculations it was observed that there was almost constantly an exudation of turbid fluid of greater or less amount into the peritoneal cavity. There was occasionally a little lymph on the surface of the intestines and sometimes there were ecchymoses in the spleen. The peritoneal exudation was highly albuminous, coagulating solid on heating. Under microscopical examination it showed large numbers of short rods, more or less actively motile. In the first inoculations some leucocytes were present in the exudation, showing phagocytosis. Later, however, as the bacillus became more virulent the cells and phagocytosis were not observed and the exudation consisted simply of a highly albuminous fluid containing enormous quantities of typhoid bacilli, sometimes in clumps, usually singly. As the virulence of the bacillus increased so did the time of death diminish and at the twenty-eighth inoculation 2 c.c. of the peritoneal exudation were injected into the peritoneal cavity of a rabbit, causing death in five and a half hours—a result which cannot be attributed solely to bacterial action but must be ascribed to the chemical poisons present in the peritoneal fluid. This was very evident in the experiment on a rabbit weighing 590 grammes, which received 0·25 c.c. of the peritoneal fluid into the left marginal vein. Symptoms of collapse soon supervened and death occurred in two and a half hours. The peritoneal exudation produced by the introduction of virulent typhoid bacilli is therefore highly poisonous, and these properties were investigated.

In all these cases the typhoid bacillus was obtained in pure culture in the peritoneal cavity, whether there was much or little effusion, and it retained throughout its typical cultural characteristics. There was no case in which there was a mixed infection with any other micro-organism, so that the effects were those of the bacillus itself. An examination was made of the distribution of the bacillus in the various organs of the body. In the earlier inoculations during the increase of virulence it was found that although the animal died the bacillus was limited to the peritoneal cavity and was not present in the spleen or the heart's blood, showing that death was produced by absorption of the poisons formed by the bacillus in the peritoneal cavity, which acted as a sort of living test tube. In the later experiments, however, the bacillus did not remain in the peritoneal cavity, although its distribution throughout the body was not constant. Thus in one experiment (peritoneal injection) at death it was found that the heart's blood, spleen, and liver all gave pure cultures of the typhoid bacillus as well as the fluid in the peritoneal cavity. This was confirmed by the next experiment, but in the one following a pure growth was obtained from the peritoneal effusion and from the spleen and not from the liver or the heart's blood. There is a tendency, therefore, more with the weak virus than with the strong, for the typhoid bacillus to limit itself in its growth to the seat of inoculation, although a general distribution of the bacillus throughout the body usually occurs with the virulent form. This limitation of the bacillus to the site of injection is well marked when it is subcutaneously injected. Thus in a guinea-pig which received subcutaneously ½ c.c. of virulent peritoneal fluid there was a swelling at the site of inoculation which ended in a slowly-forming abscess pointing in eleven days; a pure culture of the bacillus was obtained from it. The animal was killed on the twelfth day and a pure culture of the bacillus was obtained from the abscess, but the heart's blood, the spleen, the liver, and the peritoneum were sterile; the heart muscle was not degenerated. Chantemesse and Widal and others have, however, found that infection of the body can occur after subcutaneous injection of the bacillus, and this occurs readily if the process of infection be aided in the manner previously described.

It is interesting to note in this series of experiments the absence of leucocytes in the peritoneal exudation as the bacillus became more virulent, and the formation of an abscess and the limitation of the growth of the bacillus when the virulent virus was injected under the skin.

Toxic action of the peritoneal fluid.—It has been stated that the cause of death when the virulent peritoneal fluid is injected into a rabbit or a guinea-pig was due more to the action of a chemical poison than to the growth of the bacillus, since this occurred so rapidly—in one case in five and a half hours and following intravenous injection in two and a half hours. The effects of this chemical poison were examined by filtering the peritoneal fluid through porcelain in a small apparatus improvised for the purpose. In the first experiment ½ c.c. of this filtered sterile peritoneal fluid was injected into the marginal vein of a young rabbit. A moderate degree of fever followed the injection for several hours. Subsequently the temperature fell to the normal and no symptoms were observed in the animal, which died at the end of thirty days. The heart's blood was sterile and the heart muscle showed well-marked degeneration of the fibres, there being loss of striation, longitudinal fibrillation and the presence of numerous small granules staining black with osmic acid. Other experiments were performed in a similar manner, using 1 c.c., 1·5 c.c., and 2 c.c. of the filtered peritoneal fluid. In all cases some degree of fever followed the injection, but no effect was subsequently observed and death did not occur. The filtered peritoneal fluid was therefore not nearly so poisonous as the unfiltered, evidently the porcelain filtrate had kept back the greater part of the chemical poison, whether this was present in the albuminous fluid or in the bodies of the bacilli.

Examination of the poison in the fresh state in the spleen.—Before continuing this part of the subject we must return to the consideration of the poisons present in the spleen of typhoid fever patients. In all the cases examined, as has been stated, the typhoid bacillus was present in large quantities, and in only one was there an admixture with another bacterium, the bacillus coli. The splenic pulp was rubbed through sterile wire gauze and treated with about 500 c.c. of sterile normal salt solution. This was allowed to stand a short time and an attempt was made to filter it through porcelain. This was a matter of great difficulty, only a small amount of the liquid passing through. It was thin and deeply blood-stained. It was injected into the marginal vein of a rabbit on two successive days—4 c.c. on the first day and 3·5 c.c. on the second day. No appreciable effect on either the temperature or the body weight followed the injection on either day or on the subsequent two days; but on the fifth day of the experiment the temperature was found to have fallen to 97·6° F., and the animal was collapsed and had profuse and mucoid diarrhœa. The temperature remained subnormal the whole of that day and at 10 o'clock on the sixth day it was 95·4° and the animal was lying motionless on its side but breathing regularly. It was killed with chloroform. At the post-mortem examination there was subcutaneous hæmorrhage over the lower third of the abdomen extending down over the upper third of the front of the thighs. In the abdomen there was a soft blood-clot matting together the omentum and the adjacent coils of the intestine. There was no peritonitis. The thoracic organs were normal and the intestines were empty except the upper part of the colon and cæcum, which contained soft fæces. There was no enlargement or redness of the Peyer's patches or of any other part of the mucous membrane. From the peritoneal cavity was obtained a growth of the bacillus coli, but the spleen contained no micro-organisms. What is interesting in this experiment is that following the injection of the poison there was a period of incubation during which no effect on the body temperature or the weight was to be observed, and that a fall of temperature associated with great bodily prostration and mucoid diarrhœa supervened somewhat rapidly. This fall of temperature and the collapse and diarrhœa observed are, as will be seen, to be ascribed to the action of the chemical poison of the typhoid bacillus.

A more extensive chemical examination of the spleen was

made by means of the precipitation of the extract with alcohol, in order to obtain any albumoses which might be present as well as to separate the alcoholic extract. The method has already been described. The amount of albumoses obtained from each of three spleens was 0·652 gramme, 0·37 gramme, and 0·369 gramme. When dried they formed a fine whitish-yellow and very light powder, soluble in water, and giving a brownish solution, which gave a distinct biuret reaction. The alcoholic extract was yellowish in colour and was separated from the fatty bodies by precipitation with a large excess of ether. It contained a very large quantity of leucin and tyrosin, which separated out in the form of crystals on evaporation. The final alcoholic extract was a yellowish, sticky, resinous-like substance when dried over sulphuric acid. The injection of the alcoholic extract into the vein of a rabbit did not seem to produce any effect on the temperature and no appreciable effect on the body weight. In one case 0·112 gramme was injected and the animal appeared as well after the injection as before. There was no diarrhœa nor were there any symptoms to be noted. The injection of the albumoses also had but slight effect on the animal. In one case 0·2785 gramme was injected in three doses into a rabbit weighing 790 grammes, a dose of 0·352 gramme per kilo. of body weight. After the first injection of about 0·4 gramme there was no effect on the temperature. After the second injection of about 0·12 gramme there was a rise of temperature, the highest point reached being 105° during the day. After the third injection on the following day of the same amount there was only a slight rise of temperature, but on the succeeding days it was again normal. No symptoms were produced in the animal by these injections except a slight rise of temperature. This effect, therefore, is a very different one from that observed after the injection of the saline extract of a fresh spleen. It may have been, of course, that the poison was destroyed by the alcohol during the course of preparation. This, however, is unlikely, inasmuch as the manipulation was very rapid, the products being separated within three days and the alcohol being allowed to act on the albumoses less than eighteen hours.

The Ingleby Lectures

ON

EXTRA-UTERINE PREGNANCY.

Delivered at Mason College, Birmingham, on May 11th, 18th, and 25th, 1898,

BY JOHN W. TAYLOR, F.R.C.S. ENG.,

PRESIDENT OF THE MIDLAND MEDICAL SOCIETY; SURGEON TO THE BIRMINGHAM AND MIDLAND HOSPITAL FOR WOMEN; CONSULTING SURGEON TO THE WOLVERHAMPTON HOSPITAL FOR WOMEN, ETC.

LECTURE III. (*concluded*).[1]

TREATMENT.

THE treatment of extra-uterine pregnancy is essentially operative. This fact is set forth very strongly in the well-known assertion of Werth, who declares that "ectopic gestation must be considered as a malignant new growth and therefore should be removed by operation at every stage of its development." This is a sweeping assertion, and one or two exceptions must be made to it. For example, in the latter half of a tubo-abdominal or tubo-ligamentary pregnancy, when no sign of danger is present, it may be better practice to wait for operation until a time at or about the usual period of delivery when the child is viable and strong than to operate earlier when the life of the child is certain to be sacrificed. Some surgeons have advised that we should go beyond this and wait for operation until after the death of the child so as to have if possible a less vascular placenta to deal with. For my own part, in all cases of later extra-uterine pregnancy with a living fœtus and without any special sign of imminent danger I would choose whenever practicable the most convenient date in the ninth month on which to operate. I would not wait for any sign of spurious labour or seek after exact correspondence with the natural term, but I would endeavour to perform the operation under the best conditions for both lives concerned. Again, occasionally here and there a case of ruptured tubal pregnancy or of tubal mole with peri-tubal hæmatocele recovers without operation, and the fact must be recognised and dealt with. I have seen five or six cases of such recovery and there could be no doubt of the genuineness both of the disease and of the recovery; indeed, in one of these cases, as we have seen, the rupture in the tube and the traces of the old hæmatocele were plainly visible on opening the abdomen some two years later. If my own experience can be regarded as at all general or typical this would give a proportion of about 5 per cent. of all cases observed which may be expected to terminate by process of natural recovery. Is there anything to mark these cases out from all the rest? Not much, I think, for the swelling of the tube, followed by the further tumour of the hæmatocele, the acute attack of abdominal pain and the peritonitic sequel, may all be quite as marked as in the majority of cases. But if the case recovers without operation the pregnancy is usually destroyed by the first (and only) bleeding, and the hæmorrhagic discharge from the uterus, which during the period of abdominal hæmorrhage and pain has probably been irregularly abundant, absolutely ceases with the definite termination of the pregnancy and beginning of absorption, and the patient becomes free from pain. Under these circumstances—cessation of growth, cessation of hæmorrhage, cessation of pain—notwithstanding the pelvic tumour of the distended tube and hæmatocele—it may be right to withhold operation and to give the patient, by rest in bed, by a liberal but non-stimulating diet, and by attention to all excretory functions, an opportunity of natural cure. It is worthy of note, however, that this natural cure is rarely very satisfactory and that it contrasts somewhat unfavourably with operative methods. It requires many weeks or even months of rest for complete absorption to take place and at the close of the process the distortion and fixity of adjacent organs (due to the prolonged presence of the hæmatocele) may still be marked and possibly permanent. In some cases, too, the fœtus may have arrived at a stage of development in which complete absorption is impossible, and if so, although apparent recovery should follow, there may be no finality about it. Months or years afterwards suppuration may occur about the retained fœtus and the evils connected with this prove very much greater than those encountered at the earlier disturbances. Finally, in all cases the danger of waiting—the danger of temporising when any symptom of collapse or pain is present—should be thoroughly recognised and appreciated. So far as we know at present if 5 patients may possibly weather the storm by months of rest 95 patients will die if surgical aid is withheld. Now, what is the prospect or prognosis after surgical treatment? In my own series of cases 37 cases of all kinds are reported with 36 recoveries and 1 death. In Mr. Tait's list published in 1888 we find 42 cases with 40 recoveries and 2 deaths, and in Mr. Mayo Robson's cases recently reported 23 cases with 22 recoveries and 1 death. I have some reason to know that while these results are all very good they are not specially exceptional. If I turn to the statistics of the chief hospital with which I am connected, the Birmingham and Midland Hospital for Women, I find in the decade from 1886 to 1896 that 62 cases of ectopic gestation were operated on with 61 recoveries and 1 death; and smaller series of cases are being frequently reported in the medical journals none of which show any high mortality. The mortality of all cases is not probably more than 5 per cent.

The operative treatment of extra-uterine pregnancy may be considered under two divisions—viz.: (1) operations in the earlier half of pregnancy; and (2) later operations. (1) In the first we must consider—operations for diffuse hæmorrhage and operations for localised tumour, either an intact pregnancy or hæmatocele; and (2) in the second division we shall have to deal mainly with the operative delivery of the mother at or beyond the period of term under tubo-abdominal and tubo-ligamentary pregnancy.

1. Operation for diffuse hæmorrhage may be required in—(*a*) early rupture of the tube; (*b*) later rupture of the tube; (*c*) intra-peritoneal rupture of broad-ligament pregnancy; (*d*) rupture of a peri-tubal hæmatocele; and (*e*) rupture of a tubo-uterine or interstitial pregnancy. The operation here will of necessity involve abdominal section. It will be an operation of emergency. It will have

[1] Lectures I. and II. and the first part of Lecture III. were published in THE LANCET of May 28th, June 4th, and June 18th, 1898, respectively.

to be done at the patient's home—very possibly at night—under uncomfortable conditions and often without skilled assistance. None of these difficulties must be allowed to excuse any laxity in surgical asepsis and therefore the operator must himself be prepared to act as his own chief assistant and by order and method reduce his dependence on others to a minimum. Some kind of operation table is an absolute necessity, for the abdominal cavity will need washing out with warm water. Plenty of boiling water must be available. The operator arranges his portable steriliser, his instruments and his sterilised pads (some of which should be of large size) within easy reach of his right hand so that he can help himself to anything he wants. No time must be lost. When the diagnosis has once been made the operation must be performed at the earliest possible moment consistent with a prepared and cleanly *entourage*. While the patient is passing through the later stage of narcosis the abdominal wall is carefully cleaned with soap-and-water and afterwards with methylated spirit. The incision—made in the middle line—will probably at once disclose some confirmation of the diagnosis, the black colour of the blood within the abdomen showing darkly through the transparent peritoneum. On opening this blood and blood-clot pour out freely. The fingers of the left hand are inserted into the abdomen, seize the uterus, and feel at once for the site of pregnancy, the source of bleeding. If, as usually happens, this can be identified by touch it is immediately withdrawn out of the abdomen, the parts below the tube being firmly held so as to stop any further bleeding. The operator then—with his disengaged right hand—takes the needle armed with ligature silk from the steriliser, transfixes the broad ligament below the tube with Staffordshire knot or linked double ligature, ties off the pregnant tube and finally removes it. The abdomen is now thoroughly washed out with blood-warm water, the pelvis is specially cleared of blood-clot, a drainage tube is placed in the pouch of Douglas, and the abdominal incision is closed. After the wound is dressed a binder is applied tightly round the abdomen and if the patient be nearly pulseless she is placed in bed on an inclined bedstead with the lower extremities raised.

The operation itself is often an easy one, but there are difficulties which may interfere with its ready performance. The most important is the impossibility of seeing what one has to do. The blood continues to well up from the pelvis and vigorous sponging may only afford momentary glimpses of the pedicle or broad ligament. In this case pouring clear warm water over the wound and packing some of the larger pads into the pelvis and round the affected tube will often prove of service. Sometimes this difficulty of vision has a more serious bearing. If the pregnancy has already escaped from the ruptured tube it may be no easy matter to detect which is the affected side and where is the source of the hæmorrhage. Under these circumstances the temporary control of the circulation with one or two pairs of Doyen's lighter elastic forceps will allow of the washing out of the abdomen and enable the operator to search for and to find the tubal rent without fear of further loss while the search is still in progress. I always take these forceps to any abdominal operation of emergency; their pressure can be nicely adjusted so that intestine even need not suffer any injury in their temporary grasp, while the higher grades of pressure are sufficient to control the broad ligaments in a case of hysterectomy. Occasionally, when a ligature is difficult or impossible to place, a pair of these forceps may be left on the broad ligament or on the side of the uterus at the close of the operation. A compression of from eighteen to twenty-four hours is usually sufficient. In diffuse hæmorrhage from the rupture and extrusion of a tubo-ligamentary pregnancy the temporary or more lasting use of forceps may be of signal service. The bleeding points may be entirely hidden, furnished largely by branches of the uterine artery; and this or firm plugging with iodoform gauze may be the only way of arresting the hæmorrhage. In tubo-uterine or interstitial rupture with diffuse bleeding—a condition in which surgery has still to win its laurels as victor—the quick recognition of the condition on opening the abdomen will be the first element of success, and the rent on one side in the upper part of the uterus and the different levels at which the tubes appear to enter the uterus should guide the operator to a quick decision. In this case the uterus should be drawn out of the wound, two transfixion pins passed, first through the peritoneum on one side of the incision, then through the uterus well below the tear, and finally through the peritoneum of the opposite side (as in the method described by myself in 1893), a "wire-clamp" applied below these, and the latter screwed thoroughly "taut." The hæmorrhage is then absolutely controlled, and if the clamp be always ready for use the time occupied in effecting this control need scarcely be longer than that which has been used in briefly describing the method. The operator can wash out the abdomen through the upper part of the incision above the clamp, doing this carefully and thoroughly, and if drainage be considered necessary the tube can be adjusted at the upper angle of the wound. When the latter is closed the clamp is again screwed up tightly, the parts above the clamp are cut off and the stump is surrounded with iodoform gauze. The only caution necessary to mention is the danger of any slipping of the broad ligament out of the grasp of the wire before the latter is finally tightened. This is easily avoided by transfixing the broad ligament with the pins or by holding up the appendages with forceps (if these are removed) and by screwing the clamp thoroughly tight before the parts above the wire are finally removed.

Washing out of the abdomen in a simple case of diffuse hæmorrhage, as in early rupture, can often be done by pouring water from a jug directly into the abdomen, but in such a case as I have been considering and in a patient with a deep pelvis containing much blood-clot the use of a syphon tube is more handy and more efficient. By this the stream of water is carried directly to the lowest part of the pelvis and the upward returning stream washes out the blood-clot. This "washing out" should never be omitted in cases of diffuse bleeding. Besides cleansing the peritoneum it is probably a means of conveying some fluid into the depleted blood-stream—and this, followed (after the operation is over) by a nutrient injection containing brandy, and by temporary elevation of the pelvis and lower extremities, is, in my opinion, more useful in overcoming shock and in restoring the pulse than is any attempt at transfusion.

In diffuse hæmorrhage the quickest and directest route to the bleeding vessels is an absolute *sine quâ non* of operative treatment and there can be no doubt that this is attained by abdominal section above the pubes. In localised hæmatocele and in intact extra-uterine pregnancy up to mid-term other methods of operation may be employed besides abdominal section and we shall have to consider vaginal section under its two aspects of posterior and anterior celiotomy and also the sub-peritoneal incision in cases of anterior tubo-ligamentary invasion. In true retro-uterine hæmatocele, in which the pouch of Douglas is itself distended with blood, posterior vaginal celiotomy — the direct opening of the pouch of Douglas from the vagina—is obviously the proper method of treatment and no surgeon would probably dream of any other. Under this condition the operation is very simple. A free incision is made in the middle line, the contained blood and blood-clot are gently washed out by a stream of warm water carried within the cavity, nothing is done to interfere with the upper limiting adhesions or roof of the hæmatocele, and after free evacuation the pouch is drained by a tube or by iodoform gauze. In peri-tubal hæmatoceles which occupy the whole or a greater part of the pouch of Douglas an extension of the same method may be employed with advantage, especially if the bulk of the swelling be evidently within the pouch of Douglas. In this case, however, every aseptic precaution is just as necessary as in an abdominal section and before beginning to operate the hair of the vulva is shaved and the vulva and vagina are thoroughly cleansed and disinfected. For this and for the subsequent operation the patient is placed in the "lithotomy" position on a good table and the vagina is kept open by the valuable self-retaining speculum of Auvard. The surgeon sits facing the vulva of the patient and there should be a good light directly behind his head. The patient is anæsthetised previously and is therefore unconscious before any of this preparatory work is begun.

Operation.—The uterus is steadied by volsella applied to the posterior lip of the cervix and the posterior vaginal vault is opened behind the uterus with scissors curved on the flat. On reaching the pouch of Douglas blood and bloody serum will probably be found within it. There are, as a rule, no adhesions at the lowest part of the pouch. On inserting the fingers the tumour of the hæmatocele will be plainly felt and all the lower part of it may be very thoroughly explored especially if the disengaged hand be placed on the abdomen above the pubes and the examination of the mass be conducted "bimanually. During this examination the blood-clot is usually broken down and the

main part of the hæmatocele is cleared away by the vaginal opening. This may be assisted by irrigation from within the pouch of Douglas if the opening be very free and the return current unobstructed. If not it may be wise to restrict oneself to manual or digital removal only. During the process the remains of the pregnancy itself, fœtal and placental or molar, may be evacuated, and sometimes the tube containing a mole of pregnancy may be detached from its adhesions, brought outside, ligatured, and removed. It is, however, rarely necessary to do this or to strive after this unless hæmorrhage be still going on. If the pouch of Douglas be thoroughly plugged and drained by a thick pledget of iodoform gauze after the hæmatocele is broken down and cleaned away nothing more is needed to ensure the conditions essential for the safe and complete recovery of the patient. A few cautions may be necessary with regard to the conduct of this simple operation. It should be an operation of election for certain cases—those are most favourable for its employment in which the vagina is capacious and the tumour is mainly posterior to the uterus. The bladder should be thoroughly emptied immediately before the operation is begun. No violence should be used, the blood-clot and débris should be extracted gently. The gauze drain should rest one half within the peritoneal cavity and the other half in the upper part of the vagina, and no portion of it should protrude or be visible at the vaginal entrance. The urine is better withdrawn by the catheter until the drain is removed on the fourth or fifth morning. The posterior vaginal incision is so direct in its guidance to the seat of pelvic disease in so many cases of retro-uterine tumour that we cannot but wonder sometimes that it has been so little employed. Perhaps one reason may be that its employment is sometimes followed by temporary and occasional neuralgic pain in the back which is rather difficult to account for as it does not occur in vaginal hysterectomy when the incision is wider and circular. I am inclined to think that this is excited by the dragging of the uterus on the partially divided utero-sacral ligaments (or muscles) and that a median antero-posterior opening (when practicable) may be preferable (on this ground only) to a broad transverse incision.

Anterior vaginal cœliotomy or, as it is sometimes called, anterior colpotomy has been extensively used during recent years in the treatment of peri-tubal hæmatocele due to tubal pregnancy. The vaginal vault is opened between the uterus and bladder, the vesico-uterine fold of peritoneum is divided, and the fundus is drawn forwards by volsella out of the abdomen through the opening thus made. The uterus and uterine end of the tube on either side are then under the complete control of the operator and the tube together with any contained pregnancy can, as a rule, be ligatured and removed without much difficulty. But the space in which one has to work is cramped and confined and while the tube may be easy to remove it is not so with the hæmatocele. This often separates from the tube with traction on the latter and it may be very difficult or impossible to remove it afterwards. Some operators appear to regard this as quite immaterial and leave a considerable quantity of blood and blood-clot in the pelvis and abdomen at the close of the operation, providing no drainage, but trusting solely to the absorptive powers of the peritoneum itself for its removal. If the operation has been performed with perfect cleanliness this confidence may be rarely misplaced as regards the final result, but the patients do not recover easily, there being often considerable pyrexia for several days before convalescence is thoroughly established. The main objections to anterior vaginal cœliotomy as a routine method of treatment are the following: (1) occasional insufficient space for operative work; (2) frequent inability to remove thoroughly and cleanly all products of the misplaced pregnancy; (3) inability to wash out the abdomen satisfactorily; (4) inability to drain through the anterior opening; and (5) occasional inability to extract the uterus without injury, the uterus being enlarged and softened by the changes consequent on the associated pregnancy. It may be noticed that most of these objections will lose a great deal of their importance if the operator, the patient, and her friends be prepared and ready to accept the possible sacrifice of the uterus in the course of the operation. If the uterus be already diseased or damaged, justifying its removal as an initial step, the space and opportunities thus acquired are ample for all ordinary requirements; there is room for thorough and careful work, the pregnancy and hæmatocele can be completely removed, the pelvis and lower abdomen may be washed out, and at the close of the operation the most perfect drainage of the pelvic peritoneum can be established by the adjustment of a well-fitting plug of iodoform gauze.

It is, of course, of considerable advantage to the patient to be able to relieve her of her disease without making an abdominal incision and especially so in cases where drainage is a desideratum, abdominal drainage being frequently followed by hernia. But I am inclined to think that abdominal section, in spite of this drawback, is still the better operation, or rather the better route for operative work in every case in which a posterior colpotomy is inapplicable or insufficient. By abdominal section the extent and connexions of the hæmatocele can be accurately explored, the limiting adhesions to omentum and intestine can be carefully separated or broken through, and the whole of the operation from beginning to end can be performed under the most favourable conditions for manipulation and cleanliness. When operating by the abdominal method the diseased tube must invariably be thoroughly defined, ligatured, and removed. It will often have to be unrolled from the back of the uterus after the main tumour of the hæmatocele has been taken away, but the adhesions are almost always light and easy to separate. The adhesions of the hæmatocele-capsule to bowel and omentum are, on the other hand, often especially intimate and when this is the case it is better practice to leave a considerable portion of the hæmatocele capsule adhering to bowel than to make any attempt at their separation.

Dr. Berry Hart has recently described a method of operating in intact anterior tubo-ligamentary pregnancy at mid-term which is sound in principle and may be followed with advantage whenever the conditions permit of its application. In this pregnancy, as we have already seen, the anterior layer of the peritoneum is raised and at mid-term as well as at a later stage there is a space either mesially or above the groin on one side which is uncovered by peritoneum. This can be accurately defined by a preliminary incision in the middle line which opens the abdomen. When this has been done a direct incision is made into the sac of pregnancy below the peritoneal reflexion. This extra-peritoneal wound should be large enough to admit four fingers. The fœtus is removed at once, the sac tamponaded with iodoform gauze, and the placenta allowed to separate and come away slowly with the discharge.

In tubo-abdominal pregnancy at term there is no difficulty in the removal of the child by an abdominal incision. The crux of the operation is the treatment of the placenta. If this be left, sooner or later it will almost certainly become septic and putrid and I have come to the conclusion—contrary to the opinion I formerly held—that in all cases of true tubo-abdominal pregnancy it is wise to remove the placenta. A clear idea of its probable relations and attachments will, I feel sure, do much to make this part of the operation easier and to rid it of much of its otherwise alarming features. Wherever the placenta is, there is the Fallopian tube and it is from this it receives the greater portion of its blood-supply. As we have already seen, sometimes the placenta is still within the tube, absolutely surrounded everywhere by tube, and nothing can be easier than to ligature it off and ensure its complete removal without any loss of blood. When it is within the gestation-sac and mostly covered by reflexions of the amnion, no method, I think, can be better than that I employed in the case (No. 33) already reported under this heading. Accessory vascular attachments to the omentum or abdominal wall are first ligatured and divided, the placenta is slightly tilted up at the most accessible part of its circumference, and forceps are used to clamp its tubal attachments below. The placenta is then removed and the tubal attachments are subsequently ligatured. The most difficult and dangerous form of attachment is that when the amniotic membrane only lines the upper surface of the placenta and all its under surface is attached not only to the tube and broad ligament but also to the parts adjacent (the condition found in Case 3). Still in this case a modification of the plan already described will afford the best chance of success. Sometimes the deeper attachments (uterus and broad ligament) may be seized before separation by the fingers of an assistant. If not, the most accessible route to the under surface of the placenta is searched for and separation is begun. As soon as possible the tubal and uterine attachments are clamped by the lighter elastic forceps of

Doyen, the placenta is peeled off and two or three large sterilised pads are packed into the cavity from which the afterbirth has been removed. Ligatures are applied to the broad ligament and tube and wherever it is possible by so doing to control the bleeding. Where these are useless packing with iodoform gauze will prove, I believe, the best alternative method for control of hæmorrhage. When this is necessary if the original abdominal incision—probably mesial—be decidedly to one side of the placental site, it will be wise to finish the operation by making a secondary abdominal incision immediately above the gauze from which the packing may be readily removed some four or five days later. The very rare condition when the child is abdominal and the placenta intra-ligamentary belongs to a very different category. From a surgical standpoint this pregnancy remains tubo-ligamentary throughout and is governed by the same laws of treatment which apply to tubo-ligamentary pregnancy. And in tubo-ligamentary pregnancy there is no necessity for the operative removal of the placenta. If the sac be drained the placenta will itself separate and come away with the discharges; this usually takes place without any pyrexia or constitutional disturbance.

Let us take the simpler form of tubo-ligamentary pregnancy first—the posterior or retro-peritoneal variety—and consider the operation necessary for its relief. In this the peritoneal cavity is always opened by the abdominal incision. Within the abdomen full and bulging like a pregnant uterus is the sac of pregnancy. This is opened by an incision directly underneath the abdominal wound, the edges of this are held against the edges of the abdominal incision, the child is extracted and after ligature and division of the cord is entirely removed. Now it may be possible to remove the placenta with safety from the interior of the sac, especially when the infant has been dead for weeks or months, and by so doing, if no serious hæmorrhage is occasioned, convalescence may be very much shortened. If there be any doubt, however, if the placenta be full of blood and firmly attached, no interference is necessary. The incision in the sac is sewn to the abdominal wound, the cord is left hanging out of its lower angle and the sac is drained. I am aware that many modern writers have advised a much more radical and sweeping method of treatment. Dr. Dunning, in the case I have already quoted, proceeded to extirpate the sac and very naturally, as anyone who studies the specimen depicted in Fig. 22 will easily understand, had to complete his operation by removal of the uterus. Fortunately the patient recovered, but I cannot agree with the practice adopted. It is altogether unnecessary and any temporary advantage secured by it is dearly purchased at the cost of increased danger and extensive mutilation. In the similar case reported by myself (Case 4) and treated by the simpler method of drainage the patient not only made a good recovery, but has since had a normal pregnancy with safe delivery of a healthy child. In the anterior or sub-peritoneal-abdominal form of broad ligament pregnancy the same remarks apply, but the sac may sometimes be opened at a part uncovered by peritoneum. If some part of the child is obviously almost subcutaneous (and that is most likely to be found on one side of the middle line) the sac may be opened at once and the operation of removal of the child and drainage of the sac conducted without opening the abdominal cavity or seeing the peritoneal membrane. More frequently, perhaps, if the incision has been median, the peritoneal cavity will be opened at the beginning of the operation. If so the displacement of the peritoneum can be accurately estimated (as in the operation for mid-term ligamentary pregnancy) and a secondary incision can be made directly opening the sac, through which the child is removed and drainage established. The mesial exploratory incision is closed by suture.

Now we can return to the consideration of the complicated form of pregnancy in which the child is abdominal and the placenta intra-ligamentary. The main indication in this form would be, as I believe, to convert the complex "tubo-ligamentary-abdominal" pregnancy[2] into a simple tubo-ligamentary one. After the fœtus has been removed this may, perhaps, be effected by sewing the laceration of the sac to the abdominal wound. If the opening in the sac be inconveniently situated for this the (divided) cord may be dropped inside the sac, the edges of the laceration turned in, and the abdominal opening in the sac closed by suture. Then either before or after closure of the abdomen a large opening is made by vaginal section into the most dependent part of the sac, the cord is drawn down into the vagina, and the rest of the wound and the lower part of the sac are plugged with iodoform gauze.

BLOOD-PRESSURE IN THE INSANE.

BY MAURICE CRAIG, M.A., M.D. CANTAB., M.R.C.P. LOND.,

ASSISTANT MEDICAL OFFICER, BETHLEM ROYAL HOSPITAL, LONDON; LECTURER IN MENTAL DISEASES, POST-GRADUATE COURSE, LONDON.

PATHOLOGICAL conditions in the brain and elsewhere in patients suffering from insanity furnish a most important field for research, but up to the present results can hardly be said to adequately correspond to the time and labour expended. There are seen clinically, cases of intense mental disturbance which after death macroscopically and microscopically show, with the methods at present at our disposal, little or no pathological change. The fact that in an asylum it is far from uncommon to see some patients recover from marked mental aberration to apparent health within a few hours, and also in other patients the fact that after death often nothing abnormal can be discovered, has suggested to me that perhaps some light might be thrown upon the pathology of mental disease by making a systematic study of the blood-pressure in the insane. I cannot help thinking that sufficient stress has not been laid upon the important part that vaso-motor disturbances play in acute types of insanity. That vascular disturbances do exist has doubtless been long recognised, but the forms which the disturbances take have so far not been successfully worked out. The subject being a very large one I must confine myself to viewing it in a broad light and propose to discuss in this paper: (1) whether certain forms of insanity fall under definite heads so far as blood-pressure is concerned; (2) if, as seems probable, they can be arranged in such definite groups, whether in a given case the nature of the insanity is the result of the altered blood-pressure or the cause of it; and (3) if the insanity be caused by the altered blood-pressure what line of treatment suggests itself?

I have examined a large number of insane patients at Bethlem Royal Hospital as to their blood-pressures and have found that they show a marked tendency to fall under two large groups—namely, Group I.: Persons with excitement who have a low blood-pressure; and Group II., persons with depression who have a high blood-pressure.

In making these investigations I have used Barnard and Hill's sphygmometer. In all cases the metal band was placed round the left arm of the patient and in those cases in which the arms were very thin I placed a folded towel along their extensor surfaces in order to equalise as nearly as possible

the circumference of the arms in every case. All investigations, with the exception of a few to be mentioned later, were made at the same time of day, namely, between 11 A.M. and 12 noon, in order that meals might falsify the results as little as possible. No drugs were administered for some time before the investigation. The condition of the bowels was noted in all cases. In all cases I had each reading verified by one or two other persons. I find that the blood-pressure in the ordinary healthy individual taken at the time mentioned is usually about from 120 to 125 mm. of mercury, but here again variations exist—viz., an excitable active person has a lower blood-pressure than the apathetic individual. The patients upon the examination of whom I have based my investigations are all individuals whose vascular systems, so far as I could discover, were normal and in whom I could make out no definite organic disease or degeneration to account for the blood-pressure changes.

The following is an abstract from my data:—21 female patients suffering from acute melancholia give an average of about 150 mm., the range being between 140 mm. and 160 mm. of mercury. Usually the more profound the depression the higher the blood-pressure. In 15 cases of acute melancholia in male patients the average for the blood-pressure was from 140 to 145 mm., the range being from 135 to 160 mm. This is not quite so high as with the women, but the depression was as a rule less marked in the men than in the women. The depression improved as the day went on in a certain number of cases and in these cases the blood-pressure was lower towards evening, as is well shown in Table I.:—

TABLE I.

Case.	Time.	Blood-pressure.	Pulse.	Remarks.
Mr. A. ...	Morning.	160 to 170 mm.	72	Bowels open; very depressed.
	Evening.	150 mm.	72	Bowels open; less depressed.
Mrs. B....	Morning.	155 mm.	74	Bowels open; very depressed.
	Evening.	135 mm.	72	Bowels open; less depressed.
Mr. C. ...	Morning.	160 mm.	74	Bowels open; very depressed.
	Evening.	140 mm.	74	Bowels open; less depressed; employing himself reading.
Mr. D....	Morning.	165 mm.	68	Bowels open; very depressed.
	Evening.	140 mm.	69	Bowels open; less depressed; will converse readily.
Miss E....	Morning.	150 mm.	76	Bowels open; very depressed.
	Evening.	135 mm.	74	Bowels open; less depressed; working.

A certain number of depressed patients whose blood-pressure I have been investigating have now recovered or have greatly improved and it is instructive to note the changes in the blood-pressure. (See Table II.)

With regard to cases of stupor I regret to say that I have only been able to examine the blood-pressure in two instances and these were not well-developed cases. Miss A.: Blood-pressure, 150–160 mm.; bowels open; pulse, 62. Mrs. B.: Blood-pressure, 150 mm.; bowels open; pulse, 72. This latter patient is now nearly well and has been for some weeks, and the records at present are:—Mrs. B.: Blood-pressure, 125 mm.; bowels open; pulse, 73.

Turning to cases of excitement I have investigated the blood-pressure in 11 male patients with acute mania and they give an average of from 105 to 110 mm. of mercury pressure; 5 of the cases were about 105 mm. The 22 cases of female patients with acute mania likewise give an average of from 105 to 110 mm. Some of the cases were as low as from 95 to 100 mm. One patient who was very excited and restless gave a blood-pressure of 180 mm., but she was found to be suffering from chronic renal disease.

A certain number of patients have recovered or improved during the period of investigation and I will give the figures showing the improvement in the blood-pressure. (See Table III.)

There is one interesting case of a woman who was depressed for a long time and whose blood-pressure was always about 150 mm. She then improved and was apparently well and went to our convalescent hospital. At this time her blood-pressure was 125 mm. After being in the country for about six weeks she became excitable and sleepless and was brought back to the hospital, when I found that her blood-pressure was from 105 to 110 mm.

Up to the present time I have not had a case of circular insanity, but judging from the last patient and from the data of those cases which are at one time excited and at others depressed it seems more than probable that the blood-pressure will vary with the mental condition; that is, that it will be raised when the person is depressed and the reverse for excitement, but that during the period of apparent health it will be about normal.

The general paralytics whose blood-pressures I have investigated have not been especially suitable cases, as, except for six, they have been rather far advanced in the disease. (See Table IV.)

TABLE II.

Case.	Date.	Blood-pressure.	Pulse.	Remarks.
Mr. A....	Nov. 11th, 1897.	145 mm.	72	Bowels open; depressed.
	March 20th, 1898.	120 mm.	72	Bowels open; well.
Mr. B. ...	Jan. 18th, 1898.	160–170 mm.	72	Bowels open; very depressed.
	March 20th, 1898.	135 mm.	70	Bowels open; discharged relieved.
Mr. C. ...	Jan. 24th, 1898.	150 mm.	64	Constipated; very depressed.
	April 27th, 1898.	125 mm.	76	Bowels open; discharged well.
Mr. D....	Jan. 18th, 1898	140 mm.	77	Bowels open; depressed.
	April 11th, 1898.	120 mm.	72	Bowels open; nearly well.
Mr. E. ...	March 20th, 1898.	150 mm.	72	Bowels open; depressed.
	April 22nd, 1898.	130 mm.	70	Bowels open; nearly well.
Mrs. F....	Dec. 9th, 1897.	150 mm.	78	Bowels open; very depressed.
	April 28th, 1898.	120 mm.	76	Bowels open; much better.
Miss G....	Dec. 9th, 1897.	140 mm.	110	Constipated; depressed.
	April 22nd, 1898.	120 mm.	78	Bowels open; much better.
Mrs H....	Jan. 6th, 1898.	150 mm.	68	Bowels open; very depressed.
	March 3rd, 1898.	125 mm.	70	Bowels open; nearly well.
Mrs. I. ...	Jan. 6th, 1898.	140 mm.	78	Bowels open; very depressed.
	April 11th, 1898.	130 mm.	76	Bowels open; much better.
Miss K....	March 3rd, 1898.	150 mm.	72	Bowels open; very depressed.
	April 22nd, 1898.	125 mm.	74	Bowels open; much better.
Mrs. L....	March 17th, 1898.	150 mm.	72	Bowels constipated; very depressed.
	April 28th, 1898.	120 mm.	70	Bowels open; well.

Thus it appears clearly that in most acute forms of insanity the blood-pressure is markedly altered, the greatest variation being between an excited patient and one who is profoundly depressed. In depression with motor restlessness, the so-called agitated melancholia, so far as my evidence goes, the results are somewhat varied. When the restlessness becomes extreme sometimes the blood-pressure gives a low reading.

In stupor it would appear from my data that the blood-pressure is high, even more so than in ordinary melancholia, but in those cases of stupor which are secondary to mania, when the condition is due to exhaustion, the blood-pressure is inclined to be low. This also applies to depression following upon an acute attack of mania, when the depression is more exhausting in character and is not a true melancholia and the blood-pressure is usually low. In delusional insanity, when the mental disorder is ideational, in contradistinction to the affective or emotional forms of insanity, the blood-pressure does not always seem to greatly differ from the normal blood-pressure of a healthy individual.

The tendency is for it to be raised, but this is only to a marked extent when the patient is troubled and worried. For instance, at present there is residing in the hospital a man who is a paranoiac with delusions of persecution. These delusions are always present but vary in intensity. When he is fairly comfortable his blood-pressure is about from 130 to 135 mm., but when much worried by his delusions his blood-pressure rises to from 160 to 180 mm.

In general paralysis of the insane, as I have already mentioned, the cases which I have had at my disposal have not been very favourable for investigation. Excited general paralytics seem to follow the ordinary rule for excited cases

TABLE III.

Case.	Date.	Blood-pressure.	Pulse.	Remarks.
Mr. A.	Oct. 26th, 1897.	105 mm.	100	Bowels open; excited.
	Dec. 20th, 1897.	125–130 mm.	76	Bowels open; nearly well.
	Jan. 18th, 1898.	110 mm.	70	Bowels open; relapsed; excited.
	Feb. 10th, 1898.	125 mm.	76	Bowels open; convalescent.
	Feb. 26th, 1898.	105 mm.	88	Bowels open; excited again.
	April 11th, 1898.	110 mm.	86	Bowels open; still excitable.
Mr. B.	Oct. 20th, 1897.	110 mm.	90	Bowels open; excited.
	April 11th, 1898.	120 mm.	74	Bowels open; nearly well.
Mr. C.	Dec. 20th, 1897.	105 mm.	86	Bowels open; excited.
	April 27th, 1898.	125 mm.	76	Bowels open; nearly well.
Miss D.	Oct. 15th, 1897.	105–110 mm.	100	Bowels open; very excited.
	Jan. 14th, 1898.	125 mm.	78	Bowels open; well.
Miss E.	Jan. 14th, 1898.	110 mm.	86	Bowels open; excitable.
	Feb. 20th, 1898.	130 mm.	76	Bowels open; well.
Miss F.	Jan. 20th, 1898.	100 mm.	92	Bowels open; very excited.
	April 28th, 1898.	125 mm.	86	Bowels open; quiet and better.
Miss G.	Jan. 20th, 1898.	105 mm.	110	Bowels open; excited.
	April 28th, 1898.	120 mm.	86	Bowels open; better.
Miss H.	Jan. 6th, 1898.	110 mm.	100	Bowels open; excited.
	Jan. 20th, 1898.	140 mm.	94	Bowels open; depressed and weeping.
	Feb. 8th, 1898.	115 mm.	90	Bowels open; excitable.
	April 28th, 1898.	120 mm.	76	Bowels open; nearly well.

and have a low blood-pressure and when the excitement passes off the blood-pressure is found to be normal. In very exalted general paralytics the pressure is high in the cases which I have investigated, but this requires more investigation as the number of exalted cases was limited. The blood-pressure of general paralytics in the later stages, whatever may have been the previous mental condition, as in the acute maniacal general paralytics, is low. Dr. Mott[1] has been working at the cause of the degeneration in general paralytics; he considers that there is a source of auto-intoxication in those patients from the products of the disintegration that is going on in the nerve tissue of the brain. Cholin is the poison to which he attaches much importance. Now it has been found by experiment that cholin lowers the blood-pressure and this may be the cause of lowered blood-pressure in advanced general paralytics and in those early cases of general paralysis where there is much waste of brain substance going on.

Hence from the foregoing it would seem that the blood-pressure is most disturbed in affective forms of insanity—that is to say, where there is some disturbance of the emotions. Further, in all cases which have recovered during the period that I have been making these investigations I have found that the blood-pressure has been normal when the patient was considered well enough to leave the hospital. This statement also applies to general paralytics who have passed into a condition of remission and who for the time being must be considered well; when the remission terminates and the symptoms of general paralysis again establish themselves the blood-pressure once more follows the general rule of being high for depression and low for excitement.

I now pass to the second question: Is the insanity the result of the altered blood-pressure or the cause of it? Of the importance of this question there can be no doubt, for if perchance we could prove that the altered blood-pressure in any way may produce mental disorder in certain individuals we have at once the golden key for the treatment and possible cure of those forms of insanity where the change is purely functional in character. When we begin to weigh the evidence which we have at our disposal we find that that in favour of the altered blood-pressure being responsible for mental disorder is not only abundant but in many respects weighty. I shall therefore deal with this first. We are all cognisant of those cases of mental disorder in which a patient within a few hours passes from marked insanity to apparent health. It is more common in states of excitement than in states of depression and it is extremely difficult to explain except from the standpoint of some very mobile mechanism. Now the vascular system is an apparatus of this nature. Dr. Leonard Hill[2] has shown that the arterioles in the splanchnic area are the regulators of the blood-pressure in the brain and to a large extent the question whether the blood-pressure be increased or not in the cerebral area depends upon whether

TABLE IV.

Case.	Date.	Blood-pressure.	Pulse.	Remarks.
Mr. A.	Oct. 9th, 1897.	100 mm.	86	Bowels open; excited.
	Nov. 11th, 1897.	110 mm.	68	Bowels open; better.
	Dec. 14th, 1897.	115 mm.	66	Bowels open; in remission.
Mr. B.	Nov. 1st, 1897.	110 mm.	78	Bowels open; excitable.
	April 11th, 1898.	120 mm.	70	Bowels open; remission.
Mr. C.	Oct. 9th, 1897.	100 mm.	86	Bowels open; very excited.
	Nov. 1st, 1897.	115 mm.	80	Bowels open; remission.
	April 17th, 1898.	105 mm.	84	Bowels open; excited.
Mr. D.	Nov. 11th, 1897.	150 mm.	74	Bowels open; ataxic, quiet, and depressed.
	Dec. 14th, 1897.	105 mm.	100	Bowels open; excited.
	April 2nd, 1898.	115 mm.	86	Bowels open; better.
Mr. E.	Nov. 11th, 1897.	160 mm.	76	Bowels open; very exalted.
Mr. F.	Jan. 18th, 1898.	140 mm.	70	Bowels open; exalted.
	Dec. 14th, 1897.	105 mm.	80	Bowels open; excited.
	April 11th, 1898.	120 mm.	72	Bowels open; remission.
Mr. G.	Dec. 14th, 1897.	140 mm.	72	Constipation; depressed.
Mr. H.	Nov. 1st, 1897.	106 mm.	78	Bowels open; depressed case last stage.
Mr. I.	Nov. 1st, 1897.	100 mm.	72	Bowels open; depressed case last stage.
Mr. K.	April 11th, 1898.	100 mm.	80	Bowels open; exalted last stage.

they are relaxed or contracted. Everyone is probably acquainted with the feeling of depression which accompanies a loaded bowel and in the mental relief when the constipation is overcome. Some would say that the feeling of depression was autotoxic in origin, but surely the mental relief is too rapid for it to be due to any such cause. Again, in the insane, especially with melancholia, constipation is often the prevailing symptom and frequently by attending to the bowels regularly with salines, mild

[1] Vide Annual Report, Asylums Committee, London County Council, 1896.

[2] Vide Cerebral Circulation: L. Hill.

laxatives, and enemas the depression soon disappears. May it be that the mere mechanical effect of a fæcal accumulation upon the splanchnic vessels causes the rise of cerebral blood-pressure? At the end of February we admitted a man into this hospital who was suffering from marked depression, this being his third attack within the last thirty years. The day after admission I took his blood-pressure and found it to be 190 mm. and the pulse slow. The bowels were very constipated and acted but slightly to a soap-and-water enema. Two days later he had a severe convulsion. Not having any physical signs of general paralysis the convulsion seemed to be due to constipation. A large oil enema was administered and he passed a huge amount of fæcal matter; three hours later the blood-pressure was 140 mm. and he was much better and remained so for the next few weeks, but the depression unfortunately returned again later and with it increased blood-pressure. In this case probably sensory irritation was the cause of the convulsions. Dr. Leonard Hill has observed that stimulation of any sensory nerve causes a rise of general arterial pressure and intracranial or cerebral venous pressure passively follows this rise. May this not be the explanation of the feeling of depression which occurs with some cases of constipation, especially those which are at once relieved by a free purge? Professor Clifford Allbutt has laid stress upon this important point in a paper read before the Hunterian Society in 1895 upon Senile Plethora. He reports some cases of high blood-pressure in which there was a certain degree of depression and insomnia, and all the patients improved upon laxaties and salines. My observations were made before my attention was drawn to Professor Allbutt's paper, and I find that in every respect my investigation corroborates this work. In my cases, as with those of Professor Allbutt, I have confined myself to those patients whose altered blood-pressure did not in any way seem to be due to any arterial degeneration. Though I have not been able to corroborate this by post-mortem examination the fact that most of my cases were comparatively young persons and that many of the patients recovered and that the blood-pressure returned to normal is strong evidence that there was no organic cause for the altered blood-pressure. If a patient had albumin in his urine or any suspicion of vascular degeneration I rejected any observation that I made from him at once. We may have a functional psychosis occurring at any period of life and I find that the blood-pressure is raised alike in all. Again, an argument in favour of the altered blood-pressure being a determining cause in mental disorders is the action of drugs; nitro-glycerine, which I have tried in a few cases, lowers the blood-pressure. In one, that of a woman actively depressed and a victim to that symptom so common in melancholia, a feeling of weight and oppression upon the top of the head, I found before commencing to administer nitro-glycerine that her blood-pressure was constantly about 150 mm. Two days after taking $\frac{1}{200}$ gr. of nitro-glycerine three times a day the blood-pressure had fallen to 135 mm. and she was feeling better and the head was relieved. The dose being increased to $\frac{1}{100}$ gr. three times a day she improved further and the blood-pressure fell to 120 mm. and the feeling of weight was gone. If the medicine was left off she soon relapsed and the head symptoms returned. In another case I obtained similar results, but I found, as others have described, that the effect of nitro-glycerine soon passes off, that it cannot be always relied upon, and that it is not easy to keep the blood-pressure low. In other cases I have treated with erythrol tetra-nitrate, a drug the value of which as a vaso-dilator has been demonstrated by Professor Bradbury, many seemed to get immediate relief from its use, both so far as the head symptoms were concerned and also the depression lessened with the fall of the blood-pressure.

Passing for a moment from cases of depression to maniacal cases in which the blood-pressure is low I have observed the effect of the prolonged bath upon the blood-pressure in 3 cases. The prolonged bath as used here is an ordinary bath with a lid fitting upon the top. The patient sits in the bath, the head being the only part above the lid. The temperature of the water, to begin with, is about 97° F. The patient is in the bath for half an hour the first day, and the time is steadily extended up to seven or eight hours per diem, meals being taken while in the bath. It has long been observed that certain patients who are usually excited and incoherent will converse rationally and calmly during the period in which they are in the bath.

In one case before commencing the bath the blood-pressure was 105 mm. and the patient was very excited; after the bath her blood-pressure was from 120 to 130 mm. and she was quiet and reasonable; after having the bath regularly for nine days she began to keep well between the baths and they were consequently stopped. She subsequently continued to make progress and her blood-pressure remained about 130 mm.

In the second case the patient before the bath used to be each morning excited, the blood-pressure was 100 mm., and the pulse was 80. Upon being taken out of the bath in the evening she was quiet and the blood-pressure was 120 mm. Unfortunately the improvement did not last and she left the hospital uncured.

In the third case the blood-pressure before the bath was 100 mm. and after 105 mm.; little good was thus done and the excitement did not abate much. But this case was a chronic one, the patient had been ill some years, with, I fear, little chance of recovery.

From time to time we have had rapid recoveries in the past from the use of the prolonged bath; the cases which do well are always maniacal cases, and this agrees with what I have found, that the prolonged bath raises the blood-pressure. Melancholiacs do not do well with the prolonged bath and it is what we should now expect, as it merely raises the blood-pressure higher instead of relieving it.

Again, bearing upon the effect of blood-pressure on the mental condition, we have the interesting cases of insanity developing in persons suffering from cardiac disease. When the patient is a victim to aortic regurgitation and the blood-pressure is low and ill-sustained the general rule is for the form of insanity to be maniacal in character, whereas when the cardiac trouble is due to disease of the mitral valve the blood-pressure is raised and the patient is usually depressed. Looking through the case books of Bethlem Hospital I find that out of 7 patients recorded as suffering from aortic regurgitation during the last three years there was excitement in 5 cases and that, on the other hand, out of 23 patients affected with mitral disease 20 showed melancholic symptoms. As these patients, except for unstable heredity in some cases, had no other cause for insanity save the cardiac trouble, they rather lend support to the view that alteration of blood-pressure in certain individuals may assist in some way in producing mental disorder.

Further, how often has it been noted that sudden profuse hæmorrhage as the result of an accident produces delirium, and what is delirium but a temporary insanity? Now if infusion with saline solution is performed the delirium at once ceases. With profuse hæmorrhage there is a rapid fall of blood-pressure, but the pressure is re-established after infusion.

With regard to the effect of gout upon the blood-pressure the evidence is conflicting and personally I have not been able to test any cases with the sphygmometer. But if those observers are correct who say that owing to the blood condition the blood-pressure is raised we have further support in favour of the effect of blood-pressure upon mental states. For not uncommonly an attack of gout is ushered in by insomnia, depression, and irritability.

Again, it has been observed that the blood-pressure falls physiologically during the day, as if, as Dr. Leonard Hill says, the vaso-motor centre was less able to maintain splanchnic constriction. If this were the case the melancholiac should improve as the day advances and the maniac grow worse, and this is precisely what does happen. Depression is always more profound in the morning and suicides are common about 6 A.M., whilst toward evening the misery is less or gone and the patient employs or amuses himself, but this is only temporary, as the depression returns with the break of day. On the other hand, the maniac in the morning is at his best, for throughout the day the excitement increases, and how often about 4 P.M. are we requested by attendants or nurses to permit them to put a maniacal patient to bed because he or she has become so very excited and restless.

Finally, in a few cases I have observed the blood-pressure to be low for a day or two before excitement supervened.

Against the view that altered blood-pressure may cause mental disorders we have the fact that the blood-pressure may be high or low in a number of individuals who never become insane. But is this not what we should expect? A large number of persons drink, but comparatively few develop insanity as the result of alcohol; syphilis is common, but syphilitic insanity and general paralysis of the insane are comparatively rare. Like many other diseases we must have a predisposing cause which lowers the resistance of the

individual in some important particular before a given stress can act with harmful result. In insanity we legitimately anticipate that the most common predisposing cause is heredity, for it is a factor that a neurotic inheritance is present in a vast majority of cases. I do not for one moment believe that any amount of altered blood-pressure could, *per se*, produce insanity in a perfectly stable person, for the causation of insanity is no such simple problem; but given an individual with an unstable nervous system the probabilities are reversed, and we may now have the vascular mechanism more readily affecting mental states. On the other hand we may have to come to the conclusion that the blood-pressure has little or nothing to do with the production of insanity; they may have no relationship, but may each be dependent upon a common cause. In support of this latter view is the following interesting case which was recently admitted into Bethlem Hospital. A woman with a neurotic inheritance, who had had a previous attack of insanity and had recovered, applied for admission as a voluntary boarder as she was suffering from insomnia and a feeling of irritability. The blood-pressure was about 130 mm. Next day she was more restless and the blood-pressure was 110 mm. The following day the excitement had greatly increased, she was destructive and very restless and talkative, and the blood-pressure was 105 mm. In this patient the blood-pressure fell almost *pari passu* with the increase in excitement.

The next question, Can insanity cause an alteration in the blood-pressure? is a much more difficult problem to discuss. That the two—insanity and altered blood-pressure—co-exist we cannot doubt, but there is but little in favour of the view that insanity causes the altered blood-pressure. Some support is lent to this view by the fact that though in a case of delusional insanity the blood-pressure has for some period continued normal, an access of worry on the score of delusions and a corresponding emotional disturbance is found to affect the pressure of the blood. From this it may be argued that emotional forms of insanity may produce an alteration in the blood-pressure, a conclusion which appears to be corroborated by the fact that those persons who physiologically are excitable have a comparatively low blood-pressure, whilst the normally lethargic individuals have a comparatively high pressure. Again, there is the record of the case of the voluntary boarder whose blood-pressure fell steadily as the excitement developed. Also, those cases which I have recorded where the blood-pressure varies with the mental condition somewhat favours the view that the altered blood-pressure is due to the emotional disturbance. Against this theory that insanity may produce alteration of blood-pressure is the action of drugs, such as erythrol tetra-nitrate, nitro-glycerine, laxatives, &c., for by improving the blood-pressure not uncommonly the mental state likewise improves. Farther, the improvement which takes place in melancholiacs as the day advances and the reverse in maniacs might indicate that the physiological fall of the blood-pressure towards evening in some degree produces this result.

We must now turn to the treatment of the insane as indicated by the observations I have made as to altered blood-pressure. Whether the variation in blood-pressure in any way produces disorders of mental state we are not at present able to make any dogmatic statement. But I feel that it is not too much to say that probably the general lines of treatment can be indicated to no small an extent by observing the blood-pressure in any given case. This statement is borne out by the fact that I have found that a certain number of patients have improved, and others have recovered, by directing the treatment to re-establishing a normal condition of blood-pressure. Sulphate of magnesia has been described as an excellent tonic, and so it is, especially when we have to deal with a case of incipient melancholia. I have seen a number of young persons who were on the verge of melancholia who have been saved from crossing the line which separates sanity from insanity by sulphate of magnesia. Professor Allbutt has already reported some cases of senile plethora which recovered with salines and aperient waters and other treatment directed to lowering blood-pressure. If the case is an early one aperient treatment coupled with a liberal allowance of light diet and regular exercise will be all that is required. If the patient has passed into deeper depression the lowering of blood-pressure by aperients may be with advantage amplified by other medication. There is one symptom which perhaps distresses the patient more than any other, and that is the headache and constant feeling of pressure upon the top of the head. Now this symptom seems certainly to be vascular in origin and often the higher the blood-pressure the more severe the distress. This symptom I find is greatly relieved by nitro-glycerine. Unfortunately, as I have already pointed out, the relief obtained by nitro-glycerine is often very temporary and an hour or two after taking the drug the pain has returned. Professor Bradbury, in his Bradshaw Lecture of 1895, in commenting on the evanescent action of this drug, has pointed out that erythrol tetra-nitrate is more reliable and also that its effect as a vaso-dilator is more permanent and that the benefit derived by its use is present for some hours after. So far I have only tried its action upon a few patients, but the results are most encouraging, as a relief is undoubtedly more lasting and greater than with nitro-glycerine. In some instances the improvement has been most marked; a man who had spoken but little, after two ½ gr. tabloids of erythrol tetra-nitrate volunteered remarks to the attendants and has steadily improved since. Another man says that he has felt much clearer and better since he "started the new medicine" and now reads and employs himself. A woman who was very agitated and depressed, two days after commencing to take erythrol tetra-nitrate was found employing herself at needlework, a thing which she had never previously done since admission, and she told me that she felt much better and has continued to be so up to the present time. Morphia has long been known as a useful drug in some cases of melancholia; but its use has always been very restricted in maniacal cases, as little benefit seemed to be derived from its administration. The explanation has, so far as I know, never been given, but the fact is interesting, though it is now what we should expect in the light of my recent observations, as morphia lowers the blood-pressure by relaxing the arterioles in addition to its action as a hypnotic.

While working at the subject of blood-pressures I have observed that in a few cases the amount of blood in some patients seemed to be much below normal, and it was absolutely impossible to obtain a reliable reading of what the actual blood-pressure was. If these individuals are ordered large quantities of warm water daily the improvement is at once most marked. In some cases I have ordered half a pint of water to be injected into the rectum night and morning with good results. So far I have not tried infusion, but I believe that this might be most beneficial in some cases. Two years since we admitted a patient into Bethlem Hospital who upon admission was in a comatose condition and who died a few hours later. At the post-mortem examination we found that there was a great scarcity of fluids in the organs of the body. Everything was dry and there was no cerebro-spinal fluid in the various cavities. Probably if infusion had been performed in this case, life might have been prolonged, or may-be the patient cured.

To turn to the treatment of those patients whose blood-pressure is sub-normal I have already mentioned the use of the prolonged bath in certain excited individuals. So far I have not observed the action of the prolonged bath upon the blood-pressure of a sufficient number of cases to derive any very reliable data, but the action seemed very definite in two out of the three patients and the effect more than suggests why the prolonged bath should be beneficial to maniacal persons but useless as a rule to the depressed. The latter fact has been observed at Bethlem Hospital for some years, but we had never been able to obtain any satisfactory explanation.

In conclusion, to summarise the foregoing observations I find: 1. That the blood-pressure varies in different forms of insanity. 2 That the blood-pressure is raised in persons who are depressed or who are suffering from melancholia. 3. That the blood-pressure gives varied results in persons suffering from melancholia with motor excitement—so-called agitated melancholia. 4. That the blood-pressure is found to be normal upon the recovery of a patient whose blood-pressure has been raised during the period of depression. 5. That the blood-pressure is lowered in persons suffering from excitement or acute mania. 6. That the blood-pressure is found to be normal after the excitement has passed off and the patient has recovered. 7. That the blood-pressure tends to fall as the day advances, hence melancholiacs tend to improve and excited patients become more excited. 8. That the depression following upon an attack of acute mania is not necessarily an active depression, but rather more exhaustive in type, and that the blood-pressure in these cases may remain low until it finally returns to normal upon recovery. 9. That the blood-pressure is probably raised in

stupor. 10. That the blood-pressure is not always altered in delusional insanity except in those cases where there is also some emotional disturbance. 11. That the blood-pressure in healthy, active, and excitable persons is low as compared with healthy but apathetic individuals. 12. That from this it would seem that the blood-pressure is chiefly affected in emotional or affective insanities in contra-distinction to the affective or ideational forms of mental disorder. 13. That the blood-pressure is raised in general paralysis of the insane when there is depression, whereas in the excited types of this disease the blood-pressure is low, as it is also in the later stages of all types. 14. That there is evidence to prove that the altered blood-pressure may in certain individuals induce mental aberration, but that it is so far not complete enough to enable me to state definitely that mental disease is usually caused by altered blood-pressure. 15. That the altered blood-pressure in different forms of insanity suggests the line of treatment which may be adopted in the various kinds of mental diseases. 16. That the feeling of weight and pressure upon the top of the head, so common a symptom in melancholia, is apparently vascular in origin and is lessened or disappears when the blood-pressure is lowered. 17. That certain depressed patients improve with nitro-glycerine but that there is difficulty in keeping the blood-pressure down with this drug as its action is so evanescent. 18. That the action of erythrol tetra-nitrate it more prolonged and reliable and is more powerful in lowering the blood-pressure in melancholia than is nitro-glycerine. 19. That the prolonged bath raises the blood-pressure and hence is of more value in the treatment of excited patients.

Bethlem Hospital, S.E.

NOTE ON LUMBAR COLOTOMY.

BY LAWSON TAIT, F.R.C.S. ENG.,
CONSULTING SURGEON TO THE BIRMINGHAM AND MIDLAND HOSPITAL FOR WOMEN, &C.

MY letter on this subject in THE LANCET of May 21st has brought so much correspondence that I think it well to answer inquiries regarding it in a further note.

I have intended for a long time to write fully on this operation because it has been so needlessly complicated that at one time it seemed as if it would fall into disrepute. There came a "boom" on behalf of inguinal colotomy which was useless and has proved disappointing so far as I can learn. Personally I never gave any countenance to inguinal colotomy save in one case, where I had abundant reason to be dissatisfied with it. I have had every reason to be satisfied with the older operation so far as my own results were concerned, and there were arguments in favour of it as against the operation in the groin which seemed to me convincing. Thus there were of necessity many cases where the effects of the disease in the matter of obstruction were not overcome by inguinal colotomy or where the disease advanced into and above the opening which were not so affected in the event of the performance of lumbar colotomy. In fact, I have never seen a case of lumbar colotomy where the beneficial effects were destroyed by the progress of the disease. Again, it has been found, as might have been expected, that uncomfortable eversion of the gut after inguinal colotomy has been far more frequent and extensive than it ever is after the lumbar operation. Other and less important arguments also affect my choice in favour of the higher opening, amongst which is the efficiency in most cases of the imitation sphincter to which I alluded in my letter of May 21st.

I have had a number of cases of the curious non-malignant stricture of the rectum found in women, but never yet described as having been seen in men, where I have relieved the patients by lumbar colotomy, the patients living in fair comfort with the new passage after the gut below has atrophied. One of them has lived now twenty-four years since the operation and I have seen her within the last few days. According to her account she has notice of the need of an evacuation and control over the aperture very much as she had some thirty years ago before the disease attacked her. Such an amount of relief is not of course obtained in the great mass of such operations performed, for the disease is malignant in probably 98 per cent. of the cases.

There is a new group of cases at present in existence where colotomy seems more urgently needed than in any formerly amongst my experience—I mean those in which the uterus has been removed for malignant disease and the patients have recovered from the operation. I have not yet seen a case with a secondary success. It is an operation against which I was prejudiced from the first. I could not believe that any operation would be really successful in cancer of the uterus. My experience is certainly in favour of my prejudice and I can only explain any alleged success by an assertion that the diagnosis of cancer was a mistaken one. All the cases on which I have operated and now sufficiently advanced, some forty in number, have died within twelve months and most of them long before that time. Not only so, but their complications and sufferings have been more severe than in the cases left alone. Amongst these complications is a new one—one I never saw before in cancer of the uterus uninterfered with. I mean obstruction of the rectum. In the return of the disease in the pelvic cicatrix there seems an extraordinary tendency to contraction which soon pulls the bowel out of shape and afterwards completely obstructs it. Two such cases have happened to me this year already and the story of one of them will suffice. The patient was a woman, aged thirty-eight years, married three years and with one child born when I saw her first about fourteen months ago. She never got over her confinement but went on persistently losing, with menstrual exaggeration. For this she was twice treated by curettage, once in Calcutta and once in London. After the second operation she was much better for a few months and she returned to India. But all her former symptoms speedily returned and she was sent back to England and placed under my care. I diagnosed endometric cancer and advised removal of the uterus. This I carried out last November and found a polypoid patch of papilloma at what I presume had been the placental site. The body of the uterus was perfectly free from the disease apparently, the wound healed easily and in March last she was perfectly well and desirous of once more travelling eastwards. But I felt a nodule in the cicatrix and advised delay in the journey. The disease advanced with fearful rapidity and at the beginning of May I had to open the colon on account of symptoms of intestinal obstruction. In the second case I operated upon the patient for obstruction of the rectum ten days later, and she is still in bed recovering from the lumbar operation. Such experiences do not encourage me to advise removal of the uterus for cancer, for these two cases were such as ought to have had satisfactory results if ever they are to be obtained.

Now as to the method for operating on the colon for intestinal relief. I have not troubled to look up the history of the operation beyond consulting Portal and Neale and that assures me that Amussat was the inventor alike of the idea and the proceeding. According to a wit of the early part of this century the ancients have stolen most of our good ideas, but here they seem to have left us a good thing. The idea was good, and Amussat's method of carrying it out was good though complicated, but the professional anatomists have made it worse. It is very funny to hear a professional anatomist describe the structures to be seen and those to be avoided in the performance of a surgical operation. The worst operators I have ever seen have been those same people. They begin with their knives as if they meant to dissect and they proceed as if they were engaged in a demonstration. They want to see all the structures which are described in the books and to display them to the onlookers. The only thing they do not do is to recognise the fact that in the human body there are almost as many variations as there are subjects, and this is particularly true in myology. A man who attends to dissecting-room manuals in such operations as those involving incisions through the abdominal wall will come to woeful grief and may end, as I have seen happen more than once, in stripping the transversalis fascia off the peritoneum in the belief that he was undoing old adhesions. A good training in anatomical detail is all very well, but with ninety-nine out of every hundred of us it is a mere waste of time, and even with the hundredth of us the great bulk of it may be forgotten, and what is worth remembering for surgical purposes can be learnt best from frozen sections. A week with Cunningham of Dublin and his frozen sections undid all the mental mischief done to me by the careful scholastic training of Goodsir and Turner. For the first time I grasped the idea that structures were not separated, that there were no foramina, and that the abdominal organs in particular lay closely packed together in very varying relations.

So the muscles of the abdominal wall vary and so the operation of lumbar colotomy as performed in my presence by a professor was one of the most gruesome sights I ever saw in my life. He divided a lumbar artery with its accompanying nerve—he carefully identified them but could not tie the artery, for he lost it in the wealth of muscular tissue which he unravelled, and after her death his patient was found to have her peritoneal cavity full of blood. I do not recollect ever having a fatal colotomy—I am certain no case of mine ever died from hæmorrhage, for I disregard all anatomical curiosity during the operation. I put the patient on her right side with her knees bent up to steady her and I place a pillow under her right loin so as to put on the stretch that which is the guide to the whole thing—a strip of tendon which marks the union of the fascias encasing the external oblique muscle, the internal oblique, the transversalis on the one side and the latissimus dorsi (or its tendon) and the quadratus lumborum on the other. The real difficulty is that the relations of the edges of these muscles do not follow the directions of the text-books as of course they ought to do. Let the operator disregard the text-books and bear in mind that after he has divided the skin to a necessary extent over the tight band and absolutely in its direction he has only to open the glistening fascia in the same position and carefully look at the direction of the muscular fibres with which he meets. He must in his proceedings inwards bear only one route in mind and that is as nearly as possible to the umbilicus. Only one direction further is necessary so far as muscular fibres are concerned, that the surgeon must put his knife down and use only his blunt forefingers to separate the fibres. At first this would be in a direction parallel to the axis of the patient's trunk and afterwards at right angles to that axis—he need not trouble to identify even the muscles. When he has got through the two layers he will come on a layer of fascia of the greatest importance, concerning which he ought to be "well up"—the transversalis fascia. This he must slightly notch and after getting his forefingers through it he must search backward towards the body of the vertebra till he finds the base of the kidney. Having found this and remembering two arid facts of anatomy—that the descending colon is generally immediately in front of the kidney if placed on its usual side, in front of his fingers, is attached to the moveable peritoneum and separated from his finger by some loose fat, he will take two or three pairs of catch forceps and pull layer after layer of fat boldly and freely up into the wound, leaving the forceps on each layer as he lands it outside, and proceed in this way till he sees the unmistakeable gut. If he keeps the points of his forceps well downwards and pointing well forwards towards the umbilicus he cannot miss the gut. When the gut is missed it is always by dissecting-room people who go over it instead of at it. Having found the gut, haul it freely and fearlessly up out of the wound, cut it nearly through and stitch with an all-round suture into the *lower* angle of the wound, carefully replacing all fringes of fat as you proceed, or removing them if much injured by the forceps, but remove them with your fingers and not with cutting instruments. You then close the rest of the wound, the upper part. The wound need never be more than three inches long and generally need not be so much, but it may look like five inches deep. A wound so made heals immediately, and as there is nothing but a temporary separation of muscular fibres they fall back at once into position and at once resume their function. The *whole* gut has been pulled through the crosswise-made opening in the undamaged muscle, so that the almost constant tension involved in all active positions of the body secures the closure of the aperture in the gut. In a badly done colotomy only a bit of the circumference of the gut is pulled up to or out of the muscular aperture, the bulk of it being as before left inside and the gut is emptied through the relief passage only by regurgitation from below and generally when the whole of it is distended by hardened fæces. This does not give full or indeed much relief, the retained fæces having from time to time to be dug out. After colotomy is done as I recommend it should be done *all* the motion comes through the wound at once and after some practice there comes marvellous control over the passage.

If anyone compares the proceedings described above with those of Amussat as described by himself and as copied or altered in text-book after text-book after him, it will be seen that there is very little in common between the two. The operation as I give it I got from the lips of Alexander McKenzie Edwards, lecturer on surgery in the Extra-Mural School of Edinburgh, to whom I was apprentice, pupil, and assistant for about six years. I have no recollection of hearing from him that he got it from anybody else and I certainly have neither read nor heard of it elsewhere. He was a surgical genius of the highest order, as many can testify who are still alive who knew him, so that I have no doubt it was a conception of his own, and if any name is to be attached to it his name alone ought to be.

When the time came in the "seventies" that I ventured to operate upon and to remove kidneys I adopted the same incision save in such cases as those where I followed another rule as simple and imperative. Attack your tumour on its most prominent aspect and certainly avoid all dissecting-room rules about finding "oblique lines" or other untrustworthy directions.

Birmingham.

A NOTE ON THE ETIOLOGY OF BERI-BERI.

BY WALTER K. HUNTER, M.D., B.SC. GLASG.,
ASSISTANT PHYSICIAN TO THE ROYAL INFIRMARY AND TO THE ROYAL HOSPITAL FOR SICK CHILDREN, GLASGOW.

IN THE LANCET of July 31st, 1897, I reported the results of a bacteriological examination of the blood in two cases of beri-beri. Since then I have had the opportunity of carrying out in two other cases a similar investigation, and this I now put on record in further support of the opinion already expressed—namely, that the white staphylococcus of Pekelharing and Winkler is in truth the specific micro-organism of beri-beri. The two patients, both seamen from the s.s. *City of London*, were admitted into Dr. Middleton's wards of the Glasgow Royal Infirmary on Oct. 29th, 1897. Neither of them spoke English with any degree of fluency and so the account of their illnesses is necessarily very brief.

CASE 1.—The patient was a native of Bombay and as far as could be made out his illness began fourteen days previously to admission with swelling and pain in the feet and legs. There was considerable difficulty in walking and the patient was sick and very drowsy. On admission to the wards the œdema of the feet and legs was well marked. The sensation to touch and pain seemed to be blunted over a considerable extent of the body, but examination on this point was not very satisfactory. The superficial reflexes were quite active. The left knee reflex was absent and the right was diminished. The patient walked fairly well except when he was told to go along a straight line and then he had a tendency to stagger. He could not stand with the feet close together and the eyes shut. No reaction of degeneration was found in any of the muscles. The right ventricle of the heart seemed to be somewhat dilated, but no murmur was to be heard over any part of the cardiac area. There was evidence of some fluid effusion into both pleural cavities. The urine was quite normal. Examination of the blood gave the following results: hæmoglobin, 70 per cent.; red corpuscles, 71·5 per cent.; and white corpuscles, 1 in 450. The patient remained in hospital for five weeks and during that time the only change noted was a return to activity of both knee reflexes. At no time was albumin to be found in the urine.

CASE 2.—The patient was a native of Zanzibar and the history of his illness was very similar to that in Case 1. He had swelling and pain in the feet and legs, but there was no sickness or difficulty in walking. He could stand with the eyes shut and the feet close together without any difficulty. The superficial reflexes were present, but both knee reflexes were abolished. The sensation to pain seemed to be practically absent all over the body and the sensation to touch was much impaired. There was no reaction of degeneration in any of the muscles. The lungs were quite healthy, but there was a suspicion of some mitral incompetence. The urine was perfectly normal. Examination of the blood gave the following results: hæmoglobin, 90 per cent.; red corpuscles, 85 per cent.; no increase of white corpuscles. The patient was dismissed from the hospital after a month's residence in much the same condition as on admission, the knee reflexes being still absent and sensation in no way improved.

In both these cases specimens of freshly-drawn blood were examined at various times and on each occasion micro-organisms were to be seen in rapid motion in the spaces

between the groups of corpuscles. Culture media were inoculated with the blood as follows: on Oct. 31st 4 agar-agar and 1 bouillon tubes from each case; on Nov. 10th 3 agar-agar and 3 bouillon tubes from each case; and on Nov. 23rd 4 bouillon tubes from each case. Of the 30 tubes thus inoculated growth was obtained in only 4, 3 of these having been inoculated from Case 1 and the fourth from Case 2. Of these 4 growths, 3 of them (2 from Case 1 and 1 from Case 2) were pure, and they presented all the characters of the staphylococcus beri-beri as already described in my former paper. They liquefied gelatin in three weeks. The fourth growth (from Case 1) was impure, consisting chiefly of streptococci, but from it no staphylococcus could be isolated.

The pathogenic properties of these staphylococcus growths were investigated by injecting the organisms grown in bouillon broth into rabbits.

Rabbit 1 was injected with staphylococcus grown from Case 1. In this rabbit 8 injections (each injection consisting of 10 c.mm.[1] of a forty-eight hours' bouillon growth), extending over 18 days—i.e., an injection every second day—were given before signs of paralysis showed themselves. The post-mortem examination of the rabbit was quite negative as regards naked-eye appearances, there being no signs whatever of peritonitis and no abscesses in the liver. The nerves, however, showed unmistakeable evidence of parenchymatous degeneration. The experiment, then, serves to establish the relationship of this staphylococcus with the staphylococcus beri-beri of Pekelharing and Winkler and at the same time it demonstrates that it is not staphylococcus pyogenes albus—not at least as one usually meets with that micro-organism.

The next two rabbits were injected with growths of the staphylococcus which had been subjected for twenty-four hours to a temperature of 41° C.

Rabbit 2 (injected with growth from Case 1) and *Rabbit 3* (injected with growth from Case 2) each received twelve injections which extended over four weeks, each injection containing 10 c.mm. of a bouillon broth culture. That the virulence of these growths had been lessened by the temperature they had been submitted to seems to be undoubted, for at the end of the experiment the animals looked as healthy as at the commencement. After an interval of ten days the same rabbits were injected with non-attenuated growths—i.e., with the same growths as those which killed Rabbit 1. Each rabbit received nine injections, each of 12 c.mm., extending over twenty-one days. At the end of this time the rabbits still showed no signs of paralysis. They were then killed, but the post-mortem appearances in both were again negative. The white staphylococcus was cultivated from the heart and spleen in both. Careful microscopic examination of the nerves showed undoubtedly that fibres here and there were undergoing parenchymatous degeneration, but the degeneration was not nearly so marked as in Rabbit 1. Thus it is seen that in rabbits of the same size the two previously injected with an attenuated micro-organism seemed less easily affected by the unattenuated organism than those which were not so injected. I scarcely wish to suggest that an immunity had been produced, for a conclusion cannot be drawn from solitary observations. But the experiments at least make one think of the possibility of producing an immunity or of lessening the susceptibility to the poison of beri-beri.

As regards the source of infection of the two patients I was supplied through the kindness of Dr. George Marshall with samples of their food. These samples consisted of rice, split peas, and two kinds of dried fish. Several cultures were taken from each, with the result that from the rice there was readily cultivated a white staphylococcus with similar morphological characters to the staphylococcus beri-beri which was grown from the blood of the two patients. This staphylococcus which was grown from rice liquefied gelatin in 19 days. Its pathogenic properties were tested by injecting a fourth rabbit.

Rabbit 4 was injected with bouillon culture which was grown from rice; 12 injections, each consisting of 10 c.mm. of a forty-eight hours' bouillon growth were given, extending over four weeks. At the end of that time no signs of paralysis had presented themselves, so the animal was killed. The result of the post-mortem examination as regards naked-eye appearances was quite negative. The nerves, however, on microscopic examination showed unmistakeable signs in many places of a parenchymatous degeneration. Cultures of the white staphylococcus were readily grown from the blood of this rabbit.

I conclude, then, from the above that this white staphylococcus which was grown from rice is the same micro-organism as that which was found in the blood of the two patients and therefore I consider rice taken as food may be a source of infection. Possibly, however, it may be that rice only makes a suitable medium for the growth of the staphylococcus and that the entrance of the infection is entirely through the air passages. If one may draw any conclusion from comparing the experiment of Rabbit 1 with that of Rabbit 4 it would be that the staphylococcus grown on rice is less virulent than when grown from the human blood. This, however, is not warranted, for the data are too uncertain. The white staphylococcus grown from rice was not found in any of the growths from the other specimens of food.

I again have to express my great indebtedness to Dr. G. S. Middleton, who so kindly placed at my disposal these two cases of beri-beri. I have also to thank Dr. Lindsay Steven and Dr. J. Barlow for the use of their laboratories and apparatus.

Glasgow.

[1] An error occurs throughout my former paper, where it is stated that cubic centimetres (c.c.) of the bouillon broth were injected into the rabbits. It was, of course, cubic millimetres (c.mm.) which were injected.

A CASE OF FRACTURED SPINE WITH SOME UNUSUAL COMPLICATIONS; RECOVERY.

BY A. W. LYONS, M.B. LOND., M.R.C.S. ENG.,
HONORARY MEDICAL OFFICER TO THE THAMES DITTON COTTAGE HOSPITAL.

ON Dec. 24th, 1897, a carter, aged twenty-eight years, was leading his horse, which was attached to an empty brickcart, under a railway-bridge when the horse took fright at a passing train, bolted, and knocked him down, causing the cart-wheel to pass over his back. I found the patient lying by the side of the road, whither he had been carried. He complained of great pain in his back, and he was bathed in a profuse perspiration. His pulse was feeble; 65 per minute. He was conveyed to the Thames Ditton Cottage Hospital on an ambulance. On admission no bruises or other external marks of injury were discovered, but there was a puffy swelling over the situation of the ninth and tenth dorsal vertebræ. On palpating this the finger appeared to sink into the swelling; but it was difficult to make out the vertebral spines though the one next above the seat of injury appeared to be a little prominent. No crepitus was made out, neither was there any distinct dislocation of the spine. A careful search was made for a fracture of the ribs but none was discovered. At this time there was no marked paralysis, though the movements of both legs were feeble, especially of the right. The patellar reflexes were both absent. The patient was laid flat on his back and was kept in position by means of a folded towel placed across his chest and secured at the ends by a sandbag on either side. The urine was drawn off and was found to be normal. By the evening of the same day the right leg was paralysed, the patient being quite unable to draw it up in bed though he could still move the foot a little. The movements of the left leg were impaired considerably more than they had been in the morning. The patellar reflexes were both absent. He had been coughing a little and bringing up some blood-stained mucus. On auscultation a few râles were heard over the right lung but none over the left lung. Resonance was equal on both sides. The temperature of the patient on admission was 98·2 F. In the evening of the same day it was 99°. On Dec. 25th the temperature was 99·4°. The patient had passed a fairly good night, but the cough had been a little troublesome. Blood-stained mucus was still being brought up. The cough caused him acute pain over the seat of injury to his back. The movements of the right side of the chest were much diminished and there was dulness over the whole of that side. The apex beat was not displaced. Vocal fremitus was absent and no tubular breathing could be heard, but the breath sounds were very faint and vocal resonance was much diminished. The patient complained of shooting pains in the right leg. The paralysis remained stationary and there was still retention of urine. There had been no action of

the bowels since the accident. Six grains of subchloride of mercury were given. The temperature in the evening was 100·4°. The temperature on the morning of the 26th was 99·2°. The patient had had a very bad night. His breathing was very rapid and shallow. Resonance was re-established over the front of the right lung, with very large râles and profuse muco-purulent expectoration tinged with blood. It was not deemed wise to move the patient to get at the back of his chest. He was able to draw up both his legs, the left more freely than the right; there was no loss of tactile sensibility, and he was able to localise tactile sensations. He complained of shooting pains in the legs, especially in the right, and he perspired profusely. There was no action of the bowels until after an enema. In the evening the temperature was 102·2°, the pulse was 136, and the respirations were 38 per minute. The morning temperature on the 27th was 101·2°, the pulse was 114, and the respirations were 31. The patient had had a bad night. The cough was troublesome and the expectoration was profuse. The nurse reported that the breathing had been very rapid and shallow during the night. The right lung continued in the same condition as on the previous day. The left lung was quite normal. The right leg was completely paralysed, and the reflexes were still absent on both sides. He was able to move the left leg a little but not so much as on the previous day. He still complained of shooting pains in both legs. The catheter was used night and morning; he passed a little urine towards the evening, but it appeared to be overflow. A small superficial sore of about the size of a sixpenny-piece had made its appearance on quite the lower and internal part of the left gluteal fold out of the way of any pressure. The evening temperature was 102·2°, the pulse was 108, and the respirations were 40. On the 28th the temperature in the morning was 100·2°, the pulse was 112, and the respirations were 36. There was no change in the general condition of the patient. The urine drawn off by catheter was offensive, though the greatest care had been taken to render the instrument aseptic on each occasion of its use. The bladder was now washed out with warm boric acid lotion morning and evening. The temperature in the evening was 100°, the pulse was 112, and the respirations were 36. On the 29th the morning temperature was 100·2°, the pulse was 112, and the respirations were 36. The patient still expectorated large quantities of muco-purulent sputum but no blood. The urine drawn off in the morning had lost all the offensive odour. He passed a motion unconsciously; hitherto he had only had an action of the bowels after an enema. The evening temperature was 100·2°, the pulse was 100, and the respirations were 24. On the morning of the 30th the temperature was 101°, the pulse was 119, and the respirations were 28. The patient had had rather a better night. There was no increase in the weakness of the left leg. He took nourishment well—indeed, he had done so all along. There was no return of the reflexes. The evening temperature was 101°, the pulse was 112, and the respirations were 32. On Jan. 3rd, 1898, the temperature, pulse, and respirations were normal. During the last two days the patient had been making steady progress. He was reported to have had a much better night. There had been less coughing; the expectoration, however, was still muco-purulent but diminished in quantity. The râles to be heard over the right lung were smaller. There was some increase in movement in the left leg; the right leg was still absolutely paralysed. The urine had to be drawn off and the bladder to be washed out as before. There was no overflow—in fact, the urine only flowed through the catheter on pressure being made with the hand above the pubes. The patient had had an action of the bowels without an enema. The bedsore was beginning to heal. The perspiration was much less. The temperature through the day had been normal; at midnight it fell to 97°. On the 6th the temperature, &c., were normal. The patient had slept very well but he coughed a little. A few râles were to be heard over the right lung. He was able to draw up the right leg. He had no pain except on coughing violently, when he felt it in his back. The urine flowed through the catheter without any external pressure. On the 7th the temperature, &c., were normal. The patient felt "very well"; the cough had nearly gone and the expectoration had correspondingly diminished. He was able to draw up the right leg quite freely. The patellar reflexes had not returned. There was distinct lessening of painful sensibility over the right leg and thigh; he said he felt a "little prick" when a pin was pushed well into the subcutaneous tissue. He was well able to localise tactile as well as painful stimuli. The swelling over the seat of the injury had completely disappeared, but there was a hollow in the situation of the spine of the tenth dorsal vertebra and a prominence a little to the right which appeared to be the displaced spine, and there was tenderness on pressure over this prominence. The cremasteric and abdominal reflexes were absent, as they have been ever since the accident. On the morning of the 8th the patient had decidedly more power to expel the urine through the catheter. He had hardly coughed at all during the night. The patellar reflexes were absent. He passed 16 oz. of urine naturally during the evening. On the 9th the patient said that when he brought his head forward his back felt "as if it were in two pieces." He was able to draw up both legs in bed, the left more strongly than before. He could not dorsally flex either foot and was unable to abduct his thighs. There was dulness on the right side of the chest behind from the level of the inferior angle of the scapula downwards. The breath sounds over this area were very faint and vocal fremitus and resonance were both absent. The breath sounds in front of the right lung were somewhat harsh; there were no moist sounds. An exploring needle plunged into the dull area behind failed to draw off any fluid. On the 10th the general condition of the patient was unchanged. It was noticed that the abdominal reflexes were present on both sides. He passed urine freely and naturally. On the 11th the cremasteric reflex had not returned. The patient had had a very good night. In the evening he passed 10 cz. of nearly pure blood per urethram. He complained of no pain and otherwise his condition appeared unaltered. The temperature was normal. On the 12th the patient had no pain or tenderness over the bladder, but on being pressed he admitted feeling a little pain at the end of the act of micturition. The urine passed during the night contained less and less blood on each successive occasion. A specimen of urine passed in the early morning had a specific gravity of 1018; it was alkaline with a trace of albumin and under the microscope amorphous phosphates and a very few isolated pus cells were found. On the 15th the urine was slightly offensive. The patient was ordered 10 gr. of boric acid three times a day. On the 18th the urine was quite normal, being clear with no trace of albumin and no pus cells. After this date he made a perfectly uneventful progress, gradually regaining power in his legs, and was discharged at the end of April when he was able to get about on crutches. The only movement he was unable to perform was dorsal flexion of his feet. There was some slight return of patellar reflex on both sides.

The initial paralysis was probably due to hæmorrhage; had it been due to shock it would have occurred immediately after the accident and have progressively diminished, but it did not attain its maximum until the evening of the day on which the accident happened—i.e., some ten or twelve hours afterwards. There were no girdle pains complained of. The blood-stained sputum would seem to indicate some injury to the lung, and cases have been recorded in which this occurred from a violent crush to the thorax without any fracture of the ribs (Erichsen). The physical signs which developed in the right chest during the night of Christmas Eve may have been due to hæmothorax or pneumothorax or a combination of the two. One can hardly imagine a hæmorrhage so extensive as to render one side of the chest absolutely dull without some definite symptoms of loss of blood, but these were entirely absent. Pneumothorax may be accompanied by dulness (Osler). The sudden re-establishment of resonance and breath sounds over the front of the chest is difficult to explain. There were at no time symptoms of pneumonia. The sputum was never pneumonic but always copious and thin; the blood gradually diminished in quantity and finally disappeared five days after the accident. The reappearance of paralysis must have been due to a secondary myelitis, and to this probably the temperature was partly due. With regard to the bladder, the cystitis was probably due to the inability of the bladder to completely empty itself when the catheter was passed owing to paralysis of its walls. There never was over-distension, for the abdomen was percussed at least twice daily and no dulness was found. When natural micturition was re-established the washing out of the bladder was discontinued. Probably there was some trophic ulceration of its mucous membrane which was the source of the hæmorrhage. At this time he was given 10 gr. doses of boric acid, which speedily and finally put a stop to the decomposition of the urine and so aided the healing of the ulcer. The

bedsore was obviously a trophic lesion, being in a situation in which pressure was impossible. It developed on the third day after the accident and healed in about a fortnight. It seems improbable that the body of the vertebra was fractured, for if it had been union could hardly have taken place sufficiently for an examination of his back to be made by Jan. 9th, sixteen days after the accident. At all events there was no solution of continuity in the spinal column. The lumbar enlargement of the cord begins at the tenth dorsal vertebra, hence the absence of the patellar reflex. The cremasteric reflex depends upon the first and second lumbar nerves, and the abdominal reflex upon the eighth and twelfth dorsal nerves (Suckling).

Thames Ditton.

THREE CASES OF PROLONGED LABOUR.

BY JOHN MABERLY, M.R.C.S. ENG., L.R.C.P. LOND.

IT rarely happens that one is called in close succession to cases which illustrate the causes, difficulties, and dangers of prolonged labour in such a typical manner as the following which have lately come under my observation, and I have on this account been tempted to record them in the hope that they will be of interest to my fellow practitioners.

CASE 1.—The patient was a primipara, aged twenty-three years. She had been in charge of a so-called midwife who allowed labour to proceed for something over forty-eight hours, until at last becoming alarmed at the condition of the patient a medical man (Dr. J. Petersen) was sent for. When he arrived he found the patient in a terribly exhausted condition, with the vagina, vulvæ and neighbouring parts greatly inflamed and swollen. On examination the head was found low down in the pelvis and it had probably been lying there for some hours. Forceps were applied and the child, which had been dead for some time, was extracted without difficulty. The tissues were, however, in such a condition owing to the prolonged pressure that the perineum ruptured as far back as the anus in spite of the greatest care being used. Owing to the œdematous condition of the parts any attempt at immediate suture was out of the question and a douche of 1 in 2000 perchloride of mercury was ordered. This was on Jan. 14th, 1898. The patient was in a collapsed condition and it seemed doubtful whether she would survive many hours. She, however, rallied to some extent and the parts were dressed two or three times a day with the lotion and dusted with iodoform. Extensive sloughing occurred, portions being removed each day. The temperature varied from 101·5° to 105° F. and the pulse from 120 to 130 beats a minute. A liberal supply of nourishment in the form of milk, eggs, meat, broths, &c., with a good allowance of brandy and a mixture of quinine with diffusible stimulants were administered. The urine had to be drawn off with a catheter regularly. The fæces were passed involuntarily. The bladder becoming infected powders containing 10 gr. of boric acid were given three times a day if the urine was turbid and ammoniacal. On the morning of the 21st the swelling and the sloughs in the vagina had to some extent disappeared and it was possible for the first time to get a view of the cervix. It was then seen that sloughs were projecting from the cervix and extending into the uterus. As much was removed as possible and the uterus was syringed out with disinfectant lotion. At night the uterus appeared to be more enlarged than usual and a hypodermic injection of $\frac{1}{75}$ gr. of ergotin with $\frac{1}{4}$ gr. of morphia was given. On the next morning (Jan. 22nd) a large amount of clot and sloughs came away by natural efforts, and a further quantity was removed with the fingers and forceps. It was found impossible to remove all the sloughs an account of the imminent danger there appeared to be of going through the uterine walls if too much force were used in attempting to detach portions which were not easily separable from the living tissue, besides the risk of hæmorrhage, which, in the low condition of the patient, would have been fatal to her. During the day the patient appeared to rally somewhat, but on the morning of the 23rd she sank, worn out by the exhausting illness. There can be no doubt that besides the mere surgical injury inflicted by neglecting to deliver the child earlier there was superadded the septic infection caused by the dirty hands of the midwife. It is a deplorable fact that owing to laxity of the Medical Acts in South Africa a number of women who put themselves up as midwives are absolutely ignorant of the use of antiseptics or even of the necessity for ordinary cleanliness in their work, consequently one is constantly seeing cases of severe fever following confinements which have been attended to by such persons—in fact, so common is it among them that they consider it a matter of course, deluding themselves and their patients that it is what they call "milk fever," whereas the correct term would be "puerperal fever."

CASE 2.—The patient, a healthy, young, coloured woman, had previously given birth to a healthy child without any abnormal difficulty. I was called in early on the morning of Feb. 22nd, 1898. She had then been in labour about thirty-six hours. The membranes had ruptured about twelve hours previously, the pains, according to the patient, had been strong and fairly frequent from the commencement. On examination the os was found to be dilated to about the size of a two-shilling-piece and the head was felt above the pelvic brim. The frontal bone was made out to be the presenting part—the brow could be felt high up and to the front. The back of the child appeared to be turned towards that of the mother. The uterus was strongly contracted and the patient was in excellent condition in spite of the long continuance of the labour. An attempt was made bimanually to push the brow up and to promote flexion of the head, apparently with some success. 45 gr. of choral in 15 gr. doses given at intervals of twenty-minutes were administered with the object of giving the patient some rest and assisting the dilation of the os. I again saw the patient about 10 A.M. in company with Dr. Engelbach, and although the position of the head appeared to be to some extent rectified and the os well dilatable no real progress had been made, the head still being above the pelvic brim in spite of the strong uterine contraction. It was evident that, probably owing to the abnormal size of the head, a natural termination of the labour could not be expected. Chloroform was administered and after a good deal of difficulty the forceps were applied, but no amount of reasonable force appeared to have the slightest effect in persuading the head to enter the brim. Turning was next tried but was found impracticable on account of the strongly contracted state of the uterus and the fact that the waters had drained away some hours previously. The only resource left was either to do a Cæsarean section or to perforate and crush. The former was out of the question on account of the septic surroundings of the patient and it was therefore decided to perforate. After some difficulty the perforator was inserted into the posterior fontanelle and the hole having been enlarged the cephalotribe was applied and the head was crushed sufficiently to be able to make it enter the pelvic brim. The condition of the patient still being excellent it was decided to leave the case to nature to complete delivery. In this way there would be less risk of injury to the maternal soft parts, especially the perineum, which was still very resistant, and no harm could be done to the patient by the delay of two or three hours. The result was as anticipated and at about the end of three hours the child was born without further difficulty. The patient made an uninterrupted recovery. Syringing out twice a day with perchloride of mercury solution was practised for the next four days and a powder composed of 4 gr. of sulphate of quinine, 2 gr. of phenacetin, and $\frac{1}{2}$ gr. of calomel was given night and morning for the first two days, the bowels being kept open once or twice a day with the assistance of a little castor-oil. The temperature never rose above 100° and on the fourth day it was normal.

CASE 3.—The patient in this case was a woman, twenty-eight years of age, who had two years previously given birth to a healthy child, the labour then only lasting about three hours. A month previously to the present confinement I had been called in to see the patient for what she had been told was quinsy, but on examination it was seen to be an extensively ulcerated throat with a dirty sloughing ulcer perforating the soft palate, evidently specific in origin. She was given inunctions of mercury ointment and a mixture of Donovan's solution with iodide of potassium. At the date of the confinement the throat was perfectly sound except for a small perforation in the centre of the soft palate. The first signs of labour occurred on Feb. 26th, 1898, at about 1 A.M., when after a few slight pains the membranes broke, a large quantity of water coming away. The pains then almost entirely disappeared and when the patient was seen for the first time at about 7 A.M. the os was found high up and dilatable, with the head presenting at the brim

in the first occipito-anterior position; the pelvis was roomy and the parts concerned in the passage of the child were soft and dilatable. There was evidently no obstacle to rapid delivery provided the uterine contractions were normal. The pains, however, continued to be very weak and irregular and had not the slightest effect in propelling the head into the pelvis. At night 30 gr. of chloral were given with the object of giving the patient some rest, there being no reason to hurry the labour either in the condition of the mother or that of the child, judging by the fœtal heart sounds. The patient had four or five hours' sleep, and at 3 A.M. on the 27th she was awakened by the pains recommencing. They continued up to noon, but although accompanied by a fair amount of pain they appeared to be quite useless owing to the irregular contraction of the uterus. As there was no obstacle except the character of the pains to rapid delivery 2 dr. of the liquid extract of ergot were administered. About half an hour afterwards the pains became much stronger and more effectual, the head gradually progressing into the pelvis until at the level of the perineum, but it then seemed to have little inclination to come any further. The forceps were therefore applied and the child, alive and healthy, was removed, so little resistance being offered that the child appeared rather to slip out than to be pulled out. The uterus after the birth of the child again dilated and could be felt through the abdominal wall in an elongated flabby condition; the hand was therefore introduced into the uterus and the placenta was removed without difficulty. The uterine cavity was syringed out with hot solution of 1 in 2000 perchloride of mercury and a hypodermic injection of ergotine was given. This caused the sluggish member to contract fairly firmly, very little blood being lost. The pulse, which at the time of delivery was 90, quickly dropped to 75 and the patient had no further trouble, convalescing in the usual way.

When we come to examine these cases we find that they agree only in one point—viz., the abnormally prolonged time of labour. They differ materially in the causes producing this result and in the effects on the patients. They illustrate very clearly the different effects on the mother of labour prolonged during the first stage, when the head is still above the pelvic brim, contrasted with that in which it is prolonged in the second stage, with the head tightly wedged in the pelvis and causing pressure on the maternal soft parts. In Cases 2 and 3 no ill effects were noticeable, although the membranes had broken twenty-four hours or more previously to delivery, but in Case 1 the result was fatal to both mother and child although, according to the midwife's statement, the head had not been lying in the pelvis for more than eight or ten hours. As regards the causes of the prolonged labours the three cases differed essentially from one another. In Case 1 matters probably went on fairly normally until the head reached the perineum, and then the patient becoming exhausted the propulsive force of the uterine contractions became proportionately weakened, with the result that no further progress was made. If at this time proper assistance had been given in the way of forceps there can be little doubt that the fatal result would have been avoided. Case 2 was clearly one in which no natural efforts would have brought about delivery owing to the abnormal size of the head, and the result obtained justified the extreme measure of destroying the child in order to save the mother. In Case 3 it is questionable how long labour would have been prolonged if it had been left to nature, owing to the want of proper uterine contractions, and it was, I think, one of those exceptional cases in which the administration of ergot during the first stage of labour was not only justifiable but very beneficial in rousing the sluggish uterus when after careful examination it was found that there was no obstruction to rapid delivery. In this important point this case differs fundamentally from Case 2, in which the administration of ergot would possibly have led to rupture of the uterus, or at any rate would have been a most dangerous and unscientific proceeding.

Capetown.

SWANSEA WATERWORKS.—At the meeting of the Swansea Town Council held on June 16th it was stated that with regard to the reservoir and tunnel the seal had been affixed to a contract for £255,247, so that the Cray Waterworks would now be shortly commenced.

A PRELIMINARY NOTE ON THE ACTION OF ROENTGEN RAYS UPON THE GROWTH AND ACTIVITY OF BACTERIA AND MICRO-ORGANISMS.[1]

BY R. NORRIS WOLFENDEN, M.D. CANTAB.,
AND
F. W. FORBES-ROSS, M.D. EDIN.

SOME work has been done upon this subject, but as it has not led to any definite conclusions and in view of the somewhat conflicting statements published we have thought that further investigations would be desirable. With this end in view we have selected the bacillus prodigiosus as the first subject for experiment. Six culture tubes of the normal growth on potato were obtained from University College laboratory and on May 25th these were set to incubate in a Hearson incubator at a temperature of 35° C. in the dark. After five days' growth a tube was taken and from it two fresh cultures were made; one was a simple control culture and the other was rayed along with the mother culture for an hour. After twenty-four hours' growth that in the tubes which had been rayed (i.e., the mother and one of the daughter cultures) had increased markedly in comparison with the original tubes, which had now been growing for six days. The control culture appeared to be only just showing a margin of increase. The difference in growth between the two tubes which had been rayed and the non-rayed control tube was very great, showing that undoubtedly the action of the x ray tube had been exceedingly stimulative.

In order to determine whether the exposure of the potato to prolonged x ray action would produce such changes in the medium of growth as to account for any marked increase of bacillary growth, two sterile tubes were rayed for one hour, a culture was then made on one of them from one of the previous tubes which had been rayed and which showed active growth, and another culture was made in the second tube from a culture which had never been rayed at all. These were incubated under precisely the same conditions as the previous tubes. When examined two days afterwards the growth in the rayed potato culture from rayed bacilli had entirely outgrown the culture on rayed potato from non-rayed bacilli, therefore the only cause of this exceptional growth must have been a property of the bacilli themselves and not of the medium of growth.

Cultures up to the fifth generation were made and the following facts were arrived at:—A single exposure to the x rays increased growth markedly and along with it there was an increase of chromogenetic property, even though grown in the warmth. As is well known the bacillus prodigiosus does not form pigment when grown in a warm atmosphere. Further exposure to the rays so stimulates the growth as to again deprive the bacilli of power to form this peculiar pigment in the warmth, though on return to cold this property is afterwards recovered to such an extent that the amount of pigmentation, though slightly different in colour, is in excess of the original culture. Up to the fifth generation the result of exposure for an hour to x rays of the culture is to produce an exuberant growth—apparently the pigment power is somewhat altered.

The method of application of the x rays was as follows:—With a large 18 in. spark coil of Newton's make a power was used of 16 volts, and from 8 to 10 ampères. The focus-tube was placed about 6 in. above the test-tube containing the potato growth. In every instance the exposure was of from fifty to sixty minutes' duration, with occasional resting of the tubes, which were run with the anodes as nearly red-hot as practicable.

We do not here attempt to enter into the explanation of these phenomena of growth. We are content to record the facts that exposure of the bacillus prodigiosus to the radiations of a focus tube induces very marked increase of growth and peculiar changes in the pigment-forming powers of this particular micro-organism. We will merely add that in some of the lower forms of vegetable life the same changes are observed, notably in the protococcus. An exposure of this organism to x rays for from five to ten minutes appears to

[1] A paper read at the meeting of the Roentgen Society on June 7th, 1898.

much stimulate its activity, and if the exposure is a little prolonged the cells become much paler, the chlorophyll disappears, and the protoplasmic contents are more granular. The cells recover their green colour when exposed to sunlight, but on renewed exposure to x rays the chlorophyll seems to disappear more or less completely.

The following microscopic changes are to be noticed as the result of exposure of these bacilli prodigiosi to x radiations. There is apparently little to call for notice as regards the relative size of the rayed and non-rayed bacilli. As regards groupirg, an unusual property of the bacillus prodigiosus was apparent—that is, growth in chains or strepto-bacteria; and further, what is at present giving rise to controversy, spore formation, which seems to be clearly established by the presence of a chain preparation. For the rest, the bacilli appear in both cases equally granular and stain equally at the ends and as irregularly.

We are continuing these experiments, especially upon the pathogenic bacilli, among which it is possible that changes in growth may be accompanied with some alterations in the character of the bacilli.

Clinical Notes:

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL.

NOTES ON A CASE OF PUERPERAL ECLAMPSIA OCCURRING IN THE SIXTH MONTH OF PREGNANCY; DEATH.

BY H. HOWARD MURPHY, M.D. CANTAB,
HONORARY MEDICAL OFFICER TO ST. JOHN'S HOSPITAL, TWICKENHAM.

THE following notes on the case of a patient who was seized with puerperal eclampsia in the sixth month may be of interest to readers of THE LANCET in general as well as to "R. C.," who recently asked for references to cases.[1]

On Oct. 21st, 1897, I was asked in the morning to call on a patient, about thirty years of age, who had vomiting and cramps in the stomach. She had one child, an easy confinement, four years ago, and was now some five months pregnant. She had not felt very well for some days, her stomach seeming to be out of order. There was no history of colic or jaundice previously or of any serious illness, the patient being generally healthy. The attack commenced after breakfast by some colicky pains across the upper abdomen and pains across the loins. She had rolled on the floor with pain, felt faint, and vomited once. The bowels were last opened on the 19th, when they acted well twice. I ordered an enema, a mixture with tincture of chloroform and morphia, fomentations, appropriate diet, &c. In the afternoon there was another attack of the colicky pain and the patient vomited twice. The tongue was clean; the liver dulness was not increased; there was tenderness in the region of the epigastrium, but not over the gall-bladder, which could not be felt. The pulse was 75 and good and the temperature was normal. During the evening a second enema had caused a free evacuation; but the colic had been very severe and she had vomited frequently and all she took. There were no uterine symptoms at all. Morphia (¼ gr.) was injected hypodermically. She slept for four hours quietly; then she awoke and had severe colic and frequent vomiting and about 3 A.M. there occurred severe convulsions which lasted for an hour. Her pulse was 80 and good. Another hypodermic injection of morphia quieted her. At 10 A.M. she had two convulsions; she kept fairly conscious between the attacks; she complained much of epigastric pain and threw herself about and vomited frequently. She had passed very little urine, which contained a cloud of albumin. At noon she was distinctly jaundiced and was becoming less conscious. The temperature had risen to 100° F. and the pulse was 80 and of fair strength. Dr. Amand Routh kindly saw the patient on the afternoon of the 22nd in consultation. He considered that the eclamptic state demanded the induction of labour and finding that the os was patulous he was soon able to pass in a finger, to rupture the membranes, and to bring down a leg. There were no uterine contractions. He advised the continuance of the morphia and the administration of nutrient enemata with some bromide and chloral. In three hours the uterus was emptied and washed out. There were no more convulsions; the patient was quieter, but she also gradually became less capable of being roused to answer questions or to take food. On the 23rd she had a quiet night, without convulsion, vomiting, or complaints of pain. She had not required any morphia. She recognised and spoke to me, answering questions. She passed no urine and no action of the bowels took place. The pulse was 100 and weaker. She took food well. All day she lay very quietly and in much the same condition. As no urine was passed by the evening the catheter was used and yielded 16 oz. of urine which was very dark coloured with bile and contained much albumin. The liver was tender and the area of dulness was diminished. The tongue was coated. The pulse went up to 120 and got weaker. She was very jaundiced. On the 24th the patient had passed a very quiet night. She took liquid nourishment well. No urine was passed. The bowels were frequently opened with small liquid motions. She had no convulsions and did not vomit. There was loss of vision and she said she could not see me but she recognised my voice; she was rambling and semi-conscious. The pulse was 120 and very weak and the temperature was 100°. In the afternoon the catheter drew off 1½ oz. of urine which was very dark with bile and contained some blood. About 4 P.M. she became quite unconscious and very weak and died quietly in half an hour. No post-mortem examination was held.

Dr. Routh agreed with me that there was acute atrophy of the liver in this case as well as the eclampsia. The latter ceased as soon as the uterus was emptied, as did the epigastric pain and vomiting. The urine contained albumin, was scanty, and almost suppressed at last.

Twickenham.

[1] THE LANCET, May 21st, 1898.

A CASE OF CONCEALMENT OF BIRTH.

BY SANDERSON MELLOR, L.R.C.P., L.R.C.S. EDIN., L.F.P.S. GLASG.

THE following is a curious and interesting case as showing what can be done by one who has just given birth to a child.

A single woman, aged twenty-three years, lived with her father (who is a widower) and a sister, aged fifteen years. The mother died some years ago and the home surroundings and comforts of these two daughters had not been of the happiest. The elder sister, whose extraordinary conduct I am referring to, gave birth to a child about two years ago and I understand she was on that occasion attended by a midwife. She expected her second confinement last February. For some reason—most probably shame—she never mentioned her condition to anyone and for a month or six weeks before the event she kept to the house and was never seen outside, not even by the next door neighbours. At 12.30 P.M. on the day on which she was confined she told her sister that she was in pain and asked her to fetch her married sister who lived two and a half miles away. This sister was, however, unable to go as her children were all ill and she could not leave them. The young girl then ran nearly two miles for another sister, with the result that the second sister went at once. She arrived at her father's cottage at 3.30 P.M. and finding the back door locked she ran round to the front and there met the girl who had just been confined. She then told her sister that she had had a "loss" and that she had put it in the water-closet. The girl was immediately put to bed and a neighbour was called and a close inspection of the water-closet revealed nothing which threw any light on this mysterious affair. The floor near the bed, the bedclothes, and the girl's linen were all soaked in blood. In the centre of another room and on the floor was a dirty old bag which had been used for stopping up the chimney, and in this bag, in which there was a large quantity of horsehair, a fully developed after-birth was found. Up the chimney in the same room another dirty bag was discovered which contained the body of a full-time child. The matter was placed in the hands of the police and I made a post-mortem examination. The umbilical cord was one yard long and was coiled round the child's neck, and the cord

was torn about 6 in. from the placental end. The child had breathed.

This case is interesting inasmuch as barely three hours had elapsed from the time labour had commenced to the time the concealment of the birth was brought to light. Although the mother must have lost an enormous amount of blood, as evidenced by the state of the room and her linen, and notwithstanding the fact that she was removed to the union the next morning, a distance of two miles, she is now quite well.

West Malling, Kent.

A CASE OF GUMMA INSIDE THE STERNUM.

BY THOMAS COLE, M.D., F.R.C.P. LOND.,
LATE SENIOR PHYSICIAN TO THE ROYAL UNITED HOSPITAL, BATH.

I WAS a few years ago asked by his two medical attendants to see a man, aged about forty-eight years. He had been indefinitely ill for some time, suffering from dyspnœa, slight cough, and some blueness. The most minute examination of every organ revealed nothing, but I found on the front of the sternum a small boss or elevation which was a third of an inch wide and about the same in elevation. The mass was slightly tender. I was the first to discover it. I also thought the substernal respiration was somewhat more tracheal than usual. Taking the few facts into consideration I suggested that there might be some gummatous mischief and advised the administration of 20 gr. of iodide of potassium every four hours. But I could make no impression on my friends, who would express no opinion, and only (when I was gone) put eight leeches over the little swelling. In two or three days we met again. The mass was rather larger, there was a little more dyspnœa, the respiration was noisy, and there was a slight laryngeal cough I still urged my plan; it could do no harm and might confer immense benefit on the patient, whose case I began to think of with great distrust. But I could not move these practitioners by any argument whatever. Still they believed in me and on many occasions had called me in. They wished me to meet them again in a week, which of course I did. The poor fellow was evidently gradually slipping through their fingers; every symptom was worse, intra-sternal pressure was more marked, and venous stasis above the clavicles was developing. I asked, "Are you prepared to go on treating this case as you are—doing nothing?" One of them said, "Are you prepared to give us a good reason for such heroic treatment as the administration of 20 gr. of iodide of potassium every two or three hours" (which I then proposed)? A merciful providence intervened on the patient's behalf as well as on my own. Strange, indeed, was it that the left sleeve of his night-dress being unbuttoned and drawn up towards the elbow I saw a large node on the ulna at least 2½ in. by 1½ in. I pointed it out to my sceptical friends and turning to the patient said: "How long have you found this?" "It was not there, Dr. Cole, when you last came, but the day after it began to come and it is getting very painful. I intended to call your attention to it this morning as I knew you were all coming and you had asked about swellings before." Persuasion leaped into the minds of my friends after so unmistakeable a proof of the nature of the malady and the treatment was at once begun. In a very short time all the evidence vanished and the patient resumed his usual health. Of course, he was most carefully watched and when I heard of his state a year afterwards he was well and free from disease. Does not such a case prove to every practitioner the absolute necessity of an accurate diagnosis in every case which comes under his notice? How many lives would be saved were common care taken in such important and critical matters?

Bath.

NOTES ON TWO CASES OF CONGENITAL ABSENCE OF THE RIGHT EYE (ANOPHTHALMOS).

BY JOHN R. ROLSTON, L.R.C.P. EDIN., M.R.C.S. ENG.,
SURGEON TO THE ROYAL EYE INFIRMARY, PLYMOUTH, AND OPHTHALMIC SURGEON TO THE ROYAL ALBERT HOSPITAL, DEVONPORT.

IN THE LANCET of Jan. 1st, 1898, Mr. W. G. Nash of Bedford records a case of Congenital Absence of the Right Eye, with an illustration. As I have seen two cases of the same deformity—one of which very closely resembles the case related by Mr. Nash—I thought an account of them would interest the readers of THE LANCET. The accompanying illustration is reproduced from a photograph of the one which is so similar to that described by Mr. Nash.

Portrait of the patient (aged six years) in Case 1.

CASE 1.—A girl, aged six years, was brought to me in December, 1896. There was—as is depicted in the illustration—congenital absence of the right globe with a small rudimentary palpebral aperture 12 mm. long with eyelashes; a small caruncle was seen inside. No evidence of a rudimentary globe was observed. There was much flattening of the bridge of the nose and the right ala of the nose was imperfectly developed. The left eye had horizontal nystagmus. The mother has had 5 children, all of whom are healthy. She has had no miscarriage. She says that she had a fall several months before the child was born.

CASE 2.—A girl, aged six years, was brought to me in December, 1896. There was congenital absence of the right eye with a small but otherwise natural palpebral aperture 19 mm. long. The cavity seemed to be natural. There was no sign of a rudimentary globe. No defect of the face was present. In this case the mother was not seen by me and no family history could be obtained. Photography was not allowed. The left eye was normal.

I am of opinion that these two cases may be correctly classified as true anophthalmos, as in each case I failed to find any rudimentary globe (although I did not use dissection), and this class is much more rare than that to which I should imagine Mr. Nash's belongs—viz., that of microphthalmos, as he states that "a small pigmented body about the size of a pea occupied the centre of the cavity" of the orbit. The point in common is that in all three cases the right side is affected.

Plymouth.

NOTE ON A CASE OF FATAL HEART AFFECTION IN SCARLATINAL RHEUMATISM.

BY FRANK ROBINSON, M.D. VICT.,
RESIDENT MEDICAL OFFICER, CITY HOSPITAL NORTH, LIVERPOOL.

I BELIEVE that the following case of acute pericarditis (largely obliterative) will be of interest in connexion with the annotation on obliterative pericarditis in THE LANCET of June 18th, 1898.

A girl, aged ten years, suffered from an attack of scarlet fever of average severity in the City Hospital North, Liverpool, and made a satisfactory recovery from the acute stage. On the twenty-first day a mild attack of articular rheumatism commenced. There was no local swelling and but little pyrexia occurred, but the wandering pains persisted and on the fiftieth day severe pain drew special attention to the heart. An extensive area of pericardial

friction was found and by the sixty-second day the area of dulness extended beyond the sternum to the right and beyond the nipple to the left. On this day there was severe cardiac dyspnœa, which was relieved as the area of dulness diminished during the next few days. Murmurs were audible on the sixty-seventh day over the mitral and aortic areas and death resulted suddenly next morning.

Post mortem the posterior layers of the pericardium were found to be totally adherent, as was also the area where at one time paracentesis had been contemplated. The remaining portion of the pericardial sac still contained some excess of fluid (though the dulness had greatly lessened), and the free surface was coated with shaggy fibrinous deposit which was blood-stained in parts. The heart was much dilated and the edge of every valvular cusp on the left side was lined continuously with recent vegetations.

The extent to which the heart was involved in this case appears to be remarkable considering that it is comparatively seldom affected in scarlatinal rheumatism and that the joint symptoms were so trivial. Had the patient recovered the sequelæ would doubtless have been similar to those recorded by Dr. Cabot. I am enabled to report this case by the courtesy of Dr. Robertson, the visiting physician.

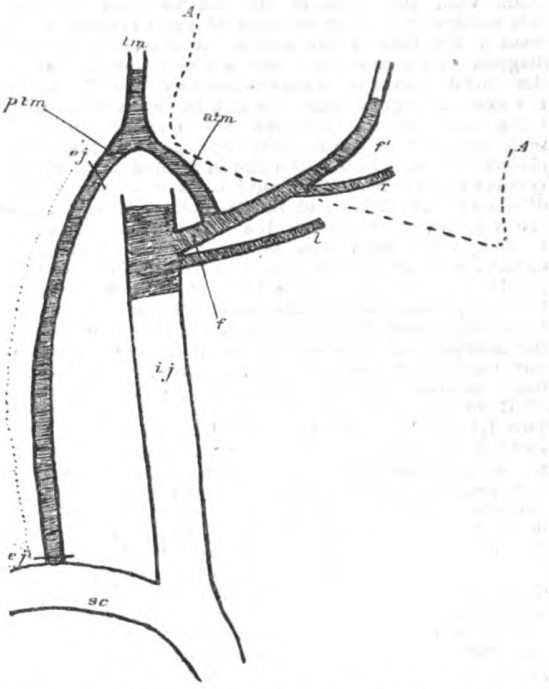
Nulla autem est alia pro certo noscendi via, nisi quamplurimas et morborum et dissectionum historias, tum aliorum tum proprias collectas habere, et inter se comparare.—MORGAGNI *De Sed. et Caus. Morb.*, lib. iv. Proœmium.



EVELINA HOSPITAL FOR SICK CHILDREN.

A CASE OF ALVEOLAR ABSCESS; DEATH FROM PYÆMIA IN EIGHT DAYS; NECROPSY.

(Under the care of Dr. F. WILLCOCKS.)

PYÆMIA arising from suppuration in connexion with a tooth is probably less rare than is usually thought, as there is great chance that the alveolar suppuration may be overlooked in many cases. When a septic clotting has been started in the veins of the part it may spread in several directions. The case below and the one quoted by Dr. Bolton in his remarks illustrate what is perhaps the most usual direction for it to take, but it is by no means rare for the septic phlebitis to extend from the facial vein into the buccal vein and so into the pterygoid plexus of veins, whence it passes into the cranium through the foramen ovale, and so affects the cavernous sinus. In this way are to be explained the cases in which severe cerebral symptoms arise early. For the notes of the case we are indebted to Dr. Charles Bolton, senior resident medical officer.

The patient was a boy, aged four years, who was taken to the Evelina Hospital for Sick Children at 8 P.M. on April 25th, 1898, on account of "pain in the sides." The mother stated that with the exception of an attack of measles from which he suffered in last December the child had had no previous illness, that for many weeks she had noticed that his teeth were "going very bad," but she took no notice of it as "bad teeth were so common," and that he had made no complaint and had been perfectly well until the evening of April 20th, when he complained of "toothache." His face was a little swollen on the right side on the next day and a medical man who was sent for said that the patient had a gumboil and ordered poultices. On the 22nd his mother took him to a hospital as he seemed to be getting stupid, and here she was told that he had a gumboil and was given some medicine. The child was much worse on the following day and complained of pain in the sides, and another medical man who was called in said that he had pleurisy and ordered poultices to be applied to the chest. He remained in the same condition until he was taken to the Evelina Hospital on the above-mentioned date. When the child was admitted he was drowsy and fretful; the skin was hot and dry and the temperature was 104·6° F. There was a hard, tender, non-fluctuating swelling with an indefinite outline fixed to the right side of the lower jaw in the molar region; the skin over it was hotter than the skin on the other side was, but it was not red, and several distended veins were seen over the surface. There were a few enlarged glands at the angle of the jaw, but nothing else abnormal could be felt in the neck. The breath was extremely offensive and the tongue was coated with a greyish-brown fur. The crowns of several teeth were completely decayed and the second lower right temporary molar was carious and loose, a brownish purulent discharge oozing from its socket and the surrounding gum and adjacent part of the floor of the mouth being ulcerated. The teeth and gums were partly covered with a dark-coloured, cheesy material, which had a foul odour. The throat was a little congested and was covered with tenacious mucus. With the exception of a few rhonchi on both sides there were no physical signs in the chest. The spleen was easily felt about two fingers' breadth below the left costal margin and the urine contained a trace of albumin. The loose molar was extracted and a quantity of thick brown pus escaped. The teeth and gums were thoroughly cleansed and the mouth and abscess cavity were irrigated every four hours with sanitas lotion. On the 27th the right eyelids were œdematous and the superficial veins were much more distinct than they had been before. The right external jugular vein could be distinctly

Diagrammatic representation of the veins on the right side of the neck. The shaded portions show the extent of the clotting in the various veins. A A, Outline of jaw. *tm*, Temporo-maxillary vein; *atm*, the anterior branch; and *ptm*, the posterior. *ej*, External jugular; the portion marked off was excised at the operation. *ij*, The internal jugular. *sc*, The subclavian. *j*, The common facial. *f*, The facial. *l*, The lingual. *r*, The ranine.

felt and rolled under the finger; the internal jugular was apparently normal. There was a free discharge of thin offensive fluid from the mouth and creolin lotion (1 in 1000) was substituted for the sanitas on account of the smell. Rhonchi and râles could be heard on both sides of the chest and the skin was a little jaundiced; the liver could not be felt. The general condition was the same as it had been before; the temperature ranged between 104° and 106°, once or twice rising to 107° and falling from 3° to 4° after each tepid sponging; there were no rigors. Mr. Makins was asked to see the case. He exposed the external jugular vein and found it to be yellow in colour and full of pus. He ligatured it below at its junction with the subclavian and above almost as high up as the angle of the jaw and cut out the intervening portion. The internal jugular was next examined and the blood in it was found to be fluid. The wound was then

closed as the child's condition was very bad. The patient died on the following day (the 28th) at 3 P.M.

Necropsy.—At the post-mortem examination the external swelling was found to be chiefly composed of glands matted together. A part of the inner surface of the lower jaw was lying bare in the abscess cavity and the adjacent portion of the floor of the mouth was infiltrated with pus and was in a sloughing condition. The veins on the right side of the neck were dissected out and are represented in the accompanying diagram. The lingual, the ranine, and the lower part of the facial vein, together with the common facial and the anterior and posterior divisions of the temporo-maxillary vein, were full of pus, the external jugular having been removed at the operation. The clotting extended for some distance up the temporo-maxillary and facial veins and also along the branches, some branches of the facial being full of pus. The clot in the internal jugular was beginning to break down and extended for about a quarter of an inch above and below the entrance of the common facial. There were several pyæmic abscesses in both lungs and the spleen was enlarged and soft. There were no abscesses in the other organs.

Remarks by Dr. BOLTON.—There are several points worthy of note in the above case. 1. The first point I will consider is the course taken by the blood-clot. This depends upon the fact that in an alveolar abscess in this situation the probable source of infection is through branches of the facial vein, the veins of the tongue being infected in this particular case on account of the extensive involvement of the floor of the mouth. A glance at the above diagram shows that there was a direct line of pus from the facial into the temporo-maxillary and thence into the external jugular vein, the clot in the internal jugular being more recent, although the common facial vein runs directly into the internal jugular. The probable explanation of this is that the clot in passing down the facial vein towards the internal jugular blocked up the lower end of the anterior division of the temporo-maxillary vein, and the volume of blood in the latter vein, being small in comparison with that in the internal jugular, easily clotted, and so the infection was carried to the external jugular, whereas the large volume of blood flowing in the internal jugular would at first sweep off any clots projecting from the common facial into its lumen and thus clotting in the internal jugular would be delayed. Pyæmia is a very rare result of alveolar abscess; however, many cases have been recorded and Mr. Pedley in his book on Diseases of Children's Teeth quotes one which was published in THE LANCET[1] by Mr. Arbuthnot Lane and which bears a striking resemblance to this case. Mr. Lane's patient was a boy, aged four years, whose illness began with toothache and swelling in connexion with the second left lower temporary molar about a week before admission into hospital. He had jaundice, rigors, and an enlarged liver. The most interesting point is that in Mr. Lane's case the course of the clotting has apparently been exactly the same as described above, the external jugular vein being thrombosed to within half an inch of its lower end and the internal jugular only for a very slight distance. Mr. Lane cut out the external jugular and facial veins and tied the internal jugular above and below the entrance of the common facial with the result that the jaundice and rigors disappeared; however, the child died and at the necropsy abscesses were found in the lungs and liver which had been formed before the operation probably by clots projecting from the common facial into the internal jugular and washed off by the blood-stream. In these cases the clotting must reach the internal jugular very soon after it reaches the temporo-maxillary, hence the earlier the internal jugular is ligatured the greater is the chance of success, and when the external jugular is found to be thrombosed it is probably too late to save the patient by operative interference. The proper treatment in such cases obviously is to examine the facial vein as early as possible and not to wait until there are signs of thrombosis of the external or internal jugular veins. 2. The next point to which I wish to refer is the inattention which is paid to children's teeth not only by the parents but even by members of the medical profession. Of this there are numerous examples daily in the Evelina Hospital: it is an extremely common thing to see children with the majority of their teeth carious, with pus oozing alongside the crowns of two or three, or several minute abscesses pointing through the gum, or probably three or four fangs of temporary teeth protruding through the gum and causing ulceration of the cheek owing to their non-absorption as a result of caries of the crown. This condition of things is totally disregarded and the teeth are never examined because the children do not complain of pain. This brings me to the third point which this case illustrates. 3. Namely, that it is quite the rule for these children never to have any pain at all. This point is not paid much attention to, but everyone can verify it for himself and he will then be surprised at the amount of destruction which can take place in children's teeth without the occurrence of any pain whatever. 4. In reference to the treatment of alveolar abscess in connexion with temporary teeth there is no doubt that in all cases the proper thing is to extract the tooth at once and not either to apply poultices or to give medicine. The abscess then drains through the socket, the cause of the abscess is removed, and the permanent tooth which lies under the temporary one will probably be saved, which it cannot be if the abscess is allowed to run its course unopened. 5. Another point illustrated here is the fact that there may be most extensive suppuration within the veins and secondary abscesses without any rigors or large variations of temperature. 6. Lastly, the value of creolin in this case as a deodoriser may perhaps deserve mention. At the necropsy, which took place twenty-four hours after death, the mouth smelt very strongly of that drug.

Medical Societies.

OPHTHALMOLOGICAL SOCIETY.

Retinitis Proliferans.—Œdema of the Conjunctiva due to Obstruction of the Lymph Stream.—The Pathogenesis of Anterior Polar Cataract.—Splinters of Steel removed from the Eye with the Electro Magnet.—Value of X Ray Examination in Old Injury to the Eye.—Large Fibroma of the Upper Eyelid.—Toxic Amblyopia.—Exhibition of Cases and Specimens.

AN ordinary meeting of this society was held on June 9th, Mr. H. R. SWANZY, the President, being in the chair.

Mr. PERCY FLEMMING described a case of Retinitis Proliferans. The specimen was obtained from a man, aged twenty-two years, who died from chronic renal disease. The following appearances were seen on section: the posterior part of the retina was much thickened, folded and detached; a thin membrane stretched across the vitreous cavity from the ora serrata to the posterior part of the retina; another membrane had a similar origin in part, but ended freely about the middle of the vitreous cavity; the space between these membranes and the retina was occupied by blood-clot; there were signs of cyclitis. The chief microscopic appearances were a thickening of the retina and disorganisation of its inner layer, a definite transformation of the clot (as seen in successive sections) into connective tissue membrane with lacunar spaces, and a pulled-out condition of the retina near the ora serrata, resulting in elongation and rupture of Müller's fibres. It was possible to trace a direct continuity between the membranes and the retinal tissue. A review of previously recorded cases was given and the suggestion made that the essential factors of the disease were: (1) hæmorrhage, and (2) an inflammation of the sustentacular tissue of the retina allied to sclerosis of the central nervous system.—Mr. C. WRAY referred to two cases, one of a man, aged sixty-eight years, with glycosuria, who exhibited detachment of retina and retinitis proliferans in the right eye and vitreous hæmorrhage and a vascular formation from the optic disc resembling the skeleton of a leaf in the left. There was no necropsy. The other, also a man, aged thirty-five years, with a similar condition of the vitreous, detachment of the retina, whose vision had improved under continued large doses of potassium iodide from the capacity to count fingers at 3 metres to $\frac{6}{9}$ths, and who had been able to work during the last five years.

Mr. HOLMES SPICER described a case of Œdema of the Conjunctiva due to Obstruction of the Lymph Stream. He said these cases presented themselves in two groups, the acute and chronic. In the acute cases, owing to a poison received into the conjunctival sac supposed in one case to have come from wood pavement, the pre-auricular and cervica

lymphatic glands became inflamed, although the local signs of conjunctival irritation were not marked. The flow of lymph was hindered and a condition of extreme œdema of the conjunctiva was produced in which the conjunctiva hung out from between the closed lid as a flaccid gelatinous bag. Two cases were narrated in which the glandular enlargement was increased by the simultaneous occurrence of follicular tonsillitis. In the second chronic group, owing to a post-suppurative inflammation of the lymphatic glands of one side of the face and neck, great cicatrisation had been produced, the lymph stream was hindered, the subconjunctival tissue spaces became filled with the solid constituents of the lymph, and a condition of solid œdema resembling elephantiasis in other parts remained, which was persistent in spite of treatment.—Dr. RAYNER BATTEN cited two cases in females, aged respectively twelve and thirty years, in whom œdema affected the conjunctiva and lids, causing limitation of movement of the globe. Incision into the orbit elicited nothing, though there was proptosis. No rheumatic history existed, but the condition subsided rapidly under salicylates. —Mr. BASS laid much stress on the coexistence of follicular tonsillitis in the cases reported, suggesting that the conjunctival sac was probably infected from the saliva in moistening the lids, which often adhered.

Mr. TREACHER COLLINS read a paper on the Pathogenesis of Anterior Polar Cataract. He first described a case in which a melanotic sarcoma of the anterior part of the ciliary body, coming in contact with the antero-lateral part of the lens, had produced an opacity of the lens in that position, which presented precisely similar microscopical appearances to those seen in anterior polar cataracts. This, he thought, strongly supported the view that these latter resulted from contact of lens and cornea arresting the osmosis of nutritional fluids in the lens. He next demonstrated the microscopical characters of a congenital cataract where there was a large anterior polar opacity, beneath which the lens fibres had undergone such extensive degeneration that the whole lens was much flattened from before backwards. He thought the changes could be accounted for by prolonged contact of the lens and cornea in fœtal life, after the anterior fibro-vascular sheath of the lens had disappeared. He then quoted several cases in which, besides an anterior polar opacity, there was a second opacity situated beneath it a little deeper in the lens. In all these the cataract had been formed in early life and several years had elapsed before the patient came under observation. He showed a drawing of the microscopical appearances of a lens presenting two such opacities. There was the usual laminated mass at the anterior pole, then some normal lens fibres, and then an area where the lens fibres had broken up into irregular amorphous granules and detritus. This area corresponded fairly accurately in shape to that of the mass at the anterior pole and he thought there could be no doubt that they were at one time in contact, having become separated by the gradual growth of new lens fibres inwards between them.

Mr. SIMEON SNELL related two cases in which Splinters of Steel were removed from the Eye with the Electro-magnet. 1. From the retina with preservation of excellent sight. The piece was observed with the ophthalmoscope as fixed in the retina in the outer and lower quadrant; the fragment had passed through the cornea close to the sclero-corneal junction, and when the patient was first seen four days after the accident the glistening of the steel was distinct, but the foreign body was partially covered with exudation. The patient could count fingers. The electro-magnet was inserted eight days after the accident between the inferior and internal recti and the fragment was removed. Later the vision equalled $\frac{6}{24}$. 2. From the vitreous, the foreign body being localised by the x rays. The patient was not seen for several weeks after the accident. The foreign body was diagnosed as having entered the upper part of the cornea, passing through the lens into the vitreous. Dr. McKenzie Davidson used the x rays and localised the splinter in the upper part of the vitreous. A skiagram showed it to be needle-shaped, measuring 8 mm. in length, and placed obliquely. The electro-magnet (fifteen weeks after the accident) was introduced through a scleral incision between the inferior and internal recti and the splinter was at once removed. The patient could afterwards count fingers.—Dr. TATHAM THOMPSON spoke of the difficulty sometimes experienced in withdrawing the foreign body through a small wound which he had overcome by approaching the body from another direction so as to get it end on. He thought one of the chief advantages in using the x rays was the power of excluding foreign bodies in doubtful cases.

Mr. W. LANG described two cases illustrating the Value of the X Ray Examination in instances of Old Injury to the Eye with Defect of Vision. The first patient consulted him for failure of vision going on to total amblyopia in whom there was a small corneal scar with corresponding openings in the iris and lens. Though there was no history of injury a foreign body was suspected and a skiagram by Dr. McKenzie Davidson revealed one in the lowest part of the vitreous covered up by opaque tissue. The second had a recent wound of the cornea, iris, and vitreous, but no foreign body could be seen. This was subsequently located in the sclerotic at the fundus. There was a small hole in the choroid. No operation was attempted in either as the eyes were quiet.

Mr. SIMEON SNELL related a case of Large Fibroma of the Upper Eyelid. The patient, a man aged forty-three years, never remembered being without the tumour and it had only increased in size very slowly. At the time of his being first seen it was pedunculated, of the size of a filbert, and by its weight and situation interfered with the movements of the eyelid and with vision. It was attached to the left upper eyelid just external to the punctum. It was dissected off. The tumour was white and glistening in section and under the microscope it was found to consist of fibrous tissue.

Mr. ANDERSON CRITCHETT showed a case of Toxic Amblyopia which was attributed to poisoning by iodoform. An elderly woman suffering from an extensive cancerous ulceration of her breast had been in the habit of applying iodoform to the ulcer over a period of three years. She developed somewhat suddenly extreme amblyopia, lost the recognition of all colours except blue, for which she had a large central scotoma, and was found to have slight pallor of the outer half of each optic disc and a small granular change to the inner side of each macula lutea. Since the iodoform had been stopped (ten weeks) the return of her colour vision had been very decided, she could recognise any colour by indirect vision, but still had a large central scotoma. Her visual acuity was still very bad, though it had shown some improvement.

The following cases and card specimens were shown:—

Mr. HARTRIDGE: Phagedæna of the Eyelids.

Mr. CHARLES WRAY: (1) Pemphigus of the Conjunctiva; and (2) Skiagram of a Foreign Body in an Eye.

Dr. TATHAM THOMPSON: Intraocular Granuloma.

Reviews and Notices of Books.

Forensic Medicine and Toxicology. By J. DIXON MANN, M.D. St. And., F.R.C.P. Lond., Professor of Forensic Medicine and Toxicology in Owens College, Manchester, &c. Second edition. London: Charles Griffin and Co. 1898. Pp. 683.

THE merits of the first edition of this work at once classed it as among the best text-books and works of reference on the subjects of which it treats. The present edition has been entirely revised and brought fully up to date, some of the sections have been re-written, and others have been added—for example, on the Obligation of Professional Secrecy, on Sudden Death from Natural Causes, on Blood Poisons, and on the Post-mortem Imbibition of Poisons.

Great interest will naturally be taken in Dr. Mann's words on the position which medical men occupy as depositories of secrets acquired in their professional capacity concerning the physical or mental condition and the doings or misdoings of their patients. The advice given is sound; if carefully followed the medical man is not likely to involve himself in a lawsuit. The author naturally considers the duties of a medical man when brought into contact with a case in which abortion has been illegally produced. He says: "The law relating to the subject is very unsatisfactory, but a medical man placed in such a difficulty would not be far wrong were he to determine his course of action by carefully considering whether the knowledge acquired whilst acting in a professional capacity

was or was not of such a character as to override the obligation to secrecy. The rule is never to violate professional secrecy, but, like other rules, it may have its exceptions." The chief point that attracts attention in reading Dr. Mann's book is the thorough manner in which the whole of the strictly scientific portions are considered; a great deal of investigation and study must have been required. A notable instance will be found in Chapter XXII.—"Death caused by Burns and Scalds"; the various theories advanced to account for death from burning are carefully analysed and summarised. The opinion arrived at is that early death from burns and scalds is a primary blood disorder, which chiefly results from injuries received by the red corpuscles when subjected to intense heat.

The subject of wounds and injuries from a medico-legal point of view is always a large and difficult one, but the classification here found will materially help the student to understand the complicated points which may arise. Dealing first with the nature of contusions and wounds, injuries of the various parts of the body are considered, then wounds produced by firearms. Next follows an excellent disquisition of wounds in their causal relation, and these sections a medical man would do well to consult before giving evidence in cases in which wounds have been inflicted.

In the present edition some of the more abstruse theoretical considerations are printed in smaller type, and this we think is an improvement, especially to aid reference. A student will necessarily have to read such paragraphs, but the busy practitioner who may suddenly be called upon to express an opinion in a medico-legal case would be glad to be able to find at once practical hints as to the matters involved and consequently by the change of type would save time by not having to read theoretical matters. The chapters devoted to Insanity in its medico-legal relationships are also very good.

The section on Toxicology is most complete and forms about the best work of reference on that science with which we have met. In this edition several additional poisons are described, some of which for the first time now find a place in a textbook of this kind. Amongst these we notice (at least, as not appearing in the first edition of the book) acetylene, bromoform, trional, creolin, cicuta virosa, &c.

In these chapters, again, the plan has been adopted of printing the less important poisons in smaller type. The symptoms, fatal doses, and methods of treatment are fully given, and to those students who wish for an advanced textbook on forensic medicine and toxicology we can strongly recommend this volume which will moreover form a most valuable book for all medical practitioners. A medical man may at any time be called upon to help the law in cases of suspected murder and unless the minutest precautions are taken to conduct the medical examination properly the medical witness may find himself in a very unpleasant position under the fire of cross-examination, but if he has carefully considered Dr. Mann's observations on similar cases he may enter the witness-box with every confidence.

L'Allaitement Mixte et l'Allaitement Artificiel. By HENRI DE ROTHSCHILD. Paris: Masson et Cie. 1898. Pp. 659.

THIS book deals with an important subject at considerable length, but the length is scarcely to be gauged by the number of pages, since only 242 are devoted to the text while about 110 are occupied with clinical observations, charts, tables, and diagrams, and the concluding 300 pages are occupied by a bibliography from the year 1519 to 1897. The author commences with a consideration of the nursing of infants at the breast and speedily passes on to deal with the causes which may necessitate artificial feeding, and in turn he reviews the conditions which affect the mother and the child. The chemical composition of milk is then considered in some detail and the author deals separately with the numerous micro-organisms which may be found in milk. The conditions suitable for a model dairy are then detailed and this includes a description of pasteurisation by means of which the various preservatives, such as borax, boric acid or salicylic acid, may be dispensed with. Great stress is laid upon the nature and cleanliness of the feeding bottle, but the most important chapter in the book is that on Sterilisation. This contains full descriptions of the various modes which have been recently recommended. Short sections are devoted to a consideration of forms of fermented milk, koumiss, and kephir, while more space is given to a consideration of condensed milk. The bibliography appears to be very complete and contains references to no less than 2877 signed and unsigned papers connected with this subject.

The Water-supply of London; or, Suggestions for an Illimitable Supply of Water to London at a Comparatively Small Cost. By C. H. F. ROUTH, M.D., M.R.C.P. Lond., Fellow of University College, London. London: Baillière, Tindall and Cox.

THE importance of the water-supply of London is so great that any honest attempt to throw light on the matter should not be passed by. Dr. Routh's pamphlet gives nternal evidence that the subject has engaged his attention, that he has spent a good deal of time and trouble in making abstracts of various reports on the London water-supply, and that as a result he has come to certain conclusions with regard to what it would be best to do.

The pamphlet contains an abstract of the Report of the Royal Commission upon the Water-supply of the Metropolis which was issued in the year 1892 and is commonly called the Balfour Report. This is followed by an abstract of the Report on the London Water-supply which was given by Mr. (now Sir) A. Binnie, engineer to the London County Council. The third abstract is from a paper by Mr. Thomas Hennel which was published in the year 1879 and which treats of the supply of sea-water to London. An abstract of a paper by Mr. Paterson on "The Hermite System of Sanitation of Towns by Electricity" follows.

With regard to the abstracts of these various papers and reports it may be said that they are carefully made and appear to give a fairly accurate summary of the reports with which they deal. Those who are not acquainted with the Balfour Report may, for example, get a very good general idea of its recommendations by reading the abstract. However, anyone who wishes to make a serious study of the question would do better to refer to the original report.

While giving every credit to Dr. Routh for the care which he has devoted to the work he has undertaken, we cannot think that the pamphlet will do anything to help anyone to solve the question as to what it is best to do with regard to the future water-supply of London, nor can we agree with all the conclusions to which the writer comes. The pamphlet shows that the author has bestowed a good deal of thought on the matters with which he attempts to deal; but it does not suggest that he possesses a sufficient grasp of the technical points of the subject to make his views, taken as a whole, of any weight.

The first conclusion to which the writer comes is that "the sea being illimitable, even during droughts, would always enable us to condense it for fresh water." No one has ever denied that there is plenty of water in the sea, and, therefore, with regard to quantity no one would be likely to take very serious exception to the statement which Dr. Routh apparently wishes to express. A captious critic might suggest that the sea is not "illimitable" either during droughts or at other times and, further, that the laws of condensation do not, as he suggests, depend on the quantity

of water in the sea. The second conclusion is that the plan of using sea-water would not affect any of the existing water companies, but that it would relieve them of the necessity of supplying so great a quantity of water for baths, for watering the streets, and for extinguishing fires. The third conclusion is that if sea-water were brought to London its electrolysation would be the cheapest and most effective antiseptic and would greatly improve the sanitary condition of London. The fourth conclusion is that the London water companies might graft this plan on to theirs as a useful adjunct and, finally, it is suggested that the "Government" or the London County Council might undertake the work of bringing the water "to the profitable advantage both of themselves and the public." There is no doubt that a plentiful supply of sea-water would be a great boon to London, but the notion that the sea would be a good source of supply for drinking purposes is open to serious question from more than one point of view.

The History and Technique of the Vaginal Radical Operation. By Professor Dr. LEOPOLD LANDAU and Dr. THEODOR LANDAU of Berlin. English Translation by B. L. EASTMAN, M.D., Assistant in the Landau Frauen-Klinik, Berlin, &c., and ARTHUR E. GILES, M.D. Lond., Assistant Surgeon, Chelsea Hospital for Women, London. London: Baillière, Tindall, and Cox. 1897. Price 7*s.* 6*d.*

BY the expression "vaginal radical operation" the authors mean removal of the uterus and the uterine appendages by the vaginal route. It is the operation they make use of "in the treatment of double inflammatory or suppurative diseases of the tubes and ovaries"—a class of cases which, according to the authors, resists every other method of treatment. They regard the removal of suppurating appendages by abdominal section as unsatisfactory and maintain that, though the immediate results may be good, permanent cure does not follow; in fact, they regard such operations as incomplete in that the diseased uterus, the real source and origin of the affection, is left behind. Certain it is that there are such cases which have been treated by abdominal section and have recovered from the operation but have not been permanently cured, and it may well be that these failures are to be attributed to the fact that the uterine ends of the Fallopian tubes, necessarily left in the pedicles when the uterine appendages are removed in the ordinary way by laparotomy, remain as sources of irritation and future trouble. We should be inclined to regard the failures rather as due to the portions of the tubes left than to the fact that the uterus remains. It is of course impossible to remove the tubes in their entire extent without removing the uterus. The book deserves the thoughtful attention of those engaged in dealing with the class of cases under consideration. So far the "vaginal radical operation" has not become, so to speak, acclimatised here, but perhaps it may become so in the future. Those who wish to try the operation will find ample directions for the purpose in the work before us. There are some ingenious diagrams at the end of the book, in which the parts removed are spread over wire frames and seem to make up, when put together, the uterus and its appendages.

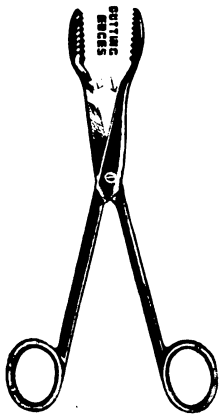
LIBRARY TABLE.

Transactions of the Iowa State Medical Society. Vol. XIV. Forty-fifth Annual Session, 1896. Desmoines, Iowa: The Kenyon Printing and Manufacturing Company. 8vo, pp. 351. —The papers read at this annual meeting of the Iowa State Medical Society were numerous and many of them were of great interest. We may especially mention a paper on Transitory Albuminuria, its Significance in relation to Life Insurance, by Dr. Jenkins of Keokuk, and a paper on the Pathology of Empyema and Hydrothorax. A very important appendix contains a report of the chairman on the Section of State Medicine, in which particulars are given of all the Bills connected with medical subjects which were passed during the preceding year by the State Legislature; the most interesting of these is one which is directed against the neglect of parents in cases of ophthalmia neonatorum. We must add a word in praise of the excellent manner in which the volume has been printed.

Statistical Tables of the Patients under Treatment in the Wards of St. Bartholomew's Hospital during 1896. By the Medical Registrars: JAMES CALVERT, M.D., F.R.C.P. Lond., and ARCHIBALD E. GARROD, M.D. Oxon., F.R.C.P. Lond.; and the Surgical Registrar, JAMES BERRY, B.S. Lond., F.R.C.S. Eng. London. 1897. Pp. 230.—The large amount of useful work which is done by medical and surgical registrars is often hardly appreciated at its full value and this more especially applies to the reports which are issued annually by many of the hospitals. Only those who have themselves prepared such statistical reports know how much time and trouble their preparation requires. The reports of St. Bartholomew's Hospital have usually been some of the most elaborate in London and the volume before us seems to be even more detailed than before. The medical report consists chiefly of a series of tables in which the diseases are classified according to the "nomenclature of diseases" drawn up by the Royal College of Physicians of London. In each disease, in addition to the total number of cases male and female with the results "discharged" or "died," we find the cases divided into nine classes according to age. The numbers which represent the fatal cases are in a very heavy-faced type; this is a great help in reading the tables. Following these tables is an index of the diseases and chief symptoms, with references to the volume in which the notes of each case can be found, and a similar index of the post-mortem examinations on medical cases. The Surgical Report by Mr. James Berry is even more elaborate. In addition to the tables of surgical diseases, arranged like the corresponding one in the medical section, there is a similar table of operations and each of these has an appendix in which all the important cases in each section are given in fairly full detail—for instance, the notes of a case of anthrax occupy thirteen lines of small type. Very many cases of interest are recorded, and we should have liked, had space permitted, to quote some of them, but we have said sufficient to show the very large amount of labour which the abstracting of so many cases must have entailed. The value of such tables and notes as these to anyone who is investigating the statistics and results of any disease can hardly be over-estimated.

La Cura Razionale dei Tisici e i Sanatorii. (*The Rational Treatment of Phthisis especially as conducted in Sanatoria.*) By Dr. AUSONIO ZUBIANI. Pp. xvi. and 239. Price 2 lire (1*s.* 8*d.*).—*Raggi di Röntgen e loro Pratiche Applicazioni.* (*The Roentgen Rays and their Practical Applications*) By ITALO TONTA. Pp. 160. Price 2½ lire (2*s.*). Milan: Ulrico Hoepli. 1898. These two volumes belong to the series of "manuali Hoepli" and are uniform with Dr. Rebuschini's work on the Serum Treatment of Disease which was noticed in our columns on April 30th (page 1198). We are glad to see that Dr. Zubiani recommends the treatment of phthisis by strict attention to personal hygiene, by remaining most of the day in the open air, and by plenty of appetising nutritious food. These conditions, however, can seldom be fully realised in the patient's home life. Dr. Zubiani describes the essentials of sanatoria in considerable detail and gives an account of those established in England, Germany, France, and Switzerland. Signor Tonta's treatise on the Roentgen rays is devoted mainly to their medico-chirurgical applications. It is copiously illustrated, chiefly with radiographs of fractures, dislocations, and congenital absence of bones, foreign bodies embedded in the tissues, &c., and presents in

a convenient form many interesting cases collected from the voluminous literature of the subject.



La Protection et la Santé de l'Écolier (The Protection and the Health of School Children). By Dr. C. DELVAILLE. Biarritz: A. Lamaignère. 1897. Pp. 15.—In this pamphlet Dr. Delvaille of Bayonne has printed an address delivered by him at a public meeting in Biarritz last year, an address well adapted to a popular audience and full of sound advice on matters of school hygiene. His principal object was to impress on his hearers the necessity of physical culture for the young. It is not enough that the school forms should have backs and that the class-rooms should be well ventilated and well lighted. There must be playgrounds, games should form part of the day's work, and children's temperance societies should be formed, through the medium of which a beneficial effect may even be produced on self-indulgent parents. For the last ten years Dr. Delvaille and Dr. Breucq have been engaged in the good work of sending delicate children of the poorer class in Bayonne for a month to the seaside at Ciboure-St.-Jean-de-Luz during the school holidays, the effect of which has naturally been very beneficial to their health and growth.

Elementary Physics, Practical and Theoretical (First Year's Course). By JOHN G. KERR, M.A. London: Blackie and Son. 1898. Price 1*s.* 6*d.*—This work is written to meet the requirements of the Education Department and details a series of simple experiments for the beginner; it is a valuable addition to the ordinary theoretical elementary text-book, when practical work is being rightly insisted on, in the conduct of any scientific teaching. We are glad to see the introduction of the "curve" as a convenient means of recording results in a few cases, furnishing a step to its much more extended use in more advanced work.

New Inventions.

COMBINATION SURGICAL SCISSORS AND DRESSING FORCEPS.

THE accompanying illustration shows an instrument which have found most useful and convenient in the routine work of house surgeon and dresser. It combines in one the functions of surgical scissors and dressing forceps and it may also be used as an emergency "clip" and sinus dilator. The blades of a medium-sized pair of dressing forceps (Spencer Wells' pattern) have been made broader and furnished with scissor edges between the terminals and the axis. At the same time a rib has been left on the unsharpened edges which renders the instrument usable as a small sinus dilator. It can be obtained with or without detachable blades, is easily cleaned and sterilised, and is of a convenient size for the pocket. It is exactly 5 in. in length. The fact that the number of instruments on a chatelaine may now be reduced will recommend it to nurses; and house surgeons and dressers will recognise the advantage of using a single instrument which can replace without inconvenience the necessity for carrying two. I believe the cost is little in excess of an ordinary pair of scissors. The "scissor-forceps" are manufactured by, and may be obtained from, Messrs. Reynolds and Branson of Leeds.

H. DE PAIVA B. VEALE, L.S.A. LOND.,
Late House Surgeon, Leeds General Infirmary; Resident Medical Officer, Ida Convalescent Hospital; House Physician, General Infirmary, Leeds.

DEATHS UNDER ANÆSTHETICS.

A DEATH under chloroform occurred recently at Bispham. The patient, a lad, aged sixteen years, had injured his arm at football and the resulting stiffness necessitated forcible movement under an anæsthetic and the removal of a sequestrum. The lad was apparently somewhat delicate and pale. In the evidence given before the coroner's court, according to the report which has reached us, the nurse, who, by the way, appears to have been questioned as if she were a medical man, stated that the patient did not seem to be taking the chloroform as he ought to have done. It was "sprinkled on lint at intervals" and the boy was told to count aloud. At 24 he stopped and although urged to say 25 he made no reply. The medical man drew him to the side of the bed and performed artificial respiration. In spite of this and other restorative measures he died. The chloroformist stated that he gave only 40 minims of the anæsthetic when a convulsive seizure came on. Death, he believed, was due to paralysis of the respiratory centre the result of shock and chloroform. In reply to a question why ether had not been given for the present operation, as it had been on previous occasions he said he had ether with him but decided that chloroform was safer under the circumstances; indeed, he would not have liked to have given ether. "From ether the same form of death occurred—viz., respiratory paralysis." Now unless the report before us is quite unreliable some of these statements are incomprehensible. In the first place the form of death, sudden failure of respiration and circulation, occurring after counting 24 in a patient who has had less than a drachm of chloroform, is not what usually takes place when respiratory paralysis results from a gradual overloading of the circulation with chloroform. Snow pointed out that "when chloroform vapour largely diluted with air is long continued it may cause not real asphyxia but a mode of death resembling it owing to the medulla oblongata and nerves of respiration becoming over-narcotised." One of two causes seem to have been instrumental in this case—fear, or too strong a vapour suddenly taken in and paralysing the heart. The youth had counted to 24 and then expired. Snow recorded at least 4 cases in which death suddenly occurred, although insensibility had not previously shown itself. Reading the evidence it appears that throughout the administration the anæsthetic was badly taken; probably the breath was held; possibly too strong a vapour was presented to the patient. It does not appear what reasons decided the administrator to condemn ether and select chloroform. The report itself seems to show not only no reason to select the less safe narcotic, but rather to contra-indicate its use. It is clearly an error to speak of the mode of death under ether as being on a parity with that under chloroform when referring to a young patient devoid of obstructive lung disease. Even the commonly accepted fallacy that a more profound narcosis and greater muscular relaxation are obtained under chloroform is not alleged as influencing the choice of anæsthetic in this case. We cannot but wish that the real properties and limitations of ether were better understood. In the report of the next case we are informed that ether or the A.C.E. mixture could not have been given for the kind of operation performed. The operation appears to have been one for hæmorrhoids! The fact that the patient was "fat and flabby" possibly made the anæsthetist anxious to avoid venous congestion and struggling such as may occur in such people when the ether is not well taken. The patient was a woman, aged twenty-seven years. Chloroform to the extent of 2 drachms was given (?) by the open method when the woman died. She struggled "very much indeed" when the anæsthetic was being administered. It seems more than probable that an overdose was inhaled during the struggles. Birmingham has to report another fatality under chloroform. The patient, a child aged ten years, was admitted into the General Hospital to undergo an operation for removal of post-nasal adenoid growths. Chloroform was given by an experienced anæsthetist and the operation was rapidly performed. The child was recovering from the anæsthetic at the time of the operation and death was believed to be due to shock reacting upon a nervous system incompletely protected by full anæsthesia. Respiration was noticed for one and a half minutes after the circulation had become imperceptible. The coroner in this case urged the necessity of fully advising parents before giving their children an anæsthetic. We concur with the recommendation.

THE LANCET.

LONDON: SATURDAY, JUNE 25, 1898.

HOWEVER political opinions may differ as to the merits of the Workmen's Compensation Act, 1897, there can be no doubt that it is one of the most interesting experiments in modern legislation. None will quarrel with the great underlying principle of the measure that the workman of our country should be in some way safeguarded against the perils of his employment, even against those which obviously arise from his own fault and carelessness. The Act comes into force before our next issue and it becomes the duty of the Home Office, which is primarily answerable both for the Act and the administration of it, to take all necessary steps to ensure its impartial application in individual cases. Though every endeavour has been made by the authors of the Act to reduce the chances and the cost of litigation to working men and to their employers, it may be pretty confidently predicted that the measure will have the effect of giving much new employment to lawyers, for no perfection of the drafting art has ever yet succeeded in making an Act of Parliament so plain as not to admit of differences of reading and dubieties of application.

It is a feature—and a somewhat novel feature—of this Act that those who administer it will require in many contingencies the assistance of sound medical advice. Without this assistance to their judgment the unfairness and mischief likely to be wrought by the Act would more than justify all that has been said against it by its severest critics. Therefore it is not remarkable that the Home Office has been at considerable pains to explain in its memorandum the duties of the medical referees whom it intends to appoint under the Act, the qualifications which it regards as indispensable, the remuneration which it proposes to give for such services, and the views which it holds in reference to the nature and dignity of them. We have already published the Memorandum of Sir MATTHEW WHITE RIDLEY[1] and in a later issue we have commented on it, but our readers will do well to study it for themselves. The subject is so important that we make no excuse for recurring to it. The medical profession has always maintained that in legal procedures it would be well if medical evidence could be divested of all appearance of partisanship. In the case of the Act now under discussion and of the appointments under it this principle is to prevail. The medical referee is not to be examined as a witness in the first instance. He is to be consulted at their discretion by the judges and the arbitrators. He is to advise them, to make a written report to them of cases which they refer to him, and to answer questions propounded by them. His position will be that of an assessor, an *amicus curiæ*. It will be judicial and within its own range authoritative. We need not point out that the creation of a number of appointments the holders of which will be placed in such a position is a matter of serious consequence to the profession at large. Such a use of medical knowledge has been too long delayed, but everything points to the conclusion that in the future it will be more and more common as the complexity of social and political problems involving medical elements increases. This Act not only creates new appointments, but it involves a new appreciation of medical science, knowledge, and experience, and as such is one of the greatest interest to a profession which has too long been inadequately used in courts of justice. The profession will do well to use its influence in promoting the appointment of suitable men for such functions and in according to them, when appointed, the respect due to their office. The questions in the decision of which the medical referees will have to assist will be by no means easy and novel points of law and legal bearing may be involved. The greatest care will have to be taken at first to avoid, on the one hand, too much dogmatism and on the other too much ambiguity. But with care and the selection of good men these difficulties will be surmounted and the medical profession will assist the legal in making the Act work well, not only for the workmen whose interests are primarily involved, but for the industry which gives them employment and the State prosperity.

The fees seem at first sight reasonable, but they are not too liberal for the services required and may have to be revised. The Memorandum of the Home Secretary evidently contemplates the appointment of men of high standing and with experience of hospital, and especially of surgical, work. There can be but one opinion as to the necessity of appointing men whose authority and judgment will be respected by their neighbours and by the profession. Such are not necessarily or in every case men of consulting or hospital rank. The country abounds in general practitioners of skill and experience and reputation whose judgment would be respected by the profession and the public alike. We therefore hope that no hard-and-fast line will be laid down which will exclude such men from the appointments. But the Home Secretary may be assured of the support of the profession in making only such appointments as will bear criticism. We shall look to the working of this system with much interest. It would be sanguine to expect no errors. To give exact decisions upon the disabling effects in the present and future of all injuries to workmen in the complicated industries of the United Kingdom—for the Act is to apply throughout—will be a task of profound difficulty. But there will be the more credit to the profession in discharging it successfully.

THE inquest recently held at Longton concerning the death of MARY ANNE POOLE has served to accentuate the widespread feeling of suspicion and unrest in connexion with perils known to attend the manufacture of pottery ware. The deceased succumbed to epileptiform convulsions—of that there can be no doubt; but the all-important issue placed before the jury was not the proximate but the primary cause of death. The medical evidence was too equivocal to warrant other than an open verdict. We do

[1] THE LANCET, April 23rd, 1898 p. 1137.

not suggest that it could have been different under the exclusive circumstances in which the practitioner conducted his investigations. The inquiry was adjourned for the purpose of enabling a post-mortem examination to be made in order that the question of "lead poisoning" might be determined—a most desirable procedure. But the only means—a chemical analysis—by which the doubt could with any certainty be dispelled was utterly ignored. The practitioner to whom the coroner issued his order was not in the least to blame for this, since his instructions did not include this particular method of inquiry.

It was alleged that the deceased had suffered from symptoms of plumbism and that her mother had died from epilepsy the result of chronic lead poisoning. In each case it was suggested that the metal had gained access to the system through the respiratory tract. The alternative theories as to the cause of the epileptiform convulsions placed before the jury were (1) lead poisoning; (2) hereditary epilepsy; and (3) exposure to cold. The last although admitted as a possible explanation may for practical purposes be excluded on the ground of its extreme improbability. The question of heredity was based on the assumption that the mother of the deceased was the subject of true epilepsy, whereas, as before mentioned, there appeared to be strong grounds for the popular belief that she also had fallen a victim to the insidious poison. But supposing this belief had no certain foundation in fact it was an additional incentive to exhaustive inquiry. How deeply the public mind has been exercised with regard to the dangers to which pottery workers are exposed is shown by the discussion which took place at the special meeting of the North Staffordshire Chamber of Commerce and by the interpellation in the House of Commons. We regret to find that, instead of a common desire being evinced to arrive at the absolute truth as to the degree—the existence cannot be questioned—of the perils to which the employés in the industry under consideration are exposed, there seems to be a spirit of antagonism which on the one hand leans to unmeasured distrust and condemnation and on the other to a tendency to ignore or minimise what is a source of danger to the public health. It is difficult to repress a feeling that commercial enterprise and profit have been preferred to the well-being of the country. In response to questions put to him Sir MATTHEW WHITE RIDLEY admitted that the report of the certifying surgeon contained matter which he deemed it inexpedient to disclose. It needs no great stretch of the imagination to idealise a state of affairs startlingly disquieting.

To the suggestion that the Home Secretary should order the body of MARY ANNE POOLE to be exhumed in order that the matters in dispute might be cleared up by an exhaustive chemical analysis there comes the reply that such a procedure is without precedent inasmuch as there is no allegation of illegal practices. Such an argument, to our minds, is too much encircled with red-tape. Surely a possible danger to the health of hundreds of operatives and to the lives of many is sufficient reason that no stone should be left unturned which might help to prove the unreasonableness or not of deep and widespread alarm. The conditions under which pottery operatives work and the effects of the operations concerned have already been thoroughly gone into and reported upon by Mr. ASQUITH'S committee, appointed in 1893, and it is the duty of the Government to take measures for the protection of the workers in this industry. It will be a lasting reproach to our independence if juries are compelled for want of available assistance to return open verdicts when a definite presentment is within reasonable reach, as we affirm it was in the case of the deceased woman POOLE.

THE recent case of death from phosphorus poisoning of a girl employed in a match factory has again drawn medical attention to the risks run by persons employed in that occupation. Numerous efforts have been made to minimise such dangers and considerable success has been obtained. The manufacturers assert that they do all that science suggests to render the work as little dangerous as possible, but as long as the present processes are continued certain risk must be encountered. There is a large demand for matches which may be struck upon any roughened surface and such matches cannot be made without the poisonous yellow phosphorus. Many of the foremost chemists in Europe have tried for years to make a match which shall answer the demand without yellow phosphorus, but they have failed, and so far as is at present known yellow phosphorus is absolutely necessary in the manufacture of "strike anywhere" matches. These statements made in the press by the managing director of Messrs. BRYANT and MAY emanate from an interested source, but they are none the less true. The substitution of the amorphous for the yellow phosphorus in the manufacture of matches by machinery in strictly confined spaces whence little or no fumes could escape would go far to avert the evil. In our Paris Letter in THE LANCET of March 13th, 1897, attention was drawn to the discussion which had taken place in the Academy of Medicine of Paris and to the hygienic conditions which it is desirable to impose upon the manufacture of matches. Among the conclusions arrived at were the following: "The suppression of the use of white phosphorus is the only certain way of insuring health to the workers in this manufacture. ..... The present unhealthiness can be diminished by thorough ventilation, short shifts for those men working in the dangerous shops, careful selection of healthy hands, and periodical medical inspection, with power to prohibit the labour, either for a time or altogether, of anyone with lesions of the mouth or whose general health is impaired." These latter points are usually lost sight of and in justice to the employers it must be pointed out that the employed can greatly lessen the dangers to which they are liable by attention to their own health.

It is not yet possible to say definitely how phosphorus fumes act upon the bones in this deadly manner, but WEGNER[1] demonstrated that necrosis of bone could be produced by the action of the fumes of phosphorus, consisting chiefly of the tetroxide, we believe, in those portions from which the periosteum had been removed. Hence, it is suggested that this explains the peculiar liability of the

[1] Virchow's Archiv, 1872.

jaw to become affected in those persons working with phosphorus. The fumes may enter a carious cavity in a tooth and so reach the periosteal membrane. It is by reason of such knowledge that regulations are formed for the dismissal from match factories of operatives suffering from bad teeth. But care of the denture of the operatives is not the only or a sufficient precaution to be taken. Strict attention, too, should be directed to the general health and none but persons who are to all intents and purposes physically sound should be employed. Personal cleanliness is of the first importance. The hands of the employés should be carefully washed before meals which should be taken outside the factory. The recent special rules issued by Dr. WHITELEGGE, the Chief Inspector of Factories, for the regulation of pottery works, lay great stress upon this point.

"The occupier" (of the factory), runs one rule, "shall provide and maintain sufficient and suitable washing conveniences for all persons employed in the places and processes named in Rule I., as near as is practicable to the places in which such persons are employed. The washing conveniences shall comprise soap, nail-brushes, and towels, and at least one lavatory basin for every five persons employed as above, and each such basin shall be fitted with wastepipe and have a constant supply of water laid on by tap."

Such regulations as these should be the rule of every factory where the fumes or dust produced in the course of trade are deleterious to human life.

The foregoing remarks will convey to our readers little or nothing that is not known to them, but we make no excuse on this score, for when the public are greatly excited it is necessary that the medical profession should have the simple facts ready to hand in case they should be called on to bear part in a controversy. There is at the present time no known method of making "strike anywhere" matches without danger to the operatives, *yet the public will have these matches.* The Belgian Government have offered a premium of 50,000 francs to the inventor of a paste for matches which will be free from poisonous phosphorus and which will ignite on cloth or any other surface, but no one has come forward to claim the prize. Until such a discovery is forthcoming the employers, supported by the workers, must take every precaution to employ only healthy hands and the hands must coöperate with their masters. It is only by mutual efforts that harm can be warded off. A last word. In spite of recent events we cannot believe that we need warn certifying surgeons as a body against connivance in the suppression of notification to the Home Office. Such suppression cannot be common, nor is it credible that any class of medical men will be found lightly to bear false witness at inquests or to tell lies upon death certificates.

SOUTH DEVON AND EAST CORNWALL HOSPITAL, PLYMOUTH.—It is proposed by the subscribers of the South Devon and East Cornwall Hospital, Plymouth, to have the portrait of their chairman, Sir Massey Lopes, Bart., who is now approaching his eightieth birthday, painted and placed in the board-room of this institution. Sir Massey Lopes has been a most munificent supporter of this charity, having given about £16,000 to the funds, and having only recently erected and partially endowed a beautiful chapel for the hospital.

Annotations.

"Ne quid nimis."

HOSPITALS AND HOMES FOR SICK AND DISABLED SOLDIERS.

THE question of making some provision for soldiers disabled by sickness and wounds by the establishment of convalescent homes to which men discharged from military hospitals might proceed, instead of being dependent upon the rates and relegated to workhouse infirmaries, has of late not only been a good deal written about, but it has been made a subject of discussion in the House of Commons. Notice has already been given by Captain Norton that he will again raise the question when the debate on the Army Estimates takes place. The matter is a really important one, and the *Morning Post* deserves credit for having called attention to it. It is a subject which has hitherto been neglected, but it nevertheless cannot be denied that it falls to the duty of the State to look after its discharged soldiers and sailors, and it would certainly be very politic in its own interest that it should do so, considering that the British Army is not raised by conscription but is a voluntary service army. In order to give a practical aim to our remarks we may indicate the directions in which something more is required than is done at present and the way in which it might be set about. As everybody knows who has had any personal experience of sickness a sick man does not regain his health and strength all at once nor does he easily do so—if the illness has been at all a severe one—in the wards or grounds of a hospital. He is not, moreover, immediately fit to return to his ordinary work on recovery or during convalescence. In the case of a soldier he remains in hospital until he is supposed to be cured and he is usually put upon some light and easy duty or is granted sick furlough at the recommendation of the medical officer when he goes out. In many cases this practically works very well, but in some it does not or does not go far enough. Much, of course, depends upon the nature and duration of the illness. What is wanted is that sick and convalescent soldiers should, in suitable cases, have an opportunity of enjoying a change of air and scene either in the immediate vicinity or at a neighbouring seaport or country garrison in connexion with some local military hospital, convalescent establishment, or barracks, and there should also be more facilities than exist at present for sending suitable cases of sickness from one locality to another. Provision might be made for accommodating sufferers or convalescents from pulmonary diseases, for example, on the South Coast, the Isle of Wight, or at Shorncliffe or Aldershot camp, and a separate block of buildings in connexion with existing hospitals or barracks at those stations might, we think, be erected for the purpose. There is no reason why the additional sick accommodation provided in this way should not lead to a reduction of the established rate of hospital accommodation by being included in, and reckoned as part of it. As regards soldiers invalided from the army on account of serious, incurable, or chronic diseases or the effects of injuries the matter is one of larger dimensions and presents more difficulties; but we think that a plan might be devised by the coöperation of the civil population with the Government. If the localisation or territorial scheme were really and properly carried out there should be no difficulty, for it would surely be a matter of pride and patriotism for one county or district to vie with another in taking care of the sick and wounded soldiers who belonged to regiments and corps with the military deeds and traditions of which the local population were so closely interested

and associated. The Government should in any case furnish a given amount of the accommodation, and this could be supplemented to the necessary extent by institutions and refuges provided from private funds subscribed by the civil population. A practicable scheme could, we think, be initiated and worked out, and it seems clear to us that something of the kind will have to be done.

THE NEW MEDICAL SCHOOLS AT CAMBRIDGE.

THE Regius Professor of Medicine has issued a further appeal for subscriptions or donations towards the building fund for providing new medical schools. It is only too well known that owing to agricultural depression the funds of the University have of late years fallen very low. The medical school of Cambridge is one of the best in the world, but, to quote the Vice-Chancellor, is "the worst housed medical school in England." To assist it is not a matter merely of local importance but may almost be described as national, for the more that is known about pathology, therapeutics, and, above all, hygiene, the better for the nation at large and the greater the saving by means of the greater health of the people. The Senate has granted a site and there only remains to find money for the building. A sum of £20,000 is required, not surely a very large one for the wealthy of this country to provide. It is, of course, for Cambridge men to bestir themselves in the first instance and already a fair amount has been subscribed. Sir Reginald Hanson has given £100 on condition that nine other non-medical graduates do the like and the Mercers' Company has given £1050. Subscriptions or donations may be paid by instalments during 1898–1901 inclusive to the University treasurer, Mr. F. Whitting, King's College, Cambridge.

RECTAL ASPIRATION.

IN the *Gazette Médicale de Paris*, May 28th, 1898, Dr. Marcel Baudouin has published an extraordinary case—the second on record—of rectal aspiration, or, as he terms it, *pétomanie*. He published the first case in the *Semaine Médicale*, April 20th, 1892. The subject was a man who could first aspirate by the anus and then expel air or liquid in large quantities. He was in the habit of giving public exhibitions of his powers. The second case was that of a married woman, aged about thirty years, the mother of five children. For a long time she had noticed the facility with which she expelled gas from the large intestine and, thinking that she was affected with some malady, she confided her troubles to a friend who had attended some of the exhibitions just mentioned. The latter assured her that instead of disease she had a fortune—in her abdomen! Accordingly she attended the exhibitions and soon learned enough to embark on this strange profession. Having aspirated a large quantity of air into the intestine she expelled it, producing characteristic sounds of various tones and intensities in imitation of laughing, whistling, the quacking of a duck, &c. These sounds were no doubt due to a power acquired over the anal muscles similar to that over the laryngeal. She introduced into the anus a cannula connected with a tube having a receptacle at the other end into which was placed a lighted cigarette. The cigarette burnt brightly when she aspirated; the smoke was driven out in a cloud when she expelled the air. But her powers appear to have been inferior to those of her model, to which even the *Temps* devoted an article. He could imitate the sound of cannon, musketry, thunder, the violin, the trombone, and the human voice; and he could even sing in this extraordinary way! However, there is nothing new under the sun, for in the writings of St. Augustine there is a description of these very powers. How is the aspiration of the air performed? Dr. Baudouin observed that with closed glottis the man made a strong inspiratory effort, attended by great depression of the abdominal wall and of the supra-clavicular regions. Negative pressure would be thus produced in the abdomen, which would be enlarged by the elevation of the lower ribs and by the upward movement of the diaphragm towards the thorax. Dr. Baudouin describes the auxiliary muscles of inspiration and probably the diaphragm as assisting in the action. The latter supposition cannot be correct. Contraction of the diaphragm would prevent, not assist, the action. With the inspiratory effort there must be, we should think, relaxation of the sphincter ani. M. Baudouin compares this abnormal power to that possessed by certain individuals over the muscles of the external ear. But a much closer parallel is furnished by cases described by Dr. John Wyllie in the Edinburgh Hospital Reports, 1895, of neurotic individuals who acquired the power of creating by muscular action negative pressure in the œsophagus, and thus sucked air into the stomach. In THE LANCET, of Aug. 1st, 1896, Dr. G. A. Sutherland published a remarkable case of this kind. The power of swallowing air possessed by one of Barnum's "freaks," who could rapidly pass from the appearance of emaciation to corpulency, to which we referred in THE LANCET of Feb. 12th, 1898, may also be mentioned. But if the air was really swallowed and not aspirated the action is of a different kind and is distinguished by Dr. Wyllie from air sucking.

THE BRADFIELD PLAY.

AT Bradfield College on June 21st occurred the first performance of the Greek play, now become quite an institution there owing to the energies of the Warden, Dr. Gray. It is difficult to know whether we should praise more the artistic merits of the production or the qualities of organisation by which an intellectual entertainment is provided both for the school and the public without in any way interrupting the drier and more necessary educational curriculum. Parents, and there are such, who are apt to look askance at dramatic entertainments of all kinds, suspecting interference with lawful studies, should know that all rehearsals are conducted on half-holidays and no extras are permitted. The spectacle of the *Antigone*, performed in the beautiful open-air theatre with such archæological exactness as modern scholarship and the conditions of modern art allow, cannot fail to rouse interest even in the dull, and to the public so hospitably admitted it has given as much pleasure as to the clever youths and masters at Bradfield. The boys will look back in after life with something like gratitude to Dr. Gray for giving them an impetus to the study of Greek literature which no imposition or parsing can ever succeed in doing. It would be ungracious to cavil at a performance so generally excellent in intention and achievement. There was, however, a certain lack of unity in the rendering. Greek tragedy should be regarded more as the stately liturgy of a dead religion than the primitive beginning of what passes for modern drama. The curious convention of the chorus constantly reminds us how impossible it is to effect any reconciliation with the classical and modern stage, and those who appreciated the scrupulous care with which the other conventions were adhered to regretted that no boys could be found to take the parts of Antigone and Ismene. The introduction of talented ladies into the cast deprives these productions of their essential characteristics, though we believe Cambridge is responsible for the unclassical precedent. Mr. J. H. Vince gave a really striking interpretation of the part of King Creon and Mr. T. B. Layton as second messenger both in gesture and voice showed an archaic restraint which was beyond all praise. Mr. S. T. Sheppard, the Tiresias, marred the dignity of his part and his excellent elocution by keeping his body bent to give the

illusion of old age—a trifling with realism which was quite out of place. Mr. H. H. Pigott as the Coryphæus led his chorus with enormous skill and wisely abstained from all facial expression which in the absence of masks is both satisfactory and convincing.

ARMY MEDICAL APPOINTMENTS IN THE WEST AFRICAN SERVICE.

IN connexion with the examination of candidates for thirty-nine commissions in the Army Medical Staff, which it is announced in our advertisement columns will be held at the Examination Hall, Victoria Embankment, W.C., on Aug. 5th next and following days, we are asked to point out that appointments in the West African Service are again open. Applications for admission to the competition should be made in writing to the Director-General of the Army Medical Department, 18, Victoria-street, London, S.W. The list will be closed on July 27th.

STREET NOISES.

THE Local Government and Taxation Committee of the London County Council has drawn up a series of by-laws under the Local Government Act, 1888, and the Municipal Corporations Act, 1892, one of which is as follows: "No person shall in any street or public place, for the purpose of hawking, selling, or distributing any article, shout or make other loud noise in such a manner as to cause nuisance or annoyance to residents or passengers, or to persons occupying shops, warehouses, or offices. Provided that this by-law shall not apply to costermongers if and so long as by virtue of the Metropolitan Streets Act (Amendment Act, 1897) they are exempted from the operation of Section 6 of the Metropolitan Streets Act, 1867." The by-laws in question were to be submitted to the council at its meeting on June 21st, but their consideration was deferred until the next meeting of the Council.

THE PROSECUTION OF JOHN HAMILTON, M.D. NEW YORK.

JOHN HAMILTON of Bedford-avenue, Tottenham-court-road, appeared on June 17th before Mr. Lushington in answer to two summonses charging him with falsely pretending to and using the title of Doctor of Medicine, he being an unregistered practitioner. Mr. Muir Mackenzie prosecuted on behalf of the General Medical Council. Mr. Morton Smith defended. A medical student gave evidence that he visited the defendant at the above address and paid him two guineas for medicine. There was a brass plate on the door with the words, "John Hamilton, M.D. New York." Mr. Mackenzie argued on decided cases that the fact that the defendant held a diploma granted in another country did not entitle him to practise as an M.D. in England, but Mr. Smith said the defendant had never described himself as other than he was and pointed out that two previous prosecutions against him had failed. Mr. Lushington dismissed the summons, saying that there was no evidence to show that the defendant had used this title with intent to deceive and allowing the defence £3 3*s.* costs. We have quoted the *Times* report of the case almost verbally, which doubtless represents accurately its essential points. The General Medical Council will not be encouraged by such a result to continue the prosecution of such gentlemen as "John Hamilton, M.D. New York." It does not follow, however, that the Council is not right in having instituted such a prosecution. For one thing, it will satisfy those members of the Council who are anxious that the Council should wage war against all questionable uses of medical titles which are not registrable. Then, it is further very important that the present meaning of the law should be ascertained by actual prosecutions even if they are occasionally unsuccessful. How else is the Council to found a claim which must some day be made to have the law amended and fortified for the protection of the public? Certainly it does not seem to have been proved in this case that the title M.D. was ever used without the source of it being indicated. This is a weak spot in the prosecution and one which differentiates it from other cases in which the prosecution succeeded.

THE DENTAL HOSPITAL OF LONDON.

THE annual report of this hospital which has been recently issued shows that the work connected with the building of the new hospital is progressing surely if slowly. The delay has been due to two causes—namely, the complicated arrangements necessary in the interior of the hospital itself and the difficulties encountered in complying with the demands of the various authorities. The estimates for the new building have, we understand, been received from the builders and are now under the consideration of the trustees and the committee, so that in the near future we may hear that the actual work of building has commenced. The demand on all dental hospitals is bound to increase by rapid strides through the increased importance rightly placed by the public on the value of teeth; in the case of the Dental Hospital of London the building at present in existence is quite unfitted to meet all the calls made upon it and the new building is an absolute necessity. It is satisfactory to find from the report that the expenses of the management are more than met by donations and annual subscriptions. Funds are, however, urgently needed for the building fund. A perusal of the list of subscribers shows strikingly the somewhat scanty support which the institution receives from the public and the liberal aid which it receives from the dental profession.

MEDICAL JOURNALISM AND MEDICAL LIBRARIES.

IN a paper read before the American Medical Editors' Association at the meeting held in Denver on June 6th Dr. G. M. Gould outlined a plan which will commend itself to most of us—in fact, to all who feel an interest in the diffusion of medical knowledge. It is practically impossible for any individual to possess more than a mere fraction of what is continually being published and the difficulty of the case is increased by the circumstance that communications of permanent value are unavoidably associated with much that is of merely passing interest. In this field of action, however, as in many others, a combination of workers can accomplish what it would be hopeless for an individual to attempt. Dr. Gould's proposal is that public medical libraries shall be founded in every large community, so that the local practitioners may have easy access to the best reference books and to current periodicals. Such libraries would have a most beneficial influence on the intellectual life of the profession, enabling practitioners who have rare or difficult cases to compare their observations with those published by their colleagues elsewhere and encouraging them in their turn to give their results to the world for the information of others. Of course, libraries, like most human institutions, vary both in degree and in kind, but surely Dr. Gould fixes his standard of excellence very much too high when he asserts that there are not half-a-dozen good medical libraries in the United States, a country with 100,000 medical graduates and a population of 70,000,000. It is generally understood that there are in the States more than half-a-dozen centres of medical education possessing good libraries, whilst the vast collection in the Surgeon-General's library at Washington is a theme of admiration for book-lovers everywhere. The first step in the realisation

of Dr. Gould's idea will be the formation of an exchange to receive medical books and periodicals from all sources by gift or purchase and to distribute them to the members of the Association of Medical Librarians. Dr. Gould has such confidence in the ultimate success of his project that he has offered in the meantime to superintend the work for the executive committee of the association.

THE UNITED HOSPITALS ATHLETIC SPORTS.

THE annual meeting of the United Hospitals Athletic Sports will be held at Stamford Bridge on the afternoon of Saturday, July 9th, Mr. Edmund Owen being president for the year. It is hoped that there will be a good attendance, as it seems quite an open question as to which hospital will have the good fortune to secure the shield. At present this shield is at St. Mary's Hospital. A team is coming to visit London this year from Dublin University to compete with the United Hospitals team on Wednesday, July 13th. Mr. J. G. Turner, dental surgeon to St. Thomas's Hospital and treasurer of the United Hospitals Athletic Club, is working hard to render these meetings a success, and both he and the honorary secretary, Mr. C. I. Graham, of St. Mary's Hospital, will be glad to furnish information to anyone applying.

MIDWIVES AT HUDDERSFIELD.

IN his report just issued the medical officer of health of Huddersfield, Mr. E. G. Annis, refers to five cases of puerperal fever of which he received notification.

"I have investigated each of these cases," he says, "and one generally finds that the patient has been attended by a midwife, who in about a week's time or, when the patient is practically *in extremis*, calls in a medical man who has very little opportunity to do anything save give a certificate of death. In these cases I visit the midwife's home, and generally the conditions there found are absolutely indescribable. Evidences of neglect, dirt, filth, and a general squalid condition abound; in fact, it is to my mind a great wonder, and shows the great power of resistance possessed by the human organism that there are not many more cases of puerperal fever, especially considering the large amount of midwifery practice carried on by these women. I have asked all the medical men in Huddersfield to kindly supply me with the numbers of the confinements attended by them during the last year or two, and I would here tender them my best thanks for the information so obtained, and I find that roughly one-half of the children born in Huddersfield are cases attended by midwives and the other half by medical men. It certainly seems to me absolutely necessary that there should be some sort of supervision over this class of practitioners in order, among other things, to ensure that their own homes are kept in as cleanly a condition as possible."

Few will be disposed to question the conclusion of Mr. Annis that some check should be placed upon the practice of midwifery by women of the type described.

CHRONIC HYDRARTHROSIS OF SMALL JOINTS.

AT a meeting of the Société Médicale des Hôpitaux on May 27th Dr. Galliard and M. Bernard showed a patient, aged thirty-nine years, who seven years ago had suffered from generalised subacute rheumatism which soon gave place to a condition of tenderness and pain in the joints. For three years she had noticed that certain joints were swollen. The wrists and the metacarpo-phalangeal and proximal phalangeal joints were swollen and fluctuating but without redness of the skin. There was no appreciable change in the bones or cartilages or any deformity. Movements were limited and sometimes painful. Aspiration of the joints gave exit to a yellowish viscid fluid. The other joints appeared normal except that there were some swelling at the left external malleolus and crackling of the knee-joints. Dr. Galliard and M. Bernard claimed this as a form of chronic rheumatism not previously recognised. But they did not refer to what appears to have been a factor in the disease—the occupation of the patient. She worked as a steam embroiderer and had constantly to make traction with her hands flexed. We have seen one case similar to the above in which, however, the disease was more limited, affecting only some of the proximal phalangeal joints, which, however, were the most severely affected in this case. Here the only cause which could be traced was the patient's occupation. She exposed her hands to heat and had to hold her fingers in a cramped position whilst soldering tins. Admitting fully the great importance of constitutional tendencies in these cases, surely occupations which can cause disease in other tissues must at times play some part in the production of joint affections. But such an influence is often overlooked.

THE HOSPITAL FOR EPILEPSY AND PARALYSIS.

AT the annual meeting of the supporters of this hospital held on June 13th a very serious state of matters was disclosed. The lease of the present premises expires early in 1900 and the trustees of the property decline to renew the lease. Canon Duckworth, who was in the chair, mentioned another unfortunate circumstance. There had been every reason to believe that under the will of Mrs. Armitage the hospital would receive a bequest of £4000. But it was with regret that he had to announce that it had recently been found that the amount at the late Mrs. Armitage's disposal was quite insufficient to provide for all the bequests. Hence the nucleus of the new building Trust would be only £2000 instead of £6000 as was hoped for. Sir Owen Tudor Burne pointed out that through no fault of anybody concerned the ground would be literally cut from under the feet of the hospital, which, unless some £15,000 to £20,000 could be raised in less than two years, would be in a position which might be described as "homeless, houseless, and helpless." The committee deserve every sympathy in their need.

THE ABUSE OF MEDICAL CHARITY IN NEW YORK.

AT the National Conference of Charities and Correction, a notice of which by our New York correspondent has already appeared in THE LANCET (June 4th, page 1570), Dr. Frederick Holme Wiggin read an interesting historical sketch of the recent movement to restrict the abuse of medical charity in New York. He said that it had been inaugurated about eighteen months ago by Dr. Stephen Smith, recently president of the Department of Charities, and Dr. Landon Carter Gray, then president of the Medical Society of the County of New York, who showed that the ratio of those applying for medical aid had risen from 16 per cent. in 1860 to about 49 per cent. in 1895. A committee of the County Medical Society, consisting of gentlemen connected not only with the general medical profession, but with the larger teaching faculties in the city, was charged with the duty of investigating the abuse and was soon reinforced by representatives of a similar committee appointed by the New York County Medical Association. Inquiry showed that the managers of all the dispensaries in the city would not voluntarily agree to any general reform, their attitude being clearly presented in the report made to the Legislature last January by the State Board of Charities, which says that they "apparently are not and have never been in a temper to come to some mutual understanding whereby better conditions shall prevail. In a large degree and for various reasons they have become competitors in business to such an extent that it is probable that nearly half of the inhabitants of New York are now receiving practically free medical treatment." Eventually the New

York State Medical Association, the Medical Society of the County of New York, the New York County Medical Association, and seven other medical societies endorsed the plan of appealing to the Legislature to limit the abuse of medical charity and in the legislative session of 1898 a Bill was introduced which among other provisions constituted it a misdemeanour to obtain relief from dispensaries by false representations and gave the State Board of Charities control over dispensaries by empowering it to grant licences to such as in its judgment would be for the public benefit. At first the Bill met with scarcely any opposition, but when it was favourably reported by the Committee on Public Health of the Senate, to which it had been referred, such vigorous protests were made that both the friends and the opponents of the measure were heard before the Senate and Assembly Committee on Public Health. After full arguments on both sides the Senate Committee reported the Bill favourably to the Senate, which passed it with only two negative votes, but the Public Health Committee of the Assembly failed to report the measure to the Assembly, although energetic efforts were made by its friends to secure a favourable report. The measure was therefore smothered in committee and failed to become law.

THE REPORT OF THE PETROLEUM COMMITTEE.

IT is premature yet to say what decision will be precisely arrived at by this committee, two draft reports having, according to the *Times*, been submitted — one by the chairman (Mr. Jesse Collings) and the other by Mr. Ure. The impression is, however, that Mr. Collings's report will with slight amendment be accepted. The recommendations in this report are almost exactly in a line with those drawn up by THE LANCET Analytical and Sanitary Commission on Dangerous Paraffin Lamps, the report of which was published in THE LANCET of Jan 4th, 1896. It is stated that Mr. Collings proposes to deal exclusively with the structure of lamps, but that Mr. Ure insists upon the flash-point being raised. We hope to deal at length in an early issue with the final conclusions of the committee. In the meantime we may express our satisfaction that the views which we published on this important question over two years ago are in practical agreement with the findings of a Select Committee of the House of Commons which has been sitting for several years.

"ONLY A PAUPER."

THE question of the nursing arrangements at the workhouse infirmaries has frequently been brought before the public by means of inquests held upon the bodies of inmates, the evidence often showing the utterly inadequate character of the attendance. In many instances the patients have to wait upon one another or an infirm pauper alone is told to look after the ward. On June 10th Dr. Danford Thomas held an inquest concerning the death of a man, aged seventy-seven years, whose death took place at the Marylebone Infirmary Workhouse, Gray's Inn-road, on June 5th. The evidence showed that the deceased had been an inmate of the workhouse for some years. Owing to the reconstruction of the Marylebone Workhouse the guardians some three years ago rented the old Holborn Workhouse, Gray's-inn-road, as a temporary resort to which they sent some of their inmates, including the deceased. On June 4th the porter noticed that the deceased appeared to be weak and feeble and told him to go to the sick ward. He did so and died there the next morning. Another of the inmates, aged sixty-three years, stated that he was an inmate of the workhouse and was in charge of the sick ward night and day and slept there, and there was no nurse over him. He further stated that the medicine was given to the patients by the porter, who also attended to the door and to the inmates having their meals. The jury returned a verdict of "Death from natural causes" and added a "strong recommendation that a proper trained nurse should be appointed to attend to the sick." Similar cases are constantly occurring and the verdict is generally the same. We are of opinion that it is expressed in terms far too mild. The guardians are responsible for the lives of the paupers so far as suitable medical attendance and nursing can cure or relieve disease, but to leave a whole ward of patients in sole charge of a man, aged sixty-three years, who was, so far as the evidence showed, without any training, is a matter for the gravest censure. Guardians are oftentimes remiss in their care of sick paupers. Had such neglect been discovered in an ordinary hospital the authorities would rightly have been deemed to be incapable of managing an asylum for the sick, yet such gross negligence on the part of the guardians is simply met with "a strong recommendation for a trained nurse," rather than with a formal and severe censure. In some infirmaries, no doubt, the nursing is everything that can be desired, but in others it is the reverse.

LARGE NUMBER OF FOREIGN BODIES IN THE STOMACH: GASTROTOMY.

IN the *Journal of the American Medical Association*, March 5th, 1898, Dr. A. H. Meisenbach has published the case of a man, aged twenty-two years, terming himself "the human ostrich," who had for nine years followed the "profession" of swallowing glass, metal, &c. He suffered no discomfort until the end of that period when he complained of pain in the stomach. Whilst standing a mass of about the size of the hand could be felt in the umbilical and hypogastric regions which could be raised and which descended with an impulse. When recumbent as he turned from his back on either side the mass moved towards that side. A skiagram showed a shadow in the umbilical region. Gastrotomy was performed and 118 articles, besides about an ounce of broken glass, weighing in all 1 lb., were removed. The articles were: 27 staples, 15 screws (1 in. and 1½ in.), 52 nails (2 in. and 1½ in.), 21 cartridges, 2 pocket-knife blades, and 2 inches of brass chain. The patient recovered but an attack of pneumonia of the right base followed the operation. Dr. Meisenbach attributes this to the x rays, to which the patient had been exposed on several occasions for long periods. X rays dermatitis is now well known and deep-seated injury has also been claimed as an effect. Dr. Sorel, a French surgeon, has already asserted that pneumonia can be produced by the rays; other writers mention periostitis. The retention for such a long period of this extraordinary collection of foreign bodies in the stomach without injury and even without symptoms is remarkable.

DEATHS IN CHILD-BIRTH.

AT a meeting of the Royal Statistical Society held on June 21st at the Royal United Service Institution, Mr. T. A. Coghlan, the Government Statistician of New South Wales, read a paper on "Deaths in Child-birth" which was of considerable interest to the medical profession. He drew the data for his paper mainly from an analysis of the deaths and births registered in New South Wales during a period of four years (1893–96 inclusive), though some of his deductions were taken from only the last three years. During these three years there were 115,669 confinements in the colony and the births caused the deaths of the mothers in 813 instances. As difficulty is always experienced in obtaining full and accurate particulars in regard to the confinements of unmarried women the statistics furnished in the paper generally excluded the 9920 confinements of the

unmarried and noticed only the 105,749 confinements of married women. In his first table Mr. Coghlan dealt with the mortality in consecutive confinements up to the twenty-third confinement, of which there were two in the colony during the period under review, though the figures beyond the twelfth or thirteenth confinement were so attenuated as to be practically valueless. From the data thus collected a corrected statement of the probability of death during each confinement was reached. It was shown that the risk attending the first birth is greater than that at any subsequent confinement up to the ninth and that the increase in risk in subsequent confinements may be due to the increased age of the mother and not to a loss of vitality arising from the number of previous confinements. The statistics of first confinements at various ages were examined with the aid of a diagram and from them it appeared that the risk attendant upon a first birth is at a minimum at the ages of twenty-two and twenty-three years. After five years more this risk increases rather rapidly with age.

THE SMOKE NUISANCE.

THE London County Council has authorised its General Purposes Committee to prosecute through the police in cases of smoke nuisance in the County of London with regard to which the local authorities have failed to take action. This is as it should be, but the first case which has been heard since the decision has not given a result calculated to reassure those who are anxious for the purity of the London atmosphere. On June 22nd the Metropolitan Electric Supply Company was summoned at Bow-street for not complying with a magisterial order calling upon them to abate a nuisance caused by black smoke. The counsel for the defence argued that the company could not get smokeless coal and that to prevent smoke with the coal which they were obliged to use they would have to reconstruct their furnaces. Sir James Vaughan said that he was satisfied that the company had done all in their power to mitigate the nuisance and he marked the summons "No conviction." We cannot agree with this judgment. The Public Health Act says nothing about smokeless coal, but it does say that a court may dismiss a summons if it is satisfied that the fireplace or furnace is constructed in such a manner as to consume as far as practicable all smoke arising therefrom. The defendant company admitted that in this case they would have to reconstruct their furnaces, so apparently the furnaces were originally built on the supposition that smokeless coal could always be got—an utopian idea. It is no defence that because only smoky coal can be got a company may foul the atmosphere and bring about a nuisance, albeit a legal one.

THE "REPRESSION" OF TUBERCULOSIS.

A WELL attended meeting of prominent members of the profession took place by invitation at the house of Sir William Broadbent on Wednesday last. The meeting had been called to consider the advisability of inaugurating a movement to disseminate knowledge concerning tuberculosis and its prevention and also the provision of sanatoria for the open-air treatment of tuberculous lung disease. Sir William Broadbent was in the chair and he briefly stated the objects in view. He read a letter from the President of the Royal College of Physicians of London expressing approval of the project and suggesting lines of work. Dr. Corfield, Mr. Malcolm Morris, Mr. Shirley Murphy, Dr. Isambard Owen, Dr. J. Pollock, Dr. Ransome, Dr. H. Weber, and others spoke; and resolutions were passed (1) expressing the desirability of forming a public association for the purpose stated and (2) appointing a provisional committee to take the necessary steps to start such an association. We heartily sympathise with any action which may be taken to diminish the amount of tuberculous disease, and consider that if, as no doubt will be the case, the methods of effecting this are pursued with wisdom and discretion much good will be done. The facts, as stated by Dr. Ransome, that under existing sanitary legislation the death-rate from such disease has been reduced by two-thirds and, as Mr. Shirley Murphy pointed out, that vast improvements have taken place in London habitations during the past twenty years, go far to encourage the hope that yet greater benefits will accrue when the community realise fully the preventable nature of tuberculosis and the value of pure air and food.

COTTAGE BATHS.

THE Corporation of Manchester seem still unable to see the advantage, or it might be said the necessity, of providing facilities for cleanliness for the youngest, the most helpless, the poorest, and perhaps the dirtiest section of their fellow citizens, and still hold out against the oft-renewed appeal for cottage baths. On May 17th a joint deputation from the Manchester and Salford Sanitary Association and the Ladies' Health Society waited by appointment on the Baths Committee of the corporation. It was introduced by Professor Leech, chairman of the Sanitary Association, who said they wished to renew the appeal made a year ago to the committee that they should try the experiment of establishing cottage baths in districts where the influence of the Ladies' Health Society could be brought to bear in making them popular. Miss Beard, of the Ladies' Health Society, stated that in the district which she superintended there were 3000 houses, representing a population of 15,000, and in the whole of that area there was not a single bath. Mr. T. C. Horsfall earnestly appealed to the committee to help the deputation in the matter and spoke of the unclean condition of many of the children who visited the Art Museum. Dr. Sawers Scott also addressed the committee, but in vain. The chairman, in reply, said the experiment would mean the purchase of cottages which might be thrown on the committee's hands if it should prove a failure. But with a charming *naïveté* he assured the deputation that "if the matter were undertaken by private enterprise *and proved successful* the corporation would not be slow to take over the property and establish other cottage baths in the city." Municipal poverty of idea as to fulfilling the duty of promoting the welfare of those whose suffrages have placed the members of the Baths Committee where they are could not be more clearly exhibited. It is not creditable to the corporation that this crying want should be left so long unsupplied and not even one cottage bath be available for the poor woman who finds it almost impossible in her single room to keep her infant sweet and clean, and all because "the experiment might prove a failure."

WE understand that it is arranged that the committee appointed by the General Medical Council to confer with the delegates from the Midwives Bill Committee will do so to-day (Saturday, June 25th). The delegates include Mr. J. B. Balfour, M.P., three medical members of the Midwives Bill Committee, and three members of the Association for Promoting Compulsory Registration of Midwives. The committee appointed by the General Medical Council consists of the following members: Sir Richard Thorne, Dr. Glover, Dr. MacAlister, and Sir Christopher Nixon. The conference will take place at the premises of the General Medical Council.

THE next meeting of the Neurological Society of London will be held at the rooms of the Medical Society, 11,

Chandos-street, W., on Thursday, June 30th, at 8.30 P.M., when Dr. C. E. Beevor will open a discussion on "The Accurate Localisation of Intracranial Tumours." Dr. Byrom Bramwell, Dr. Michell Clarke, Dr. Ormerod, Dr. Newton Pitt, Dr. Sharkey, and Mr. Marcus Gunn will take part in the discussion.

THE annual meeting of the Brussels Medical Graduates' Association will take place at the Café Royal, Regent-street, W., on Tuesday, July 12th, at 6.30 P.M., and will be followed by the annual dinner at 7.30 P.M. Any Brussels medical graduate desiring to be present should communicate with the honorary secretary, Dr. Major Greenwood, 243, Hackney-road, London, N.E.

THE complimentary dinner to Dr. Playfair (postponed from June 8th) will be held at the Grand Hotel on Monday, July 4th, at 7.15 P.M. Lord Lister will preside. Applications for tickets should be made not later than Thursday, June 30th, to Dr. John Phillips, 68, Brook-street, W.

DR. BEATTIE CROZIER has received information that his pension from the Civil List has been increased from £50 per annum to £100 per annum, to assist him in completing the remaining volumes of the "History of Intellectual Development."

THE foundation-stone of the Nurses' Home of Queen Charlotte's Lying-In Hospital in the Marylebone-road will be laid by Viscountess Portman on the afternoon of Wednesday, July 6th.

THE Lord Mayor visited Stone, near Dartford, Kent, on Saturday last and laid a foundation-stone for a new church to be erected in connexion with the City of London Asylum.

DR. G. E. SHUTTLEWORTH has been elected a Foreign Member of the Moscow Society of Neurology and Mental Sciences.

THE MEDICAL SERVICE OF OUR ARMY.

IN the account of the annual dinner of the Indian Medical Service which we published last week, we intimated that we intended to refer again to the speech made by Surgeon-Major-General Jameson, C.B., Director-General of the Army Medical Department, when responding to the toast of "The Sister Services." The speech, interesting in itself, is particularly interesting regarded as an expression of opinion of the value of the service and of the professional skill and bravery of the medical officers. We are therefore glad to be able to publish it at length, especially as by so doing we may make better known facts which in the opinion of the Director-General have not received adequate notice in the medical press, but which, slightly to transpose Surgeon-Major-General Jameson's words, show, "by the results of military expeditions in tropical and unhealthy climates, that the medical service of our army, including, of course, the Indian Army, is the best in the world." The following is the text of the speech:—

Sir JOSEPH FAYRER and GENTLEMEN,—"A prophet is not without honour save in his own country" is an expression which may well be applied to the department which I represent. At home the Army Medical Service is looked upon as a very ordinary affair, often subjected to adverse criticism regardless of a cause; but what do they say of us abroad, in France and Germany, for example? They say that the medical service of our army, including, of course, the Indian Army, is the best in the world, as proved by the results of military expeditions in tropical and unhealthy climates. This is a subject not much alluded to in the general press or, indeed, in the medical press, probably in ignorance of the facts. What are the facts?

Since the year 1860 we have had eighteen military expeditions the medical statistics of which have been separately recorded, and by a strange coincidence the French have had exactly the same number under circumstances somewhat similar—that is to say, in tropical or semi-tropical climates. Comparing the mortality of these eighteen French and eighteen English expeditions it will be found that the French loss from disease alone in relation to strength has been a little more than four times greater than the English. That does not represent all the difference, for we have nothing to compare with the appalling disaster of Madagascar, where the loss from disease was 30 per cent. of the entire strength. Compare that with our last expedition in Ashanti (a climate just as deadly as Madagascar), where the mortality was only 4 per cent. And yet it is reported that the sanitary and medical equipments in Madagascar were exceedingly good. What, then, was the cause of the disaster? Just this. The general officer commanding saw only one enemy—*man*—and he took no account of a far greater enemy—*disease*—and accordingly the medical and sanitary equipments, in spite of medical protest, were left at the base. The result of that was that 7 men were killed in action and 4189 men died from disease.

I shall make another contrast which at the present time may possess a particular interest. It is between the Spanish war in Cuba and our late war on the north-western frontier of India. From the end of 1895 until March, 1897 (a period of 15 months), Spain had an army in Cuba numbering 200,000 men. During that short time there died from yellow fever alone 13,322, and from other diseases, irrespective of killed and wounded, 40,125, while 20,000, or 10 per cent. of the force, were invalided to Spain. It is calculated that at the present moment only 70,000 out of the 200,000 men are now alive. In the frontier war in India the whole loss from battle and disease was only between 4 and 5 per cent. and the greatest number in hospital at the front, on the line of communications, and at the base in any one day was 11½ per cent.

When the medical history of the last war in India is written it will prove interesting reading. There were many difficulties overcome and hardships endured with the usual element of danger. A good instance of this was when General Woodhouse was wounded early in the war. A bullet struck him in the thigh, passed down below the knee, broke into pieces, and lodged. The Roentgen ray apparatus revealed the exact conditions and it was determined to extract the pieces. In the middle of the operation artificial light being used the Afridis crawled up and suddenly blazed into the tent, sending 13 shots through the canvas. Now that might have been a very disturbing circumstance and apt to interfere with the perfect application of the aseptic form of surgery. And what happened? Nothing. The operation went on and was successfully completed as if there was no Afridi within 100 miles. As usual we had many examples of great personal bravery and devotion to duty in the midst of danger. Surgeon-Captain Beyts of my service is an example. He arrested hæmorrhage under a hot fire, and Sir Wm. Lockhart speaking of the incident said that no one ever better merited the reward of the Victoria Cross than he. He got nothing; but that is another story. Another medical officer greatly distinguished himself, Surgeon-Captain Hugo of your service. The incident is so graphically described by Mr. Churchill in his book on the Malakand Field Force that I shall ask this sympathetic audience for permission to read an extract.

"Lieutenant Ford was dangerously wounded in the shoulder. The bullet cut the artery and he was bleeding to death when Surgeon-Lieutenant V. Hugo came to his aid. The fire was too hot to permit of lights being used. There was no cover of any sort. It was at the bottom of the cup. Nevertheless the surgeon struck a match at the peril of his life and examined the wound. The match went out amid a splutter of bullets which kicked up the dust all around, but by its uncertain light he saw the nature of the injury. The officer had already fainted from loss of blood. The doctor seized the artery and as no other ligature was forthcoming he remained under fire for three hours holding a man's life between his finger and thumb. When at length it seemed that the enemy had broken into the camp he picked up the still unconscious officer in his arms and without relaxing his hold bore him to a place of safety. His arm was for many hours paralysed from cramp with the effects of the exertion.

of compressing the artery. I think there are few, whatever may be their views or interests, who will not applaud this splendid act of devotion. The profession of medicine and surgery must always rank as the most noble that men can adopt. The spectacle of a doctor in action among soldiers in equal danger and with equal courage saving life where all others are taking it, allaying pain where all others are causing it, is one which must always seem glorious, whether to God or man. It is impossible to imagine any situation from which a human being might better leave this world and embark on the hazards of the unknown."

The retirement down the Bara Valley was full of dangerous incidents. It was the rear of the column that was always the part the most fiercely attacked. It was there that the wounded and the medical officers were placed, and in repelling the numerous rushes made by a fierce enemy every one had to fight for his own hand. Under such circumstances it would perhaps be difficult to differentiate between the combatants and the so-called non-combatants. If medical officers are non-combatants one might well exclaim with the Frenchman: "Que diable allait-il faire dans cette galère." The great importance of an efficient army medical service is well shown in a report lately received from an American surgeon who, writing of the War of Secession in 1862–66, said that the mortality from disease alone had been 250,000, and he expressed the opinion that had their medical service been as complete in the first three years of the war as it was in the last at least one-third of these lives would have been saved.

Gentlemen, these are facts which tend to show that even in war, paradoxical as it may appear, the preservation of life may be as important as its destruction.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.

ELECTION OF MEMBERS OF COUNCIL.

ON Thursday, July 7th, the election of members of Council will take place. Every year at least three vacancies occur, as three members retire by rotation, and it not unfrequently happens that by death more vacancies arise, but this year there are only the three regular vacancies.

The following list of the 24 members of Council gives the date at which each member retires:—

Retire in 1905: Mr. H. G. Howse, Guy's Hospital (first elected 1889), Junior Vice-President; Mr. Edmund Owen, St. Mary's Hospital; and Mr. Rickman J. Godlee, University College Hospital.

Retire in 1904: Mr. Bryant, Guy's Hospital (first elected 1880); Mr. Pickering Pick, St. George's Hospital (first elected 1888); and Mr. Davies-Colley, Guy's Hospital.

Retire in 1903: Mr. Willett, St. Bartholomew's Hospital (first elected 1887), Senior Vice-President; Mr. Butlin, St. Bartholomew's Hospital; and Mr. Treves, London Hospital.

Retire in 1902: Mr. Reginald Harrison (first elected 1886); Mr. Howard Marsh, St. Bartholomew's Hospital (first elected 1892); and Mr. J. Hardie, Royal Infirmary, Manchester.

Retire in 1901: Mr. Macnamara, Westminster Hospital; Mr. Mayo Robson, Leeds General Infirmary; and Mr. Watson Cheyne, King's College Hospital.

Retire in 1900: Sir Thomas Smith, Bart., St. Bartholomew's Hospital; Mr. J. Tweedy, University College Hospital; and Mr. Alfred Cooper.

Retire in 1899: Sir William MacCormac, Bart., St. Thomas's Hospital (first elected 1883), President; Mr. T. R. Jessop, Leeds General Infirmary; and Dr. Ward Cousins, Royal Portsmouth Hospital.

Retire in 1898: Mr. J. Langton, St. Bartholomew's Hospital; Mr. Mitchell Banks, Liverpool Royal Infirmary; and Mr. Henry Morris, Middlesex Hospital.

An analysis of these names shows that at present St. Bartholomew's Hospital has 5 representatives, Guy's Hospital has 3 representatives, University College Hospital has 2 representatives, London Hospital has 1 representative, St. Mary's Hospital has 1 representative, St. George's Hospital has 1 representative, Westminster Hospital has 1 representative, King's College Hospital has 1 representative, Middlesex Hospital has 1 representative, and St. Thomas's Hospital has 1 representative; making a total of 17. Attached to the London medical schools are 17 representatives, to the special London hospitals 2, and to the provincial hospitals 5, of which number Leeds furnishes 2, Manchester 1, Liverpool 1, and Portsmouth 1.

The approaching election will be perhaps less exciting than have been many of the recent elections. As we have pointed out above, no vacancies on the Council having occurred through death there are only 3 places to be filled at the coming election. One of the retiring members of Council, Mr. Mitchell Banks, does not intend to offer himself for re-election, but the 2 others, Mr. Langton and Mr. Henry Morris, are candidates. 3 other Fellows have come forward, Mr. Clement Lucas, of Guy's Hospital, Mr. Bennett May of Birmingham, and Mr. Richardson Cross of Clifton. We think there can be no reasonable doubt that Mr. Langton and Mr. Morris will be re-elected. They are two very distinguished surgeons, each attached to an important London medical school, and it would be a distinct loss to the Council should either not be reappointed. Thus it happens that there is practically only 1 vacancy on the Council and for this there are 3 candidates. In the present Council there are 5 provincial Fellows and 19 London Fellows, and as Mr. Mitchell Banks does not seek re-election it follows that unless a provincial Fellow is appointed there will be only 4 representatives from the provinces. It is difficult to decide exactly how many provincial representatives there should be, but it may fairly be said that 6 and 4 represent a reasonable maximum and minimum. Of the 3 candidates for this single post Mr. Clement Lucas is the only London Fellow and should the voters think that 4 provincial representatives are sufficient they could not do wrong by voting for Mr. Lucas. He has already been a candidate for a seat on the Council and at the last election he received only 34 fewer votes than the lowest successful candidate. He is connected with a large medical school, is well in touch with current medical education, and would supply to the Council a further instalment of the reforming element which is so much wanted on that body. If, on the other hand, it is felt that a provincial Fellow should replace the provincial representative who has retired, then a choice will have to be made between Mr. Bennett May and Mr. Richardson Cross. Mr. May is a well-known surgeon at Birmingham and the fact that he is unanimously supported by all the Fellows of the College in Birmingham tells greatly in his favour. He was a candidate at the last election and was only 23 votes behind the last successful candidate. Mr. Richardson Cross is a distinguished ophthalmologist and is connected with the Bristol Royal Infirmary. He would prove a decided acquisition to the Council.

THE THIRTEENTH INTERNATIONAL MEDICAL CONGRESS, PARIS.

AUG. 2ND TO AUG. 9TH, 1900.

THE next meeting of the International Medical Congress will take place in Paris during the year of the great exhibition in 1900—from Aug. 2nd to 9th. Professor Lannelongue, the well-known surgeon and a member of the Senate, has been chosen President and Dr. Chauffard (21, Rue St. Guillaume) has been appointed secretary-general. The committee of organisation has already been at work for some months and considerable progress in the arrangements, which will be on a large scale, has been made. The President of the Republic has consented to open the Congress in person, and foreign countries are being invited to join in the work.

Sir William Mac Cormac has received an official letter from the President and Secretary-General asking him to organise an English national committee if possible before Aug. 1st. They hope that England will take a large interest in the Congress which promises to be a great success. No effort will be spared by our French *confrères* to make it one and they are all the more stimulated by the great *éclat* which attended the last meeting of the Congress in Moscow. It is interesting to recall that the first International Medical Congress took place in Paris under the Presidency of Professor Bouillaud in 1867.

A meeting of those interested in the matter will, we understand, be held at some convenient time and place, to be announced shortly, in order to carry out the wishes of our French colleagues.

THE BRITISH PHARMACOPŒIA.

VI.[1]

THE ADDITIONS—(*continued*).

THESE new tinctures only are added to the British Pharmacopœia. These are the *Tinctura Ergotæ Ammoniata*, *Tinctura Quillaiæ*, and the *Tinctura Pruni Virginianæ*. To the last two we have already referred. The tincture of ergot of the old British Pharmacopœia is now omitted; it was of the same strength as the new preparation (1 in 4) which now contains 2 oz. solution of ammonia in each pint and which has a dose of from ½ to 1 drachm—i.e., double the dose given in the old Pharmacopœia for a tincture of the same strength. The addition of ammonia to the menstruum used in exhausting ergot has been found to give a much more stable and uniform result; whether this is caused by its power of dissolving out all the active principles of the drug or by its influence in precipitating some of the antagonistic complex alkaloidal bodies always present, we know not. The admission of the new tincture is a decided advantage.

Trochiscus Acidi Carbolici.—Simple as it may seem we believe that this is one of the most important and valuable additions to the list of new Galenical preparations in the British Pharmacopœia, 1898. Carbolic acid has a specific action upon the throat and palate muscles which can be obtained by no other drug; it paralyses them slightly, destroying the sensibility of the nerves in inflamed conditions and it is, moreover, a powerful antiseptic. These properties rendered a lozenge of it most desirable and it was always remarked as "surpassing strange" that the British Pharmacopœia did not contain one whilst lozenges of benzoic acid, bismuth, opium, iron, soda, &c., retained a place in the national pharmacopœia. The new trochiscus contains 1 gr. of phenol in each lozenge and it will prove of great value in the treatment of various forms of sore-throat and in suppurative and painful conditions of the gums and tongue. It has not been our desire to criticise the work of the revisers in any fault-finding spirit, upon the contrary we have rejoiced in their success at the very great improvement which they have effected in this, the first really praiseworthy attempt at reform, but we cannot congratulate them upon their action in introducing the following list of lozenges—i.e., *Trochiscus Eucalypti Gummi*, *Trochiscus Guaiaci Resinæ*, *Trochiscus Krameriæ*, and *Trochiscus Krameriæ et Cocainæ*. There are now no less than seventeen of these antiquated specimens of confectionery in the new volume. Fortunately the revisers have simplified the direction for their *manufacture*—we use the word advisedly, as they will never be prepared by the ordinary pharmaceutical chemist.

To *Unguentum Aquæ Rosæ* we have already referred. It is a substitute for the popular "cold cream" and is an elegant emollient if it be found to keep without resolving itself into its component parts, as it sometimes does.

Unguentum Capsici will be welcomed especially by all who have a leaning towards hydropathy, as this is now the official representative of the popular "chili paste" so much used at most of the hydropathic establishments. The original formula we believe recommended the use of the oleo-resin of capsicum (United States Pharmacopœia), but the new ointment seems to meet all requirements; it is of the strength of about 1 in 5 and will prove a valuable rubefacient.

Unguentum Cocainæ is a 5 per cent. ointment of the alkaloid dissolved in oleic acid and lard. It was required, and is a valuable addition to high-class pharmacy as well as an agent certain to be prized by the physician or surgeon who is called upon to treat painful affections especially in the neighbourhood of the junction of skin and mucous membranes as about the anus and vulva. Its anæsthetic action will be much more uniform and prolonged than that of a watery solution of the drug.

Unguentum Hydrargyri Oleatis has already been referred to under Hydrargyri Oleas. *Unguentum Hydrargyri Oxidi Flavi* is introduced as a substitute or representative of the celebrated Pagenstecher's ointment. The revisers have shown their sound judgment in making the new ointment of the strength of about only 10 gr. to 1 oz., though the original ointment was made by rubbing up 30 gr. with 1 oz. vaseline. This preparation may be substituted for the popular "Golden" ointment made with the red precipitate of mercury. It is very efficacious in most chronic inflammatory conditions of the eyelids and may be used with great advantage in many forms of conjunctivitis. We would, however, recommend the practitioner when prescribing this or any other similar eye ointment to slightly vary the official strength so that the dispensing chemist will feel himself compelled to make up the preparation afresh and not fill it out of a pot which contains the ointment made up in bulk. We give this advice because the preparation of eye ointments especially requires laborious trituration and can only (when not made by complicated machinery) be well made in small quantities at a time. It is a good practice for the prescriber to add the words (underlined) *tere bene* in the subscription of his recipe. If the trituration be not most carefully performed the particles of the yellow oxide will act like an irritant when applied to the conjunctiva. The British Pharmacopœia directions for making this ointment, which is seldom used except for ophthalmic purposes, are summed up in the word "mix."

Unguentum Paraffini is simply a mixture of three parts of hard paraffin with seven parts of vaseline and is introduced as a basis for other ointments. The British Pharmacopœia directs that when paraffin ointment is used as a basis of white ointments it should be prepared with the white variety of soft paraffin or vaseline and when used in coloured ointments it should be prepared with the yellow variety. It also makes a noteworthy departure in the directions following the process by stating that "the proportions of hard and soft paraffins in paraffin ointment may be modified to meet the exigencies of climate and prevailing temperature." This is very nice, but we expect that no two chemists will agree about these exigencies and that patients will be furnished with a little variety when travelling about or when compelled to get their recipes filled up by a new chemist, but no harm can otherwise come of the little latitude given to the dispenser.

It remains for us to notice some of the new Galenical preparations of the British Pharmacopœia belonging to drugs which were already official.

Extractum Belladonnæ Liquidum.—Though this preparation is chiefly of pharmaceutical interest it cannot fail to be of importance to the practitioner of medicine, since its introduction marks the first step in what must prove to be a sweeping change in the vegetable materia medica. This change was first suggested by Barclay a few years ago and there can be no doubt about the wisdom of the revisers in acting upon it. The old green extract of belladonna was, and, we regret to say, still is, an official preparation of very variable composition and strength owing to the insuperable difficulties in effecting its standardisation. There are now in addition to the folia, radix, and succus eight preparations of belladonna in the new British Pharmacopœia. All these with the single exception of this variable old green extract are now standardised preparations made to contain definite and unvarying percentages of the alkaloids of belladonna root. This uniformity and accuracy is obtained by the introduction of the preparation now under notice; from it all the other preparations of belladonna are made. It is standardised to contain 0·75 per cent. alkaloids and is prepared by percolating belladonna root with alcohol and finally finishing the process when the liquid is made to contain ½ gr. of alkaloids in every 110 minims. From it the following Galenical preparations are made—i.e., extractum belladonnæ alcoholicum (1 per cent. alkaloids); emplastrum belladonnæ (0·5 per cent. alkaloids); linimentum belladonnæ (0·38 per cent. alkaloids); suppositoria belladonnæ (⅕ gr. alkaloids in each); tinctura belladonnæ (from 0·048 to 0·052 per cent. alkaloids); and unguentum belladonnæ (0·6 per cent. alkaloids). It will thus be seen that this new liquid extract is one of the most important preparations in the Pharmacopœia and should receive the attention of every practitioner prescribing belladonna. We would, however, caution about one fallacy in prescribing belladonna which is likely to arise from an arithmetical study of these preparations. The practitioner must not compute the therapeutic action of these Galenicals

[1] Articles I., II., III., IV., and V. were published in THE LANCET of April 16th and 23rd, May 7th and 28th, and June 18th, 1898, respectively.

in units of atropine. It is essential to have preparations of definite alkaloidal strengths, but it must be remembered that their doses must not be calculated upon the basis of the atropine dosage. Binz states that recent investigation shows that good belladonna root does not contain any atropine but merely *hyoscyamine*, which by the action of alkalies or prolonged heating is converted into atropine. It is thus of vital importance that all the preparations of the root of belladonna be prepared from this liquid extract. It remains for the practical therapeutist at the bedside to determine the exact dosage and action of the belladonna Galenicals by patient and numerous observations, commencing with the doses of the Pharmacopœia.

Extractum Ipecacuanhæ Liquidum.—This, like the previous liquid, is a valuable addition, and though it is chiefly of pharmaceutical interest it should receive the attention of the prescriber because of its influence upon the dosage. The old vinum ipecacuanhæ was made by first preparing a *dry* extract of the root and then macerating it in sherry; the result was not satisfactory. The prolonged heating necessitated by the evaporation to complete dryness spoiled to a certain extent the alkaloidal richness of the wine, and we believe that the new wine will be more active and more uniform though the doses remain nearly as before. It is made by mixing 1 oz. of liquid extract of ipecacuanha with 19 oz. of sherry. The liquid extract is standardised to contain from 2 gr. to 2¼ gr. *alkaloid* in 110 minims. Cephaeline is also contained in ipecacuanha and it is a stronger alkaloid than emetine. Probably we may have these alkaloids separated, as suggested by Wilde, and the emetine alone retained for Galenical preparations of ipecacuanha in some future edition of the British Pharmacopœia.

Extractum Jaborandi Liquidum.—This preparation does not appear to be of any interest to the practitioner and there does not seem to be any reason for its introduction since we have a powerful tincture 1 in 5. Its presence in almost identical form in the American Pharmacopœia probably suggested to the revisers that it should be included in the British Pharmacopœia.

Extractum Nucis Vomicæ Liquidum.—This liquid extract is introduced for the same reasons as have caused the introduction of the liquid extract of ipecacuanha. Formerly, in making the tincture of nux vomica the semi-solid extract after being standardised was dissolved in alcohol and water, but now the introduction of this liquid does away to a certain extent with the danger of deteriorating its virtues by prolonged evaporation as the standardised liquid extract is simply dissolved in alcohol and water. An important change is thus introduced into the tincture—i.e., from being standardised to contain 1 gr. *total alkaloids* in 1 oz. it is now made to represent ¼ gr. *strychnine* in 110 minims, and the dose is slightly reduced—i.e., from 5 to 15 minims. This tincture must be altered in the next revision. It gives a precipitate with water which is most undesirable in a liquid containing strychnine when dispensed in prescriptions; moreover, there is no necessity for such precipitation. We sincerely hope that few of the new Galenical preparations will be found open to objections like this. Every new compound should be made and experimented with for long periods before becoming officially honoured.

Extractum Strophanthi.—As already stated in a former article this is a valuable addition. Its composition is, however, a debatable one. The extract is made in the ordinary way and then milk sugar is added so that every ounce of the strophanthus seeds is to make 2 oz. of the extract. This makes the new extract a dry powder or *abstract*. These abstracts were numerous in a comparatively recent edition of the Pharmacopœia of the United States, but they have since been rejected, as altogether unsatisfactory, from the American Pharmacopœia, a fact no doubt well known to the British Pharmacopœia revisers, who have, it is to be hoped, tested the keeping qualities of this extract and those of physostigma.

NEWPORT (MON.).—It is stated that the total expenditure up to the present on the Wentwood Waterworks undertaking for the Newport Corporation amounts to £118,740. The works are yet very far from completion.—The Parliamentary Committee of Newport Borough Council recommend the purchase for £5350 of a site near Caerleon which consists of 53 acres, for the new Borough Lunatic Asylum.

THE ROYAL COMMISSION ON THE METROPOLITAN WATER-SUPPLY.

THE twenty-sixth sitting of the Royal Commissioners was held on June 20th at the Guildhall, Westminster. The Commissioners present were the Chairman (Lord Llandaff), the Right Hon. J. W. Mellor, Mr. De Bock Porter, and Major-General Scott.

The first part of the sitting was occupied in hearing the evidence of Mr. William Chambers Leete, Vestry clerk to the parish of Kensington, and of Mr. John Collins, a member of the Whitechapel District Board of Works. The examination of these witnesses was concluded. After the adjournment for luncheon Mr. Littler, Q.C., Chairman of the Middlesex County Council, whose evidence was taken at a previous sitting, was cross-examined by Mr. Balfour Browne on behalf of the London County Council.

Mr. LEETE, in answer to the Chairman, said that the parish of St. Mary Abbotts, Kensington, comprises an area of 2245 acres, contains 22,000 inhabited houses, a population of 170,000, and has a rateable value of £2,107,894. The Kensington vestry had during recent years considered the question of the water-supply of the metropolis in connexion with the various Bills which had been promoted by the London County Council and had on more than one occasion expressed their disapproval of the purchase of the water companies' undertakings by the London County Council. The vestry favoured an alternative policy—namely, the promotion of legislation for the creation of a central body representing the ratepayers of the whole of "Water London," and that this body should be vested on behalf of the water consumers with powers of control and of supervision over the undertakings of the water companies. On Jan. 16th, 1895, the vestry passed the following resolution:—

That it is inexpedient, in the opinion of this vestry, that any further steps should be taken for promoting the passage of the Bills through Parliament having for their object the purchase of the water companies' properties by the Council and thus incurring expenditure which may ultimately prove useless in addition to that already incurred, but the vestry fully recognises the absolute necessity of there being some form of control and supervision by a representative body over the sources of supply from which London water is now and may in future have to be derived, and is prepared to give its support to any well-considered public measure having that object in view.

On May 8th, 1895, the following resolution was passed:—

That in the opinion of the vestry it is desirable that legislation should be promoted which shall have the effect of bringing the undertakings of the water companies which now supply the metropolis under the supervision and inspection, with powers of regulation, of a central body representing the ratepayers, by which in return for the rights conferred on the companies and without hampering their operations within the area of supply of each, the systems of distribution may be rendered thoroughly efficient in all weathers and universally intercommunicating.

The witness pointed out that the object of the resolutions was to obtain for representatives of the ratepayers such control and supervision for the whole of the water-supply of the metropolis as would without the necessity of purchasing the undertakings give to the consumers large statutory powers and a directing influence in regard to all schemes for the extension of the supply in future as well as for the due regulation of the system and manner of distribution, such as Parliament has imposed on similar private undertakings in times more recent than those at which the original Acts were passed in favour of the existing metropolitan water companies. With regard to the powers of levying water rents at present possessed by the companies the witness said that the vestry felt that there were anomalies which should be dealt with by Parliament. The attention of the vestry had been directed to a question which had arisen between the owner of some small stables and one of the water companies. The complaint arose out of the statutory powers possessed by the Grand Junction Waterworks Company. It appeared that the stables and two rooms over them were assessed at £8 a year: the amount paid for water both for stables and domestic use had been 19*s*. a year under an agreement made with the company by the occupant. The company sought to increase the charge to £2 14*s* a year. Objection to this was taken by the owner and the company threatened under their powers to require that the water should be supplied to this particular stable and to two small stables adjoining by meter. The company had statutory power to charge for 100,000 gallons per annum as the minimum quantity at the rate of 9*d*. per 1000

gallons, and at this rate the charge would have been even higher than that which the company had proposed. The points raised were whether it was reasonable that the water company should have power (*a*) to charge for domestic supply in the case of a stable when the water used for the horses and vehicles forms a distinct item in the demand upon the full rateable value of the hereditament, and (*b*) failing agreement as between the company and the ratepayer to require that the supply shall be by meter, looking to the power of the company to charge for 100,000 gallons per annum as the minimum quantity at 9*d*. per 1000 gallons. The vestry considered the statements submitted to them and came to the conclusion that the Metropolis Water Act of 1897 would not enable them to obtain any relief in this case. It was, however, thought that the facts did betray an anomaly as regards the charges which the Grand Junction Company were empowered to levy under their Waterworks Act of 1852 (15 & 16 Vict. c. 157), and they were of opinion that, if exercised to the full, the provisions of this Act would undoubtedly be a serious matter for many of the ratepayers within the area of supply of this company. The vestry had therefore communicated with the Secretary of State for the Home Department calling attention to this anomaly and urging the Government to consider the expediency of further legislation dealing with this and other charges which the water companies had power to levy. A statement of this case was sent to other local authorities in order to obtain their opinion with regard to the matter, and the answers received showed that these authorities agreed with the Kensington vestry in advising legislation on the subject. With regard to the power at present possessed by the water companies to cut off the supply from occupied houses the vestry as the sanitary authority were strongly of opinion that this power should no longer exist. They felt that it was not right that the companies should merely as a coercive measure for securing payment of the water rent be allowed to create what might be a dangerous nuisance. The vestry wished to call the attention of the Commissioners to the fact that the first report of the Royal Commission appointed in 1884 to inquire into the housing of the working classes contained a recommendation to the effect that the water companies should be prevented from cutting off the water supply from an inhabited house.

Mr. PEMBER, on behalf of the water companies, and Mr. CRIPPS, the Parliamentary agent of the London County Council, on behalf of that body, cross-examined the witness. The cross-examination referred chiefly to the question of the equalisation of water-rents, and the witness pointed out that although the amount levied on the rateable value was less in the Kensington district than in some other parts of London yet the amount paid for water per gallon was probably more. The water-rents were levied on the rateable value, and the witness gave a striking example of what had occurred in his own case. When he moved from Highbury to Kensington he took a house of about the same size and used about the same amount of water, but he had to pay about 50 per cent. more for it because the rateable value of the new house at Kensington was higher than that of the one he left at Highbury. The present charges must be admitted to be anomalous, but the anomaly would certainly not be done away with simply by basing the water rents on the rateable value of houses throughout London, and this the witness's own case conclusively proved.

Mr. JOHN COLLINS, in answer to the CHAIRMAN, said that he was a member of the board of works of the Whitechapel district. He was by trade a basket-maker and his wife carried on a laundry business. Towards the end of the year 1895 he suffered from a short supply of water and was subjected to much inconvenience. In the month of July, 1896, the supply of water was again deficient and he and his neighbours were greatly inconvenienced. He first referred to the turncock of the East London Water Company which supplied the district in which he lived. He was told that the water could only be supplied in that neighbourhood for two hours a day. The witness then went to the office of the company and tendered the amount of his water rent up to Christmas, 1896, because the regulations of the company were that the money should be paid in advance. The clerk after some demur accepted the money and gave him a receipt. The witness then asked to see the manager and was taken to an inner office to make his representation. He produced his receipt for water-rate, and said that he required to have a proper supply of water, that he had paid for it, that his business as a laundryman was suffering from his not being able to obtain a supply, and that, as a matter of fact, his business was at a standstill for want of water. The evidence of the witness was taken down at the office, and he was promised that the matter should be attended to. On the following day water was supplied for about two hours only. The witness was inconvenienced in his business, and on the following day therefore he went to the Worship-street police-court and made an application to Mr. Cluer for the purpose of obtaining a summons. The witness's case was that the company, although refusing to supply him as an ordinary customer, yet still supplied other customers who took water by meter. Mr. Cluer advised the witness that his remedy was by a civil action against the company. The witness, however, felt that his means would not allow him to go to the expense of a civil suit. A few days after this event the East London Waterworks Company distributed a notice to say that the water-supply would be continued for six hours during the day. The conditions of that notice were not complied with; a supply of about two hours twice a day was given and that supply was not sufficient for the business purposes of the witness.

In answer to Mr. DE BOCK PORTER the witness said that some people in the district had for a time refused to pay their water rents to the company. The company had made no abatement in their charges in consequence of the inadequacy of the supply which they had given. Water in Whitechapel was so scarce that the witness had known people give ½*d*. or 1*d*. a pail for it. At the same time supplies were given by meter to those customers who took it by measure. On July 30th, 1896, a special meeting of the Whitechapel District Board of Works was held. At that meeting the following resolution was passed:—

> That this board feel strongly the serious crisis through which this district is passing owing to the renewed breakdown of the East London Water Company to fulfil its legal and moral obligations to the inhabitants, that pressing representation be made to the Government and the London County Council forthwith, urging immediate action to secure a competitive supply or to take over the whole supply of London by a body directly representative of the ratepayers.

A deputation was appointed by the board to wait on the East London Water Company and urge on them the necessity of increasing the domestic supply. The deputation was received on Aug. 7th, 1896, and explanations were given by the secretary of the company, who promised that more standpipes should be put up in the district and that the hours of supply should be extended as much as possible. Shortly afterwards a notice was issued by the East London Water Company that storage cisterns must be fixed to all supplies as required by the "company's Acts of Parliament." The witness said that the cisterns which were formerly in use had been removed in consequence of the sanitary requirements of the district and that all the houses were upon the constant service system. The notice issued by the company that cisterns should be supplied throughout the district would have entailed an enormous expense and was, in fact, practically impossible. The witness visited the premises of many people who, like himself, complained of the inadequacy of the water-supply, and he had satisfied himself of the justice of the complaints which had been made both by inspecting the houses and by hearing the evidence of the inhabitants who complained. The scarcity of water continued for some little time during the autumn of 1896 and the supply given came in some instances as early as six o'clock in the morning, and the water thus supplied could not under ordinary circumstances be utilised. The witness had suffered much from the want of water and had at the wish of his constituents taken a prominent part in inquiring about the details of the water famine. The witness, therefore, was well known to the East London Water Company, and they had since shown considerable anxiety that no possible waste could take place on his premises, which they had constantly inspected since the occurrence of the events which he had related.

In answer to the CHAIRMAN the witness said that he did not know whether the Whitechapel District Board of Works had communicated with the London County Council with regard to the water famine, but they had not received any help from that body.

The CHAIRMAN pointed out that as he read the Act of 1871 it was in the power of the Whitechapel District Board of Works to prosecute the company and he could not understand why they had not done so.

In answer to Major-General SCOTT the witness said that

he was not aware of the provisions of the Metropolitan Water Act of 1897 and the witness was glad to have his attention called to it. He said that it had not been brought to the attention of his board.

In answer to Mr. PEMBER the witness stated that the notice with regard to the shortness of the supply was not issued by the company until some days after the supply had failed.

Mr. LITTLER, Q.C., said that since he had given his evidence he had received a letter from the Willesden Urban District Council stating that that body did not agree with the views he had expressed, but that they were in favour of the water companies being vested in one central authority or trust.

Mr. BALFOUR BROWNE, Q.C., on behalf of the London County Council, asked Mr. Littler whether the views he had expressed as chairman of the Middlesex County Council agreed with the views which he intended to lay before the Commissioners on behalf of the Kent Water Company which he represented as counsel.

In reply the witness said that as counsel for the Kent Company he should express the views of his clients, for which they were responsible. In his character as chairman of the Middlesex County Council and as a private individual he was not in favour of a water trust, he was not in favour of purchase, and he did not wish to answer questions about control. He did not agree with the form of control which had been suggested by Sir John Lubbock. He had no method of control to suggest. An honourable and gallant member of the Commission knew much more about the question than he did. He was in favour of using the water of the Thames so long as that could be done without injuring the navigation of the river. He thought that a sufficient supply of water by right belonged to the county of Middlesex, which was, in his opinion, entitled to the "first drink" of the water before it was used for the supply of the counties below. The witness objected to any new wells being sunk in Middlesex for the supply of other districts and contended that the water from such wells should belong to that county. He was in favour of the present statutory control of the dividends of the companies. The witness was of opinion that if purchase did not take place and it ever became necessary for the companies to spend money in obtaining water from a new source they would undoubtedly spend it rather than lose the valuable privileges which they possessed. He did not, however, think it would be necessary to go to a new source.

In answer to Lord ROBERT CECIL, who appeared for the Hertfordshire County Council, the witness said that in his opinion if the outside authorities were supplied with water in bulk by the London County Council the outlying districts would undoubtedly suffer first in the case of scarcity of water.

The next sitting will be held on Monday, June 27th.

THE REBUILDING OF UNIVERSITY COLLEGE HOSPITAL.

IT will be within the recollection of our readers that last year Sir J. Blundell Maple made a noble gift of £100,000 to University College Hospital for the purpose of re-building the hospital. The property at the back of the existing hospital was immediately acquired at a cost of £30,000 and a site being thus provided it has been decided to make a start with the rebuilding.

On Tuesday, June 21st, the foundation-stone was laid in the presence of a large company by H.R.H. the Prince of Wales. Among those present were the following members of the Reception Committee:—The Duke of Bedford (President of the hospital), Lord Reay, G.C.S.I., LL.D. (President of University College), Lord Monkswell (treasurer of the hospital), Mr. Henry Lucas (chairman of the hospital committee), Sir J. Blundell Maple, Bart., M.P., the Bishop of London, Mr. J. F. Rotton, LL.B., Q.C., Mr. A. Prevost, Sir George Young, Bart., Captain H. M. Jessel, M.P., Dr. C. J. Hare, Dr. H. Charlton Bastian, F.R.S., Sir John Williams, Bart., M.D., Sir Henry Thompson, F.R.C.S., Mr. S. J. Hutchinson, Mr. Rickman J. Godlee (dean of the medical faculty of University College), Dr. Sydney Ringer, F.R.S. (senior physician to the hospital), Mr. Christopher Heath (senior surgeon to the hospital), Dr. G. Vivian Poore, and Mr. Newton H. Nixon (secretary to the hospital).

Among the general public might have been seen the Duchess of Bedford, Lady Reay, Lady Maple, Mrs. Henry Lucas, Sir G. and Lady Faudel-Phillips, Sir Douglas and Lady Galton, Sir Samuel Montagu, Bart., M.P., and Lady Montagu, Sir Savile and Lady Crossley, Lady Jessel, Lady Russell Reynolds, Sir James Peile, K.C.S.I., and Lady Peile, Lord Lister, P.R.S., Sir Wm. Mac Cormac, P.R.C.S., Sir Henry Burdett, K.C.B., Professor W. Corfield, M.D., Dr. W. J. Collins, L.C.C., Mr. Victor Horsley, F.R.S., Professor Wm. Ramsay, F.R.S., Sir Wm. Roberts, the Chief Rabbi (Dr. Hermann Adler), Dr. J. Rose Bradford, F.R.S., Dr. Thomas Barlow, and Professor A. Kennedy, F.R.S.

A temporary auditorium had been erected, where the invited guests assembled at 3.15 P.M. Fine weather happily prevailed and an unusually brilliant amount of colour was provided, not only by the dresses of the ladies present, but also by the gowns and hoods of a large number of Doctors, Masters, and Bachelors of various Universities who were present in academical dress, conspicuous among them being Dr. Fleming in the brilliant scarlet and gold-coloured gown and hood of a D.Sc. of the University of London. The ceremony was timed to commence at 3.45 P.M., and during the half-hour of waiting the visitors were entertained by a selection of music by the band of the Scots Guards.

Their Royal Highnesses the Prince and Princess of Wales arrived with their accustomed punctuality, and being ushered on to the platform the Duke of Bedford thanked the Prince on behalf of the governors of the hospital for his presence, and called upon Mr. Henry Lucas to make a short statement in reference to the rebuilding of the hospital.

Mr. HENRY LUCAS, after giving a short history of the progress of the hospital since 1833 and stating the need for rebuilding, said that three or four years ago the rebuilding fund had reached a sufficient amount to justify the committee in making a beginning and they requested Mr. Waterhouse to prepare a design for a new hospital. After much consideration and consultation between Mr. Waterhouse and the hospital and medical committees the design which is now to be carried out was adopted, which provides for a hospital to contain about 290 beds, with ample accommodation for out-patients and nurses and for the means of clinical instruction. Complete isolation of every ward from every other part of the hospital will also be secured in the new hospital—an idea emanating from Dr. Poore, "who has," said Mr. Lucas, "for many years given much attention to the subject and to whom the committee are much indebted for his many valuable suggestions in reference to the new hospital." The amount of the rebuilding fund was, however, not large enough to allow of more than a small portion of the new hospital being built at first, and the committee had no hope of its completion until after the lapse of an indefinitely long period. They were then agreeably startled by the splendidly generous proposal of Sir J. Blundell Maple to build the new hospital entirely at his own expense. It was trusted that the whole of the new building would now be completed within three or four years, and be an institution of lasting benefit to the poor and the means of development of the great school of medicine associated with University College.

The PRINCE OF WALES, in reply, said:—"The needy of this locality should indeed be thankful that Sir J. Blundell Maple, who has shown himself so anxious to promote their welfare, is living in their midst. No such magnificent gift for the sick poor of London has, I believe, been made since Thomas Guy established the hospital which bears his name. The prosperous will, I trust, practically mark their appreciation of his generosity by their liberal support of the hospital he is building, and contribute to allay the sufferings of the sick and indigent. I beg subscribers to consider that all general collections for hospitals ought to be regarded as supplements to, and not substitutes for, local subscriptions. Of the utility and the important requirements which the University College meets there can be no doubt. In its immediate vicinity there exists a large population of the labouring classes, many of whom have difficulty, even when they are in full work, in maintaining themselves and their families. When incapacitated by illness or accident it is impossible for them to provide themselves with the means of medical relief. I would point out how valuable are the resources of the hospital when grave accidents occur

in connexion with the three large railway companies—the North-Western, the Great Northern, and the Midland—which all have their London stations within a short distance of a place where the sufferers can obtain immediate relief. Let me say a few words on the incalculable value of the hospital as a school of medicine. Several thousands of its graduates are putting in practice in various parts of the world the lessons they learned at this institution. Many students have risen to great distinction in their profession and foremost among these I am proud to reckon my old friend Sir William Jenner, who is universally recognised as one of the most eminent men of the nineteenth century. I am sure you will unreservedly agree with me that the new building will increase in an immense degree the benefits derived from this hospital. The additional accommodation for the patients and the material improvements in the medical, surgical, and nursing arrangements, as well as in various details of administration, commend themselves to the approval of all who have studied the question. In all the advantages which I have enumerated the medical school will fully participate. When the new building is completed the training of the pupils will be carried on under far more favourable circumstances than hitherto, and by continuing to study the treatment of patients according to the newest improvements, regulated by the most modern science, the students cannot fail to acquire a practical knowledge advantageous to themselves and ultimately to the higher benefit of the general public."

Sir J. BLUNDELL MAPLE then requested His Royal Highness to lay the stone, which was duly done "In the name of the Father, the Son, and the Holy Ghost."

The stone bore the following inscription:—

THIS STONE WAS LAID BY
HIS ROYAL HIGHNESS
ALBERT EDWARD PRINCE OF WALES, K.G.,
Vice-Patron of the University College Hospital,
On TUESDAY, JUNE 21st, 1898,
AS A MEMORIAL OF THE REBUILDING OF THIS HOSPITAL THROUGH THE GENEROSITY OF SIR J. BLUNDELL MAPLE, BART., M.P.

Under the stone was a jar containing a copy of the current *Times*, the annual report of the hospital for 1897, and a programme of the proceedings.

The choir of St. Pancras Church having sung a hymn, the Lord Bishop of London recited the Lord's Prayer and an appropriate collect, after which he gave the Benediction. The proceedings terminated with the singing of the National Anthem.

QUEEN'S BIRTHDAY CELEBRATIONS AT TAMPA BAY, FLORIDA.

WE have received the following letter from a correspondent dated May 29th, 1898:—

"One of the most pleasing functions took place on the 24th inst., one familiar to most Britishers in their own country, but coming as a most agreeable surprise to those of the English-speaking race who are staying at the headquarters of the army here in Florida. The Tampa Bay Hotel was quite *en fête* to celebrate the seventy-ninth birthday of our beloved Queen. The upper end of the palatial dining-room was draped with the two stirring emblems of the Anglo-Saxon race, the British Union Jack being folded cross-wise and leaning towards the American Stars and Stripes. Beneath the folds of the two flags sat the distinguished President, Colonel A. A. Wiley of Montgomery, the Governor of the State of Alabama. On his left was the Commander-in-Chief of the Military Staff here, Major-General Shafter. At the entrance of the hall was placed an immense framework in the form of a crown tastefully decorated with red, white, and blue flowers, which was universally admired. On one side of the President's table was placed the large body of war correspondents, and on the right the military officers serving under the popular general and the naval officers of the gunboats in the port. The body of the immense hall was filled with the visitors and civilians of the town. Before each guest was placed a ménu card, on the top of which was printed in colours the crossed flags with the motto below, "Blood is Thicker than Water."

The band struck up "God Save the Queen," which is identical with the American air, "My Country, 'tis of thee," followed by the "Star-Spangled Banner." The banquet, at which an address was delivered on the Unification of the English-speaking People, will be long remembered by those who were privileged to take part in it. Surgeon A. E. Wynter, M.R.C.S. Eng., L.R.C.P. Lond., 2nd Division U.S. Army Corps, responded to the toast of "Her Britannic Majesty, Victoria, Queen of England and Empress of India, the greatest ruler of the greatest government in the most marvellous century of the world's history."

VITAL STATISTICS.

HEALTH OF ENGLISH TOWNS.

IN thirty-three of the largest English towns 6752 births and 3167 deaths were registered during the week ending June 18th. The annual rate of mortality in these towns, which had increased in the four preceding weeks from 16·4 to 16·9 per 1000, declined again last week to 14·7. In London the rate was 13·8 per 1000, while it averaged 15·3 in the thirty-two provincial towns. The lowest rates in these towns were 8·5 in Cardiff, 9·2 in Leicester, 9·5 in Burnley, and 9·6 in West Ham and in Croydon; the highest rates were 19·3 in Manchester and in Salford, 19·7 in Preston, 20·6 in Gateshead, and 22·2 in Newcastle-upon-Tyne. The 3167 deaths included 340 which were referred to the principal zymotic diseases, against 389 and 380 in the two preceding weeks; of these, 105 resulted from measles, 93 from whooping-cough, 49 from diarrhœa, 45 from diphtheria, 26 from scarlet fever, 22 from "fever" (principally enteric), and not one from small-pox. No death from any of these diseases was recorded last week in Norwich or in Bolton; in the other towns they caused the lowest death-rates in Brighton, Cardiff, and Huddersfield, and the highest rates in Wolverhampton, Salford, Halifax, and Newcastle-upon-Tyne. The greatest mortality from measles occurred in Plymouth, Halifax, Bradford, and Newcastle-upon-Tyne; from whooping-cough in Swansea, and Gateshead; and from "fever" in Portsmouth and Wolverhampton. The mortality from scarlet fever showed no marked excess in any of the large towns. The 45 deaths from diphtheria included 26 in London, 6 in Leeds, 3 in West Ham, 2 in Salford, 2 in Liverpool, and 2 in Burnley. No fatal case of small-pox was registered last week in any of the thirty-three large towns, and only one case of small-pox was under treatment in the Metropolitan Asylums Board Hospitals on Saturday last, the 18th inst. The number of scarlet fever patients in these hospitals and in the London Fever Hospital on the same date was 2194, against 2195, 2207, and 2169 on the three preceding Saturdays; 230 new cases were admitted during the week, against 256, 220, and 206 in the three preceding weeks. The deaths referred to diseases of the respiratory organs in London, which had been 226 and 212 in the two preceding weeks, further declined to 185 last week, and were 42 below the corrected average. The causes of 48, or 1·5 per cent., of the deaths in the thirty-three towns were not certified either by a registered medical practitioner or by a coroner. All the causes of death were duly certified in Portsmouth, Cardiff, Hull, Newcastle-upon-Tyne, and in twelve other smaller towns; the largest proportions of uncertified deaths were registered in Birmingham, Liverpool, Blackburn, and Sheffield.

HEALTH OF SCOTCH TOWNS.

The annual rate of mortality in the eight Scotch towns, which had been 23·0 and 21·3 per 1000 in the two preceding weeks, further declined to 20·2 during the week ending June 18th, but exceeded by 5·5 per 1000 the mean rate during the same period in the thirty-three large English towns. The rates in the eight Scotch towns ranged from 17·2 in Paisley and 18·7 in Greenock to 21·2 in Glasgow and 27·2 in Perth. The 609 deaths in these towns included 32 which were referred to measles, 22 to whooping-cough, 22 to diarrhœa, 8 to scarlet fever, and 8 to "fever" (principally enteric). In all, 92 deaths resulted from these principal zymotic diseases, against 112 and 116 in the two preceding weeks. These 92 deaths were equal to an annual

rate of 3·0 per 1000, which was 1·4 above the mean rate last week from the same diseases in the thirty-three large English towns. The fatal cases of measles, which had increased from 27 to 42 in the three preceding weeks, declined to 32 last week, and included 16 in Glasgow, 12 in Dundee, and 3 in Edinburgh. The deaths from whooping-cough, which had been 43 in each of the two preceding weeks, fell to 22 last week, of which 8 occurred in Glasgow, 5 in Edinburgh, 4 in Aberdeen, and 4 in Paisley. The 8 fatal cases of scarlet fever exceeded by 4 the number recorded in the preceding week and included 4 in Glasgow and 3 in Edinburgh. The 8 deaths referred to different forms of "fever" corresponded with the number in the preceding week, and included 3 in Glasgow and 3 in Paisley. The deaths from diseases of the respiratory organs in these towns, which had been 133 and 109 in the two preceding weeks, were 108 last week, and were within one of the number in the corresponding period of last year. The causes of 24, or more than 4 per cent., of the deaths in these eight towns last week were not certified.

HEALTH OF DUBLIN.

The death-rate in Dublin, which had been 19·7 and 25·1 per 1000 in the two preceding weeks, declined again to 21·9 during the week ending June 18th. During the past four weeks the rate of mortality in the city has averaged 22·5 per 1000, the rate during the same period being 15·6 in London and 21·0 in Edinburgh. The 147 deaths registered in Dublin during the week under notice showed a decline of 21 from the number in the preceding week, and included 6 which were referred to the principal zymotic diseases, against 10 and 4 in the two preceding weeks; of these, 4 resulted from different forms of "fever," 1 from whooping-cough, and 1 from diarrhœa, but not one from small-pox, measles, scarlet fever, or diphtheria. These 6 deaths were equal to an annual rate of 0·9 per 1000. the zymotic death-rate during the same period being 1·7 in London and 3·5 in Edinburgh. The deaths referred to different forms of "fever," which had declined from 4 to 1 in the four preceding weeks, rose again to 4 last week. The mortality from whooping-cough showed a further decline from that recorded in recent weeks. The 147 deaths in Dublin last week included 29 of infants under one year of age, and 40 of persons aged upwards of sixty years; the deaths of infants showed a further increase upon recent weekly numbers, while those of elderly persons showed a decline. Four inquest cases and 5 deaths from violence were registered; and 51, or more than a third, of the deaths occurred in public institutions. The causes of 11, or nearly 8 per cent., of the deaths in the city last week were not certified.

THE SERVICES.

NAVAL MEDICAL SERVICE.

STAFF-SURGEON GEORGE FREDERIC DEAN, B.A., M.B., has been placed on the retired list of his rank.

ARMY MEDICAL STAFF.

Surgeon-Lieutenant-Colonel Green, Surgeon-Lieutenant Hearn, Surgeon-Lieutenant McArdle, and Surgeon-Lieutenant O'Gorman are under orders for service in Egypt. Brigade-Surgeon-Lieutenant-Colonel Grier's appointment to the Scottish District is cancelled *pro tem.* and he is ordered to remain at Aldershot for the present. Surgeon-Major Addison joins at Woolwich for duty. Surgeon-Colonel William Graves is placed on retired pay. Surgeon-Major Arthur Harding is placed on temporary half-pay on account of ill-health.

THE SPANISH-AMERICAN WAR.

There is but little to chronicle regarding the Spanish-American War, which still drags its weary length along. The American transports conveying the military expedition are reported to have arrived in the vicinity of Santiago. With regard to the general invasion of Cuba and Porto Rico it is thought that some 200,000 troops will be required; but the President of the United States, who is apparently a strong man of independent and sound judgment, is averse to the conduct of military operations in Cuba for sanitary reasons until the end of the rains. Manila, if it has not already fallen, must certainly soon do so, and it is believed that the town will be occupied by forces from the war vessels together with the troops sent to Admiral Dewey's aid from America to form a land force. It was generally thought that this war would afford some interesting lessons in naval strategy, tactics, and new inventions. We had very sensational descriptions of the terrible effects of the dynamite shells fired by the *Vesuvius*, resembling those of an earthquake, but these have not been since followed up by any corroborative particulars. It was, at any rate, open to Spain to make a strong defence of her colonies and to harass the naval ships and transports of the States in various ways and directions, but the Spaniards have so far shown a lamentable want of naval skill and enterprise. They seem to have been content to exhibit their undoubted courage by dying at their posts in honour of their country. The Spaniards were not only entirely unprepared for war, but their Government has shown that it was quite incompetent to conduct any war. The Cadiz fleet has put to sea, but its destination and object are alike unknown, and it is not apparently strong enough, in any case, to do much. We hear very little news of the medical departments of either Spain or America; indeed, there has not seemingly up to the present time been very much to do so far as the sick and wounded are concerned. The Spanish losses about Manila must, however, have been large. Admiral Dewey's fleet is reported to be very healthy.

THE VOLUNTEER MEDICAL ASSOCIATION.

The annual meeting of the Volunteer Medical Association was held at 20, Hanover-square on Wednesday, June 15th. Brigade-Surgeon-Lieutenant-Colonel Andrew Clark, V.D., was re-elected Chairman of Council, and Surgeon-Captain Rory Fletcher and Surgeon-Captain J. Harper, honorary secretaries. Surgeon-Lieutenant J. Cantlie was appointed honorary treasurer, and Surgeon-Lieutenant-Colonel A. T. Norton, C.B., V.D., elected a Vice-President. The old council, with three exceptions, were re-elected and the name of Surgeon-Lieutenant L. A. Bidwell was added to that body. The report of the retiring council, which was of a highly favourable character, was adopted. The competition for the Ambulance Challenge Shield will take place at Wellington Barracks on Saturday, July 23rd, at 4 P.M. We may remind intending competitors that entries will close on July 1st.

THE WEST AFRICAN ARMY MEDICAL SERVICE.

Appointments in the West African Medical Service are again open and will be competed for at an examination of candidates for the Army Medical Staff to be held on Aug. 5th next. Applications should be sent to the Director-General of the Army Medical Department, 18, Victoria-street, London, W., before July 27th.

THE PRINCIPAL MEDICAL OFFICER IN INDIA.

It is announced that Surgeon-Major-General W. Taylor is to succeed Surgeon-Major-General Gore as Principal Medical Officer of H.M.'s Forces in India. Surgeon-Major-General Taylor is to be congratulated upon his good fortune. He has some thirty-six years' service and was in the last Ashanti campaign of 1895 in medical charge of the expedition under Sir Francis Scott.

THE COMING SOUDAN CAMPAIGN.

All the officers of the medical staff ordered from this country to Egypt will, it is understood, embark early next month. The Anglo-Egyptian force designed to take part in the advance on Khartoum will be a large one, as it is anticipated that there may be a good deal of fighting on the part of the Dervish forces. It may be assumed that on this occasion stretchers will be provided with moveable hoods for the protection of the wounded and sick against the sun, that the Roentgen ray apparatus will be carried with the field army, and that so far as is compatible with the nature of the operations the Government and military authorities will see that everything required by the medical staff for the efficiency of the hospital and transport service is forthcoming.

COUNTY LABORATORY FOR GLAMORGANSHIRE.—At the meeting of the Glamorganshire County Council held on June 16th it was decided to advertise for a bacteriologist and that 9, The Parade, Cardiff, should be taken and converted into a county laboratory.

METROPOLITAN HOSPITAL SUNDAY FUND.

THE following is a record of some of the principal amounts received at the Mansion House, according to the lists which have reached THE LANCET office up to our going to press on Thursday, when the total sum amounted to over £25,500. At the corresponding period last year the total was £23,000.

Correspondence.

"Audi alteram partem."

"VITALITY."

To the Editors of THE LANCET.

SIRS,—In his paper in THE LANCET of April 16th, Dr Beale denies that life can result from matter and forces, but does not give his own view as to its origin. It seems to me we must either admit that matter and forces can generate life or accept the statement in Genesis that the breath of God imparted life to inanimate matter. To me and to all who believe in the correlation and transmutability of physical forces, the matter and force origin of life is far more intelligible and probable than the miraculous and we see no good reason why life, the vital force, should be excluded from the list of convertible forces, such as heat, motion, chemical action, light, and electricity. The possibility of abiogenesis—the genesis of living from non-living matter—has been admitted by many profound thinkers and scientists, including Aristotle, and some years ago Dr. Charlton Bastian made a series of experiments (published at the time in *Nature*) which seemed to prove that abiogenesis was not only a possibility but a fact. He made infusions of hay, turnip, &c., and exposed them in hermetically sealed flasks to temperatures which Pasteur and Tyndall admitted were destructive of germs and every form of life; after some days he examined these infusions microscopically and found in them various forms of vegetable life. These experiments, however, did not convince Pasteur and Tyndall, who considered them fallacious and inconclusive. Tyndall had long before contended that the earth was once in a nebular condition, that it gradually cooled down and became solid, and that then low forms of vegetable life appeared upon it; but as he did not believe in abiogenesis how did he account for this first appearance of life? Assuming that living things can be generated by matter and forces, we can go back in imagination to the nebular period when the earth was "without form and void," then to the period when it cooled and solidified and produced low forms of vegetable life. Evolution would then carry us forward to the earliest and lowest forms of animal life and thence through the whole series of animals up to man and mind. In nature there are no hard-and-fast lines of demarcation; things run into one another, like the prismatic colours of the rainbow. The vegetable kingdom runs into the animal and vegetable and animal protoplasm are indistinguishable. When we arrive at fishes we find them gradually passing into reptiles, reptiles into birds, birds into mammals, apes into man; and on the borderland between any two kingdoms we find creatures with some of the characters of both, so that it is difficult to decide to which they belong. There are anthropoid apes and pithecoid men, and those who believe that man alone has a soul would find it difficult to determine which animal on the borderland possessed it and which did not and to say this monkey-like man has it, that man-like ape has not. If then in nature we find no hard and fast lines of demarcation why should we try to draw one between dead matter and living and at a certain point in evolution call in the aid of a miracle such as the breath of God? We can draw no hard and fast line between light and darkness, day and night, spring and summer, autumn and winter, boyhood and manhood, the ebb and flow of the tide, the terrestrial atmosphere and the illimitable ether beyond it; and if living matter runs into dead why not dead matter into living?—I am, Sirs, yours very truly,

D. HOOPER, B.A. Cantab., M.B. Lond.,
Physician to the Surrey Dispensary.

Trinity-square, S.E., June 10th, 1898.

POISONING BY STRYCHNINE.

To the Editors of THE LANCET.

SIRS,—THE LANCET of June 18th contains a letter from Dr. Robert Barnes, in which he emphasises the fact that the most effectual treatment of the convulsive state is absolute rest—a maxim with which, I think, everyone will be in accord. However, it is not sufficient only to protect the motor muscular system from every source of

external irritation, but great additional benefit may be obtained by deadening the acuity of the sensory organs of sight and hearing. I well remember when I was house physician at St. Bartholomew's Hospital having the charge of a case of hydrophobia in which strong tetanoid spasms had set in and these attacks were excited by the slightest noise or even by the sight of anyone moving in the room. In order to reduce these sources of irritation to a minimum I had the man's eyes blindfolded and his ears plugged with cotton-wool. Of course, it is needless to say that the patient did not recover; but I am sure of this, that by the measures adopted his last sufferings were greatly ameliorated, the convulsions being immediately lessened in frequency, duration, and in violence.

I am, Sirs, yours faithfully,

Worthing, June 20th, 1898. W. T. WYATT.

"PUBLIC SCHOOLS AND FOOD."

To the Editors of THE LANCET.

SIRS,—With reference to the subject of school diet so ably and sensibly handled in THE LANCET of June 18th I would ask, Why should not the physiologist construct a model diet table for schools, just as has been done in the case of prisons and kindred institutions with the very best results as regards the health of the inmates? Such a model diet would at one and the same time be the healthiest and the cheapest. Without attempting to construct one myself I would throw out the following suggestions. Breakfast should consist chiefly of porridge and milk, brown bread should be substituted for white, and tea and alcohol should be banished. Care should be taken, moreover, to give food which requires a good deal of mastication. Our children are fed for the most part on soft and pappy foods which are swallowed after little or no mastication, with the result that the teeth and jaws are not properly exercised. This is, I am convinced, one of the chief causes of the decay of the teeth so common among us.

I am, Sirs, yours faithfully,

Wimpole-street, June 20th, 1898. HARRY CAMPBELL.

"THE ALLEGED DEARTH OF QUALIFIED ASSISTANTS."

To the Editors of THE LANCET.

SIRS,—In connexion with this subject, and more especially with a letter from "G. P." in the *British Medical Journal* of June 11th, it would be very interesting to know what "G. P." does really consider a "tempting" salary to offer to a qualified assistant. I have for the last few years been a constant peruser of the advertisement columns of THE LANCET and the *British Medical Journal* and I fail to recall to my memory any offer of such an alluring character as hinted at by "G. P." appearing in them, or, moreover, being made through the medium of an agent. Take, for instance, last week's medical journals: there are some twelve indoor appointments and six outdoor ones of which the salary is stated, the average remuneration of the former working out at some £98 per annum; of the latter—two with unfurnished houses, three with rooms and attendance, and one with unfurnished house—at the munificent sum of £138 per annum. Surely none of these offers can be a repetition of that "tempting" one that "G. P." almost pitifully tells us of? I do not know how "G. P." arrives at the conclusion that there are so many vacancies for qualified assistants, but admitting that such is the case I trust that most of these vacancies will remain unfilled until the monetary inducement for employment in this capacity is substantially increased and until the status, comfort, and general treatment of the qualified assistant are greatly improved. This piteous plaint of the scarcity of the qualified assistant is only a phase of the agitation for the retention of the unqualified one, but the sooner those men who have been employing the latter kind of aid make up their minds that the decision of the Council is irrevocable, the sooner will there be—owing to the better position and salary offered them—a sufficient supply of qualified men.

It is not, however, altogether the financial question which causes men to "bar" assistantships so persistently. Principals should bear in mind that they cannot treat men their equals in birth, if not of better, and in a great many instances professionally and generally better educated, as they have hitherto treated the broken-down failure or, in so many cases, the drunken wastrel *sine diploma* but with full curriculum. There is, again, another factor to be considered. The young practitioner has recognised the fact that the action of the Council has placed him in a much better position to combat the game of "grab" played by so many men who, finding that they have much more than they can do, are not willing to let the young ones have a chance, but "sweat" two, three, even five assistants, qualified and unqualified. *Apropos* of "sweating" there is an advertisement offering a man £150 per annum for working a branch avowedly worth £700 per annum. Surely this is "sweating" pure and simple, but he can now make his bid for a fair share of patronage, assured that—if the Council does its duty—he will be protected from the "underbidding" opposition of the unqualified and that the trading tactics of the "limited liability company" class of practitioner will be materially hampered. I challenge his statement that death and retirement absorb some 600 men annually. I have not the means of verification at hand, but he will find, I think, that during the last few years a surplus of some 300 or 400 (over and above the removals from the two causes mentioned) has been added yearly to the Register. As to his medical friend who was unable to obtain a "locum"—even for an advance of 25 per cent. on the usual terms—if he will consult the columns of the medical journals he will find (omitting the various agencies) some eight or nine gentlemen ready to accommodate him, though they require for remuneration something more than the benefits of "bracing air and an interesting country," so ingenuously offered by a practitioner as the sole salary for a three weeks' "locum"—25 per cent. increase on the *locum's* "usual terms"! Ye gods! I am in want of neither assistantship nor "locum" myself—as a matter of fact I am not in "general practice," else I might almost be tempted to offer my services to this belated and almost recklessly extravagant individual.

I am, Sirs, yours faithfully,

June 20th, 1898. M.A. CANTAB., M.A., M.B. DUBLIN.

To the Editors of THE LANCET.

SIRS,—The continuance of the correspondence against the act of the General Medical Council *re* unqualified assistants has a tendency at first sight to make one think that it has not been a popular one. From a personal knowledge of several large Lancashire towns I do not believe such to be the case, the different medical societies having approved of it. Nor have I noticed as an effect any more activity on the part of midwives, as was suggested by a correspondent in THE LANCET of June 18th. It appears to me that it must be the unqualified men and those who have made use of them that are keeping up the agitation. Amongst the younger men in these towns there is much jubilation and in the case of those who are assistants it has not only improved their status but has considerably improved their salaries. In one of these towns I know personally four men who were until recently diagnosing, prescribing, &c., daily who have never been near a medical school and who are ignorant of the rudiments of anatomy and physiology. It is this class that medical men want to see abolished. One can almost excuse the maintenance of a man who has really tried the legitimate study of medicine and has not succeeded in finishing his task, but to see qualified men wanting to maintain those whose knowledge is equivalent to that of a quack is a puzzle to me.

I am, Sirs, yours faithfully,

June 20th, 1898. AN ASSISTANT, M.D.

BORIC ACID IN BUTTER.—At the quarterly meeting of the Local Government Committee of the Glamorganshire County Council held on June 16th the county analyst (Mr. C. A. Seyler) presented his quarterly report. This stated that of 38 samples of butter which had been examined 25 were free from boric acid, the remaining 13 contained the acid, but the amount used had now decreased below the limit imposed by the council and in no case exceeded 0 5 per cent. Mr. Seyler had examined 5 hams, all of which contained boric acid, the average giving 0 24 per cent., and he suggested that the same limit should be placed on ham as on butter—viz, 0 5 per cent. The committee adopted the report.

THE MADRID MILITARY HOSPITAL.

(FROM A SPECIAL CORRESPONDENT.)

IT suffices to visit the Madrid military hospital to be convinced that sanitary progress in Spain is not only possible but has actually been achieved, at least in one direction, and this with no mean measure of success. At the same time it must also be recognised that such progress is fraught with exceptional difficulties. The poverty of the country is a valid excuse for delay, but the innate spirit of procrastination which is a prominent feature of the national character constitutes a still greater obstacle. This, however, adds to the credit of the energetic minority which has finally overcome both apathy and poverty. The history of the military hospital is a good illustration of the patience and perseverance which Spanish sanitary reformers must exercise before they can achieve their purpose. The hospital originated in a large edifice erected in the Calle de las Princesa by order of King Philip V. Here the sons of the nobility were to study theology and various sciences under the tutelage of the Jesuit Fathers. Some rooms in this building were set aside as a military hospital so that the pupils of the seminary might have facilities for studying medicine and surgery. Of course no one concerned in this enterprise had any idea of sanitation. Gigantic cesspools were constructed, as if the main object was to preserve pathogenic germs on the premises as long as possible. The patients were placed where there was hardly any light or ventilation, but a vast amount of space was wasted in building a monumental staircase, a magnificent chapel, and luxurious saloons and rooms for the wealthy pupils of the establishment. As a result it was found very difficult to successfully treat any of the patients and those who came in with slight complaints soon contracted much more serious illnesses as a consequence of their sojourn in such an unwholesome place. Nor did the mischief end here, for these diseases soon spread to the pupils and to others. There were no means of isolating infectious diseases and, the building being four storeys high, disease spread from floor to floor. In 1822 this edifice became the Imperial College and the birthplace of the Central University. In 1844 its use was restricted solely to that of the military hospital for Madrid. These changes did not alter the insanitary condition of the edifice, and even in 1885, when the cholera broke out in Madrid, the state of the military hospital was most unsatisfactory. Efforts were then made to render the hospital more wholesome. New doors were opened, extra windows were cut in the walls, partitions were erected for purposes of separation and isolation, and the patients had to lie close to the fresh whitewash and the moist mortar of new walls.

There had been some proposals made to build a new military hospital, but the chief argument was not based on the unwholesome character of the existing hospital: it rested on the fact that the building was old and likely to fall to pieces. These proposals date back to the year 1873. A commission was appointed and it suggested the construction of a new hospital with 300 beds and also indicated means by which the old hospital could be improved. Five years later there was another project for building a new hospital with 1000 beds. The military, medical, and engineering departments worked together and other schemes were propounded, notably one for the building of two hospitals as far apart as possible. Thus projects and reports accumulated, but nothing was done. In the meanwhile the old hospital showed signs of decay which became more evident every day. In 1887 it really seemed as if the crisis was at hand and to facilitate its solution the municipality of the outlying district of Lower Carabanchel offered, as a free gift to the Ministry of War, a large piece of land for the erection of a new hospital. This gift was nominally accepted, but still nothing was done. Discussions continued and there is no knowing how long they might have lasted but for an accidental circumstance which fortunately clinched the matter. Early in February, 1889, a fire broke out in the old hospital, destroying one of the wards, and the municipality of Carabanchel seized this opportunity of renewing its offer, which this time was definitely accepted. By a Ministerial order of May 23rd, 1889, measures were taken in view of the early construction of a new military hospital at Carabanchel.

The land offered is situated on a slope which is 40 metres above the lower levels of Madrid and 680 metres above the Mediterranean Sea at Alicante. The surface measurement of the ground is equal to 84,123 square metres. Close at hand there are two triangular plots of land measuring together 17,074 square metres, which it is proposed to purchase as a reserve in case of epidemic, where temporary huts or pavilions could be built to receive and isolate patients. The distance from the centre of Madrid to the new military hospital is 5 kilometres and an electric tramway will connect the hospital with the town. At present the only means of communication is by carriage, ambulance waggons, or the ordinary tramway drawn by mules which goes to the village of Carabanchel, whence the hospital can be reached after a few minutes' walk. The soil of the hospital grounds consists of a mixture of sand and clay, the latter becoming more and more compact deeper down till it finally constitutes an impermeable stratum.

After duly levelling the soil it was decided to build pavilions in a N.E. to S.W. direction, which suits best the climate of Madrid. The height of the buildings, in proportion to the width of the open spaces or streets, is as 1 to 1·748. Thus the highest pavilion with an upper floor and attic reaches a height of 13·77 metres. The pavilion opposite is at a distance of 21·88 metres. In all, 24 pavilions or separate blocks of buildings were erected and an effort has been made so to place them as to facilitate the services and yet not to mar the general aspect of the hospital. Though the land is in the shape of a somewhat irregular hexagon there is space enough to carry out a fixed design. The site is surrounded by an avenue which constitutes a promenade and also affords means of removing corpses without passing through the hospital grounds.

The principal entrance faces a garden which is spread out in front of the block of buildings devoted to the general directorship of the hospital. Here I was most courteously received and permitted to inspect the private rooms of the medical staff, their library, and on the ground-floor the offices where the entry and departure of patients and all other details are registered. Immediately behind this block there is a building which in itself constitutes a complete hospital. This is reserved exclusively for officers. There are quarters for two generals, each consisting of a small study or sitting-room, a bed-room, dressing-room, bath-room, and private lavatory. There are also 2 special apartments for colonels and 14 beds for officers of inferior rank. There is a small operating-room, a kitchen, and rooms for the medical staff and nurses attending the officers. Thus the officers have under the one roof all they need and their quarters constitute a small self-contained hospital, which is quite independent of the general hospital intended for the rank and file of the army. Behind these two buildings, the administrative offices, and the officers' quarters there is a vast garden with a chapel in the centre. On each side of this garden are three large pavilions. Four of these six pavilions have an upper floor and they are intended to receive medical cases. Two pavilions with no upper floor receive the surgical cases and are connected by a covered way with a separate building which contains a model operating-room.

Each pavilion has a large basement 2·50 metres high which is not utilised for any other purpose than that of warming and ventilating the ward above and of protecting it from damp. On the medical side each of the four pavilions consists of four wards, two on each floor. These wards have a surface measurement of 179 square metres, contain only sixteen beds, and this, taken with the height of the ward, gives 50·35 cubic metres of air-space to each patient, which is rather more than the amount required in the most recent model hospitals. At the outer extremity of these wards are situated the bath-rooms and the closets. These latter are on the flush-out system, and the flush, which I tested, is efficient. The drain-pipes and waste-water pipes are carefully trapped. The closets are far enough away for a current of air to be established between them and the wards. At the other end of the wards, or the centre of the pavilion, are two rooms where patients may be isolated. Here also are the rooms for the nurses, attendants, &c. In these smaller rooms, as in the wards, the angles have been rounded off to prevent the accumulation of dust, and the ceilings are arched so as to facilitate the evacuation of the vitiated air. There is a horizontal ventilating-shaft along the apex of the ceiling leading the vitiated air to a vertical shaft which communicates with a Boyle ventilator on the roof. For the inlet there are Tobin

tubes. A boiler placed in the basement provides a slight pressure of steam, which circulates in coils disposed so as to warm every part of the building.

The surgical wards only differ from the medical wards in so far that there is no second floor and in the fact that each ward has a little operating-room of its own. Instead of dressing wounds in the common ward and before the other patients this is done privately in these small operating-rooms. For serious operations a magnificent operating-room has been built, consisting of a rotunda of iron and glass which joins the roof by a parabolic segment. A large portion of the roof is of glass. The operating-room measures 85 square metres, so that if necessary several operations can be performed at the same time. Needless to say that the operating table, of nickel and plate glass, the cases for dressings, the trays for instruments, in fact, all the furniture, are made according to the most recent aseptic principles. The operation room, in spite of its loftiness, its size, and the fact that a portion of its walls are of glass, is so well provided with warming apparatus that the temperature can be raised to 38° C. The whole can be washed out with a fire hose. Adjoining and forming part of the same building there is a retiring room for the surgeons, a chamber for administering chloroform, a bath-room, and "arsenal" (so-called) for the surgical instruments, and a room where numerous coloured anatomical drawings of operations, &c., are kept for reference. The splendid light which the rotunda gives and all the surrounding conveniences have been carefully thought out and the Madrid military hospital can therefore be said to possess one of the best operating-rooms which have ever been constructed. In size and convenience it surpasses the operating-room of the Mahommedan Women's Hospital at Constantinople.

The four medical and the two surgical pavilions constitute the main portion of the hospital where the greatest number of patients will be found, but there is also a pavilion for soldiers under arrest. Here the windows have iron bars and there are other indications that this is a prison hospital. Then there is a separate building for the insane, surrounded by high railings with space within for the patients to take a little exercise. Right at the back, separated from the rest of the hospital, there are three pavilions reserved for infectious cases. The only difference between these and the other pavilions is that the wards contain only 12 instead of 16 beds. Adjoining is a building where the washing and the cooking can be done, not only for the patients in the pavilions set aside for infectious cases, but also for those who may in the event of an epidemic occupy the huts or tents which would be put up on the surrounding vacant ground. For the rest of the hospital there is a much larger laundry establishment with the most recent labour-saving machinery. A disinfecting stove is attached to this laundry so that linen, &c., can be sterilised before it is given over to the washerwomen. Another large building contains workrooms for the repairing of linen, vast warehouses for the storing of linen, blankets, &c. The cupboards are some 5 ft. deep; they open at the back and in front and there are holes in the door to permit a free passage of air. But many of these cupboards were empty, their contents had been sent to Cuba. In the basement of this building there is a vast bakery, where all the bread consumed in the hospital is made, and the pharmacy occupies the ground floor. In the kitchen, with the aid of steam, meals for 500 persons can be prepared and there are coke stoves as well in case the supply of steam should accidentally fail or in the event of a larger number of meals being required. Of course, there are vast store rooms for provisions, cellars for wine, and separate pavilions for the nursing sisters and other attendants.

At first it was proposed to build an anatomical and pathological institute and museum, but subsequently it was found more convenient to construct an institute of military hygiene in the town of Madrid itself. Thus there remains at Carabanchel only a small or branch museum. Nevertheless this contains all that is necessary to aid the professors of surgery and medicine in their work. One of the most remarkable installations is a separate building in which are situated the post-mortem room and the mortuary room. In the basement and connected by a lift with the upper part there is a refrigerating chamber where corpses can be kept for any time in a temperature, if necessary, of 10°C. below zero. As the entire hospital is lighted by electricity there has been no difficulty in providing all that is required for the employment of Roentgen rays whenever necessary.

For all these buildings the foundations are of granite. A stone wall surrounds the basement, which is 1 metre below ground and 1½ metres above ground. From the top of the basement the wall is in brick of the best quality, with an air space in the thickness of the wall so as to regulate the temperature and protect the patients from the risk of sudden changes. The walls are painted inside with the Psicroganoma varnish, manufactured at Turin, and which can be washed with antiseptic solutions without being damaged. In the basement the earth is covered over with compressed tar and asphalt. This forms a good damp-proof course. The sewers which drain the hospital are more than 2 miles in length and have their outfall in the river. They do not join any other system of sewerage. There are gullies to catch the sand and Doulton automatic flushing tanks to wash out the sewers at regular intervals. As the village of Carabanchel has not sufficient water for its own purposes a special canalisation had to be built for a distance of 9 kilometres, and by this means a supply equal to an average of 600 litres per patient per day has been obtained. As, however, the supply is somewhat irregular large tanks had to be constructed so as to keep a reserve ready at hand. Telephonic communication connects all the buildings and the services. The director from his office can speak with anyone in any part of this vast establishment. Finally, it should be noted that, though within easy reach of Madrid and close to the suburb of Carabanchel, the hospital is practically in the country; it stands by itself with cornfields just outside its walls, and the patients therefore enjoy pure air. Though there was much unnecessary delay in the building of this hospital everything that could be done to atone for this loss of time has been achieved. The military authorities of Spain can now boast that they possess a model institution. All who visit this hospital must acknowledge that sanitary progress in Spain is possible, that if a fair opportunity is afforded to the architects of the country they are fully competent to and would soon place Spain on a level with the most advanced nations in respect to public institutions of this description.

NOTES FROM INDIA.

(FROM OUR SPECIAL CORRESPONDENT.)

Plague Administration in Bombay.—The Recrudescence in Karachi.—The Outbreak in Calcutta.

AFTER passing through many hands the responsibility for all plague operations in Bombay is now vested in the Municipal Commissioner. A special deputy commissioner will also be appointed. It is proposed in addition to appoint a special medical officer for the charge of plague hospitals and other plague medical duties, who will be deemed to be a joint health officer under the Municipal Act. These changes refer to plague, but there is also a scheme in hand for the re-organisation and extension of the Health Department. The general health of the city is now good and there does not seem to be any very active plague anywhere, although from 10 to 20 cases continue to be reported daily. Relapsing fever still lingers amongst the famine immigrants, but means are being taken to transport them back to their villages. It must be admitted that thousands of houses in the city of Bombay are cleaner than they ever were before, that sanitary supervision has improved, and that perhaps the plague has taught some people cleaner habits. Some ultimate good may thus arise from this disastrous epidemic.

At Karachi the disease is apparently subsiding, but large numbers of the inhabitants have gone out into the jungle. The worst houses have been emptied and the people sent into camps. General cleansing of dirty houses and removal of dangerous rubbish has been extensively carried out. No trouble has been experienced in carrying out the various operations, many of the natives voluntarily reporting their cases and otherwise assisting the authorities. Inoculation has been offered as an alternative to segregation and is now being freely accepted. With regard to the general administration of plague operations the same errors have been made here as elsewhere. Medical men are placed in subordinate positions while military and civil service officials reign supreme. In consequence of the little trust which can be placed in native medical men the duties of some of the

English practitioners have been considerably less technical than those of a sanitary inspector. The same disappointment in the duties allotted to them has been felt by the English medical men nearly everywhere. The rate of mortality from Plague in Karachi has been over 78 per cent. but the type seems now somewhat less virulent.

In Calcutta disturbances have been very numerous although not extensive. It is now found necessary to send a guard of European police with the English medical men on their rounds of district duty as in a recent disturbance Surgeon-Lieutenant-Colonel Laing narrowly escaped being severely handled by a large crowd and only saved himself by the use of his revolver. He had to fire three times, wounding three men, two of whom have since died. Considerable difficulty exists in carrying out any plague measures, but the number of cases so far recorded is only about 62. As plague has been existent in Calcutta for several weeks it is difficult to suppose that the few daily recorded cases represent the correct number. It is most probable that, as in Bombay, many cases are being concealed and that deaths are being returned as from other diseases.

June 2nd.

SCOTLAND.

(FROM OUR OWN CORRESPONDENT.)

Presentation of the Freedom of the City of Edinburgh to Lord Lister.

ON Wednesday, June 15th, the M'Ewan Hall, Edinburgh, was for the first time utilised for a civic function and a large number of citizens assembled to witness the conferring of the freedom of the city on Lord Wolseley and Lord Lister. The medical and military professions were well represented and the hall was barely large enough to accommodate all those who had secured tickets of admission. Lord Lister appeared in morning dress, while Lord Wolseley was attired in the full-dress uniform of Commander-in-Chief. After the proceedings were opened by the Moderator of the Church of Scotland engaging in prayer the presentation was made first to Lord Wolseley and thereafter to Lord Lister. A minute of the council was read by the Town Clerk, in the course of which it was stated that the freedom of the city had been conferred on Lord Lister "in recognition of their very high admiration of his brilliant and distinguished career as a surgeon and particularly of his discovery and establishment of the antiseptic method of treatment in surgical operations." The Lord Provost, in his speech, referred to the considerations which had lead them to confer the freedom of the city on Lord Lister; he recalled Lord Lister's work in Scotland, beginning with his appointment as house surgeon under Professor Syme. Subsequently to this he became successively assistant surgeon to the Royal Infirmary, Lecturer on Surgery in the Edinburgh Extra-mural School, Professor of Surgery in Glasgow University, and, finally, Professor of Clinical Surgery in the University of Edinburgh. In 1877 he left Edinburgh and went to London, where he occupied the chair of Clinical Surgery in King's College Hospital until 1896. He was now President of the British Association and of the Royal Society of London. It was in Glasgow that Lord Lister commenced his investigations into the cause of the bad results which so often followed surgical operations in those days, with a view to finding a remedy for the evil, and these investigations, continued in Edinburgh, culminated in the institution of "the antiseptic system of surgery," which would always be associated with his name. He had revolutionised the science and practice of surgery and had done more to diminish suffering and prolong life than any other living man. It was surely the highest honour to which any man could wish to attain to be a benefactor of his species. It was the glory of such a discovery as his that its blessings were not confined to his own practice or to his own age; it was for all mankind and for all time. Many suffering ones in all lands had already reaped the fruit of his labours and untold numbers in the years to come would have cause to bless his name. The Lord Provost having in appreciative and eloquent terms indicated the reasons which had led the town council to confer the freedom of the city on Lord Lister then turned and addressed him as follows: "My Lord Lister, we have great pleasure in enrolling you an honorary burgess of this city, with which you have already such close associations. We and our fellow citizens—among whom there are many who are your devoted admirers and disciples and some who are your warm personal friends — welcome you to the highest honour it is in our power to bestow." The Lord Provost, on concluding his speech, handed to Lord Lister the burgess ticket enclosed in a silver casket. Lord Lister, in replying, expressed great gratification at the distinction which had been conferred on him by the city of Edinburgh. He had special reasons for feelings of gratitude to Edinburgh dating from the conclusion of his student days in London, when as a perfect stranger he had come to Edinburgh with a letter of introduction to Professor Syme. In Edinburgh he had spent his best and happiest years. He felt that the honour received by him that day was much enhanced by the fact that it was conferred at the same time on the illustrious head of the British army. The work of the surgeon was in some respects analogous to that of the soldier, although happily the analogy was not now so close as it once had been. He thanked the Lord Provost for his generous reference to the share which he had had in bringing about the latter result, for he regarded all worldly distinctions as nothing in comparison to the hope that he might have been the means of in some degree reducing the sum of human misery. On the conclusion of Lord Lister's speech the Lord Provost according to custom called for three cheers for the young burgesses. These having been heartily given the proceedings terminated.

Social Functions in Honour of Lord Lister.

Lord Lister's presence in Edinburgh was taken advantage of by the President and Fellows of the Royal College of Surgeons of Edinburgh to hold an afternoon reception in his honour at Surgeons' Hall. The invitations bore that it was "to meet the Right Honourable Lord Lister." Mr. Chiene, the President of the College, received the guests, while behind him stood Lord Lister and behind them the Vice-Presidents and other officials. The hall was crowded by members of the profession and their wives from the city and its neighbourhood, while many prominent men from Glasgow were also present.—The Lord Provost gave a dinner in his lordship's honour, while the Residents' Club had arranged their dinner for the following day so that he might be their guest also.

A Chair of Public Health for Edinburgh University.

The University Court of the University of Edinburgh has received the order of Her Majesty in Council declaring her approbation of the ordinance of the Scottish Universities Commissioners that a Professorship of Public Health and Sanitary Science be instituted in the University, the chair to be called "The Bruce and John Usher Chair of Public Health." The court in which the patronage of the chair is vested intends to make the appointment on Monday, July 18th next. The court has learned with great satisfaction that through the munificence of a benefactor of the University a sum sufficient to build and equip a laboratory and class-room in connexion with the chair is to be placed at the disposal of the Court.

June 21st.

IRELAND.

(FROM OUR OWN CORRESPONDENTS.)

The City of Dublin Hospital.

THE sixty-sixth report of this institution has just been issued and includes an account of the new Drummond Wing which was opened in the beginning of the year for the treatment of patients suffering from infectious diseases. The building is completely detached from the main hospital, has a separate entrance, and is officered by a staff of nurses and probationers who reside in it.

A Catholic University in Ireland.

With the object of supporting the claim for a Catholic University in Ireland Mr. Dillon, M.P., intends to apply to the House of Commons for a return giving the names and numbers of matriculated students of the Royal University of Ireland who, in the years 1893-94-95-96-97 respectively, passed any of the University examinations in arts, medicine, or law from any of the Queen's Colleges, or from any other college in which the Fellows of the University

are required by the Senate to teach or from any college or medical school for men or women from which a total number of at least twelve matriculated students have presented themselves for the examination of the University during the year; the return to include also a list of the honours obtained and other matters connected with the Royal University of Ireland and its teaching staff.

The late Mr. O'Grady.

The oil paintings and library of the late Mr. O'Grady of Merrion-square, Dublin, are about to be sold by auction on the 22nd inst. and following day.

A Medical Coroner for Limavady.

The election of a coroner for Limavady took place at that town on June 16th. Both the candidates were medical men, Dr. B. Lane and Mr. J. C. Lynd. The franchise was the ordinary Parliamentary, but the system of voting was open and both candidates had conducting agents and a large staff of assistants. The candidates in these elections are allowed to use vehicles freely and to pay the expenses of electors. The contest was very keen and special trains were run on the railway lines to and from Limavady to carry voters. The following was the result of the poll, as declared on June 18th: Dr. Lane, 1141; Mr. Lynd, 1035; so that the former was elected by a majority of 106.

June 21st.

PARIS.

(FROM OUR OWN CORRESPONDENT.)

The Ophiasis of Celsus.

AT the meeting of the Society of Dermatology and Syphilography held on June 9th M. Sabouraud drew attention to "ophiasis," an alopecia peculiar to children. This disease makes its appearance almost invariably during early childhood, and is characterised by an alopecial spot situated either in the middle line of the occiput or by two lateral and symmetrical patches. It spreads along the edges of the hairy scalp, which it surrounds with a bald border some two or three fingers in breadth. It may occasionally commence at the forehead or the temples. The disease spreads irregularly, leaving isolated patches of hair intact upon the surface of the bald places. Sometimes total baldness results and the disease usually lasts eighteen months. Spontaneous recovery results at puberty in the vast majority of cases, but the disease sometimes returns in adult life or the recovery may be incomplete with persistence of the original bald patch upon the occiput. The hairs along the edge of the diseased area are atrophied and show a series of knobs and constrictions; they break at the level of a knob and this fracture leaves the broken end of the hair in a brush-like form. No specific microbe has been discovered and the symmetrical disposition of the patches points rather to a nervous origin. It is not contagious and an hereditary tendency has been noticed in only a very few cases. The best treatment is by using revulsives and vesicating agents, but epilation of the hairs at the edges of the diseased patches is of no good. The complaint has nothing in common with the seborrhœic alopecia of Bateman, for this latter is never seen before puberty, is contagious, occurs in round patches indifferently situated and is always accompanied by its proper microbe. The infantile form, however, was described long ago by Celsus in his usual masterly fashion and without doubt the best name for it is the old one of "ophiasis."

Transport of the Sick and Insane.

The Municipal Council has just been discussing the following proposals which were laid before it by M. Chassaigne Goyon: an ambulance carriage is to be kept in every one of the fourteen Paris hospitals, which are connected by telephone with the *mairies*, the police and ambulance stations, the look-out station, the principal druggists' shops, the chief factories, and the large builders' and engineers' yards. This carriage shall be ready to start at any moment of the day or night and shall be accompanied by one or two stretcher-bearers taken from the staff of the hospital, to whom a special grant shall be given for every attendance. A special course in first aid to those suddenly taken ill in the street or who have met with an accident shall be organised by the administration. A certain number of *gardiens de la paix* in every *arrondissement* shall be told off to undergo this course. Their duty shall be to remove the sick or wounded by means of stretchers, supposing that the ambulance carriage shall be detained, to the nearest hospital, such stretchers being taken from the police-station. A special grant is allowed for every journey. A closed-in vehicle fitted for the transport of furious maniacs is to be kept at the infirmary of the Police Prefecture. It is to be at the disposal of the police commissaries whenever they shall think it necessary and it can be summoned by telephone. Two attendants skilled in the management of dangerous lunatics will accompany this vehicle and will have with them a strait jacket.

The Diphtheria of Wounds.

At the meeting of the Biological Society held on June 11th M. Maurel and M. Rispail reminded the society that the older surgeons applied the name of diphtheria or *pourriture d'hôpital* to certain pseudo-membranous exudations occurring on the surface of wounds and accompanied by similar false membranes on the tonsils. M. Maurel and M. Rispail recently came across an analogous case in a patient who had undergone the radical cure of hernia. On the day of the operation the temperature rose to 39° C. (102·2° F.); the day after the operation it reached 40° C. (104° F.). The wound was opened up and found to be suppurating freely. Tubes of serum sown with some of the pus collected from the wound rapidly became filled with a bacillus presenting all the characteristics of the bacillus of diphtheria. When inoculated into a guinea-pig it killed it in forty-eight hours with the characteristic lesions. Bouillon cultures filtered through porcelain gave a not very active toxin, for it did not kill a guinea-pig in a smaller dose than $\frac{1}{10}$ c.c. A guinea-pig which had been immunised with Roux's serum and injected with $\frac{1}{2}$ c.c. of this toxin remained unaffected. The patient was treated with both the serum of Roux and the serum of Marmorek and the wound rapidly improved. Cicatrisation occurred at the normal rate and the temperature fell. In the false membranes, which were examined at different times, the bacillus of diphtheria was invariably found. It is considered, therefore, that the Klebs-Löffler bacillus is one of the pathogenic agents in the production of *pourriture d'hôpital*.

Radiography of Arteries and of Extra-uterine Pregnancy.

At the same meeting of the Biological Society M. Turbert showed some radiographs, the first of which, taken from a dead body, showed clearly the radial and ulnar arteries, and the course of these arteries could be followed even where their radiographic shadow was superimposed upon that of the bone. The vessels had not been injected. The second plate was taken from the foot of an old man. The anterior tibial artery could easily be seen and followed throughout the greater part of its course. These plates are the first where the shadow of the uninjected artery has been obtained. M. Turbert also obtained some months ago a radiograph of a young woman, about twenty-five years of age, who had been sent to the hospital with a diagnosis of extra-uterine pregnancy. He was able to confirm this diagnosis in opposition to the opinion of some of his colleagues, who considered that she was suffering from either a hæmatocele or a growth. The radiograph showed clearly the presence of a fœtus of about five or six months, and the head and body and lower limbs were clearly shown upon the plate.

BERLIN.

(FROM OUR OWN CORRESPONDENT.)

Syphilitic Inoculation in Medical Men.

ONE of the dangers incidental to medical practice formed the subject of a paper read a short time ago before the Medical Society of Bonn by Dr. Brandis, formerly a well-known practitioner in Aix-la-Chapelle. Among his patients in that city there were a considerable number of medical men who had contracted syphilis either while performing surgical operations or while making vaginal or rectal examinations in syphilitic cases. In ten instances they contracted the disease in its most malignant form. The place of infection was invariably the finger-tip and it was remarkable that the disease, after an incubation period of four weeks, developed in an exceedingly rapid way. The ulceration on the finger became phagedænic and suppuration of the axillary glands, deep ulceration of the palate or the skin, and necrosis of

the bones quickly ensued. There was also fever of a septic character which sometimes lasted several months. Notwithstanding these serious symptoms complete recovery followed mercury and iodine treatment. In every instance the diagnosis was made very late, which appeared rather strange in view of the fact that the patients were medical men and had consulted practitioners of recognised standing. The diagnosis, indeed, was far from easy, for the primary ulcers on the finger as a rule did not show the characteristic induration, and the patients themselves were slow to acknowledge the possibility of syphilitic infection, being generally of opinion that their symptoms were due to some septic or tuberculous inoculation to which they had also been exposed. In this way it happened that anti-syphilitic treatment was commenced rather late. One of these sufferers went to Aix-la-Chapelle after having made a journey to the Cape of Good Hope by the advice of his medical attendant, the effect of which was that he became worse instead of better; another had been sent to an Alpine health resort; and a third, who had become seriously ill during the journey home, happened to stop at Aix-la-Chapelle, where the nature of his illness was at last ascertained. Four of the ten patients are still alive at periods varying from five to twenty-five years after the infection. Five died either from enteric fever, pneumonia, or pulmonary tuberculosis; and one who had waited an exceedingly long time before consenting to anti-syphilitic treatment died from a cerebral affection which was reported to be due to arteriosclerosis. Dr. Brandis concluded from his experiences that medical men ought to be very careful when performing operations and making examinations in cases which are either known or suspected to be syphilitic; he himself had always used gloves at such times. He also pointed out the advantage of early diagnosis, especially in serious cases, where anti-syphilitic treatment ought to be commenced as soon as possible. Fever and prostration should not be regarded as a contra-indication of mercurial treatment.

June 20th.

Obituary.

GEORGE VERNON BLUNT, M.D. ABERD., M.R.C.S. ENG.

DR. BLUNT died at Birmingham on June 10th, in the seventy-sixth year of his age. The son of Alderman Blunt, who was for some years a member of the Birmingham Town Council, Dr. Blunt never took any part in public affairs, nor was he connected with any of the hospitals or public institutions. Possibly a defect in one limb which caused him to be lame and made walking uncomfortable and painful accounted for this. Still he exercised an important influence and possessed a wide reputation, more especially in medico-legal cases and in nervous disorders. He was educated at Queen's College and did not take any qualification until 1859, when he became a Member of the Royal College of Surgeons of England and M.D. of Aberdeen. His professional attendance upon the late Cardinal Newman and the confidence he possessed among the authorities of the Oratory at Edgbaston gave him a large *clientèle* in that direction. Shrewd and sagacious as an observer of human nature and character, reticent, and exclusive in his friendships, Dr. Blunt never took any prominent part in professional amenities or mixed with his brethren in any movements of a corporate or private kind. His life was a quiet and uneventful one, pursued with a reserve which was appreciated by those who consulted him but which did not tend to make his abilities so well known or so markedly advantageous to the medical profession as they otherwise might have been.

DEATHS OF EMINENT FOREIGN MEDICAL MEN.—The deaths of the following eminent foreign medical men are announced:—Dr. Levieux, honorary medical officer of the Bordeaux Hospital.—Professor F. J. Trier, a Copenhagen physician.—Dr. David W. Yandell, Professor of Clinical Surgery in the University of Louisville.—Dr. Charles Van Everbroeck, late President of the Medical *Cercle* of Turnhout, Belgium. He was very active in attending the wounded in the war of 1870 and many French and German soldiers have cause to remember him with gratitude.

Medical News.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—The following gentlemen having previously passed the necessary examinations, and having now conformed to the by-laws and regulations, have been admitted Members of the College:—

John Hamilton Crawford, M.B., B.S. Edin., Edinburgh University; Robert Henry Strong, M.B., B.S. Melb., Melbourne University and Kings College Hospital.

UNIVERSITY OF CAMBRIDGE.—At the congregation on June 16th the following degrees in medicine and surgery were conferred:—

M.D.—Edward Henry Douty, King's; Hugh Kerr Anderson, Caius; John Brian Christopherson, Caius; Joshua James Taylor, Emmanuel.

M.B. and B.C.—John Beuzeville Byles, King's; Henry Goodridge Deller, Trinity; John Edward Sandilands, Trinity; Frederick James Watson, Trinity; Edward Ernest Prest, St. John's; Percy William George Sargent, St. John's; Henry Stringfellow Pendlebury, Pembroke; Thomas Betteridge, Caius; William Ernest Heilborn, Caius; Arthur Cyril Ransome, Caius; John Lamplugh Kirk, Christ's; Clement White, Christ's.

M.B. only.—Henry Ernest May, Clare; Frederick André Mills, Clare.

SOCIETY OF APOTHECARIES OF LONDON.—In June the following candidates passed in the subjects indicated:—

Surgery.—J. C. Bell, Guy's Hospital; F. Elias, London Hospital; and J. Prentice, Liverpool.

Medicine.—J. S. Barnes, St. Thomas's Hospital; P. D'E. Burrell, St. George's Hospital; F. Ede, Royal Free Hospital; and J. M. Edwards (Section I.), and J. W. King (Section I. and II.); Charing-cross Hospital.

Forensic Medicine.—J. S. Barnes, St. Thomas's Hospital; P. D'E. Burrell, St. George's Hospital; F. Ede, Royal Free Hospital; J. M. Edwards, Charing-cross Hospital; D. Hamilton, Royal Free Hospital; and J. W. King, Charing-cross Hospital.

Midwifery.—C. J. Barnes, King's College Hospital; W. T. Davies, London Hospital; F. Ede and D. Hamilton, Royal Free Hospital; and J. W. King, Charing-cross Hospital.

The diploma of the Society was granted to the following candidates: J. S. Barnes, J. C. Bell, and J. Prentice.

FOREIGN UNIVERSITY INTELLIGENCE. — *Bonn:* Dr. H. Graff has been recognised as *privat-docent* of Surgery, and Dr. Walter Kruse has been promoted to an Extraordinary Professorship of Hygiene.—*Bologna:* Dr. Agatino Barbera has been recognised as *privat-docent* of Experimental Physiology, and Dr. Ettore Bidone as *privat-docent* in Midwifery and Gynæcology.—*Bordeaux:* Dr. Chavannaz has been appointed after a public competition *professeur agrégé* of Surgery, and Dr. Fieux has been similarly appointed *professeur agrégé* of Midwifery.—*Göttingen:* Dr. Reichenbach has been recognised as *privat-docent* of Hygiene.—*Innsbruck:* Dr. Adolf Posselt has been recognised as *privat-docent* of the Diagnosis and Therapeutics of Internal Diseases.—*Iurieff (Dorpat):* Dr. Chirvinski, Extraordinary Professor of Pharmacology, has been promoted to the Ordinary Professoriat.—*Lille:* Dr. Cousin has been appointed after public competition *professeur agrégé* of Anatomy, and Dr. Gaudier has been appointed after public competition *professeur agrégé* of Surgery.—*Lyons:* Dr. Nové-Josserand and Dr. Bérard have been appointed after public competition *professeurs agrégés* of Surgery.—*Montpellier:* Dr. Imbert has been appointed after public competition *professeur agrégé* of Surgery.—*Nancy:* Dr. Bouin has been appointed after public competition, *professeur agrégé* of Anatomy, and Dr. P. André has been appointed after public competition *professeur agrégé* of Surgery. — *Naples:* Dr. Angelo Lamari has been recognised as *privat-docent* of Medical Pathology; Dr. Carmelo Bruni as *privat-docent* of Surgical Pathology; Dr. Francesco Del Greco as *privat-docent* of Psychiatry; and Dr. Andrea Baroni as *privat-docent* of Midwifery and Gynæcology.—*Paris:* Dr. Launois has been appointed after public competition *professeur agrégé* of Anatomy; Dr. Langlois has been similarly appointed *professeur agrégé* of Physiology; and Dr. Legueu, Dr. Mauclaire, and Dr. Faure have been appointed after public competition *professeurs agrégés* of Surgery. Dr. Lepage and Dr. Wallich have been similarly appointed *professeurs agrégés* of Midwifery.—*Philadelphia (Medico-Chirurgical College):* Dr. E. R. Kirby has been appointed Professor of Genito-Urinary Diseases.—*Rome:* Dr. Gelosio Chiucini has been recognised as *privat-docent* of Laryngology; Dr. Roberto Magnanimi as *privat-docent* of Forensic Medicine; Dr. Giuseppe Pacinotti as *privat-docent* of Surgical Pathology; and Dr. Geronzi as *privat-docent* of Laryngology.—*Toulouse:* Dr. Bardier has

been appointed after public competition *professeur agrégé* of Physiology, and Dr. Cestan and Dr. Banby have been appointed after public competition *professeurs agrégés* of Surgery. Dr. Andebert has been similarly appointed *professeur agrégé* of Midwifery and Dr. Verdun *professeur agrégé* of Natural History.—*Tübingen:* Dr. Hofmeister has been promoted to an Extraordinary Professorship of Surgery.—*Vienna:* Dr. Moritz Heitler and Dr. R. von Limbeck, *privat-docenten* of Internal Medicine, have been granted the title of Professor; Dr. L. von Frankl-Hochwart, *privat-docent* of Neurology, Dr. M. von Zeissl, *privat-docent* of Dermatology, Dr. A. Felsenreich, *privat-docent* of Midwifery and Gynæcology, and Dr. F. Frühwald, *privat-docent* of Children's Diseases, have also been granted the title of Professor.—*Warsaw:* Dr. Kolosoff has been promoted to an Ordinary Professorship of Histology and Embryology. Dr. Ushinski has been promoted to an Ordinary Professorship of General Pathology.

DEATH OF MR. JOHN JOHNSTONE OF LIVERPOOL.—The death of Mr. John Johnstone, L.R.C.P., L.R.C.S. Edin., occurred on June 14th under very distressing circumstances, he having been found dead in his consulting-room on the morning of that day. In close proximity to the couch upon which the deceased gentleman was found lying was an empty bottle which had contained hydrocyanic acid. The medical evidence at the inquest was to the effect that death had resulted from poisoning by prussic acid, which had probably been mistaken for a solution of morphia which the deceased had been in the habit of administering to himself to allay the pain caused by the passage of gall-stones. A verdict of "Death through misadventure" was returned by the coroner's jury.

PRESENTATIONS TO MEDICAL MEN.—On the distribution of certificates and badges to the St. John Ambulance Class of Abersychan and Talywain, Mon., on May 26th, Mr. John W. Mulligan, M.D. Irel., of Abersychan, was the recipient of a silver-mounted driving whip as a recognition of his instructions to the class.—Mr. P. J. Finigan, L.R.C.P., L.R.C.S. Irel., has been presented with an address and service of plate by his friends in the dispensary district of Carlingford Cooley, county Meath, and neighbourhood, on the occasion of his marriage.—On June 2nd, at a meeting of the ambulance class for Braemar and district held in the Victoria Hall, Auchindryne, Mr. James Noble, M.D. Aberd., of Braemar, the lecturer, was presented with a driving whip and also with a travelling rug having Macduff tartan on one side and Farquharson on the other, thus representing the two estates to which the class belonged.—On June 4th the members of the Curzon-street division of the St. John Ambulance Association, Birmingham, presented Mr. W. A. Loxton, F.R.C.S. Edin., L.R.C.P. Lond., M.R.C.S. Eng., of Birmingham, the honorary instructor of the class, with a stationery cabinet, as a mark of respect.—Mr. D. M. Forbes, L.R.C.P., L.R.C.S. Edin., the medical superintendent of the Shoreditch Infirmary, was the recipient on June 6th of several presents on retiring into private life. On that day, as many of the patients as were able assembled in the open air and presented him with a "literary machine" (reading-desk, lamp, and table combined). A patient, Thomas Landon, who has been under Mr. Forbes's care for many years, handed to him a gilt framed testimonial, on which the good-will of the patients was expressed in the form of an acrostic. Later in the evening the nursing staff and officers assembled at the Nurses' Home to wish him God-speed and to present him with a silver salver and tea and coffee service in recognition of the good work he had successfully carried on at the infirmary for the past thirty years.—Mr. John E. H. Davies, L.R.C.P. Lond., M.R.C.S. Eng., L.S.A., of Wrexham, North Wales, has been presented with a silver-mounted walking-stick, suitably engraved, by the members of the Great Western Railway class of the St. John Ambulance Class as a mark of appreciation of his services as honorary lecturer.—Mr. M. Bryson, L.F.P.S. Glasg., of York, was presented, on June 16th, by the members of the Midland Railway Engineer's Ambulance Class at Denaby, in connexion with the St. John Ambulance Association, with a case of razors, as a token of appreciation for his gratuitous lectures for the past four years.—Mr. R. Hensleigh Walter, M.B., C.M. Edin., of Stoke-under-Ham, Somerset, has been the recipient from the members of the Tintinhull Medical Club, on the occasion of his marriage, of a handsome entrée dish and preserve stand.

THE North London Hospital for Consumption has received a donation of £1000 from "R. S. P.," per Canon Fleming, the rector of St. Michael's, Chester-square, to endow a bed in the hospital.

TYPHOID FEVER AT CAMBORNE.—The Camborne District Council have instructed their clerk to write to the water company informing them that the Council hope such compensation will be paid as will meet the extraordinary expenditure incurred.

AN EXPENSIVE CASE OF SMALL-POX.—At the meeting of the Bideford board of guardians held on June 14th it was stated that a recent case of small-pox at Appledore had cost the Northam Council £94 and there was more to pay.

MR. CHARLES GRIER, M.R.C.S., died at St. Ives, Cornwall, on June 11th. For many years the deceased had an extensive practice in Canada and about eight years ago went to St. Ives, where he soon made many friends. Mr. Grier, who was seventy-six years of age at the time of his death, leaves four sons, one of whom is a member of the profession. Mr. Grier was very popular at St. Ives and much regret is felt there at his death.

ASSAULT ON A MEDICAL MAN.—Recently at the Cheltenham police-court two men were charged with assaulting Mr. J. P. Bevan, L.R.C.P. Lond., M.R.C.S. Eng., and Mr. Brown. On June 4th one of the defendants having struck a woman down Mr. Bevan, who was passing along the street, stopped to see if he could be of any assistance, whereupon he received a blow on the lower jaw which knocked him down, and whilst on the ground he was kicked. Mr. Brown went to his assistance and he also was knocked down. One of the prisoners was sentenced to six weeks' imprisonment with hard labour and the other was fined 28*s*.

A NEW FORM OF TESTIMONIAL.—We are glad to be able to report an interesting variant in the matter of testimonials. On June 8th a meeting was held at the Castle, Ryde, for the purpose of presenting to Dr. A. G. Davey, the senior medical officer of the Isle of Wight Infirmary, a cheque for £1000 to endow a cot in the children's ward of that institution. The following inscription is to be placed upon the cot: "The Alexander Davey Cot.—This cot was named and endowed in perpetuity by the friends of Alexander George Davey, M.D., in recognition of his great professional skill and of the devotion and sympathy with which he has ever sought to alleviate pain and sickness. 1898." The presentation was made by Colonel Cradock, J.P., who gave a short history of the inception of the scheme and alluded to the fact that it had been intended to make the presentation at the end of February. It was, however, found necessary to postpone the function and therefore they had waited until that very appropriate day, Dr. Davey's birthday. Dr. Davey, in reply, thanked all his friends in the warmest way. No merely personal gift could, he said, have given him such pleasure. He had been thirty years on the staff of the hospital and the one thing he wanted now was to live long enough to see the hospital take its proper place as a county hospital and as a training school for nurses. The rector of Whippingham, on behalf of those living outside the borough of Ryde, wished to congratulate Dr. Davey, to wish him "many happy returns of the day," and to hope that he might be spared to them for many years to come. The proceedings terminated with a vote of thanks to Colonel Cradock and the members of the committee.

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS.

Habitual Inebriates Bill.

WHEN this measure goes before the Grand Committee on Law Mr. Hobhouse proposes to move the insertion of words enabling county and town councils, singly or in combination, to contribute to the establishment or maintenance of retreats for inebriates.

Lunacy Bill.

On Tuesday, June 21st, the Lunacy Bill passed the Standing Committee of the House of Lords. Practically the only point in the Bill discussed was the provision requiring local authorities to grant

superannuation allowances to their officers and servants in lunatic asylums, and though an amendment was proposed, it received very little support.

HOUSE OF COMMONS.

THURSDAY, JUNE 16TH.

The Inspection of Match Factories.

Mr. Tennant asked the Home Secretary whether he was aware that in match factories provisions for the health of the workers largely turn upon questions involving structural alterations which by the regulations are *ultra vires* for the women inspectors; whether, when visiting a match factory, a woman inspector has no direct power under Special Rules Nos. 2 and 3 to require the separation of the dangerous from the non-dangerous departments by the erection of a door or an addition to washing appliances by the erection of a basin and tap; and whether such matters must be referred by her to the district inspector.—Sir M. White Ridley replied: Structural questions are undoubtedly very important. Any such questions, other than questions of sanitary accommodation for females, which appear to the lady inspector to require attention are referred by her to the district inspector. It then becomes his duty to take immediate steps to secure the enforcement of the law or of the special rules, to inform the lady inspector of the result, and to forward to headquarters her communication, with a statement of the steps he has taken upon it. This practice applies to all factories, whether special rules are in force or not, and the matters mentioned in the question would in the ordinary course be dealt with in this way.

FRIDAY, JUNE 17TH.

The Army Medical Service.

Captain Norton asked the Under-Secretary of State for War if he could state whether there were sufficient army medical officers in the United Kingdom to meet the full requirements of two army corps upon a war footing without denuding the military medical establishments of the United Kingdom of their entire executive staff and thus disorganising the Army Medical Service both at home and abroad.—Mr. Powell Williams, replying for Mr. Brodrick, said that the Army Medical Staff when at its full strength was fully adequate to meet the requirements of two army corps. Recently the staff had not been at full strength, but in case of general mobilisation there was a reserve of 268 medical officers who could be called upon.

Queen Charlotte's Hospital and Vaccination.

Mr. Channing asked the President of the Local Government Board whether his attention had been called to the case of Elsie Boon, of 116, Euston-road, who was vaccinated when only five days old at Queen Charlotte's Hospital; was he aware that the child's arm was in so serious a state that it had to be treated by Dr. Thompson at the parish dispensary in Clarendon-square, St. Pancras, for the results of vaccination, a few days after leaving the hospital; whether the Local Government Board had given its assent to the conditions under which mothers are admitted to Queen Charlotte's Hospital, which compel the child to be vaccinated within fourteen days of birth; whether he was aware that the average number of children born in the hospital is about 1100; whether the fees payable for the successful vaccination of these children go to the medical staff or to the funds of the hospital; and whether, in the Bill now before Parliament, he would introduce words forbidding compulsory vaccination in hospitals immediately after birth and placing such children on the same footing as other children for whom the period of twelve months is to be allowed.—Mr. Chaplin replied: I have made inquiry as to the case referred to. The child was vaccinated on the sixth day after birth at Queen Charlotte's Hospital and left the hospital quite healthy eight days afterwards. The mother took the child to a tenement house and some five days afterwards paid a single visit to the district medical officer in consequence of an extension of the ordinary areola around the vesicles. I am informed that the case never was serious, that the excess of redness rapidly disappeared and that the child became and remains perfectly well. The conditions under which mothers are admitted to the hospital in question are not subject to the jurisdiction of the board. But I am informed that although vaccination is referred to in a notice as a condition of admission to the hospital, no mother who objects to the vaccination of her child before leaving the hospital is ever compelled to have it vaccinated. The average number of children born at the hospital during the last three years is as stated. The fees for vaccination are received by a member of the hospital staff who acts as public vaccinator. The hon. Member has given notice of an amendment to the Vaccination Bill for which, I think, there is a good deal to be said, to the effect suggested by him, and my views will be stated when the amendment is moved.

The Administration of the Food and Drugs Act.

General Laurie asked the President of the Local Government Board whether he had received a communication from the vestry of Paddington relative to the failure to obtain a conviction against the proprietor of certain stores for selling as coffee a mixture found on analysis to contain 50 per cent. of chicory, and as butter a mixture containing 88 per cent. of margarine; whether he had been informed that the summonses were served by the warrant officer of the Marylebone Police-court, leaving them at the shop, and that the magistrate decided that this was not a service in accordance with Section 20 of the Sale of Food and Drugs Act, 1875, and Section 10 of the Amendment Act, 1879; whether he had been informed it had been ascertained that the defendant has no address in this country other than his stores in various districts and that the same difficulty was experienced in 1896 in connexion with a purchase of coffee from the same defendant, in the same shop, and which coffee was found to be adulterated with 60 per cent. of chicory; and whether he would make such provision in the new Bill it was proposed to introduce or would introduce such amendments in the present Act as would enable local authorities who are anxious to carry out the law to enforce it against those who so persistently sell adulterated food products.—Mr. Chaplin replied: I have received a communication from the Vestry of Paddington containing the statements referred to in the question of my hon. friend and I am considering what amendments of the law may be desirable in view of the circumstances.

The Crypt of St. George the Martyr, Southwark.

Sir Charles Cameron asked the Home Secretary whether he was yet in a position to describe the purport of the Inspector of Burials' report upon the state of matters alleged to exist in the church and crypt of St. George the Martyr, Southwark, and whether he proposed to take any action in connexion with it.—Sir M. White Ridley said, in reply, that the report disclosed a state of affairs which he was satisfied constituted a sanitary danger and he had issued a notice to the churchwardens under Section 23 of the Burial Act, 1857, calling upon them to remove the human remains from the crypt.

Lead Poisoning in the Potteries.

Mr. Tennant asked the Home Secretary whether his attention had been called to the report of the adjourned inquest upon the body of Mary Ann Poole, supposed to have died from lead-poisoning; whether, in view of the very unsatisfactory nature of the medical evidence, he would direct that the body be exhumed and a chemical analysis be conducted; and whether he was now prepared to lay before the House the report of the certifying surgeon in this case.—Sir M. White Ridley replied: My attention has been called to this case. I regret that the medical evidence was inconclusive as to the origin of the epilepsy which was the immediate cause of death. Exhumation is, however, I fear out of the question. This course is never taken except where there is a suspicion of foul play or in very special cases at the request of relatives. I have received the report of the certifying surgeon. Like other reports of the kind it contains confidential information which it would be detrimental to make public. The facts bearing on the cause of death appear to have fully come out at the inquest, at which the factory inspector of the district was present. On that point the report throws no fresh light.—Mr. Woodall asked whether it was not stated in the course of the medical evidence that there were no symptoms in this case which were not attributable to other causes than lead poisoning.—Sir M. White Ridley said he was aware that there were certain marks in the case of death from epilepsy due to lead poisoning which were not present on this occasion.—Mr. Woodall asked whether the jury did not decline to attribute the death to lead poisoning.—Sir M. White Ridley said that was the case.—Sir Charles Dilke asked whether they did not also decline to take an opposite course.—Sir M. White Ridley said that was so and that was what he meant when he said that the verdict was inconclusive. If there were any object to be gained he would be prepared to make further inquiry, but he saw no object.

MONDAY, JUNE 20TH.

Proposed Factory Legislation.

Sir M. White Ridley introduced a Bill to amend the Factory and Workshops Acts, 1878 to 1895, as to the time of employment of women and young persons in processes necessary for the preservation of perishable materials. He explained that in the main the Bill provided exemptions from the Factory Acts for the fish-curing trade connected with Scotland and for creameries in Ireland, both of which were liable to suffer at certain seasons if work were prohibited. The Bill repealed all existing exemptions and enabled the Secretary of State to grant exemptions by means of orders which were strictly defined and which would be laid before Parliament and made subject to the vote of the House. The measure applied only to the hours of daily labour and affected women and young persons, but in no circumstances children, and its scope was confined to processes where exemption was absolutely necessary to preserve perishable materials from destruction.—Sir Charles Dilke took exception to the Bill as a relaxation of factory legislation and announced that he would oppose it on that and other grounds.

Before the close of the sitting, Sir Charles Dilke gave notice that on the second reading of the Bill he would move: "That this House regrets that it should be proposed to amend the Factory Acts by relaxing the law as to fish curing without dealing at the same time with lead processes in the potteries, with the use of phosphorus, and with the failure of the sweated districts clause."

Dangerous and Injurious Employments.

On the motion of Mr. Hedderwick a Bill was introduced "to extend the provisions of the Workmen's Compensation Act, 1897, to injuries to health and loss of life suffered by persons employed in certain dangerous and injurious occupations."

THE VACCINATION BILL.

PROCEEDINGS IN THE GRAND COMMITTEE.

The Grand Committee of the House of Commons on Law met again on Friday, June 17th, with Sir Henry Campbell Bannerman in the chair, for the consideration of the Vaccination Bill introduced and promoted by the Government.

Discussion was resumed upon the amendment moved by Sir Walter Foster at the previous sitting to insert in Clause 1 of the Bill the following words, viz.:—"2. Where a child is by this Act required to be vaccinated within a certain time (hereinafter called the appointed time) the parent or person having the custody of the child may, not less than two months before the expiration of the appointed time, make in the prescribed form a statutory declaration of conscientious objection to the vaccination of the child, and if the statutory declaration is within seven days after its date delivered to the registrar of births for the district in which the child resides the registrar shall register the same, and shall, if required, deliver to the parent or other person making the declaration a certificate of such registration, and shall also send a copy of the certificate to the public vaccinator of that district, and thereupon an order shall not be made or proceedings taken with reference to the non-vaccination within that appointed time of the child mentioned in the certificate. 3. The parent or other person registering a statutory declaration under this section shall, if he requires a certificate of such registration, pay to the registrar the prescribed fee for a certificate of registration."

Mr. Logan, speaking as one who represented people with conscientious objections to vaccination, appealed to the committee to modify the Bill in the manner suggested by the amendment and by the recommendation of the Royal Commission on Vaccination. In one of his speeches the President of the Local Government Board had spoken of there being only one prosecution for each child, but he (Mr. Logan) was advised that there might be three prosecutions and the total expenses and costs to the parent might be as much as £4 per child. This Bill, he said, did not pretend to enforce compulsory vaccination, for it contained a provision whereby those who suffered a certain amount of inconvenience and persecution would not be troubled any

more. That was not enforcing compulsory vaccination; it was merely punishing a man for conscience' sake. It would punish the well-to-do just a little, but the poor it would punish cruelly and in some cases utterly ruin. The Royal Commission in their report said that there would have been more persons vaccinated if the law had been enforced with more discretion. With that he absolutely agreed. Men in his constituency (Harborough Division of Leicestershire) had been prosecuted 17 times and a man was sold up the other day and he would be sold up a hundred times before he would have his child vaccinated. Persistent prosecutions which were contemplated under this Bill were certain to arouse hostility throughout the length and breadth of the country and they would create sympathy with the prosecuted and lead to a further defiance of the law and he appealed to the Government in the interests of law and order if nothing else to accept this amendment. If they did not and the Bill went to the country in its present form the troubles and difficulties which vaccination officers and others who tried to enforce vaccination had experienced in the past would be mere child's play to what they would experience in the future.

Mr. Carlile said he was a believer in the efficacy of vaccination and had perfect faith in the safety of calf lymph and he was prepared to support this amendment. His wish was that vaccination should be increased and made more popular and he was perfectly certain that the only way to do that was to kill the present agitation against it. He had been at some trouble to find out the wishes of the medical profession in his own constituency (North Bucks) and with one exception they believed in an amendment such as that now proposed. Personally he should very much like to see the promoters of the Bill taking a stronger line altogether. In the elections of 1892 and 1895 the question of vaccination was often raised and on both occasions he gave an evasive reply for the simple reason that it was the only thing to do. His opinions were not very strong then and he thought it better to wait until the Royal Commission reported. He was not a medical man and could not claim the knowledge of the subject which the Royal Commission had and therefore he gave this reply. Now the Royal Commission had reported and having read the report and in fulfilment of his pledge he was going to support the recommendation of the Royal Commission which said most emphatically that conscientious objection should be allowed.

Sir William Priestley said that while in this matter he was very much in accord with Sir Walter Foster he regretted he could not support his amendment. They were both most anxious to promote vaccination by every means in their power but he took a somewhat different view from him with regard to this matter. All those who knew anything about this subject were of opinion that a very large number of those—by far the largest number of those who now allowed vaccination to go by default—were not conscientious objectors but parents who were careless and heedless of their children. There was no doubt about this, and it was emphasised in the report of the Royal Commission. He took it that the trend of the opinion of the Commission was not that penalties should be abolished altogether but that repeated penalties which were so irritating should be abolished. His view was that penalties should not be abolished altogether, but after the first penalty which would whip up all the indifferent parents they, at any rate, should try to disarm all those who had conscientious objections by not pursuing the penalties further. The object, of course, was to make vaccination more efficient. He was very much in sympathy with many of those parents who really believed that if their children were injured by vaccination it was very hard indeed to impose it upon them. He believed they were absolutely wrong. He thought they had been misled by agitators. The whole scientific world, so far as its best members were concerned, was unanimously in favour of vaccination. On one occasion, when Oliver Cromwell was extremely angry with the Assembly in Edinburgh, he said: "I beseech you by the mercy of God to consider that you may be mistaken." He (Sir William Priestley) would say that to those who were opposed to vaccination, to consider whether it was not possible that they might be wrong in this matter. What he suggested was not that the parent should go scot free after the first penalty was inflicted—that would be illogical; but that after the first one the penalty should be suspended, say, until the child was four years of age, when it was likely to go to school and become a source of danger to other children. He would then give the parent with conscientious objections an opportunity of making a statutory declaration.

Colonel Long moved in the place of "parent or person having the custody of the child" to insert "father of the child, or if the father is dead or the child illegitimate then the mother of the child."

Mr. Chaplin intimated in a few words that so far as he was concerned he must oppose both the amendment and this amendment to it.

Sir Charles Cameron said he was extremely sorry to hear this intimation. He was a firm believer in vaccination. He had devoted many years to the study of it and the more he studied the firmer became his belief. He agreed with the Royal Commission that vaccination would have been very much more general had it not been for errors in the administration of the law. The chief of these had been the creation of martyrs. Every martyr who had been created by the operation of the vaccination laws had become the centre of an agitation against them. It had been said that this proposal was illogical, but the whole thing was illogical. The State at the present moment said, "You must vaccinate the child," but if the parent refused the State did not vaccinate the child—it simply punished the parent for not doing what it would not undertake itself. Until very recently repeated penalties were never enforced in Scotland and the consequence was that martyrs had not been created, and until the very latest years anything like organised resistance and agitation against vaccination had been unknown in Scotland. In all the circumstances he thought the amendment of Sir Walter Foster met the case. A number of children might go forth into the world unvaccinated if it were carried, but a vast number did so at present, and the question was whether they would not bring about a better state of things by adopting this proposal than by insisting upon the course which Mr. Chaplain had foreshadowed.

After there had been some discussion among the legal members of the Committee as to the meaning and necessity of Colonel Long's amendment to the amendment Colonel Long agreed to withdraw his proposal altogether.

Colonel Long then moved to substitute for "statutory declaration" the words "declaration before not less than two magistrates in petty sessions or before any of the persons authorised to administer oaths by the Commissioners for Oaths Act, 1889."

This amendment was defeated by 28 to 15 votes and thereafter the Committee resumed the discussion of Sir Walter Foster's amendment as originally proposed.

Mr. Radcliffe Cooke submitted that a great deal too much had been made of the conscientious objectors to vaccination. He believed there would not be one in a hundred of them if it were not for paid agitators who kept instilling in the minds of the ignorant doctrines which in their heart they knew to be false. If they took the case of Gloucester they found that the moment these conscientious objectors saw they were likely to die from small-pox they hurried off to the public vaccinator. He objected to the amendment, believing that if they were to have a law they must have one with some force in it and not one which could be obeyed at pleasure.

General Russell said that as a matter of expediency, purely in the interests of vaccination, he was prepared to urge the Government to accept such an amendment as had been proposed.

Mr. Hazell also spoke in support of the amendment.

Mr. Chaplin said that the Government were perfectly aware of all the difficulties in connexion with this exceedingly thorny question, and it was because he recognised the extent of the feeling in certain classes—feeling which he regarded as to a great extent the result of popular ignorance and the clamour raised upon the question—that he felt it his duty to propose this fresh legislation and to resist the amendment now proposed. It had been stated with perfect truth that this amendment embodied the recommendation of the Royal Commission, although he was bound to say that the members of the Commission were not wholly unanimous on this particular point. There were, however, two considerations which had always weighed with him in this connexion. The first of them was that a very large number of children throughout the country remained unvaccinated at the present moment, not so much from any deep-rooted dislike on the part of the parents to vaccination in itself, but owing largely to their carelessness and neglect to perform their duty. Another consideration was that with the law amended, as he hoped it would be in the future, and with many of the present objections, in which there was great force, to vaccination removed, it was not unreasonable on his part and that of the Government to hope and expect that a better feeling would prevail in the country and that much of the present opposition would vanish. He was willing to make this admission, that when he read and studied the report of the Commission he thought there might be something in their proposal and he was prepared to, and did, most carefully consider it, but later information on the subject had entirely decided him against it. It must be remembered that the Commission reported in 1893 and a good deal had happened since then. A great deal of information bearing on this subject had come to his notice at the Local Government Board which was not before the Royal Commission and which, if it had been, probably would have very considerably modified their views. He begged the Committee to observe what the difference was between the mover of the amendment and himself. They were absolutely at one as to the importance and necessity of vaccination; they were also both agreed as to the great advantages of the new methods by which it was proposed to carry out vaccination; where they differed was as to the best means of accomplishing their common objects. The mover of the amendment believed in objectors being allowed to make a statutory declaration. He (Mr. Chaplin), on the other hand, believed that if that were done in many districts of the country vaccination would become a dead letter altogether. It happened that at the present moment the Local Government Board had some experience of the system advocated in the amendment. It appeared that in the union of Barton Regis, near Bristol, the guardians pending fresh legislation had taken the law into their own hands. Acting, he supposed, on suggestions contained in the report of the Royal Commission these guardians some eighteen months ago elected to issue a circular on their own account to this effect. It set forth that the vaccination officer had informed the guardians that the person addressed had not had his child vaccinated and that the officer had given the usual notice. Having given these and other particulars the circular went on to say: "If you have a conscientious conviction that the vaccination of your child is calculated to do it injury, and will furnish me a declaration to that effect within fourteen days from the date of this letter on a form which you can get from me, and which must be signed by yourself and witnessed by a magistrate, the guardians will favourably entertain your objection." That was to say the guardians would take no further steps in the matter. Now what had been the effect of this action? First, he was informed there was an increasing demand for these forms, a demand made daily, and the result was that parents who had been in the habit of getting their children vaccinated as a matter of course and without mishap of any kind now applied for the forms and had their children vaccinated no longer. Conscientious objectors, as it was described to him, were springing up like mushrooms and whole districts were in danger of remaining unvaccinated altogether. The system only began in 1896 and out of 300 cases reported in default in the last two quarters of 1897 no less than 183 availed themselves of this expedient. He submitted to the Committee with all seriousness that if this was what was being done while the system was illegal, what was likely to be the case if the system were sanctioned and encouraged by the actual passing of a law? Remember this also, that they would have the Anti-Vaccination League ceaselessly working for the great object they had in view—namely, the abandonment of vaccination altogether—everywhere encouraging and assisting and organising conscientious objections by the thousand. What a weapon for evil they would be putting in the hands of this body. If a single board of guardians could accomplish these results illegally in two quarters of a single year, what would be the effect all over the country with the Anti-Vaccination League absolutely unchecked in their operations? The birth population of this country was estimated at 922,000. According to the vaccination returns 150,000 remained unvaccinated in 1895. In 1897 the return had increased to something like 250,000 and at the present moment he did not hesitate to say it was 300,000, or one-third of the entire birth population. He was perfectly aware that with these facts before him he laid himself open to much blame for going so far as he had done in agreeing that repeated prosecutions should not be permitted, but if he were to accept this further demand it would not only be fatal to the future of vaccination, but in his judgment it would be to invite a recurrence, continuance, and repetition of those disastrous epidemics of small-pox which had occurred too frequently all over the country. It had been said that they must abandon compulsion—that

the Royal Commission had killed it. That was a counsel of despair and he refused for a moment to entertain it. Great and beneficent results had been obtained in Germany, small-pox almost having been stamped out. How was it done in Germany? By compulsion; and what Germans had done in Germany surely Englishmen could do in England if they had only the pluck and determination to try and the courage to face popular clamour and ignorance. He hoped that under the scheme of this Bill they would accomplish something of what had been done in Germany and he relied on the patriotism and the courage and the judgment of the Committee to assist him.

Mr. Channing asked why if the President of the Local Government Board had so much belief in Germany he had not proposed the methods of compulsion adopted in that country.

Sir Charles Dalrymple said that in spite of the strong speech of the President he stood by the report of the Royal Commission which he had signed. The state of things in Barton Regis was startling and unsatisfactory, but there was all the difference in the world between the independent action of one board and that which was authorised after careful consideration by an Act of Parliament.

The Solicitor-General (Sir Robert Finlay), speaking against the amendment, said that the proposed declaration would be made with absolute impunity because it would be idle to talk of a prosecution for making a false declaration.

After some further discussion the debate on the amendment was adjourned until the next meeting of the Committee.

The Committee met again on Tuesday, June 21st, and resumed the debate on Sir Walter Foster's amendment, which in the end was lost by 2 votes, 26 voting against it and only 24 in its favour.

Appointments.

Successful Applicants for Vacancies, Secretaries of Public Institutions, and others possessing information suitable for this column, are invited to forward it to THE LANCET *Office, directed to the Sub-Editor, not later than 9 o'clock on the Thursday morning of each week for publication in the next number.*

BARRS, A. G., M.D. Edin., F.R.C.P. Lond., has been appointed Professor of Medicine, Victoria University (Yorkshire College), vice J. E. Eddison, resigned.

BEATTY, W. J., L.R.C.P. Edin., L.F.P.S. Glasg., has been appointed Medical Referee under the Workmen's Compensation Act for the County Court District of Stockton-on-Tees, County Court Circuit No. 15.

BILL, J. FRANCIS, M.B. Lond., M.R.C.S., L.R.C.P., has been appointed Senior Resident Medical Officer for the London Temperance Hospital, Hampstead-road, N.W.

BONNEY, W. F. V., M.B., B.S., M.R.C.S., L.R.C.P., has been appointed Resident Medical Officer to the Chelsea Hospital for Women.

BROWN, W. H., F.R.C.S. Irel., M.R.C.S., of Leeds, has been appointed Medical Referee under the Workmen's Compensation Act, 1897.

CLARK, W. ADAMS, M.D., M.R.C.S., L.R.C.P., has been appointed Clinical Assistant to the Chelsea Hospital for Women.

COOKE, G. H., M.D. Lond., L.R.C.P., M.R.C.S., has been appointed Medical Referee under the Workmen's Compensation Act for the Birkenhead County Court District.

DENNY, E. B., L.R.C.P. Edin., L.R.C.S. Irel., has been appointed Medical Officer for the Hainton Sanitary District of the Louth Union.

ELLIS, W. H., M.R.C.S., has been appointed Medical Referee under the Workmen's Compensation Act for County Court Circuit No. 11, Shipley, Yorks.

EVANS, T. H. FENCOTT, M.R.C.S., L.R.C.P., has been appointed Medical Superintendent for the Small-pox Lazaretto at Rietfontein, South Africa.

FAWCETT, HENRY, M.D., B.S. Durh., has been re-appointed Medical Officer of Health by the Middlesbrough Rural District Council.

FRASER, P., M.D. Edin., has been re-appointed Medical Officer of Health by the Llanrwst Urban District Council.

FURNESS, T., L.D.S., F.P.S. Glasg., has been appointed a Dentist for the Industrial Schools by the Chesterfield Board of Guardians.

GIBB, R. S., M.B., C.M. Aberd., has been appointed Medical Officer of Health for Berwickshire.

GOLDING-BIRD, C. H., M.B. Lond., L.R.C.P., F.R.C.S., has been appointed an Examiner in Surgery at Cambridge University.

HENCHLEY, A. R., L.R.C.P.E., L.R.C.S.E., L.F.P.S. Glasg., has been appointed Junior House Surgeon for the General Dispensary, Nottingham.

HUNTER, G. H., M.R.C.S., has been appointed Medical Officer for the Haughley Sanitary District of the Stow Union.

HUNTER, R. C., L.R.C.P. Edin., M.R.C.S., has been appointed Medical Referee under the Workmen's Compensation Act for Pontypridd, the Rhondda Valleys, Aberdare Merthyr, and Breconshire.

LAVERY, ANTHONY, L.R.C.P. & S. Edin., has been appointed Clinical Assistant for the Birmingham and Midland Hospital for Skin and Urinary Diseases.

LEIGH, J. DICKINSON, M.B., F.R.C.S., D.P.H. Edin., of Scarborough, has been appointed Medical Referee under the Workmen's Compensation Act, 1897, for the Malton, Whitby, and Scarborough Districts.

LEWIS, F., L.R.C.P. Lond., M.R.C.S., has been appointed Medical Officer for the Fifth Sanitary District of the Stevning Union.

LEWIS, J. K., M.R.C.S., has been appointed Medical Officer for the Rewe Sanitary District of the St. Thomas Union, Devon.

MACGREGOR, P., L.R.C.P., F.R.C.S. Edin., has been appointed Medical Referee under the Workmen's Compensation Act for the Huddersfield County Court area.

MITCHELL, T., M.D. Glasg., D.P.H. Cantab., has been re-appointed a District Medical Officer of Health by the Llangyfelach District Council.

MORGAN, E. R., M.R.C.S., has been appointed Medical Referee under the Workmen's Compensation Act for the County Court District No. 30, which includes the County Court Districts of Swansea and Bridgend, and has been re-appointed a District Medical Officer of Health by the Llangyfelach District Council.

NASH, W. GIFFORD, F.R.C.S., has been appointed a Medical Referee under the Workmen's Compensation Act for County Court Circuit No. 35, which includes Bedford and several adjacent towns.

NORTON, E. E., L.R.C.P. Lond., M.R.C.S., D.P.H., has been appointed Medical Officer for the Shoreditch Board of Guardians.

PETHICK, C. S., M.B., B.C. Camb., L.R.C.P. Lond., M.R.C.S., has been appointed Medical Referee under the Workmen's Compensation Act for the County Court Circuit of St. Helens and Widnes.

PORTER, J. F., M.D. Dub., M.R.C.S., has been re-appointed Medical Officer of Health by the Helmsley Rural District Council.

ROBINSON, H., M.B., C.M. Edin., has been appointed Medical Officer for the Cottage Homes of the Soulcoates Union.

SAYERS, M. H., M.R.C.S. Eng., L.R.C.P. Lond., has been appointed House Surgeon to the Royal Berks Hospital, Reading.

SYRETT, E. F., M.D. Durh., L.R.C.P. Lond., M.R.C.S., has been appointed Medical Officer for the Seventh Sanitary District of the Sudbury Union.

THYNE, W., M.D., C.M., L.R.C.P., L.R.C.S., has been appointed Clinical Assistant to the Chelsea Hospital for Women.

TUXFORD, A., M.D. Edin., has been appointed Medical Referee under the Workmen's Compensation Act for the County Court Circuit No. 17, of Boston, Holbeach, Sleaford, Spalding, and Spilsby.

WALLACE, A. J., M.D. Edin., has been appointed Honorary Assistant Medical Officer for the Hospital for Women, Shaw-street, Liverpool, vice J. E. Gemmell.

WATSON, C. GORDON, M.R.C.S., L.R.C.P. Lond., has been appointed Assistant House Surgeon for the Norfolk and Norwich Hospital, Norwich.

WEBB, T. L., L.R.C.P. Lond., M.R.C.S., has been appointed Honorary Pathologist for the Salop Infirmary.

WHITAKER, E. T., M.B., Ch.M., B.Sc., F.C.S., D.P.H., has been appointed Medical Officer of Health by the Oakengates Urban District Council.

WIGHAM, W. HARPER, M.B. Durh., M.R.C.S., has been re-appointed Medical Officer of Health by the South Molton (Devon) Urban District Council.

WILLIS, A., M.R.C.S., has been appointed Medical Officer for the Sixth Sanitary District of the Newmarket Union.

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index).

BIRKENHEAD AND WIRRAL CHILDREN'S HOSPITAL, Woodchurch-road, Birkenhead.—House Surgeon. Salary £50, with board, apartments, and laundry. Applications to Mr. F. H. Carver, Hon. Sec., 5, Rumford-place, Liverpool.

BLACKBURN INFIRMARY.—Locum Tenens from July 1st for six weeks to perform the duties of House Surgeon. Terms two guineas per week and travelling expenses paid.

BRISTOL ROYAL HOSPITAL FOR SICK CHILDREN AND WOMEN.—Registrar (Honorary).

CANCER HOSPITAL (FREE), Fulham-road, S.W.—House Surgeon for six months. Salary at the rate of £50 per annum, board and residence.

CARDIFF INFIRMARY.—Assistant House Physician for six months. Board, washing, and apartments provided, and an honorarium of £10.

COUNTY OF LANARK, District of the Middle Ward. Resident Physician for the Middle Ward Isolation Hospital. Salary £140 per annum, with board, &c. Applications to Mr. T. B. Ferguson, County Buildings, Hamilton.

WEST LONDON POST-GRADUATE COURSE (West London Hospital, W.).—5 P.M. Mr. C. B. Keetley: The Treatment of the Various Kinds of Hernia.

THURSDAY (30th).—CENTRAL LONDON THROAT, NOSE, AND EAR HOSPITAL (Gray's Inn-road, W.C.).—5 P.M. Dr. D. Grant: Diseases of the Sphenoidal and Ethmoidal Cells.

CHARING-CROSS HOSPITAL.—4 P.M. Dr. A. Routh: Demonstration of Gynæcological Cases. (Post-graduate Class.)

Notes, Short Comments, and Answers to Correspondents.

EDITORIAL NOTICE.

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITORS," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff. It is urgently necessary that attention be given to this notice.

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this Office.

Lectures, original articles, and reports should be written on one side of the paper only, AND, WHEN ACCOMPANIED BY BLOCKS, IT IS REQUESTED THAT THE NAME OF THE AUTHOR, AND IF POSSIBLE OF THE ARTICLE, SHOULD BE WRITTEN ON THE BLOCKS TO FACILITATE IDENTIFICATION.

Letters, whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers, not necessarily for publication.

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor."

Letters relating to the publication, sale, and advertising departments of THE LANCET should be addressed "To the Manager."

We cannot undertake to return MSS. not used.

MANAGER'S NOTICE.

THE INDEX TO THE LANCET.

THE Index and Title-page to Vol. I. of 1898, which is completed with the issue of to-day, will be given in the next number of THE LANCET.

"THE CAPACITY OF THE FEMALE BLADDER."

To the Editors of THE LANCET.

SIRS,—Owing to absence from town it was only to-day that I read in THE LANCET of May 21st, p. 1397, that Dr. Simpson asks what is the largest quantity of urine which has been drawn off from the female bladder. I find in the *British Medical Journal*, 1885, vol. i., p. 177, a note of Mr. W. H. Green, stating that he has drawn off nine imperial pints (180 oz.).

I am, Sirs, yours faithfully,
Geneva, June 9th, 1898. A. CORDES, M.R.C.P.Lond.

ANNUAL ERYSIPELAS.

To the Editors of THE LANCET.

SIRS,—I have a patient, aged thirty-four years, who has had since 1892 annual attacks of erysipelas chiefly confined to the nose. Each attack follows a cold and commences with a rigor, and in four consecutive years the attack has commenced in the month of March and on the same day of the month. His father had erysipelas when nineteen years of age. Other than that I can find no cause for the repeated attacks. My patient is steady and very regular in his habits, and is very much annoyed at the frequency of the attacks which necessitate his staying from work (that of a fitter) for ten days or so each time. Will anyone be good enough to suggest the probable cause and the best line of treatment as a preventative? I am, Sirs, yours faithfully,
June 20th, 1898. M.B. AND C.M.

A PLUCKY HOSPITAL PORTER.

AN inquiry was held on June 11th by Mr. Langham, the City and Southwark coroner, into the circumstances attending the death of Frederick Webb, who died in Guy's Hospital. The patient was suffering from pneumonia and, according to the evidence of his widow, was addicted to drink. He was admitted to the hospital on June 7th. The hospital porter deposed that on the morning of June 8th at about a quarter-past nine he saw deceased get out of the window of one of the wards and drop a distance of some 6 ft. on to a parapet. He (the porter) got a ladder and managed to get hold of deceased, who struggled with him, when another porter came to help. They all fell and rolled to the edge of the parapet, when deceased suddenly became quiet. He was taken back to the ward, but died within five minutes of being put back into bed. The house surgeon gave evidence that the cause of death was cardiac failure following upon exertion, and a verdict in accordance with this evidence was returned. It should be added that the night nurse deposed that Webb had slept quietly all night until ten minutes to nine. It is, of course, well known that sudden accesses of delirium are common in pneumonia, during which patients are likely to do rash acts, but we do not suppose that this unfortunate man knew in the least what he was doing or had any suicidal intent. The porter deserves every credit for his pluck, for to struggle with a delirious patient upon a roof is by no means a safe thing to do.

"VESALIUS."

To the Editors of THE LANCET.

SIRS,—In reply to "Frequent Correspondent" in THE LANCET of June 18th I beg leave to inform him that a paper by J. M. Ball on Andreas Vesalius, the Greatest of Anatomists, appeared in the *St. Louis Medical and Surgical Journal*, 1897, vol. lxxii., pp. 9-21.

I am, Sirs, yours faithfully,
June 22nd, 1898. W. F.

THE TREATMENT OF SEA-SICKNESS.

To the Editors of THE LANCET.

SIRS,—As I am shortly sailing as surgeon on a passenger boat I should be much obliged if you or your readers could tell me what treatment for sea-sickness they have found, from personal experience, to be the best as to diet, medicine, &c. The majority of the text-books are practically silent on the subject. I am, Sirs, yours faithfully,
June 18th, 1898. M.R.C.S., &c.

Justitia may be alluding to the case, but apparently he does not know all about it. He will nowhere find in our remarks any attempt or intention to bolster up the position of the unfit. But it is for the general practitioner to recommend to a patient the need for consultation; and if a consultant, whether practising on general or special lines, is aware that his practice is growing at the expense of his fellow practitioners through the kind offices of a tradesman, it is, in our opinion, his duty to beg the tradesman to desist from volunteering his praises. If the tradesman is distinctly asked to name a medical man of course there is no harm in his doing so, but the gist of the matter to which we have referred is that, according to our informant, the tradesman was not asked.

Mr. Charles Nye.—The pamphlet is unsuitable for public circulation in the way that all quack literature is unfit. It is a direct invitation to the public to find themselves martyrs to neurasthenia and dysmenorrhœa, to say nothing of organic disease of kidneys, bladder, &c. Of course the remedial action of the nostrum is purely imaginary.

The Wedding Garment.—There does not seem to us any suggestion that the expense of the robes should be borne by the College. We do not see the force of the simile, "when suitably attired as so many old ladies," while we are certain that the cause of reform was never advanced by rudeness.

Provincial.—We cannot hazard a guess as to which course would be the most remunerative, but a man is generally paid best for what he does best. Surely our correspondent is not equally equipped in all directions. Has he no bias or special knowledge?

Medical Ethics.—We agree with our correspondent that the publication of such a list places the profession frankly in the category of tradesmen bidding for the support of the visiting population.

M.B. B.Ch., R.L., and *Qual. Asst.*—We have received several letters on the subject with which our correspondents deal for which we are unable to find room, at any rate in this issue.

Rusticus will find letters in our columns this week and in previous issues of THE LANCET giving publicity to different sides of a vexed question.

Poste Restante, Glasgow.—We will obtain the information if possible; in any case it will take a few days to procure it.

Apothecary's course is the right one.

During the week marked copies of the following newspapers have been received: *Lancashire Express, Newcastle Weekly Chronicle, Western Mercury, Times of India, Pioneer Mail, Eastern Morning News, Harrogate Advertiser, Architect, Sun, Kingston News, Leeds Mercury, Builder, Sheffield Telegraph, Scotsman, Citizen, Birmingham Gazette, Bristol Mercury, Glasgow Herald, Croydon Guardian, Herald of Wales, Berkhampstead Times, Stafford Advertiser, Liverpool Daily Post, Worcester Herald, Sussex Daily News, Bedfordshire Times, Manchester Courier, Yorkshire Post, Derbyshire Times, Leicester Post, Portsmouth Times, Brighton Gazette, Sanitary Record, Local Government Chronicle, City Press, Hertfordshire Mercury, Reading Mercury, Staffordshire Sentinel, Mining Journal, Le Courrier de la Presse, Local Government Journal, Weekly Free Press and Aberdeen Herald, Guy's Hospital Gazette, Isle of Wight County Press, Surrey Advertiser, Hong-Kong Weekly Press, Manchester Weekly Times, Le Temps, Epsom Herald, Derbyshire Courier, Western Mail, Kidderminster Sun, West Middlesex Herald, Guernsey Advertiser, Inverness Courier, Rawtenstall Times, Sevenoaks Chronicle, Tadcaster News, &c., &c.**

Communications, Letters, &c., have been received from—

A.—Dr. R. Y. Aitken, Blackburn; Messrs. Allen and Hanburys, Lond.; Mr. A. E. Abrahams, Lond.; Messrs. Armour and Co., Lond.; Dr. G. A. Abrath, Bradford; A. S.; "Amiral" Soap Syndicate, Lond.

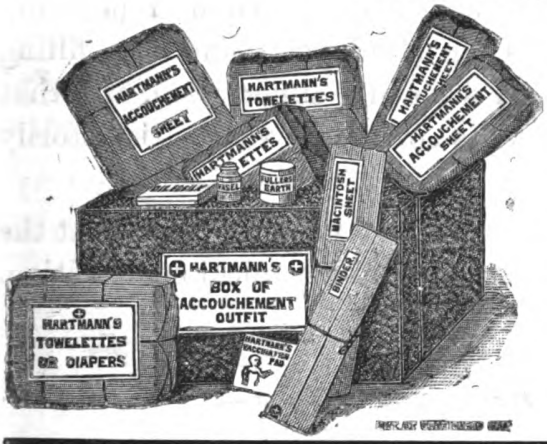
An original and novel feature of "THE LANCET General Advertiser" is a Special Index to Advertisements on pages 2 and 4, which not only affords a ready means of finding any notice, but is in itself an *additional* advertisement.

Advertisements (to ensure insertion the same week) should be delivered at the Office not later than Wednesday, accompanied by a remittance.

Answers are now received at this Office, by special arrangement, to Advertisements appearing in THE LANCET.

The Manager cannot hold himself responsible for the return of testimonials, &c., sent to the Office in reply to Advertisements; copies only should be forwarded.

Cheques and Post Office Orders (crossed "London and Westminster Bank, Westminster Branch") should be made payable to the Manager, Mr. CHARLES GOOD, THE LANCET Office, 423, Strand, London, to whom all letters relating to Advertisements or Subscriptions should be addressed.



THE LANCET can be obtained at all Messrs. W. H. Smith and Son's and other Railway Bookstalls throughout the United Kingdom. Advertisements are also received by them and all other Advertising Agents.

Agent for the Advertisement Department in France—J. ASTIER, 8, Rue Traversière, Asnières, Paris.

IMPROVED OBSTETRIC REQUIREMENTS.

RISK OF PUERPERAL SEPTICÆMIA

IS REDUCED TO A MINIMUM BY USING

HARTMANN'S

COMPLETE

GUINEA OUTFIT FOR ACCOUCHEMENT.

It contains 3 different sizes of Hartmann's Absorbent Wood Wool Sheets, 4 dozen Hartmann's Hygienic Towelettes, Binder, Safety Pins, Antiseptic Ointment, Thread, Umbilical Pad, Fuller's Earth, Oiled Silk, Mackintosh Sheeting, &c.

It affords great cleanliness and comfort to the patient, and diminishes the risk of puerperal fever.

Too much attention cannot be given in selecting the best articles for use during confinement; and in the interest of their patients we ask physicians to recommend Hartmann's Complete Guinea Accouchement Outfit.

A Smaller Outfit is also put up, price 10/6.

REDUCED PRICES to DOCTORS & NURSES.

The above Boxes will be sent to any Medical Man or Nurse on receipt of 19/- or 9/6.

HARTMANN'S HYGIENIC WOOD WOOL TOWELETTES.

Five Sizes—but one Quality.
From 6d. to 2s. per Doz.

Put up in the following sizes:—

In BROWN paper, -/6 per doz. size (our new halfpenny size).
In WHITE paper, 1/- per doz. size.
In BLUE paper, 1/4 per doz. size (new make).
In GOLD paper, 2/- per doz. size.
In YELLOW paper, 2/- per doz. size (special make for use after accouchement).

} Superior to any other make.

FOR HOME USE, DELICATE HEALTH, FOR LADIES TRAVELLING AND ACCOUCHEMENT THEY ARE INVALUABLE AND INDISPENSABLE. THEY ARE SOFT, LIGHT, ANTISEPTIC, AND ARE SUPPLIED AT THE ACTUAL COST OF WASHING. AFTER USE THEY ARE SIMPLY BURNT.

Carriage Paid to the Medical Profession only. Samples free on application.
Sample Packets of 1 dozen at 2/-, 1/4, 1/-, and -/6, post free; or 12 Packets at 19/6, 13/6, 9/6, and 5/6.

ACCOUCHEURS WILL FIND IT A GREAT COMFORT TO THEIR PATIENTS BY USING

HARTMANN'S SANITARY WOOD WOOL SHEETS

For Accouchement, Bedsores, Operations, &c.

PERFECTLY ANTISEPTIC, CLEAN, & COMFORTABLE.

The most comfortable Appliance for Accouchement ever made. "Risk of Puerperal Fever diminished."

A Great Boon for Patient, Nurse, and Physician in attendance.

Used in the Principal Lying-in Hospitals of London, Manchester, Edinburgh, Glasgow, &c.

These Sheets are made of Hartmann's Patent Wood Wool Wadding, the most absorbent substance ever known. They are most comfortable and healthy, are perfectly antiseptic, have not the disagreeable smell so common to indiarubber sheets, and are much cheaper. In Accouchement a large sheet is laid under the patient, it absorbs the discharge completely, and is SIMPLY BURNT after use. No soiled clothes; risk of puerperal fever greatly lessened; and perfect comfort and cleanliness.

Prices of the Three Sizes - - 1/-, 1/6, and 2/6.

Sizes: 24 by 18 in., 26 by 20 in., 32 by 32 in.

Reduced Prices to Doctors and Nurses.

BUDAPEST, *January 27th, 1898.*

CERTIFICATE.

At the request of the Apenta Company of Budapest, I hereby certify to them that I have for a considerable time repeatedly examined the **APENTA SPRINGS** at Ofen (Budapest) and the filling of the water, which were placed under my scientific supervision, and that I have become convinced that the working is conducted very satisfactorily from a hygienic point of view.

I have also satisfied myself by repeated personal investigations that the **APENTA WATER** as despatched is constant in its chemical composition.

Josef von Fodor

Palatable.

BAKED BY ALL

HOVIS BREAD

FAMILY BAKERS.

Nutritious.

BOVRIL

is prepared by a process which retains the entire nourishing as well as the stimulating properties of Prime Ox Beef, thereby differing from ordinary fluid extract of Beef or meat extracts, which merely stimulate without nourishing.

BOVRIL is manufactured under the supervision of eminent Analysts, and every package is guaranteed.

INVALID BOVRIL

is specially made for use in the sick room, being highly concentrated and containing no seasoning. INVALID BOVRIL is a perfect Beef Tea *plus* the Albumen and Fibrine of Beef in a form capable of digestion and assimilation by the most sensitive and debilitated stomach, thus providing the substantial nourishment necessary to furnish renewed strength and vitality to carry the patient through the crisis of an ailment to convalescence and recovery.

VIROL

is an ideal strengthening Food for Infants, Growing Children, Invalids, and others. It enriches the blood, and supplies all the elements for growth and nutrition, being composed of finest Extract of Malt, Bone Marrow, Fresh Eggs, and Lemon Juice. It is extremely palatable, and may be used with advantage in place of nauseating mixtures of cod-liver oil.

Re PHENACETINE.

IMPORTANT WARNING to MEDICAL MEN.

As discoverers and original makers of this **safe and valuable antipyretic,** we consider it to be our duty to **warn** the Medical Profession that an adulterated substance is now on the market, and is being sold as genuine Phenacetine. (*Vide* current Chemical and Pharmaceutical periodicals.) Our name is so well known in connexion with this product, that, for our reputation's sake, we are compelled to issue this notice.

Medical Men can protect themselves and their patients, and can rely upon obtaining a thoroughly pure product by adding the name BAYER when prescribing Phenacetine.

PHENACETINE-BAYER

is the pure and original product: the name is a guarantee of purity. Phenacetine-Bayer is put up in 4, 5, 8, and 16 grain Tablets, as well as in the Powder and Crystal form.

Samples and Literature can be obtained on application to the Wholesale Depots for all Bayer's Pharmaceutical Specialties—

ELBERFELD FARBEN FABRIKEN CO., Ld., 19, St. Dunstan's Hill, LONDON, E.C.

Also at MANCHESTER, GLASGOW, and BRADFORD.

Veritable Ferruginous Salt assimilable

Discovered by **M. Maurice ROBIN** in **1881**

Fac simile of the box reduced to the fourth.

Thyroid.

To name the affections in which the Thyroid treatment has been tried would necessitate the enumeration of a long list of pathological conditions.

It is a specific of the first importance in Myxœdema, Cretinism, Goitre and Obesity. It is of great value in Acute and Chronic Melancholia and Acute Delirium. The results following its employment in Psoriasis, Scleroderma, Eczema, Tetany, and certain phases of Insanity, and in retarded development of children, have been such as to warrant further experiment.

Armour's Desiccated Thyroid
Thyroid Tablets
and Elixir Thyroid

are carefully made from selected material, and may be depended upon in all cases where the Thyroid treatment is indicated.

Bone Marrow

acts as a Stimulant to the Formative Processes and increases the production of red blood corpuscles and hæmoglobin, making it the ideal remedy in all diseases due to defective hæmogenesis.

The best results follow the use of a preparation made with Marrow taken from the animal immediately after it is killed.

Glycerine is practically the only medium for preserving the product in an unaltered condition.

Armour's Extract of Red Bone Marrow

Is made from absolutely fresh material and pure Glycerine, and contains all the essential ingredients of raw Marrow.

ARMOUR & COMPANY (Chicago), LONDON, S.E.

Will be pleased to send Samples of any of their Laboratory Products to Physicians interested, with Pamphlets.

TANNALBIN
(KNOLL).

This non-toxic **INTESTINAL ASTRINGENT and ANTI-DIARRHŒAL** occurs in the form of a light-brown powder, which is insoluble in the gastric juice and only slowly soluble in intestinal fluids; it causes no disturbance in the stomach, no nausea, no anorexia; it is tasteless, odourless, and is readily taken by adults and children. Dr. von ENGEL, Brunn, and Prof. Dr. VIERORDT, University Clinic, Heidelberg, and many other observers recommend **TANNALBIN in all cases of Subacute and Chronic Enteritis, whether of Children or Adults, as it unquestionably deserves the first place among astringent medicines.** See pamphlet just published: *Hints on the Use of Tannalbin* (1) in Acute, Subacute, and Chronic Enteritis, Dysentery; (2) in Diarrhœa of Phthisical Patients; (3) in Diarrhœa of Infants and Children; and (4) its Preventive use in conjunction with other remedies.

TANNALBIN is sold in Powder and 5-grain Tablets.

DOSE.—Fifteen grains three times a day for Adults; eight grains three times a day for Children.

PAPAÏN-FINKLER.

The ideal purely vegetable digestive ferment is largely used in the curative treatment of Gastric Ulcer (THE LANCET, Feb. 9th, 1895, p. 333), and as an aid to the nutrition of patients suffering from Phthisis, its value cannot be overrated (see THE LANCET, April 27th, 1895, page 1050). The solvent action of Papaïn on albuminous bodies is also turned to account in Diphtheria. Under the application of a 5 per cent. aqueous mixture the false membranes promptly disappear, leaving the mucous membrane accessible to the action of suitable antiseptics. The importance of this effectual local treatment is in no wise diminished by the constitutional effects of the Antitoxin treatment. Papaïn is further indicated in all forms of dyspepsia, its action being fully maintained in acid, alkaline, and neutral medium, exhibiting at the same time a tonic and antiseptic effect.

Sold by all Wholesale and Retail Chemists, or where not obtainable apply direct to

H. K. LEWIS'S PUBLICATIONS.

Just published, with 13 Plates and other Illustrations, crown 8vo, 10s. 6d.

DISEASES OF THE NERVOUS SYSTEM.

A HANDBOOK FOR STUDENTS AND PRACTITIONERS.

By CHARLES E. BEEVOR, M.D. Lond., F.R.C.P.,

Physician to the National Hospital for the Paralysed and Epileptic, the Great Northern Central Hospital, and the National Orthopædic Hospital.

[Lewis's Practical Series.

"The author is to be congratulated on having produced a treatise on nervous diseases which is likely to be as interesting to the general reader of medicine as to the specialist. The remarks on treatment are excellent and practical throughout. We feel sure that Dr. Beevor's book will be of the greatest value both to the student and to the practitioner."—BRITISH MEDICAL JOURNAL.

"It is a great pleasure to come across a work that we can so strongly advise our readers to purchase. It should certainly be in the library of every general practitioner."—QUARTERLY MEDICAL JOURNAL (SHEFFIELD).

"We have great pleasure in very cordially recommending this book as a handy and reliable manual for the study of diseases of the nervous system. The volume is remarkable for the conciseness and lucidity of its style throughout. We wish the book every success."—GLASGOW MEDICAL JOURNAL.

"This is a good clinical guide to diseases of the nervous system. In its description of facts it is accurate, and in regard to treatment it is safe."—THE HOSPITAL.

Just published, THIRTEENTH Edition, thoroughly revised, 8vo, 16s.

A HANDBOOK OF THERAPEUTICS.

By SYDNEY RINGER, M.D., F.R.S.,

Holme Professor of Clinical Medicine in University College; Physician to University College Hospital; and

HARRINGTON SAINSBURY, M.D., F.R.C.P.,

Physician to the Royal Free Hospital and the City of London Hospital for Diseases of the Chest, Victoria Park.

"We welcome a new edition of this familiar work, which still remains one of the most useful alike to advanced student and practitioner. The article on Serum Therapeutics is excellent. The admirable introduction on symptoms as a guide to prognosis and treatment ought to be studied by every practitioner."—LIVERPOOL MED.-CHIR. JOURNAL.

Just published, FIFTH Edition, thoroughly revised, with 4 Plates and 174 Illustrations, crown 8vo, 10s. 6d.

DISEASES OF WOMEN: a Practical Text-book.

By ARTHUR H. N. LEWERS, M.D.Lond.,

Obstetric Physician to the London Hospital, and Joint Teacher of Practical Midwifery at the London Hospital Medical School; Examiner in Midwifery and Diseases of Women at the Conjoint Board of the Royal College of Physicians, London, and Royal College of Surgeons, England, &c. *[Lewis's Practical Series.*

"This work can be recommended to practitioners and students as giving a concise view of the present state of gynæcological knowledge and practice."—THE LANCET.

"One of the safest guides upon diseases of women both for the practitioner and student."—BRITISH MEDICAL JOURNAL.

"Dr. Lewers has found a large demand for his popular treatise on gynæcology. Those who have ceased to be students will be interested in Dr. Lewers' report on his operation cases for cancer of the uterus. This edition will no doubt meet with continued favour at the hands of the profession."—BRITISH GYNÆCOLOGICAL JOURNAL.

"It is one of those interesting and practical records of an extensive individual experience in which English literature is specially rich, and it is thus eminently readable."—SCOTTISH MEDICAL AND SURGICAL JOURNAL.

SEVENTH Edition, crown 8vo, 10s.

ELEMENTS OF PRACTICAL MEDICINE.

By ALFRED H. CARTER, M.D. Lond., F.R.C.P. Lond.,

Professor of Therapeutics in Mason College, Birmingham; Senior Physician to the Queen's Hospital, Birmingham.

"It merits its popularity in that it contains accurate information. Thoroughly practical in its aim and sound in therapeutics."—THE LANCET.

"We can thoroughly recommend the work to all who stand in need of an introduction to medicine." EDINBURGH MEDICAL JOURNAL.

Just published, with numerous Illustrations, crown 8vo, 6s.

A Manual of Obstetric Practice for

STUDENTS and PRACTITIONERS. By Prof. A. DÜHRSSEN, M.D. Translated and Edited from the SIXTH German Edition by J. W. TAYLOR, F.R.C.S., and F. EDGE, M.D. Lond., M.R.C.P., F.R.C.S.

"We are grateful to the translators for introducing to us so extremely practical and clearly written a book. May be read with much interest and benefit by all."—BRITISH GYNÆCOLOGICAL JOURNAL.

FOURTH Edition, with Illustrations, 8vo, 10s. 6d.

On Deafness, Giddiness, and Noises in

the HEAD. By EDWARD WOAKES, M.D. Lond., Senior Aural Surgeon, London Hospital; Lecturer on Diseases of the Ear, London Hospital Medical College; assisted by CLAUDE WOAKES, M.R.C.S., L.R.C.P., Assistant Surgeon to the London Throat Hospital.

"It is clearly written, and contains much that is likely to be most useful from the point of view of treatment."—BRITISH MEDICAL JOURNAL.

SEVENTH Edition, crown 8vo, 4s. 6d.

Gout and its Relations to Diseases of the

LIVER and KIDNEYS. By ROBSON ROOSE, M.D., F.R.C.P.Ed.

"It is one of the clearest and most complete reviews, in a small space, of existing knowledge with regard to this disease which we remember to have read, and it may be strongly recommended to the study of the young practitioner."—BRITISH MEDICAL JOURNAL.

With Illustrations, small 8vo, 5s. 6d.

A Guide to the Examination of the Nose;

with REMARKS on the DIAGNOSIS of DISEASES of the NASAL CAVITIES. By B. CRESSWELL BABER, M.B.Lond., Surgeon to the Brighton and Sussex Throat and Ear Dispensary.

Just published, crown 8vo, 3s. 6d.

Yellow Fever in the West Indies. By Izett

ANDERSON, M.D. Edin., Extraordinary Member of the Royal Society, Edinburgh; Honorary Member of the Institute of Jamaica.

"The symptoms and course of the disease and the state of the urine in yellow fever are discussed; the observations regarding the latter point are valuable."—THE LANCET.

FOURTH Edition, entirely rewritten and enlarged, with new Illustrations, demy 8vo, 10s. 6d.

Ringworm and Alopecia Areata: their

Pathology, Diagnosis, and Treatment. By H. ALDERSMITH, M.B. Lond., F.R.C.S., Medical Officer, Christ's Hospital, London.

"It is certainly the most complete treatise on Ringworm which has yet appeared."—EDINBURGH MEDICAL JOURNAL.

"The work throughout is characterised by simplicity of style, directness of diction, and strong common sense. Every practitioner ought to possess and read it."—BRITISH JOURNAL OF DERMATOLOGY.

With Illustrations, crown 8vo, 9s.

Medical Microscopy: a Guide to the Use

of the MICROSCOPE in MEDICAL PRACTICE. By FRANK J. WETHERED, M.D., M.R.C.P., Medical Registrar to the Middlesex Hospital; Demonstrator of Practical Medicine at the Middlesex Hospital Medical Schools. *[Lewis's Practical Series.*

"This work is a very complete manual, containing all that a student need learn of the various modes of preparing and mounting sections, and of examining the fresh tissues and fluids of the body."—THE LANCET.

SEVENTH Edition, with Illustrations, fcap. 8vo, 3s. 6d.

A Guide to the Examination of the Urine.

By J. WICKHAM LEGG, F.R.C.P., formerly Assistant Physician to St. Bartholomew's Hospital, &c. Revised by H. LEWIS JONES, M.A., M.D., F.R.C.P.

The South African Climate.

Embracing Climatology and Balneology, and Pointing out the Advantages, Peculiarities, and Capabilities of the Country as a Health Resort—more particularly with reference to Affections of the Chest. By WILLIAM C. SCHOLTZ, M.D.Edin., of Cape Town.

"A book with this title is what medical men, both in South Africa and in Europe, have long been on the look out for, and there is no doubt that any reliable information upon the subject will be always welcome to the members of the medical profession."—SOUTH AFRICAN MEDICAL JOURNAL.

Cassell & Company, Ltd., London, and all Booksellers.

MACMILLAN & CO.'S LIST.

VOLUME V. NOW READY.

A NEW SYSTEM OF MEDICINE.

BY MANY WRITERS.

Edited by Professor T. CLIFFORD ALLBUTT, M.D., F.R.S., &c.

Demy 8vo, 25s. net each Volume.

VOL. I.—PROLEGOMENA AND INFECTIOUS DISEASES.

THE LANCET.—"Will most certainly be found to be of high value to the student and practitioner, and we await the appearance of the remaining volumes with great interest."

VOL. II.—INFECTIOUS DISEASES *(continued)*, INTOXICATIONS AND INTERNAL PARASITES.

BRITISH MEDICAL JOURNAL.—"The high standard of the first volume is well maintained, and the title, 'A SYSTEM OF MEDICINE,' is so fully justified that the editor must be heartily congratulated on the success of his constant labours and anxieties."

VOL. III.—CERTAIN GENERAL DISEASES, DISEASES OF THE STOMACH AND BOWELS.

TIMES.—"The high standard of the previous volumes is well maintained."

BRITISH MEDICAL JOURNAL.—"A worthy successor to the previous instalments, and remarkable for the combination of conciseness and completeness in its articles."

VOL. IV.—DISEASES OF LIVER AND OTHER GLANDS, DISEASES OF THE THROAT

BRITISH MEDICAL JOURNAL.—"Thoroughly maintains the high standard of excellence and efficiency that has characterised it from the outset."

VOL. V.—DISEASES OF THE RESPIRATORY SYSTEM, DISEASES OF THE CIRCULATORY SYSTEM.

UNIFORM WITH THE ABOVE.

A SYSTEM OF GYNÆCOLOGY.

BY MANY WRITERS.

Edited by T. CLIFFORD ALLBUTT, M.A., M.D., F.R.S., and W. S. PLAYFAIR, M.D., LL.D., F.R.C.P.

Demy 8vo, 25s. net.

PRACTITIONER.—"Will no doubt be widely studied by members of the profession who are interested in this branch of medicine."

EDINBURGH MEDICAL JOURNAL.—"Will undoubtedly take an important place in the ranks of modern gynæcological literature."

Volume II. Now ready.

ELECTRO-PHYSIOLOGY. By W. BIEDERMANN,

Professor of Physiology in Jena. Translated by FRANCIS A. WELBY. With 149 Figures. Vol. II., 8vo, 17s. net.

NATURE.—"The second volume is equal to the first in scientific interest and importance, and the technical difficulties of rendering it into English have been overcome with even greater success. ..... The student who desires to appreciate the experimental basis of Hering's doctrine cannot have a better guide than is here provided for him. It must not, however, be supposed that the work is mainly theoretical; on the contrary, on the subjects of which it treats, it is the best 'reference-book' that the physiological worker has at present at his disposal."

Now Ready, demy 8vo, half bound, 17s. net.

DEFORMITIES.

A TREATISE ON ORTHOPÆDIC SURGERY. By A. H. TUBBY, M.S. Lond., F.R.C.S. Eng. Illustrated by 15 Plates and 300 Figures.

BRITISH MEDICAL JOURNAL.—"Standard work on the subject in the English language."

GUY'S HOSPITAL GAZETTE.—"The printing and get-up are excellent. We have no hesitation in strongly recommending this volume to the young practitioner and advanced students for whom it was written."

CLINICAL JOURNAL.—"A book which we confidently anticipate will be the work of reference on the subject of Deformity."

Works by T. LAUDER BRUNTON, M.D., &c.

HEART DISEASE AND THE NAUHEIM TREATMENT.

SECOND EDITION. With a NEW CHAPTER on REST.
By JOSEPH KIDD, M.D.,
Author of "THE LAWS OF THERAPEUTICS," &c.

London: HODDER & STOUGHTON, 27, Paternoster-row.

Just published, price 12s. 6d.

DISEASES OF THE JOINTS & SPINE.

NEW EDITION.
By HOWARD MARSH,
Surgeon to, and Joint Lecturer on Surgery at, St. Bartholomew's Hospital; Consulting Surgeon to the Hospital for Sick Children; Examiner in Surgery at the University of Cambridge.

"It is clear, well arranged, full of practical work, and excellent alike for reading and for reference. The chapters on Charcot's disease, on bone-setters, and on the different forms of epiphysitis, are models of good clinical teaching: and the chapters on diseases of the spine, now first published, are admirable. The illustrations are well chosen; the whole book is the outcome of wide experience, careful observation, and what is called 'surgical instinct.'"—BRIT. MED. JOUR.

ELEMENTS OF HISTOLOGY.

BY
E. KLEIN, M.D., F.R.S.,
LECTURER ON GENERAL ANATOMY AND PHYSIOLOGY,
AND
J. S. EDKINS, M.A., M.B.,
JOINT LECTURER AND DEMONSTRATOR OF PHYSIOLOGY IN THE MEDICAL SCHOOL OF ST. BARTHOLOMEW'S HOSPITAL, LONDON.

WITH 296 ILLUSTRATIONS.

EXTRACT FROM THE PREFACE TO THE REVISED AND ENLARGED EDITION:—

"Since the last edition of this book in 1889, considerable additions have been made to the knowledge of minute structural anatomy. The progress in the knowledge of the structure and life of the cell and nucleus, the remarkable discoveries in the structure of the central nervous system and sense organs—introduced by the method of Golgi and followed up by the brilliant work of Ramón y Cajal, Kölliker, Lenhossek, Retzius, and others—have made it necessary to revise and to make considerable additions to the chapters dealing with these organs. While care has been taken to correct and amplify other parts of the book, the chapters on the Central Nervous System have been practically rewritten.

"The task of rewriting and re-editing the chapters on the Brain and Medulla and on the Alimentary Canal has devolved upon my colleague Dr. Edkins, who is now associated with me as joint-author.

"While a large number of the Illustrations of the former edition have been retained, a considerable number has been added."

NEW AND RECENT VOLUMES.

Now Ready. Price 10s. 6d.

TROPICAL DISEASES. A Manual of the Diseases of Warm Climates. By PATRICK MANSON, M.D., LL.D. Aberd., Fellow of the Royal College of Physicians, London; Lecturer on Tropical Diseases at St. George's Hospital and Charing Cross Hospital Medical Schools; Medical Adviser to the Colonial Office and Crown Agents for the Colonies. With Two Coloured Plates and 88 Illustrations.

Now Ready. Price 7s. 6d.

RINGWORM IN THE LIGHT OF RECENT Research: Pathology, Treatment, Prophylaxis. By MALCOLM MORRIS, Surgeon to the Skin Department, St. Mary's Hospital. With 22 Micro-photographs and a Coloured Plate.

Now Ready. Price 9s.

CLINICAL METHODS: a Guide to the Practical Study of Medicine. By ROBERT HUTCHISON, M.D., M.R.C.P., and HARRY RAINY, F.R.C.P.Ed., F.R.C.S.E. With 137 Illustrations and 8 Coloured Plates.

Complete in Two Volumes. Price 48s.

With 252 Illustrations.

**** *A Catalogue of Cassell & Company's MEDICAL and CLINICAL MANUALS will be sent post-free on application.*

CASSELL & COMPANY, LIMITED, LUDGATE HILL, LONDON.

With 2 Portraits, 8vo, pp. xxii., 510, price 18s.

THE LIFE AND TIMES OF THOMAS WAKLEY,

By S. SQUIRE SPRIGGE, M.B.Cantab.

"The book is tersely and clearly written, and its interest never flags. It puts before us a vivid picture of a typical Englishman—a man of untiring energy, of sterling honesty, and of dauntless courage—who found certain duties lying before him to be done, and who applied himself to them with all his might."—TIMES.

"Will be read with considerable interest by the *laudatores temporis acti* who are old enough to remember the personality of the most ardent reformer, passionate and fluent orator, and powerful writer for the press of the second quarter of the current century. ..... His feats of derring-do have been appreciatively recorded in Dr. Sprigge's ably-written biography."—DAILY TELEGRAPH.

"Dr. Sprigge has shown great skill in unravelling the three-fold strand that makes up the bulk of Wakley's life. He presents a perfectly clear picture of a noteworthy man who lived in stirring times ..... and deserves to be gratefully remembered by every medical man in the United Kingdom."—MORNING POST.

"Mr. Wakley's biographer has done his work skilfully, spiritedly, and well, and his pages will be read with equal interest by the medical man, the layman, and the journalist, who in this stirring life story will find example and encouragement of the highest kind."—DAILY CHRONICLE.

"His (Thomas Wakley's) career was one of immense activity, and no small part of it was spent in the courageous championship of political and social reforms of importance. It was well, therefore, that we should have a fuller and more authoritative biography than we have yet possessed of one who was from many points of view a notable man in his time. The task of writing it could hardly have fallen into better hands than those of Dr. Squire Sprigge."—DAILY NEWS.

"His biographer has executed his task with remarkable skill and discernment. ..... Whatever our politics we can only find admiration for the pluck, perseverance, and honesty of the greatest of medical reformers."—ST. JAMES'S GAZETTE.

"A man whose impress on his own and on our age cannot easily be over-estimated."—PALL MALL GAZETTE.

"A really good book."—WESTMINSTER GAZETTE.

"A biography of unusual attractiveness both as monograph and as history."—GLOBE.

"A very curious picture of the state of the medical profession during the first sixty years of this century."—ECHO.

"No man better deserves a biographical monument than Thomas Wakley, who may be regarded as the real founder of medical journalism in this country, while his courage, original genius, and passion for reform greatly advanced many important professional and social problems, of some of which, indeed, he at once furnished the solution. Wakley is the leading figure in the medical history of this century, and this biographical record is a volume of great historical importance, while it furnishes a vivid and living picture of one of the greatest, if not the greatest, of our medical reformers. The volume is carefully prepared from authentic records and is written in a sympathetic spirit and shows great literary capacity."—BRITISH MEDICAL JOURNAL.

"The most intensely interesting medical biography of the century."—MEDICAL PRESS AND CIRCULAR.

"He (Wakley) was an energetic reformer, wholly honest, in the main sensible, in many things before his time. ..... Mr. Squire Sprigge has done his work very well."—SPECTATOR.

"An interesting life of a man who certainly deserved a full and accurate biography. ..... Dr. Sprigge has described his (Wakley's) numerous controversies with singular accuracy and moderation."—ATHENÆUM.

"We are grateful to Dr. Sprigge for his judicious and clear presentment of a man whom it is good for all of us to know; a man whose single aim in life was to right injustice and to combat tyranny."—SPEAKER.

"Thoroughly well-written, not overloaded with details or entangled in controversies, but giving a very interesting account not only of a very remarkable man, but of the Radicalism which has been such an important factor in the constitutional history of England."—GUARDIAN.

"A worthy memorial."—CHRISTIAN WORLD.

"Mr. Wakley was a very remarkable person. ..... His career deserved to be told, and Mr. Sprigge has told it very well. The volume is very interesting indeed."—ARMY AND NAVY GAZETTE.

"Well written, simple, and graphic."—ACADEMY.

"Alike as legislator, coroner, doctor, journalist, pioneer of enlightened methods, and crusader against abuses, Thomas Wakley deserved well of posterity, and this welcome biography is a worthy tribute to the memory of one who was 'ever a fighter' but whose pugnacity and whose powerful intellect were invariably exercised in the cause of honesty and justice."—WORLD.

"A most interesting biography."—TRUTH.

"An able and sympathetic ..... account of its hero's services to the world. ..... To read Mr. Sprigge's book, in short, is to see what an immense power for good may be wielded by a high-souled and able man who devotes his life to one great purpose."—MANCHESTER GUARDIAN.

"A most interesting book. ..... His (Wakley's) 'Life' should find a place in every public library in the land."—NEWCASTLE CHRONICLE.

"Dr. Sprigge has performed his congenial task with ability and good taste."—MANCHESTER CITY NEWS.

"Dr. S. Squire Sprigge is no mere panegyrist. ..... It is a pity perhaps that Wakley's biography appears more than thirty years after his death. But if it is sadly belated it is so from a creditable motive. To have written the life of Thomas Wakley much sooner would have incurred the chance of causing pain to many people. Now that it is done the work has been done thoroughly."—SCOTSMAN.

"We must congratulate Dr. Sprigge on the excellent use he has made of the materials. These records of a useful life, commenced more than a hundred years ago, cannot fail to deeply interest not only the medical faculty, but the general reader and the student of modern history."—SHEFFIELD INDEPENDENT.

"He (Thomas Wakley) was an honest, restless, fearless man, and the sworn foe of abuses medical and political. He rendered signal service in both spheres, and the oblivion which has overtaken his memory is altogether undeserved. ..... An estimate of a reformer who served his day and generation with courage and who, in spite of his foibles, was a genuine lover of his fellow men."—LEEDS MERCURY.

"His life was one which deserved to be put on record, and the full and ample exposition in this volume will do much to make known to posterity the name and work of one who did conspicuous service to his generation."—BRADFORD OBSERVER.

"Gives a very complete picture of the man and his career and a highly interesting account of the conditions of the medical profession which prompted him to the work of reform ..... The book is a document essential to the student who would make himself acquainted with the history of medical progress during the present century."—GLASGOW HERALD.

"Few men have better deserved the honour of a biography than Thomas Wakley."—WESTERN MORNING NEWS.

"A bracing chapter of biography."—LIVERPOOL POST.

"Of what an able and energetic medical politician can do for his profession, as well as for his country, there could hardly be a better illustration than the Parliamentary work of Thomas Wakley as set forth by Dr. Squire Sprigge in his admirable biography of that great reformer."—PRACTITIONER.

"Dr. Sprigge set himself a difficult task in writing the life of Thomas Wakley, but he has succeeded in bringing vividly before the mind of the reader the personality of one who contributed not a little to the progress of the Victorian Era."—REVIEW OF REVIEWS.

"The period from 1823 to 1860, during which Wakley was an active agent in the life of the profession and in public affairs, was, indeed, the formative period which created the position of the medical profession as it now exists. Everyone who ventures to give counsel on the many problems that call for consideration should attentively study the pages in which Dr. Squire Sprigge has so admirably recorded the singular struggles of Wakley a career. ..... Wakley was the greatest and most thorough as he was the first of medical reformers. ..... When more attention is given to the history of the profession a juster estimate will prevail, and the name of Wakley will then be properly honoured as the pioneer of medical journalism and the greatest medical statesman of the century."—Sir Walter Foster, M.P., in EDINBURGH MEDICAL JOURNAL.

LONGMANS, GREEN, & CO., London, New York, and Bombay.

Now Ready, 8vo, pp. xvi-418, with 18 Illustrations, 2 Coloured, price 12s. 6d. nett.

Diabetes Mellitus and its Treatment.

By R. T. WILLIAMSON, M.D. (Lond.), M.R.C.P.; Medical Registrar, Manchester Royal Infirmary, and Assistant to the Professor of Medicine, Owen's College, Manchester.

"The handsome volume which Dr. Williamson has produced contains a good account of diabetes and the various problems which are grouped around it. The book is very well written, and is evidently the outcome of honest clinical and pathological work."—BRITISH MEDICAL JOURNAL.

THE STETHONOSCOPE.

(TESKE'S PATENT.)

A NEW INSTRUMENT for AUSCULTATION.

THE STETHONOSCOPE is an instrument constructed on the same principle as the Microphone. It is of English manufacture, and is preferable to the Phonendoscope in that it can be attached to any ordinary Binaural Stethoscope and, when not in use, can be carried in the waistcoat pocket without the slightest inconvenience.

ONE OF THE LEADING LONDON CONSULTANTS says:—"By its use the sounds are rendered much more distinct than is the case when an ordinary stethoscope is used. This is exemplified in the highest degree in regard to the lung sounds. The varieties of rales can be most easily distinguished, and areas of tubercular breathing can be mapped out with greater facility than heretofore. In regard to the heart, the relative loudness of the normal sounds—always a very important point—is most accurately determined. Murmurs can be distinguished which, under other circumstances, would pass unnoticed."

Price, in case, 21s. 6d.

MAW'S ANTISEPTIC DRESSINGS.

Prepared under Medical Supervision in accordance with the Special Formula of Lord Lister.

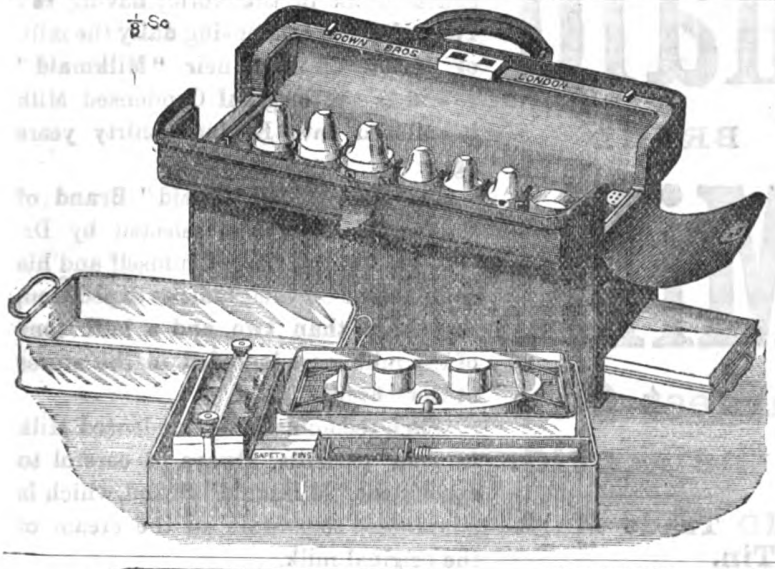
GUARANTEED to CONTAIN THE CORRECT PERCENTAGE of the ANTISEPTIC:
The Best Materials are used, and the greatest possible care is taken to prevent contamination during the course of preparation.
Large quantities of these Dressings are now being supplied to most of the Leading Hospitals.

SPECIAL PRICE LIST ON APPLICATION.

S. MAW, SON, & THOMPSON, 7-12, Aldersgate Street, London.

PROTARGOL.

A new Silver Preparation, highly efficacious in the treatment of Gonorrhœa, and most strongly recommended as an Antiseptic Wound Healer. PROTARGOL contains 8 per cent. of silver, and is easily soluble in cold or warm water, is non-irritating, and possesses a better penetrating effect on the tissues than any other known silver preparation. PROTARGOL is a chemical compound of silver and a protein substance. Its solution is not precipitated by albumen, chloride of sodium, or diluted hydrochloric acid.



Dr. BENARIO, of Frankfort, declares that PROTARGOL possesses high bactericidal properties, and is therefore excellent for the treatment of Wounds. Professor NEISSER, of Breslau, states his opinion that PROTARGOL is the best, the safest, and the quickest remedy he has yet employed in the treatment of Gonorrhœa. An eminent surgeon, in "THE PRACTITIONER" for March, confirms, so far as his experiences go, the favourable opinion expressed by NEISSER, especially with reference to its powerful anti-bactericidal properties. The usual strength of the solution for injection is ½ to 2 per cent.

METAL ASEPTIC HYPODERMIC SYRINGE.

This Instrument is fitted with a Spring Metal Piston Rod fitting accurately inside a Metal Barrel. The Piston rod is a permanent and efficient one, merely requiring occasional lubricating with vaseline. The whole instrument may be boiled and rendered perfectly aseptic without fear of injury or detaching the mounts. Price, in Metal Case, with 2 Steel Needles, 13/6; fitted with Platinum Iridium Needles, 1/3 per Needle extra.

IMPROVED ELECTRIC HAND LAMP FOR THROAT & EAR.

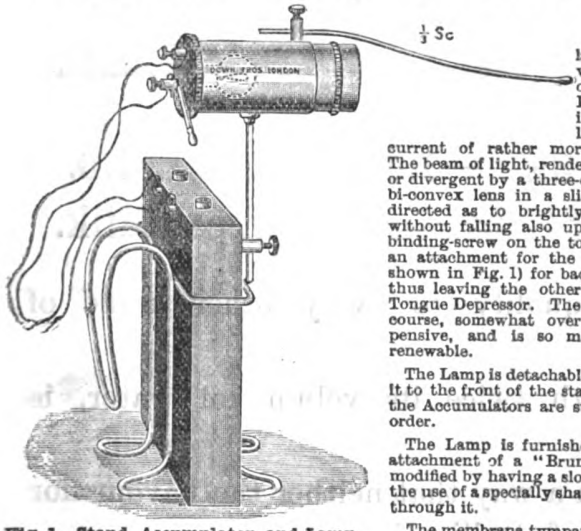

Fig. 1. Stand, Accumulator, and Lamp, with Wire for Swab attached.

A Four-volt Accumulator, carried in a light wire stand, is the source of electric power. The Lamp, a small 3½-volt incandescent one, is brilliantly lighted by a current of rather more than half an ampère. The beam of light, rendered parallel, convergent, or divergent by a three-quarter inch focal length bi-convex lens in a sliding mount, can be so directed as to brightly illuminate the fauces without falling also upon the lips or teeth. A binding-screw on the top of the lamp case forms an attachment for the end of a wire swab (as shown in Fig. 1) for bacterioscopic examination, thus leaving the other hand available for the Tongue Depressor. The Incandescent Lamp is, of course, somewhat overworked, but it is inexpensive, and is so mounted as to be easily renewable.

The Lamp is detachable from the pin which fixes it to the front of the stand. After two years' use the Accumulators are still in excellent working order.

The Lamp is furnished with a flange for the attachment of a "Brunton's" Otoscope (Fig. 2) modified by having a slot cut in it so as permit of the use of a specially shaped Myringotome (Fig. 3) through it.

The membrana tympani is very well illuminated by the Electric Lamp, and operation upon it rendered easy.

Suggested by Dr. E. O. HOPWOOD, London Fever Hospital.

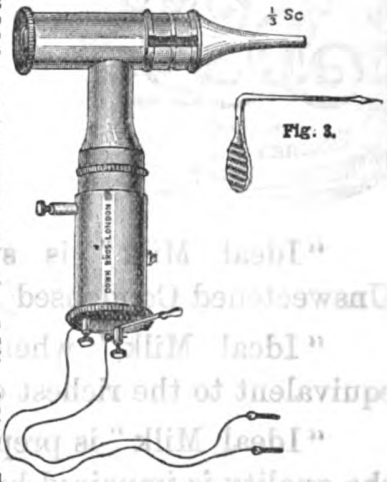

Fig. 2. Lamp with the Otoscope attached and the Myringotome.

Fig. 3.

AUDITORS.—HOWARD SMITH, SLOCOMBE & Co., Bank Chambers, 14, Waterloo Street, Birmingham.

SECRETARY.—WILFRED FRANCIS SOUTHALL. *REGISTERED OFFICES.*—Lower Priory, Birmingham.

PROSPECTUS.

This Company is formed to purchase as a going concern the business carried on under the names of SOUTHALL BROTHERS AND BARCLAY, and T. and W. and W. SOUTHALL, Manufacturing and Wholesale and Retail Chemists and Druggists.

The business was established seventy-eight years ago at Bull Street, Birmingham, by the late Thomas Southall, who was joined shortly afterwards by his brother, William Southall, and is now carried on in various Departments as follows:—

Wholesale Chemists and Druggists	**Lower Priory, Birmingham.**
Druggists' Sundriesmen and Druggists' Shopfitters	
Pharmaceutical and Analytical Chemists	**Bull Street, Birmingham.**
Manufacturing Chemists and Drug Grinders	**Dalton Street, Birmingham.**
Manufacturers of Surgical Dressings and Sanitary Appliances	
Manufacturers of Distilled Table Waters	
Manufacturers of and Dealers in Scientific and Chemical Apparatus	**Broad Street, Birmingham.**
Manufacturers of Cod Liver Oil	**Balstad, Norway.**

The business will be taken over by the Company as a going concern as from the 1st day of January, 1898, and the purchase will include the freehold and leasehold properties in Bull Street, Dalton Street, Lower Priory, Birmingham, and at Balstad, in Norway; the plant, machinery, fixtures, furniture, and trade appliances; the book debts (guaranteed); the stock-in-trade; the goodwill, patents and trade marks, including those of the sanitary specialities manufactured and sold by the Vendors; and the cash in hand and at Bank on December 31st, 1897.

The freehold and leasehold properties, and the plant, machinery, fixtures, furniture, and trade appliances stood in the books of the Vendors, on December 31st, 1897, at the sum of £38,089 0s. 1d. When to this sum are added the values of the book debts (guaranteed), of the stock-in-trade, and other assets, exclusive of goodwill patent rights, and trade marks, the aggregate was, on December 31st, 1897, the sum of £84,640 19s. 3d.

Since December 31st, 1897, the Vendors have contracted to purchase four acres of freehold land at Saltley, Birmingham, which will be transferred to the Company for the erection by the Company of Laboratories, Mills, Factories, and Workshops to provide for the increasing demands of the business.

The purchase money is the sum of £133,000, payable as to £23,333 in Preference Shares (the largest number the Vendors can take with a view to obtain a settlement on the Birmingham Stock Exchange), £63,000 in Ordinary Shares, and the Balance in Cash.

The Vendors will also take up and pay for a sufficient number of Ordinary Shares to provide additional capital to acquire the freehold land at Saltley, and to erect and equip the intended Laboratories, Mills, etc., thereon.

The Company will pay and discharge the liabilities of the business on the 31st day of December, 1897, amounting to £8,090 1s. 7d., and all liabilities incurred in the ordinary course of the business since that date, and will take the profits from the first day of January, 1898.

The business has been of steady growth, and the volume of business done in the year ending December 31st, 1897, was larger than that in any preceding year.

The net profits of the business have steadily increased, and after making allowances for bad debts, sinking fund on leasehold properties, and depreciation of plant and fixtures, but not for interest on capital, have for several years past been more than sufficient to pay three times the dividends on the whole of the £70,000 Preference Shares.

The Directors are the persons who constitute the Vendor firm, and the management of the business will be conducted in the same manner as heretofore.

All expenses of formation and registration of the Company up to the first allotment of shares will be paid by the Vendors.

The following agreements have been entered into—

1. Agreement dated the 22nd day of June, 1898, and made between Thomas Barclay, Alfred Southall, Wilfred Francis Southall, John Barclay, Alfred William Southall, Gilbert Southall, and Thomas Barclay the younger, of the one part and the Company of the other part being an Agreement for the sale of the business of the Company.
2. Indenture dated the 22nd day of June, 1898, and made between Alfred Southall of the 1st part, Thomas Barclay of the 2nd part, Wilfred Francis Southall of the 3rd part, John Barclay of the 4th part, Alfred William Southall of the 5th part, Gilbert Southall of the 6th part, and Thomas Barclay the younger of the 7th part.
3. Agreements all dated the 22nd day of June, 1898, and made respectively between Alfred Southall, Thomas Barclay, Wilfred Francis Southall, John Barclay, Alfred William Southall, Gilbert Southall, and Thomas Barclay the younger, of the one part and the Company of the other part being agreements relating to the engagements of the parties thereof of the first part with the Company.

There are also numerous trade and other contracts, agreements and engagements, relating to the business taken over by the Company entered into in the ordinary course of business. All applicants for shares shall be deemed to have had full notice of such contracts, agreements, and engagements, and to have waived production of any further particulars.

The Memorandum and Articles of Association and the Contracts above specified may be inspected by Applicants for shares at the office of the Solicitor to the Company.

Application for settlement and official quotation on the Birmingham Stock Exchange will be applied for in due course.

In every case where no allotment is made the deposit will be returned in full and where the number allotted is less than that applied for the surplus will be credited to the balance payable on the shares allotted.

Prospectuses and Forms of Application may be obtained from the Bankers, Solicitor, and Auditors of the Company. Applications for Shares may be lodged at Lloyds Bank, Limited, or any of its Branches.

BIRMINGHAM, 22nd JUNE 1898.

SOMATOSE

is an Albumose Food product. It is prepared from meat, and contains the albuminous elements of the latter in an easily soluble form. The salts present in SOMATOSE correspond to the nutritive salts of fresh meat, among which occur Phosphate of Potassium, so important in the formation of muscular and cellular tissue.

SOMATOSE is a Tasteless, Odourless Powder,—is easily tolerated, even by the most delicate stomachs. It is invaluable in Wasting Diseases, in Convalescence from Exhausting Diseases, and is especially indicated in cases of Children of Backward Development.

SOMATOSE is well borne when no other aliment can be administered. It is also of the greatest service in cases requiring rectal alimentation.

SOMATOSE has been found invaluable in the uncontrollable vomiting of pregnant women and in vomiting following the administration of chloroform.

SOMATOSE is indicated in all conditions where an invigorating and easily absorbed food is required. With the aid of SOMATOSE it is possible to tide the patient over critical periods, since it is capable of acting for a long time as a complete substitute for other nitrogenous foods.

ADULT DOSE: One teaspoonful three times a day, in milk, soup, coffee, cocoa, &c.

The following is the Analysis of SOMATOSE as obtained by Goldman:—

Water	9·20
Total Nitrogen	12·84
Albumoses...	77·85
Peptone	2·20
Ash	6·78

IRON-SOMATOSE

(Ferro-Somatose).—An excellent tonic, containing the albuminous substances of the meat (albumoses) organically combined with Iron in the proportion of 2 per cent. of the latter. Under the use of Iron Somatose the weight of the body is increased and the amount of hæmoglobin is augmented. Iron Somatose combines in a most suitable way the well-known and appreciated properties of Somatose with a good Iron preparation.

SPECIAL INDICATIONS: Chlorosis and Anæmia. DAILY DOSE: 75 to 150 grains.

MILK-SOMATOSE

(Lacto-Somatose).—A strength-giving food containing the albuminous matter (albumoses) of the Milk, with 5 per cent. of Tannic Acid in chemical combination. The chief indications for Milk-Somatose are the various chronic maladies of the digestive organs, and especially those disturbances of digestion which, as in Enteroptosis and Anæmia, can be referred to the atonic condition of the muscular organs of the stomach. Milk-Somatose is a good flesh-forming preparation, without irritation, and slightly astringent with patients of weak or diseased digestive organs. In the case of Typhus maladies it is of great value.

Samples and Literature can be had on application to the Wholesale Depôt for all Bayer's Drug Specialities:—

ELBERFELD FARBEN FABRIKEN CO., Ltd.,

19, ST. DUNSTAN'S HILL, LONDON, E.C.

Also at MANCHESTER, GLASGOW, and BRADFORD.

BAYER'S
PHARMACEUTICAL SPECIALITIES

TRIONAL. (*Diethylsulfonmethylethylmethan*).—A most reliable and quickly acting hypnotic of the Sulphonal group. In simple insomnia Trional will produce sleep with absolute certainty in from fifteen to thirty minutes. Has no influence on the heart, respiration, or temperature.

DOSE: From 15 to 30 grains. Best administered in a cupful of hot liquid, or in aerated water, when a considerably smaller dose suffices.

TANNIGEN. (*Acetyl of Tannin.*)—A most valuable remedy in cases of Acute and Chronic Diarrhœa, and invaluable for the Summer Diarrhœa of Children. Tasteless and Odourless. Passes through the stomach entirely unchanged, decomposition only occurring in the intestines.

DOSE FOR CHILDREN: 2 to 5 grains.
DOSE FOR ADULTS: 8 grains every three hours.

TANNOPINE. (*Hexamethylene-tetramin Tannin*).—A New Intestinal Astringent. Has an excellent effect, without secondary phenomena, in all the various kinds of Enteritis. Has given especially good results in cases of Tuberculous Inflammation of the Bowels, in cases of Non-Tuberculous Subacute and Chronic Intestinal Inflammation, and also in cases of Typhoid.

DOSE FOR CHILDREN: 3 to 10 grains.
DOSE FOR ADULTS: 16 grains, two to four times daily.

SALOPHEN. (*Acetyl-paro-amydosalol*).—The best substitute for Salicylate of Sodium, as it acts quite as promptly, but without any of the unpleasant after-effects of the latter. Its special indication is Acute Articular Rheumatism. It is invaluable for Influenza, Migraine, &c.

DOSE: 16 to 24 grains three or four times a day.

LYCETOL. (*Tartrate of Di-Methyl-Piperazine*).—Combines the Uric Acid solvent properties of Piperazine, with the diuretic properties of Tartaric Acid. Invaluable in all cases of the Uric Acid Diathesis.

DOSE: 16 to 32 grains daily. Best administered in aerated waters, such as Seltzer, &c., or in granular effervescing form. (Effervescing Lycetol: Messrs. A. Bishop & Sons, Ltd.)

IODOTHYRINE. The active principle of the Thyroid Gland. A stable product containing a definite amount of the Iodine compound which forms the active principle of the Gland. Iodothyrine acts more quickly than either the fresh or dried gland substance. It is a preparation of perfectly definite composition, stable and permanent.

ADULT DOSE: 5 grains two to eight times a day.

EUROPHEN. (*Isobutylorthocresoliodide.*)—A perfect substitute for Iodoform. Odourless and non-toxic. Has a specific gravity five times less than that of Iodoform. Non-irritating and does not produce a rash. Adheres closely to mucous surfaces. Specially indicated in Syphilitic Diseases, Gynæcology, Burns and Bedsores, Eye, Ear, Throat, and Nose Affections, &c., &c.

ARISTOL. An Iodine Derivative containing 48% of Iodine. Is an ideal Cicatrisant, forming an absolutely unirritating covering over the surfaces on which it is placed, under which the processes of granulation and cicatrization proceed with extraordinary rapidity. It is a convenient, Non-Irritating and Effective Antiseptic Dressing in General Surgery, Dentistry, Gynæcology, Diseases of Eye, Ear, and Nose. In the treatment of Burns Aristol has proved to be of the greatest value, its antiseptic and healing properties being specially marked.

PROTARGOL. A new silver preparation for the treatment of Gonorrhœa, containing 8% of silver, easily soluble in warm or cold water. Has a better penetrating effect on the tissues than any other known silver preparation. Non-irritating. Usual strength of solution, ¼ to 2%. An excellent antiseptic in the treatment of Wounds. Of the greatest possible service in Ocular Therapeutics.

PHENACETINE-BAYER, SULPHONAL-BAYER, PIPERAZINE-BAYER, SALOL-BAYER, SOMATOSE, IRON SOMATOSE, MILK SOMATOSE, ANALGEN, LOSOPHAN, TETRONAL, &c.

THE LATEST PROFESSIONAL REPORTS ON

INGLUVIN.

[COPY.]

"FOREST GATE, LONDON, Oct. 18th, 1897.

"I have for over thirty years used Warner's Ingluvin in the sickness of pregnancy and for the nausea and inability to digest food often met with in womb troubles, as well as for vomiting after gynæcological operations and chloroform, and have been very pleased with the relief which has ensued.

(Signed) "H. ERNEST T——, M.R.C.P., F.R.C.S., &c.

"Late Physician to the Glasgow Hospital for Diseases of Women."

"——, 1897.

"In writer's practice the use of 'Ingluvin' has been limited to treatment of vomiting in pregnancy. However, his first trial of it was in a case of acute indigestion. Mrs. P——, aged thirty-eight, married and mother of a large family, had been unsuccessfully treated by a colleague. Every means available to an intelligent and skilful physician of experience had been employed, but apparently to no purpose, as patient grew worse day by day. Writer was called, and for a while fought malady with same or like weapons and a like result.

"Having exhausted every other resource at hand, preparation called 'Ingluvin' (then new) was thought of, and immediately an ounce was procured from nearest druggist and its use commenced. Without knowledge of its value, surprise at result obtained can be appreciated only by one who has had similar experience.

"Every morsel of food taken had been vomited as soon as received in stomach. Not only that, but drink and medicine were promptly ejected, vomiting continuing to recur at intervals, without apparent cause. Imperfect digestion, or rather, no digestion, had been succeeded by innutrition, patient's condition bordering on inanition. Gastric pain and repletion with eructations were the burden of constant complaint. Administered in 10-grain doses, mixed in cold water, medicine was readily taken without murmur. There followed cessation of pain and fulness, and return of ability to receive and retain light nourishment. So decisive and unmistakable were effects, that word 'specific' seems better fitted than any other to describe its action.

"Such was character of writer's introduction to 'Ingluvin.' From that time to the present, a period of fifteen years, preparation has been held in high esteem. For vomiting in pregnancy and sequelæ, malnutrition and debility, it is not too much to say, preparation has justified my confidence.

"Of the many cases of this class, only one can be remembered that seemed not to be greatly benefited by it. That occurred in practice of another physician—on request, and without seeing case, adaptability of 'Ingluvin' was suggested. As this was the one break in an otherwise unbroken record, writer regrets the lack of opportunity that keeps him from observing for himself exact condition of patient. The more so because in no case over which he has been permitted to exercise personal supervision has result been other than satisfactory in character. When treating the vomiting of pregnancy physicians would do well not to wait until everything else has been tried and go to 'Ingluvin' as a last resort, but to use it from the start and persist in its use to a finish. No remedy yet in use can surpass it in my experience, as well as that of Prof. Bartholow, Dr. Bell, of Newcastle, and Dr. Solares, Barcelona, Spain. It replaces pepsin in all cases in 8 to 10 gr. doses, before or after meals, in powder to be taken in water, wine, or milk.—Very truly, ——"

Per ounce bottle, 4s., and in Tablets at same price.

TONO SUMBUL CORDIAL

(WM. R. WARNER & CO.).

An examination of the ingredients used in this combination and due consideration as to their physiological effects will satisfy the physician of the wide scope covered by this excellent tonic. The delicate stomach of the invalid rebels against the distasteful and nauseating bitter tonics. Tono Sumbul Cordial is free from this objection, having a delightful and pleasing taste in its combination with glycerine, therefore it replaces all such compounds.

Its potency is highly increased by the addition of the Iron and Cinchonia, the respective medicinal virtues of which, when properly presented, would admit of more than passing comment.

"A recent very elegant and palatable preparation of Wm. R. Warner & Co.—viz., 'TONO SUMBUL CORDIAL'—should be familiar to every practising physician. The formula is as follows:—

Sumbul	Acid Phosphate
Ferri Phosph.	Aromatics
Cinchonia	Sherry Wine.

"Sumbul, the root of Ferula Sumbul, natural order Umbelliferæ, habitat mountains of Russia in Asia, is a much used remedy of Russian physicians. Its action is similar to, but much more powerful than, Musk, Valerian, and allied drugs.

"It forms the chief ingredient of 'Tono Sumbul.'" It has marked nerve tonic and stimulant properties, and is a positive heart tonic. From a personal experience with this cordial I have found it to be a true tonic to the stomach and most pleasing to the palate taken in tablespoonful doses before meals or as an after-dinner cordial to relieve flatulence and promote digestion. It certainly promotes appetite, quiets the nerves, and gives a general sense of well-being. The ingredients combined with it are the most important for the therapeutic effects desired. "F. S. G——, M.D."

SAMPLES CHEERFULLY FURNISHED.

MEDICAL PREPARATIONS.

NAME.	PROPERTIES.	DOSE.
CREOLIN - -	A refined preparation of Jeyes' Fluid for medicinal purposes, forming an emulsion with water, used as a powerful non-irritating antiseptic.	In ½ to 2 per cent. solution.
JEYES' FLUID -	A coal-tar disinfectant of uniform, constant, and active composition. Used as a general disinfectant.	In 2 to 5 per cent. solutions, and in soaps, disinfectant powders, &c.
JEYES' SOLUBLE FLUID	A refined preparation of Jeyes' Fluid, forming a clear solution with water. For sterilisation of surgical instruments and as a general antiseptic.	For sterilisation purposes, in 2 to 3 per cent. solution; for irrigations, in ½ to 1 per cent. solution.
BRANALCANE -	A specially prepared and concentrated Glyceride of two non-poisonous antiseptic tar by-products, and containing Boracic Acid. A coloured syrupy liquid, strongly antiseptic in diphtheria and diseases of the mucous membrane.	Painted on the mucous membrane, undiluted. A teaspoonful in 5 oz. (a teacupful) of warm water as a gargle, spray, &c.
ANTINOSINE -	Iodoform substitute, being the sodium salt of Nosophen, a blue powder soluble in water.	As gargle and for irrigation in 0·1 to 0·25 per cent. solution, or undiluted in powder form like iodoform.
EUDOXINE - -	A reddish-brown tasteless powder, insoluble in water, combining the properties of Nosophen and Bismuth. Used as an internal antiseptic.	5 to 8 grains thrice daily; children ¾ to 3 grains thrice daily according to age; infants ⅛ to ¾ grain thrice daily. Best given in powder or pills.
NOSOPHEN -	Tetra-iodo-phenolphtalein, a greenish-yellow powder, insoluble in water, tasteless and odourless, containing 61·7 per cent. iodine. A powerful substitute for iodoform, free from poisonous and irritant properties.	Used undiluted and also diluted in the form of powder, ointments, paste, gauze, &c. Internally, in doses of 5 to 8 grains.

Eminent Medical Men,

Officers of Health, and Trained Nurses, recommend Lifebuoy Soap for use during Epidemics. Read what Dr. Karl Enoch, Chemisch Hygienisches Institut, Hamburg, says in his report of Experiments made with Lifebuoy Soap:—

"The examination of the sample of LIFEBUOY ROYAL DISINFECTANT "SOAP furnished to me by the Hamburg Agents of Messrs. Lever Brothers, "Limited, of Port Sunlight, England, gives the following results as to its "action as a disinfectant.

"Solutions of one, two, and five per cent. of LIFEBUOY ROYAL DISIN- "FECTANT SOAP in water were made. These solutions were brought to bear "on a variety of clean cultivated germs or microbes (*Bacillus*), in each case a "certain exact time being allowed for the operation; and thus the capacity of "this soap for destroying the various live and growing germs was proved. To "carry out this the following species of germs or microbes, amongst others, "were used:—

"1. Typhoid Microbe. 2. Cholera Microbe, taken from Hamburg water. "3. Diphtheria Microbe. 4. Carbuncle or Boil Microbe.

The results were as follows:—

"1. The obstinate Typhoid Microbes, with the five per cent. solution, were dead "within two hours.

"The operation of this soap on the Cholera Microbes was very remarkable, and "showed this soap to be in the highest degree a disinfectant. These were taken "from Hamburg water, and showed a result as follows:—

"With the two per cent. mixture, Cholera Microbes were dead within fifteen "minutes.

"With the five per cent. same were dead within five minutes.

"3. The Diphtheria Microbes were killed after two hours, with the five per "cent. solution.

"4. The five per cent. solution was tried on fresh Carbuncle germs, and the "result showed that the Microbe life was entirely extinct after four hours."

GUARANTEED PERFECTLY PURE, and FREE FROM ANY INJURIOUS CHEMICALS.

LIFEBUOY ROYAL DISINFECTANT **SOAP.**

VINOLIA TOILET VINEGAR.

7½d

As a charming Toilet Vinegar for use in water for the Toilet or Bath, this preparation is guaranteed as representing the highest excellence as regards choice ingredients, desirable proportions and perfection in method of scientific manufacture.

7½d., 1/3, & 2/6 per bottle.

SPECIAL TERMS TO MEDICAL MEN.

VINOLIA COMPANY LTD., Malden Crescent, London, N.W.

PEPTONIZED MILK

(PATENT CONCENTRATED).

The remarkable value of Peptonized (*predigested*) Milk has now been completely established. Without calling for any digestive effort, it can, in the absence of all other food, supply the system for an indefinite period with the nutriment which it requires. The great drawback to the more extended use of Peptonized Milk has been the trouble, care, and even skill required to be daily expended to prepare a fairly palatable and uniformly peptonized product. These disadvantages are entirely obviated by the use of this Concentrated Preparation, as by mere dilution with water a deliciously-sweetened Peptonized Milk, of uniform composition, can be instantly prepared by the most inexperienced person.

In Tins, 2s. 6d.; in Half-Tins (Samples), 1s. 6d.

PEPTONIZED COCOA AND MILK

(PATENT CONCENTRATED).

In this preparation the Cocoa as well as the Milk is peptonized and rendered soluble, and is therefore more readily assimilable than any other preparation of Cocoa extant, and can be digested by even the most confirmed dyspeptic. Besides its extreme digestibility, its perfect palatableness renders it a most delicious as well as wholesome beverage, which can be taken alike by the invalid and by those who, although otherwise healthy and robust, frequently experience a difficulty in digesting any form of Cocoa. For general convenience in use it is unrivalled, as no addition of milk or sugar is needed, but only mixture with hot water.

Tins, 2s. 6d., to make fifteen breakfast cups of Cocoa, or ten or more breakfast cups of rich Chocolate. Also in Half-Tins (Samples), 1s. 6d. each.

N.B.—The milk used in these preparations is secured from farms under our control, and where the sanitary arrangements have been made perfect, and, in addition to this, sterilisation after the most approved modern methods is provided for, thus ensuring complete immunity from communication of the infectious diseases which are unhappily so often spread by means of milk.

OPINIONS OF THE MEDICAL PRESS.

THE LANCET, June 15th, 1889:—

"Peptonised Milk (Patent Concentrated) is an excellent article. In consistence it is like a thick cream, agreeable in flavour, and yet so well peptonised that it gives no coagulation with dilute hydrochloric acid, even after heating. It will be of great value. The Peptonised Cocoa and Milk (Patent Concentrated) is clearly founded on the above. In appearance it resembles chocolate cream, and it is delicate in flavour, and yet peptonised. It is almost needless to say of Messrs. Savory & Moore's novelties that they are well prepared."

The PRACTITIONER, July, 1889:—

"We have carefully examined and tested Savory & Moore's Peptonised Cocoa and Milk and Peptonised Milk, and have used them ourselves and for patients of fastidious appetite. We find them well peptonised, capable of keeping even when the tins are opened for a considerable time, and very palatable. The Cocoa and Milk forms a thin and inviting beverage of a pleasant nutty flavour, and is retained well even in cases of chronic neurotic vomiting. The Peptonised Milk mixes well with tea or coffee, and improves the taste of both. These properties render Messrs. Savory & Moore's latest preparations a valuable addition to the sick-room dietary, and we can recommend them to the profession."

The MEDICAL PRESS AND CIRCULAR, Sept. 4th, 1889:—

"The Peptonised Cocoa and Milk and Peptonised Milk introduced to our notice by Messrs. Savory & Moore, like everything emanating from their laboratory, are most carefully prepared and of the highest quality. There is, moreover, a delicacy in flavour and aroma with the Peptonized Cocoa which shows at once that the products of selected growths only obtain a place here. It is, therefore, one we can unhesitatingly recommend."

N.B.—THESE PREPARATIONS KEEP WELL AFTER THE TINS ARE OPENED.

SAVORY & MOORE,

Chemists to the Queen, H.R.H. the Prince of Wales, H.H. the Khedive of Egypt, &c.,

143, NEW BOND STREET, LONDON.

SAVORY & MOORE'S
BEST FOOD FOR INFANTS.

The attention of the Medical Profession is especially requested to the following characteristics of this old-established **SELF-DIGESTING** *Food, which has so thoroughly maintained its reputation for superiority during an experience of 30 years:—*

Ratio of Albuminoids to carbohydrates. The ratio of the albuminoids to the carbohydrates is the same as in human milk—viz., 1 to 6·4; the ratio in cow's milk being only 1 to 3·8.

Albuminoids easy of digestion, not predigested. The albuminoids are not predigested as in pancreatised foods, but are rendered easy of digestion, leaving (as in human milk) just sufficient work to strengthen and develop the immature digestive powers, instead of weakening and abrogating them by keeping them inactive. Sir WILLIAM ROBERTS' experiments in feeding kittens show that distinct failure of nutrition occurs when the milk is predigested (peptonised), and the same thing has been observed in feeding infants, probably owing, as THE LANCET points out, to atrophy of unemployed glands.

Healthy nature of evacuations. As a consequence of the foregoing the proper peristaltic action of the bowels is maintained, and the healthy nature of the evacuations of infants fed on this food is a satisfactory feature much and favourably commented on by Mothers and Nurses.

The curdling of cow's milk prevented. When mixed with cow's milk it prevents the troublesome curdling in the stomach which takes place when cow's milk is given alone, and assimilates its composition to that of human milk.

Complete conversion of the starch. The active Malt Diastase present provides for the rapid and complete conversion of the starch at the time of mixing into the soluble assimilable products of maltose and dextrine. The point of the gelatinisation (thickening) of the Food—viz., 140° F.—is just that at which Malt Diastase is most active, and the conversion of the starch is consequently the work of a very few minutes only.

Retention of the Phosphates and Fat. The retention of the fat and of the phosphates of the wheat and malt, which are so essential to bone formation. These exist chiefly in the outer portions of the grain, the very parts which some manufacturers pride themselves upon so successfully rejecting.

Absence of Fermentable sugar. The absence of the fermentable sugar, which in the various malt extracts and milk foods so often gives rise to Diarrhœa and Flatulence.

Verdict of Jury as to inferiority of imitations. It is the *only* Infants' Malted Food which obtained a Gold Medal at the International Health Exhibition, the Jury being comprised of such authorities as Dr. ATTFIELD, F.R.S.; G. W. WIGNER, F.I.C., the then President of the Society of Public Analysts; Dr. JAMES BELL, F.R.S., the Head of the Government Laboratories; and other distinguished Medical and English and Foreign Experts. This affords significant indication of the value to be attached to the numerous imitations, which, whilst pirating the descriptive notices of the Food, utterly fail to approach its standard of excellence.

SAVORY & MOORE,

LONDON, 1884.

ADELAIDE, 1887.

MELBOURNE, 1888.

BENGER'S FOOD.

GOLD MEDAL AWARDED
Health Exhibition, London.

FOR INFANTS, INVALIDS, AND THE AGED.

This Delicious, Highly Nutritive, and most Easily Digested Food is specially prepared for Infants, and for those Adults whose digestive powers have been weakened by illness or age.

THE FOLLOWING LETTER IS PUBLISHED BY SPECIAL PERMISSION OF THE RUSSIAN COURT:—

"BALMORAL CASTLE, SCOTLAND, 25th Sept., 1896.

"Sirs,—Please forward to Balmoral Castle one dozen 2/6 Tins of BENGER'S FOOD for H.I.M. THE EMPRESS OF RUSSIA, addressed to Miss Coster. We have received the box ordered from Peterhof.

"Yours truly, F. COSTER."

PUBLISHED BY PERMISSION OF HER ROYAL HIGHNESS PRINCESS ALEXANDRA VON HOHENLOHE:—

"SCHLOSS, LANGENBURG, WURTTEMBURG, Nov. 29th, 1897.

"Sirs,—I thought you would like to hear how the little Prince of Hohenlohe is getting on. I have fed him entirely on 'BENGER'S FOOD' since he was two and a half months old, and now he is eight months. He is the finest and strongest child I have ever had charge of. He really is a splendid boy, and always so good and happy. He has already four teeth, and has cut them without any trouble.

"I remain, Sirs, yours truly, "MARY GALLOWAY,
"(Nurse to the little Prince Gottfried v. Hohenlohe)."

"Dec. 5th.

"I shall be very pleased to have my letter printed, or any portion of it you wish. I have the permission of Her Royal Highness Princess Alexandra von Hohenlohe. H.R.H. is very delighted with your food."

The Lancet describes it as "Mr. Benger's admirable preparation."

The London Medical Record says:—"It is retained when all other foods are rejected. It is invaluable."

The British Medical Journal says:—"Benger's Food has by its excellence established a reputation of its own."

The Illustrated Medical News says:—"Infants do remarkably well on it. There is certainly a great future before it."

A Government Medical Officer writes:—"I began using your Food when my son was only a fortnight old, and now (five months) he is as fine a boy as you could wish to see."

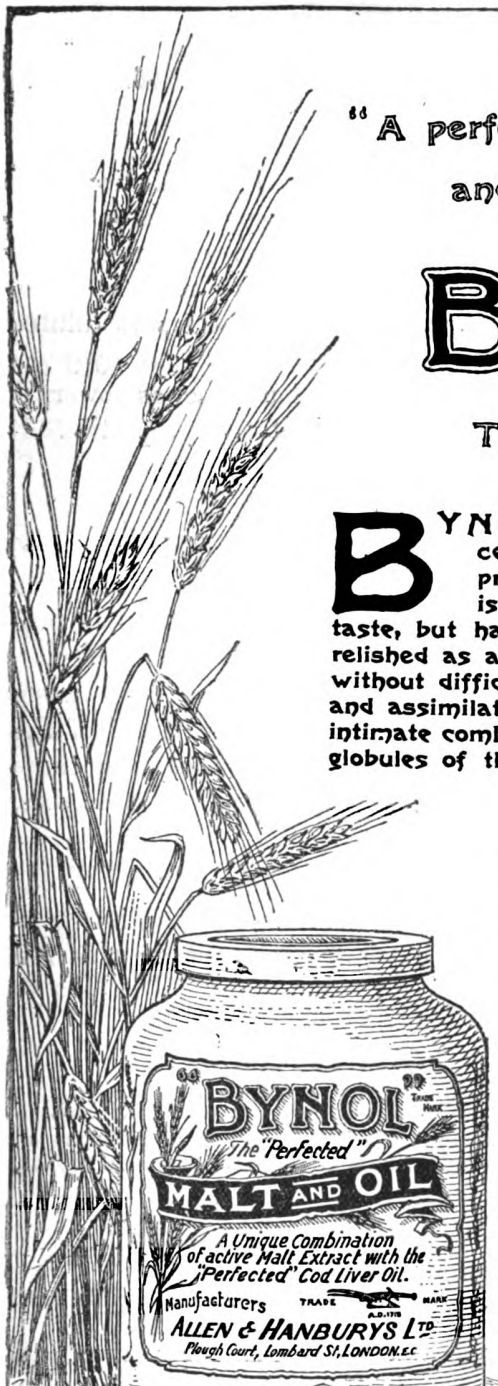
From an Eminent Surgeon:—"After a lengthened experience of Foods, both at home and in India, I consider Benger's Food incomparably superior to any I have ever prescribed."

A Lady writes:—"Really I consider that, humanly speaking, Benger's Food entirely saved baby's life. I had tried four other well-known Foods, but he could digest nothing until we began the 'Benger.' He is now rosy and fattening rapidly."

BENGER'S FOOD may be obtained in Tins, at 1/6, 2/6, & 5/-, of leading Chemists, &c., everywhere; wholesale of all wholesale houses, or of

F. B. BENGER & CO., Limited, OTTER WORKS, MANCHESTER.

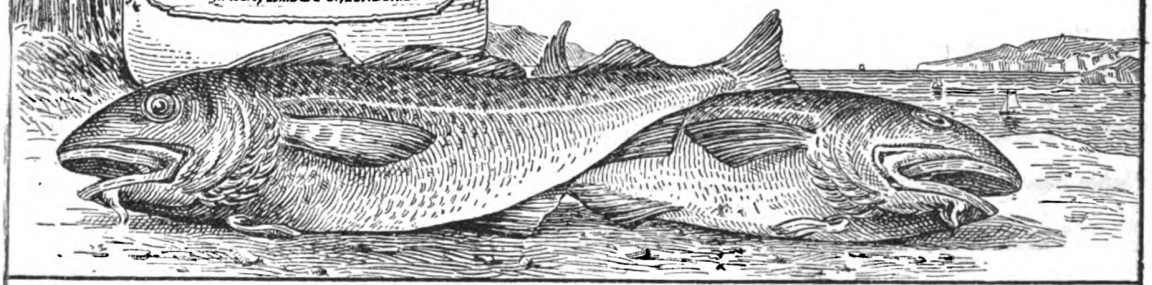
Telegraphic Address: "*BENGER'S, MANCHESTER.*"



"A perfect combination of Malt Extract and Cod-liver Oil."—*British Medical Journal.*

BYNOL

The "PERFECTED" Malt and Oil.



BYNOL, though containing a much larger percentage of COD-LIVER OIL than the ordinary preparations of MALT and OIL so widely sold, is, nevertheless, not only free from all unpleasant taste, but has a most agreeable nutty flavour, so that it is relished as a sweetmeat by many children. It can be taken without difficulty by delicate patients, being readily digested and assimilated. This result is due in large measure to the intimate combination of the MALT EXTRACT with the OIL, globules of the latter not being distinguishable even under a microscope.

The Malt Extract employed is exceptionally nutritious and active, while the Cod-liver Oil is of absolute purity, being made at Allen & Hanburys' own factories in Norway, from the fresh and selected livers of the Cod-fish only. *SAMPLES FREE TO MEDICAL MEN.*

The late Sir ANDREW CLARK, in a lecture at the London Hospital, remarked:—

"I have said that these fibroid cases are poor creatures, thin and white, and have what may be called nutritive debility, and the question is, What am I to do with them? You cannot do better than endeavour to make the patient walk in the way of physiological righteousness. But that sometimes will not do. Some people may be physiologically well behaved, and somehow they do not thrive on it. Can you do anything in those cases? There are two remedies which sometimes do succeed where the ordinary diet will not succeed in nourishing the patient—the one is Cod-liver Oil and Malt given with food—a preparation called **BYNOL**—*and the other is the remedy called* **BYNIN EMULSION,** *consisting of Hypophosphites, Oil, and Malt; both are prepared by Messrs. ALLEN & HANBURYS. These are two good nutritive agents in promoting nutrition."*

ALLEN & HANBURYS LTD., Plough Court, Lombard St, LONDON, E.C.

NON-POISONOUS. **MEDICAL IZAL.** NON-CORROSIVE.

A REFINED PREPARATION OF IZAL, specially prepared for Medical and Surgical use. The investigations of several eminent bacteriologists have established the high disinfecting power of MEDICAL IZAL; its superiority in practice is testified to by many leading members of the profession. Every separate make is tested bacteriologically by a well-known bacteriologist; it is not passed unless 1 part diluted with 200 parts of water destroys the *Bacillus coli* and the *Staphylococcus pyogenes aureus* in five minutes. MEDICAL IZAL is thus *proved* to be quite four times as powerful, antiseptically, as *absolute phenol* and yet free from danger and irritative properties. It is therefore

IDEAL IN OBSTETRICS.

MEDICAL IZAL is an emulsion, containing 40% pure IZAL OIL. This new coal (*not* coal-tar) product consists of oxidised hydrocarbons containing a greater proportion of hydrogen to carbon than the recorded member of the phenol series, and a less proportion than the members of the alcohol series.

EXCELLENT RESULTS have attended the use of this non-poisonous body when ADMINISTERED INTERNALLY in Typhoid, Dysentery, and other specific diseases of the Alimentary Canal. In Surgery, MEDICAL IZAL has won unqualified praise from those who use it. Proved to be exceedingly valuable in Ozœna, Erysipelas, old Abscesses, old Sinuses, and Fœtid Bronchitis.

PULMONARY TUBERCULOSIS.

When vaporised in the patient's room, IZAL quickly produces a marked improvement. The results are such as to warrant the highest hopes from its use in this fell disease. **Write for Special Pamphlet.**

IZAL PREPARATIONS.

MEDICAL IZAL (40% pure Izal Oil). In bottles, 1/6 & 2/6 each, and in Winchester quarts, 10/- each.
IZAL DISINFECTANT (40% Izal Oil), *proved* four times as strong, antiseptically, as absolute phenol. Officially adopted by H.M. Government for Use in Military Hospitals and in the Navy. In bottles, 6d., 1/-, 2/6, and 4/6 each; and in bulk.
IZAL LINT (1% Izal = 4% Carbolic), 2/4 per lb.
IZAL WOOL (1% Izal = 4% Carbolic), 2/- per lb.
IZAL GAUZE (1% Izal = 4% Carbolic), 1/- per 6-yard length.
To be had from the Makers, GIBBS, CUXSON & CO., Oldbury.
IZAL PERLES (2½ minims Izal Oil in oil), for Internal Use. Boxes of 25, 1/-; boxes of 75, 2/6; and in bulk.
IZAL LOZENGES (1-4th minim Izal in each), very valuable for the Throat. In boxes, 1/1½ each.
IZAL OINTMENT (5% Izal Oil = 50% Carbolic). For Ringworm and all Skin Diseases. In pots, 1/1½ each.
IZAL CREAM (1% Izal Oil = 10% Carbolic). Bland and Emollient. Valuable in Midwifery practice. In tubes, 1/1½ each; 4/6 per lb.
IZAL MEDICAL SOAP (4% Izal Oil = 40% Carbolic), 3 Tablets in box, 2/- per box.
PURE IZAL OIL, in glass stoppered bottles, 8 oz., 5/- each.

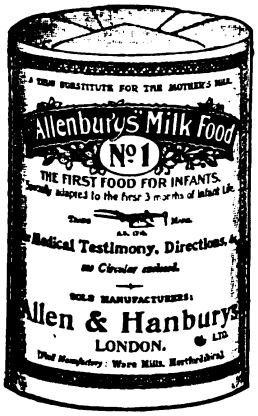
Verbatim Reports of Bacteriological, Pharmacological, & Surgical Experiments post free, also Samples, to the Profession.

NEWTON, CHAMBERS & COMPANY, Ltd., Thorncliffe, Sheffield.

ALLEN & HANBURYS, Ltd., Bethnal Green, London.

A PROGRESSIVE SYSTEM OF

Infant Feeding.



No single Food is suitable for the Infant for the whole period of the first nine months. At birth, the digestive powers are only able to assimilate human milk or its physiological equivalent; and it is not until the child is six months old that any starchy Food is admissible.

ALLEN & HANBURYS have introduced a Series of Foods to meet the increasing requirements of the infant economy.

THE

"Allenburys" Milk Food No. 1

is, as far as possible, an exact equivalent for human milk. It is prepared in the form of a dried powder, from fresh and carefully selected cow's milk, at their Factory at Ware. The proximate composition of the cow's milk having been ascertained, the excess of casein is removed and the deficiency in fat and milk-sugar made good. The mixture is then sterilised and concentrated in *vacuo*, care being taken not to overheat the mixture and thus destroy the anti-scorbutic element present. Sterilised *(boiled)* water is then added in the proportions indicated on the labels, and a perfect humanized milk is obtained. The portability, ease of mixing, and freedom from bacterial contamination render this preparation invaluable not only for general use but for delicate infants suffering from diarrhœa, and also in those cases where the milk supply is not above suspicion, or where long journeys have to be taken, whether by land or sea. This Food, as well as the **"Allenburys" No. 2,** is now being extensively used in India and tropical climates, and is found to keep perfectly in the hermetically sealed tins.

This Food should be given for the first 3 months.

THE

"Allenburys" Milk Food No. 2

is identical with No. 1, but contains in addition small quantities of maltose, dextrine, and soluble phosphates, derived from the digestion of whole meal. These are included to meet the increasing requirements of the infant economy; but it should be understood that there is **no unaltered starch** present.

This Food is designed for infants from 3 to 6 months.

THE

"Allenburys" Malted Food. No. 3.

This preparation (generally known as ALLEN AND HANBURYS' Malted Infants' Food) is a perfectly assimilable farinaceous Food. It is prepared on Baron von LIEBIG'S principle of malting, but by greatly improved methods. It differs from other forms of malted food in that the malt is present in a soluble, concentrated, and most active form.

The basis of the Food is fine wheaten flour, rich in nitrogen, with this advantage, that a large proportion, but not all of the starch is converted by the action of Malt Extract. The Food is rich in soluble phosphates and albumenoids, for the formation of firm muscle and solid bone.

It is prepared for use by the addition of cow's milk. With delicate children, however, the transition from No. 2 to No. 3 Food is too great, if cow's milk be used; it is better, therefore, to employ the **No. 1 Food** as a substitute for the cow's milk, thus ensuring the preparation being made with a true humanized milk.

Allen & Hanburys Ltd., Plough Court, Lombard Street, London.

Infants' Food Manufactory: **Ware Mills, Hertfordshire.** *Laboratories and Warehouse:* **Bethnal Green, London, E.**

For special details concerning these Foods, see succeeding numbers of the *British Medical Journal* and *Lancet*

Saccharin Tablets.

½ grain in each.

Nearly 300 times as sweet as Cane Sugar.

For Dietetic Use.

These minute Tablets are put up in small vinaigrette bottles, and are particularly recommended to be used instead of sugar in diabetes, obesity, and the gouty diathesis. SACCHARIN passes through the system unchanged, and is *absolutely innocuous*.

For Culinary Purposes.

Soluble Saccharin is prepared for sweetening tarts, puddings, &c. A ready and rapid disintegration of this very insoluble drug is ensured.

Cascara Sagrada Tablets.

Sugar Coated.

CASCARA SAGRADA is a tonic aperient, which can be taken without fear of injury to, or losing its effect on, the bowel. Not only does it relieve constipation, but it restores the healthy action of the bowel, and its use is unattended with discomfort of any kind. It is best given in small repeated doses.

ALL NAUSEOUS DRUGS
CAN BE HAD SUGAR COATED.

These *rapidly dissolve*, and are *readily assimilated*.

The "Allenburys" Tablets.

Should be prescribed thus

℞. Tab. cascara sagrada A H.

Sulphonal Tablets.

Disintegrating.

These are made of the pure drug, and are as readily absorbed as the powder. The dose is presented in an accurate form, and, being put up in small vinaigrette bottles, the Tablets are very portable.

SULPHONAL is one of the most reliable and useful hypnotics now in common use. No ill effects result from a reasonable employment of this drug, nor does it give rise to headaches afterwards.

Tablets contain five grains in each.

Phenacetin Tablets.

Disintegrating.

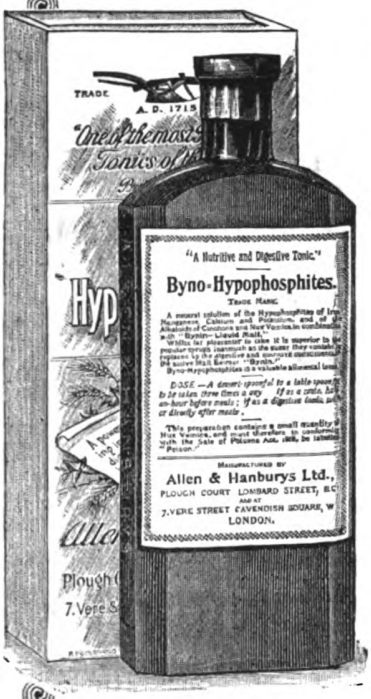
This insoluble drug is so put up in Tablets that they readily and quickly disintegrate in the stomach. Portability is the great recommendation, as well as accuracy of dose, in the use of Tablets.

PHENACETIN is invaluable in this country for headaches, migraine, neuralgia, & influenza, while in the tropics it has been found the most reliable of all febrifuges.

In Central America the value of Phenacetin is being rapidly understood and appreciated.

Allen & Hanburys Ltd., Plough Court, Lombard Street, London.

DIGESTIVE. TONIC. NUTRITIVE.



Byno-Hypophosphites.

"One of the most popular tonics of the day."

—British Medical Journal.

ADVANTAGES:

The inert sugar of the ordinary syrupy preparations is in BYNO-HYPOPHOSPHITES replaced by the active Malt Extract BYNIN. Hence BYNO-HYPOPHOSPHITES is DIGESTIVE and NUTRITIOUS, containing as it does the diastasic ferment of Carbo-hydrates and also the soluble Phosphates and Albumenoids of the finest malted barley.

BYNO-HYPOPHOSPHITES is a Tonic not only to the nervous system but also to the heart muscle and digestive apparatus.

With **BYNIN** (a very active and by far the most palatable Malt Extract on the market) as a vehicle, it contains the Hypophosphites of Iron, Manganese, Calcium, and Potassium, together with the Alkaloids of Cinchona and Nux Vomica in combination with their natural acids, in which form they are more readily assimilated. The quantity of Alkaloid is carefully standardised, there being the equivalent of 1-40th grain of Strychnine in each ounce.

☛ *The presence especially of Iron and Manganese in this preparation indicates its value as a direct hæmopoietic agent.*

The Hypophosphites, taken as a group, are invaluable restoratives in cases of brain fatigue and nervous exhaustion. It is a matter of clinical observation that PHOSPHORUS, essential in the production of the lecithin compounds of the nervous system, is FAR MORE READILY ASSIMILATED in the form of HYPOPHOSPHITES than as Phosphates, Phosphoric Acid, or even free Phosphorus.

The other allied Tonics in which BYNIN is used are:

Bynin-Amara = Easton Syrup.

Byno-Phosphates = Chemical Food.

PEPSENCIA.

PEPSENCIA is an ever-ready digestive fluid, possessing remarkable peptic and rennet activity.

PEPSENCIA contains *pure pepsin*, the vitality of which is unimpaired by chemical action or manipulation, as it is obtained by direct solution from the secreting glands of the gastric mucous membrane, every care being exercised to preserve its full physiological activity.

PEPSENCIA facilitates the administration and aids the remedial action of drugs and chemicals which disturb the stomach and impair digestion. It is indispensable to the continued successful use of the mercurials, iodides, sodium salicylate, etc. It is helpful also in the toleration of morphia.

PEPSENCIA, made direct from the fresh rennet of the nursing calf, is of peculiar value as a stomachic, antiseptic, corrective and digestive. The milk-curdling ferment has a distinct physiological action in the infant's digestive economy. It renders milk curd more flocculent and digestible.

* * * * * *

WHEY, prepared with Pepsencia, contains all the soluble constituents of the milk, separated from casein and fat, and is therefore a valuable "rest" food, under conditions so favourable to fermentation that whole milk must, for the time, be avoided.

JUNKET, made with Pepsencia, a soft, jelly-like milk curd, is a delicious food for the Invalid, giving the sense of substance craved by the Convalescent, yet readily diffusible in the stomach, and very digestible. This Junket also forms an admirable, tasteless vehicle for the mercurials, iodides, chloral, sodium salicylate, etc.

'Kepler' Malt Products

HAVE FROM THE FIRST BEEN RECOGNISED AS STANDARD PREPARATIONS OF UNDENIABLE EXCELLENCE AND RELIABILITY.

Burroughs Wellcome and Co., London and Sydney.

'Kepler' Malt Extract.

IS the "best known and largest used Extract of Malt" (*The Lancet*). It is the Malt Extract upon which the medical profession relies, and its unique reputation to-day is built upon the solid foundation of practical experience. Its perfection is not, therefore, theoretical only, but is established by actual clinical facts.

Small and large bottles, 1s. 8d. and 3s. each.

H 66

'Kepler' Solution.

IS a molecular incorporation of the finest Norwegian Cod Liver Oil in 'Kepler' Malt Extract. During the summer the intolerance of cod liver oil is conquered and its digestibility increased by its administration in solution in 'Kepler' Malt Extract. "An ideal form for the administration of fat."—*British Medical Journal.*

Small and large bottles, 1s. 8d. and 3s. each.

ASCERTAINED Maltine FACTS.

Value of "MALTINE" in Diastase.

"As to diastase-converting power, 'Maltine' is superior to the best extracts of malt I have ever seen."—Prof. STUTZER, Bonn.

"Repeated experiments show that 'Maltine' converts from 25 to 30 times its own weight of starch into sugar."—Prof. C. MÉHU, Paris.

"'Maltine' exhibits in an eminent degree the starch-dissolving power of diastase; in fact, a teaspoonful is capable of converting instantaneously a surprising amount of stiff starch paste into a thin, limpid liquid."—THE LANCET.

Albuminoids.

"Extracts of malt (i.e., malted barley) are pretty widely known, but in 'Maltine' we find the first example of a combination of the nutritious principles of these three cereals. The *greater value* of this combination is apparent, as wheat and oats are especially rich in muscle- and fat-producing elements. ..... Clinical experience enables us to recommend it as a nutritive agent in virtue of its albuminoid contents."—BRITISH MEDICAL JOURNAL.

"'Maltine' contains more flesh-forming substance than any other extract of malt."—Prof. DEPAIRE, Brussels.

Phosphates.

"Contains more bone-producing substance than any other extract of malt."—Prof. DEPAIRE, Brussels.

Carbo-hydrates.

"Maltine" contains a large proportion of the digested carbo-hydrates, dextrine and maltose. "Maltine," by reason of its diastasic superiority, renders assimilable and utilises for the organism a larger amount of farinaceous food than is the case with other extracts of malt.

As a Menstruum for Cod Liver Oil.

The BRITISH MEDICAL JOURNAL, referring to "Maltine" with Cod Liver Oil, states: "We can recommend it on the ground of its perfect admixture, the ease with which it is assimilated, the good quality of the cod liver oil, and the value in diastase of the 'Maltine.'"

"MALTINE" obtained the ONLY GOLD MEDAL for Extract of Malt at the International Health Exhibition, London.

TEN GOLD MEDALS AT INTERNATIONAL EXHIBITIONS.

TOILET 'LANOLINE'
in small and large collapsable tubes, 4/6 and 9/- per doz.

. . . .

'LANOLINE' TOILET SOAP
in boxes containing three tablets, 4/6 per dozen tablets.

'Lanoline' Preparations

'LANOLINE' is a preparation of the purified fat of lamb's wool, and is similar to the natural fat of the human skin.

TOILET 'LANOLINE.'

The most natural and therefore the best emollient for the skin. The 'British Medical Journal' says:—"Useful for chapped lips and hands, abrasions and eruptions of many kinds. In a thin layer over a wound it is an effective protective. . . . Such a layer forms an impassable barrier to disease germs."

'LANOLINE' TOILET SOAP.

A pure neutral soap carefully superfatted with 'Lanoline'. It thoroughly cleanses the skin and renders it beautifully supple without causing the slightest irritation even to the most delicate and irritable integument. "An excellent and valuable preparation."—'The Lancet.'

SCHACHT'S
DIGESTIVE FLUIDS
Are the Most Efficient and Reliable.

SCHACHT'S PEPSINA LIQUIDA
(Registered Title.)

Fluid pepsine of extraordinary activity—tasteless, odourless, attractive to patients, and reasonable in price. Every teaspoonful, when tested by the official B.P. process is *guaranteed* to effect the solution of **1000 grains** AND MORE of albumen, a weight equal to that of two hard-boiled eggs. Peptic power is the only test of value. Most of the fœtid and repulsive dry Pepsines have proved worthless. Dose: ½ to 1 drachm. In 4-oz.; ½-lb.; 1-lb.; and 2-lb. bottles.

SCHACHT'S PEPSINA LIQ. c. BISMUTHO

Each dose contains in a concentrated form, besides the fluid pepsine, a full dose of Schacht's Liquor Bismuthi. An elegant and successful combination. Invaluable in irritative dyspepsia, gastritis, &c. Dose: One drachm.
N.B.—Peps. Liq. c. Bismutho Co. contains, in addition, one gr. of soluble Euonymin in each drachm.

SCHACHT'S PEPSINA LIQ. c. EUONYMIN

Each drachm contains, dissolved in fluid pepsine, one grain of soluble Euonymin, and is a highly active and reliable digestive and hepatic stimulant. Dose: One drachm. For dispensing, ½-lb. and 1-lb. bottles. If desired, this preparation can be had combined with tasteless Cascara.

SCHACHT'S LIQUOR BISMUTHI

Absolutely pure. The original preparation, invented and introduced to medicine by Mr. Schacht in 1855. Its distinct superiority is universally admitted. Dose: One drachm diluted; equivalent to a full dose of the Trisnitrate. When prescribing or ordering, please to specify "SCHACHT'S." In ½-lb.; 1-lb.; 2-lb.; and 5-lb. bottles.

SCHACHT'S LIQUOR BISMUTHI SEDATIVUS

Contains pure Bismuth and *Pepsina Liquida* in combination with sedatives; viz., in each drachm gr. 1-24 Morphiæ; min. ij. Acid. Hydrocyan., B.P.; and min. v. Tinct. Nucis Vom. A formula most serviceable in the treatment of gastric pain, nausea, and vomiting. Dose: ½ to 1 drachm, diluted.

SCHACHT'S BI-DIGESTIVE (PEPSINE AND DIASTASE).

A bland liquid of very agreeable flavour, presenting both ferments in fullest activity. Although such a combination, capable of converting both albuminoid and starchy foods, is often needed by physicians as a dietetic aid in disease or in convalescence, nothing of real value has hitherto been available. A most active, palatable, and reliable preparation is now offered to the profession. Dose: From a dessertspoonful to a tablespoonful with each meal. In 8-oz. and 16-oz. bottles.

The Profession is respectfully warned against substitutors and imitators. Articles are being offered that, except in name, bear no resemblance to those whose reputation rests upon a successful experience of more than forty years. The safeguard is to insist on having "SCHACHT'S."

GILES, SCHACHT, & CO., CLIFTON, BRISTOL.

A PERFECT MALT EXTRACT.

"D.C.L." MALT EXTRACT

THE DISTILLERS COMPANY, LIMITED, having exceptional experience of malting, and commanding the services of highly-trained Analytical Chemists, together with the choice of the finest grain procurable, consider that they occupy an unusually favourable position for the manufacture of a PERFECT MALT EXTRACT, which they claim "D. C. L." to be. It is, of course, concentrated *in vacuo*, and the temperatures at which the malted barley grist is mashed and the wort subsequently concentrated are carefully regulated, so as to ensure the production of a Pure Extract of Malted Barley of unusually high Diastasic strength and nutritive value.

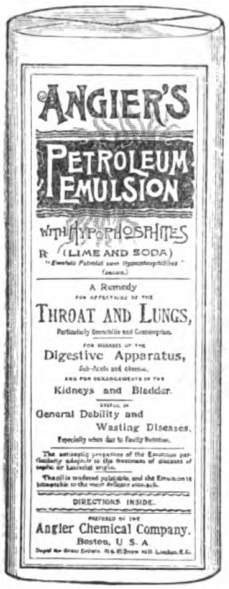
"D.C.L." MALT EXTRACT has been submitted for analysis to a high scientific authority, who reports as follows:—

"REPORT ON THE 'D.C.L.' MALT EXTRACT.

"Composition in 100 parts:—

"Maltose	56·50
Dextrin	12·18
Albuminoid Matter	7·71
Ash (chiefly Phosphates)	1·92
Moisture, &c. (including Diastase)	21·69

"RELATIVE STARCH-CONVERTING POWER.—The diastasic or starch-converting power gives Malt Extract its chief value as an adjunct of food. A smaller quantity of this brand is required for such a purpose than of any brand known to me. Hitherto the four best brands in the market are required in the following proportions for the purpose just mentioned: Brand A, 100 parts; B, 95½; C, 91½; D, 56½. I find that only 54 parts of THE DISTILLERS CO.'S Brand are required to do the same starch-converting work. The samples of three different batches I have examined varied very slightly from this average of 54, the exact figures being 52, 54½, 55½. Each was of good flavour and was well prepared."



SAMPLES SENT FREE TO MEDICAL MEN ON APPLICATION.

"D.C.L." MALT EXTRACT is put up in Bottles and specially prepared lever lid Tins.

Sole Manufacturers: THE DISTILLERS COMPANY, LTD., EDINBURGH.

Angier's Petroleum Emulsion

WITH HYPOPHOSPHITES LIME AND SODA

IS INDICATED IN THE TREATMENT OF

PHTHISIS

IN ALL ITS STAGES.

It relieves the Cough and Fever, and is of undoubted efficacy in checking the Diarrhœa and Night Sweats; while it has great power to improve Digestion, Assimilation, and Nutrition. Bland, soothing, creamy, it is unobjectionable to the most fastidious patient and agrees with the most sensitive stomach.

PRESCRIBED BY EMINENT LUNG SPECIALISTS.

In two Sizes (6 and 15 oz.), of all Chemists.

NEURALGIA.

THE one great characteristic of all varieties of neuralgia is debility of the nervous system, and whatever tends to produce structural or functional enfeeblements of the nerves induces neuralgia, hence all the causes inducing loss of nerve power may be cited as causes of neuralgia. This affection, when not directly the result of some physical cause interfering with the integrity of the nerve system in which the pain is situated, is invariably due to loss of nerve power. Its very existence is evidence of deficient energy. The remote factor may be malaria, syphilis, rheumatism, gout, or any other cause capable of devitalizing the organism, and as a consequence that of the nerves also. Our remedial measures should therefore be directed principally to improving the nutrition of the nervous system generally, and to the removal of any constitutional taint that may be present. The first indication is filled by CELERINA and a generous diet. In facial neuralgia and brow ache it should be administered in connection with quinine, or other tonic remedy, and if malarial influence be suspected, full doses of some reliable anti-malarial remedy should be given. The CELERINA treatment is also applicable to sciatic and spinal neuralgias. Neuralgia in men is frequently an expression of loss of nerve power, and the direct consequence of dissipation and excesses of various kinds, but over-work and intense intellectual exertion will also produce it. Where the pain is located is of little moment, the treatment should be general. In these cases CELERINA seldom fails to give relief. Women suffer more frequently and more intensely from neuralgia than men. They are liable to be affected by all the causes which induces it in men, besides the derangements in health associated with menstruation—menorrhea especially. Hyperfecundation (rapid child-bearing), frequent miscarriage, hemorrhage, prolonged lactation and changes occurring at the climacteric period of life, all tend to induce a neuralgic condition of the nerves. The general treatment should be directed to the removal of the cause whenever this is possible. In these cases CELERINA, combined with ALETRIS CORDIAL will be found to exercise a magical influence.

RIO CHEMICAL CO., St. Louis, Mo., U. S. A.

HARVEY'S
SUGAR-FREE PALE ALE

(Protected by Her Majesty's Royal Letters Patent).

The only **ALE** which may be drunk with impunity by persons with whom, from various causes, ordinary Beer does not agree.

ABSOLUTELY FREE FROM SUGAR.

Mr. T. FAIRLEY, Leeds City and County Analyst, F.R.S.Edin., F.C.S., F.I.C., certifies, June 3rd, 1896, that this Pale Ale is

"ABSOLUTELY FREE FROM FERMENTABLE SUGAR."

For further analyses see THE LANCET, May 22nd, 1897, and the BRITISH MEDICAL JOURNAL, April 24th, 1897.

An article in THE LANCET says: "For years I have been unable to take beer as a beverage on account of the lethargy, indigestion, pain, and stiffness which invariably followed such indulgence; but for three months continuously I have taken one glass of this Sugar-free Pale Ale at luncheon without the slightest 'rheumatic' effects."
—THE LANCET, August 14th, 1897.

SPECIAL TERMS allowed to the Medical Profession, to whom a SAMPLE BOTTLE will be sent FREE on application.

The Sugar-free Pale Ale is supplied, upon receipt of cheque or postal order, in Imperial Half-pints, price **3s. 9d.** per dozen; Reputed Pints, **5s. 0d.** per dozen.

And HARVEY & CO., PELLON BREWERY, HALIFAX.

MOUNTJOY BREWERY, LTD.

(Late FINDLATER & CO.),

RUSSELL STREET, DUBLIN.

NOURISHING STOUT.

THE attention of Medical Men is respectfully called to the value of this finest of Malt drinks as a valuable Tonic Restorative. Numerous Unsolicited Testimonials have been received by our Bottlers all over England.

SAMPLES will be sent direct from the BREWERY, Carriage Paid, with name of nearest Bottlers, on application.

ANALYTICAL RECORD FROM "THE LANCET."

"CROWN STOUT.—MOUNTJOY BREWERY, RUSSELL STREET, DUBLIN.

"The nourishing qualities of Stout are due mainly to a comparatively high proportion of Malt extractions, which, consisting principally of maltose and dextrine, offer little task to the digestive organs. The sample before us is marked by an excellent proportion of these extractions, while, at the same time, the alcoholic strength is by no means excessive.

"The results of analysis were as follows: Malt extractions, 9·0 per cent.; mineral matter, 1·38 per cent.; alcohol—by weight 4·62 per cent., by volume 5·78 per cent.; equal to proof spirit 10·13 per cent. The mineral matters consisted almost entirely of soluble potassium phosphate. The Stout was in good condition, ripe, yet free from undue acidity, and possessed a characteristic malty flavour."

SIR CHARLES CAMERON'S ANALYSIS.

"DUBLIN.

"I have analysed a specimen of **Nourishing Dublin Stout**, submitted to me for that purpose by **The Mountjoy Brewery, Dublin.** I have never examined a specimen of Porter in which the solid or nutritive constituents were so abundant as in the case of this Stout. It contains **Ten Per Cent.** of its weight of solid matter, or nearly the amount of solids contained in milk. Its flavour is good, and it is **Remarkably Free from Acidity.**

"CHARLES A. CAMERON,

"*Professor of Chemistry, College of Surgeons, Dublin.*"

PROFESSOR TICHBORNE'S ANALYSIS.

"DUBLIN.

"I have examined and analysed for several years the Stouts brewed by **The Mountjoy Brewery**—viz, **Single, Extra,** and their speciality known as **Nourishing** or **Crown** Stout. The gravities of all these Stouts are very high, as proved by my analysis. **The Crown** or **Nourishing** Stout gave me one of the highest gravities I have ever seen in Stout. They are all of first-class quality. **The Nourishing** Stout being exceptionally fine, and owing to its **strength** and **purity,** is a most valuable food for **Invalids.** They are all brewed from **Malt** and **Hops only,** the water used being the best brewing water the City of Dublin affords. "CHARLES R. C. TICHBORNE,

"*Professor of Chemistry, Dublin.*"

Hunyadi János

A VERY INTERESTING and important contribution on Natural Mineral Waters of the purgative saline type was published in the report of a Special Analytical Commission in THE LANCET of December 5th, 1896. This report is made all the more interesting and reliable from the fact that a LANCET Commissioner personally visited the Saxlehner Springs, near Buda Pesth, and obtained samples on the spot, which were subsequently analysed in THE LANCET Laboratory, and the results obtained compared with samples purchased at a number of shops in London. The results showed that **HUNYADI JÁNOS, the Prototype of all Bitter Waters,** was, wherever it might be obtained, a water showing a **perfect uniformity of composition,** and one that could be **relied upon absolutely as at all times being identical** with that drawn from the Spring and fountain head. The numerous analyses in THE LANCET Report give very striking evidence not only of the **honesty of the water,** but bear out also the **remarkable uniformity of composition** that has characterised **HUNYADI JÁNOS** for **a third of a century.** Thus, the results recently obtained in THE LANCET Laboratory accord exactly with those obtained in Liebig's Laboratory over thirty years ago. **Nothing could be more satisfactory than this from the therapeutic point of view. Practitioners can thus depend** upon the water they prescribe, and may be assured that when **HUNYADI JÁNOS** is administered the **medicinal effects will always be the same,** and **with the same good results.** As is pointed out in the Report, an important feature in **HUNYADI JANOS** Water is the constancy of ratio of the active saline constituents to each other. The sodium and magnesium sulphates are together in almost exactly equal proportions, so **that what therapeutic property is lacking in the one is balanced by the other.** Neither the sodium sulphate nor the magnesium salt are in excess of each other. **In this way the purgative effect is not drastic,** but **mildly yet decidedly effective.** Again, besides these chief medicinal salts there are present in important quantity also in **HUNYADI JÁNOS** Water, Sodium Chloride, **Sodium Carbonate,** and **Lithium Chloride.** It cannot be doubted that each of these constituents contributes towards the **favourable action of the water,** which has for so long been a **distinctive and satisfactory feature attending its administration.** Last, but by no means least, the report of THE LANCET Commission shows that **HUNYADI JÁNOS** Water is bottled under **admirable sanitary precautions.** In the details of the analyses given there was not the slightest indication that **HUNYADI JÁNOS** Water contained any objectionable organic matter from whatever source. While therefore the medicinal properties of **HUNYADI JÁNOS** as a natural aperient are **sure and reliable,** it is **safe** also from the very important fact of its **extreme organic purity.**

Hunyadi János

PROPRIETOR

ANDREAS SAXLEHNER, BUDAPEST.

NERVES and FOOD.

One of the greatest living authorities on dietetics, writing under the heading "Why Vegetarian?" in the current issue of the NINETEENTH CENTURY, gives some very pertinent advice on the necessity of altered dietary suited to the enormous demands made on a man's activity, especially that of the brain, in these days of intense nervous energy and high pressure.

Food, he says, "must not be bulky. Much of it may be, advantageously, soluble in form, so as to be rapidly and easily assimilated, even pre-digested sometimes; and when solid, not requiring much mastication. I have found nothing which fulfils these conditions so completely as the various concentrated extracts of meat which are now so extensively used. A teaspoonful of sound beef extract in a breakfast-cup of hot water, when the brain is fatigued and the stomach unfit for work, is often the best antidote possible—reinvigorates the system, and prepares it for a light meal or for a little more work, as the case may be."

Science has shown by the most searching chemical analysis that **VIMBOS** contains less water and more actual nourishment, besides being purer, than any meat extract yet produced. It is therefore an ideal Food for Young and Old, for the Sportsman and the Athlete, the Brain Worker and the City Man, for those who have health and strength, and for those who seek to regain them.

TAMAR INDIEN GRILLON.

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION.

HÆMORRHOIDS, BILE,
CEREBRAL CONGESTION, HEADACHE,
LOSS OF APPETITE,
INTESTINAL OBSTRUCTIONS, &c.

By augmenting the peristaltic movement of the intestine without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness; and the same dose always produces the same effect—that is to say, never needs increasing.

It is recommended by the most eminent physicians of Paris, notably Drs. BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success.

Wholesale—London: E. GRILLON, 47, Southwark Street, London, S.E.
Sold by all Chemists and Druggists, 2s. 6d. a box, stamp included.

Paris, 22, 20, rue Drouot.

and from all good Chemists.

CIMOLITE (Gr. κιμολια).

Terra Cimolia (popularly known as "WHITE FULLER'S EARTH"). A fine and very scarce natural variety of Steatite, composed principally of Silicate of Magnesium, and reduced by the most careful trituration and sifting to the FINEST POSSIBLE POWDER.

Highly recommended by the most eminent Dermatologists. As a Dusting Powder in Eczema it is simply invaluable, and is infinitely superior to Oxide of Zinc, Prepared Calamine, Carbonate of Bismuth, Powdered Starch, or any other Amylaceous Compound; also in all cases of Infantile Chafing, for most Irritations of the Skin, and all Excoriations. For the Profession *only*, in Tins, free per post, send 18 penny stamps. For the general public, post free, send 13 or 36 penny stamps.

Introduced into medical practice and prepared by JOHN TAYLOR, Chemist (many years with Squire, Oxford-street), 13, Baker-street, Portman-square, London, W.

LIQ. SECALIS CORNUTI (BATTLEY'S).

Please specify BATTLEY'S.

This Liquor contains the equivalent of a dram of powdered Ergot to each fluid dram. It is a preparation which can safely be relied on for purity and strength, and this is what is required of Ergotic Preparations, among which Battley's Liquor is pre-eminent. Perhaps there is no drug of which so many useless preparations exist. Many things may account for this. The official preparations of the British Pharmacopœia, the ammoniated liquid extracts, the stale powder, and the tincture being often almost inert, we therefore again bring to your notice this reliable Liquor, which has stood and does stand out before all others in efficiency, and which is now used in all parts of the inhabited world.

LONDON, MANCHESTER, BIRMINGHAM, BRISTOL, HARROGATE, & MITCHAM.

CONTREXEVILLE

Be Careful to specify:

SOURCE DU **PAVILLON**

(Diuretic, Tonic, Digestible)

GOUT, GRAVEL, DIABETES, ARTHRITISM

The Contrexéville Mineral Water (Pavillon SPRING) is a diuretic and laxative, a tonic, a stimulant, and aid to digestion. — It acts upon the secret mechanism of nutrition, as is proved by its influence in checking the production of uric acid and glucose: it favourably modifies those morbid processus of biological chemistry which result in the accumulation of uric acid in the blood, inducing the phenomena of gout. — It facilitates the elimination of urinary deposits, by contracting the ducts containing them and increasing the quantity of liquid by which these vessels are flushed. — It assists the cicatrization of the inflamed mucus of the urinary organs, and helps to restore the normal acidity of the urine; facilitates the flow of the bile, by causing contraction of the biliary ducts and the expulsion of calculi; and is invaluable in the treatment of congestion of the liver.

Samples free to Members of the Medical Profession on application to INGRAM & ROYLE, *East Paul's Wharf, 26, Up. Thames St., E.C.*

Report by Sir E. FRANKLAND, K.C.B., D.C.L., F.R.S., upon Messrs. Cooper & Co.'s Distilled Water, as used in the manufacture of their Aërated Waters:—"WATER ANALYSIS LABORATORY, THE YEWS, REIGATE, May 17th, 1898.—I have submitted to complete analysis and bacterioscopic examination the sample of Distilled Water from Messrs. Cooper & Co.'s Mineral Water Factory. I enclose results of chemical analysis, and have to report as follows: The sample contains no trace of organic matter, and is quite free from microbes or their spores. It is admirably adapted for the manufacture of Aërated Waters.—(Signed) E. FRANKLAND."

C. & CO. have erected SPECIAL DISTILLATORY APPARATUS for the production of DISTILLED WATER.

The following are prepared with "Oxycarbonated" Distilled Water, in Patent Porcelain-lined Syphons, thus ensuring absolute freedom from metallic contamination—viz.: LITHIA, LYSIDINE, LYCETOL, PHENOCOLL, PIPERAZINE, SODA, SELTZER, POTASH, LEMONADE, &c. C. & Co. prepare Aërated Medicinal Waters in any strength or combination as desired by the Medical Profession.

The above Waters were exhibited at the Medical, Surgical, and Hygienic Exhibition held at the Queen's Hall, Langham-place, London, W., from May 31st to June 3rd, 1898.

Telephone, 340 Kensington. ESTABLISHED 1863. **Telegrams: "Sinapine, London."**

"IN THE FRONT RANK."

TIBBLES' Vi-Cocoa

Is a Combination of the African Kola Nut, Extract of Malt, Hops, and the best Caracas Cocoa.

REFRESHING, AGREEABLE, and STIMULATIVE.

TAKES THE PLACE OF TEA AND COFFEE AS A MORNING AND EVENING BEVERAGE.

☞ THE LANCET says:—"Vi-Cocoa must be assigned a place in the front rank of really valuable foods, since it is the embodiment of the numerous principles contained in malt, hops, kola, and cocoa. ..... Of distinct value as a restorative and stimulative food."

THE BRITISH MEDICAL JOURNAL says:—"Vi-Cocoa is a very palatable beverage of great stimulating and sustaining properties.

THE MEDICAL MAGAZINE says:—"Medical practitioners will find a valuable weapon in Tibbles' Vi-Cocoa in combating the various conditions of nervous exhaustion and enfeebled digestion. The ingredients of which it is composed are carefully selected and of undoubted purity and strength."

DIABETES

BLATCHLEY'S Celebrated Breads and Biscuits supplied to nearly all the London and County Hospitals & Infirmaries. Blatchley's Gluten and Bran Biscuits, a speciality in treatment of Obesity, made from a receipt of Dr. Yorke-Davies. Price Lists free.
E. BLATCHLEY, 167, Oxford St., London.

OBESITY

HAUSEN'S OATMEAL COCOA

Is a happy combination of two of Nature's most nourishing products. On account of its high percentage of digestible albumen, and its low percentage of fatty matter, it is most suitable for Children, Invalids, and Convalescents, and in all cases of Disorders of the Stomach and Bowels.

Manufactured under the control of Professor DIETRICH of the Royal Laboratory at Marburg, it is highly recommended by Professor KUSSMAUL (Heidelberg), Professor GURLT (Berlin), Professor VON STRUMPELL (Erlangen), Professor Dr. VON ESMARCH (Kiel), and many other medical authorities.

A SAMPLE BOX WILL BE SENT FREE ON APPLICATION TO

THE SERVUS COMPANY. 65 & 66, Basinghall Street, London.

SOLE AGENTS FOR THE UNITED KINGDOM.

DIPSOMANIA.

DURING the last six months we have invited the Medical Profession to test "HALL'S WINE" as a probable antidote to Dipsomania. We are receiving some opinions from those who have tried the experiment.

The following have been recently received, and confirm those already published :—

Dr. J. H. R., L.R.C.P., &c.:—"About January 16th last you forwarded at my request a sample of 'Hall's Wine.' I had a case just then of Delirium Tremens, or rather Convalescence from it. I had it administered twice a day, morning with luncheon and after supper at bedtime. The result was distinctly good, no other stimulant was given. He now takes it regularly three times a day, and wants no other stimulant. His nerves are much stronger, and he sleeps well. I can strongly recommend 'Hall's Wine' in similar cases."

Dr. E. F. N., M.D., L.R.C.P. & S.Ed., &c.:—"I beg to mention that I can already testify to the value of 'Hall's Wine.' I have prescribed it in the treatment of Dipsomania with marked good results. I have two patients at the present who are taking it with excellent effects."

We desire to impress upon Medical Men the important fact that "HALL'S WINE" has no addition of Cocaine, and that it is carefully prepared by macerating the best Bolivian Leaves in partially detannated Port Wine, the proportion being one drachm of leaves to the wineglassful.

DAINTINESS.

A woman of dainty habits, a dainty home, daintily clean linen, and daintily prepared food arranged in a daintily appetising manner are charms to life appreciated alike by Peer and Peasant; and equally esteemed in the mansion, villa, or cottage. Daintiness is a virtue, for it bespeaks cleanliness, which we have ample authority to hold "next to godliness." When an article therefore is daintily bright and transparent to the eye, when we know it is mainly produced by ingenious apparatus, that reduces hand labour to a minimum and ensures a maximum of cleanliness, we are attracted thereto at once. And when we are told that the apparatus employed in manufacture is silver electro-plated, just as the forks and spoons of our every day life are silver plated with the same object in view, viz., cleanliness and non-contamination, our sympathies are still further enlisted. Now let us take the best possible materials and be certain of their absolute purity; to these we will ally an unique delicacy of flavour, a bright and attractive appearance, and the daintiness of manufacture referred to above, and behold now we have the finished product, to wit, Chivers' Gold Medal Table Jellies. These Jellies are easily and quickly prepared by even inexperienced persons—by an intelligent child, in fact. They are brilliantly transparent and daintily appetising. Need we say that children love Chivers' Jellies? Of course they do. And withal the Jellies are nutritious, wholesome, and digestive. Another great advantage in their favour is that they are flavoured, not with some secret chemical concoction, but with rich, ripe, pure fruit juices—Raspberry, Strawberry, Orange, and Lemon. Chivers' Gold Medal Table Jellies are made, not in the tainted air of a London slum, but in the sweet country air of a Cambridgeshire village. Hence their delicacy and daintiness. Messrs. Chivers gained the first prize at the Royal Show, Windsor, for Jams, made from fruit of their own growing.

Chivers' Jellies are sold by Grocers and Stores in packets. Half-pints, 2½d; Pints, 4½d.; Quarts, 8d. A Free sample will be sent on receipt of post-card. Address, S. Chivers & Sons, Histon, Cambridge.

GENUINE SPARKLING WINE.

2/- per Bottle; 1/2 per ½-Bottle.

(BY LONDON AGENTS.)

See THE LANCET, Dec. 4th, 1897:—"As the title of this sparkling beverage would imply, it is made solely from pure grape juice. This is fully confirmed by our analysis, which is not different from the results obtained with many high-class champagnes. ..... It is evidently prepared with the greatest care, or otherwise the delicate fruity and pleasantly acid flavour of the juice of the grape would not have been so successfully retained. ..... It compares favourably in regard to its pleasing qualities with similar sparkling but much more expensive wines."

SALMON'S ABDOMINAL BELT

For use before and after accouchement, and for all cases of abdominal weakness, affords a more complete lifting support than any hitherto made, as it effectually raises the lower part of the abdomen. Air-pads are fitted to it for cases of hernia and prolapsus when required. Prices from 25s. to 50s. Ladies can address to Mrs. SALMON.

HENRY R. SALMON,
42, Beaumont-street, Upper Wimpole-street, London, W.
(ESTABLISHED 1861.)

SALMON'S OBSTETRIC BINDER

For immediate use after accouchement (6s. 6d., 10s. 6d., and 13s. 6d.) is invaluable for preserving the figure, and entirely dispenses with the ordinary pinning. Exhibited before the Obstetrical Society, and recommended by the leading Physician-Accoucheurs. Measurement required, ordinary size of the waist. Each one stamped with name and address; others are imitations.

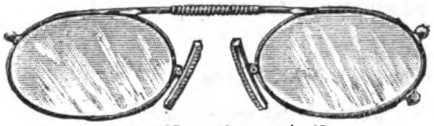
UNIVERSAL TUBULAR WATER AND AIR BED

Prize Medals Sanitary Congress, 1878. Industrial Exhibition York, 1879. Certificate of Honour, Sanitary Congress, 1879.

Brighton, 1881. International, 1881. Kensington, 1882.

POCOCK BROTHERS,
Patentees and Sole Manufacturers,
235, SOUTHWARK BRIDGE ROAD, LONDON.



Consists of a series of separate and distinct cylinders, any diameter and suitable length, made of Waterproof material either for Water or Air, fitting into a case which keeps them side by side, but slightly apart.

1. In cost it is less expensive.
2. It is warm and light, and well adapted for a camp or field-bed, being waterproof.
3. It is quickly filled and easily adjusted.
4. It admits of ventilation in the space between the tubes.
5. It can be regulated so as to relieve pressure from any part required.
6. By the addition of tubes it will raise one part of the body higher than the rest.
7. By the temporary removal of one or two tubes it affords room for the introduction of a bedpan.
8. It can be inclined to any angle (even when filled with water) to suit the condition of the patient.
9. It is free from noise and surging, so disagreeable to the invalid on changing his position on a water bed.
10. In case of injury to the tube it can be withdrawn, and a fresh one substituted at a trifling cost, and without loss of time; whereas the ordinary water-bed, if injured in any part (from being in one compartment), is rendered useless.
11. In the treatment of invalids, especially the insane, who are paralysed and have no control over their evacuations, they cannot lie in a pool of wet, the fluid passing away between the tubes.

ITS ADVANTAGES OVER ORDINARY WATER OR AIR BEDS ARE AS ABOVE.

ROSS'
SPIRAL CLIP

Is the best Horizontal Pince-nez in the Market.

Registered Nos. 248,322 and 268,501.

St. Luke's Hospital, London, E.C.

Established 1751.

This Hospital was established for the Treatment of Mental Diseases of the Middle Classes. Preference is given to acute cases, and these are admitted either gratuitously or on payment of a weekly sum varying from 14s. to 30s., according to the circumstances of each. Patients are eligible for admission from any part of the United Kingdom.

The Convalescent Establishment in connexion with the Hospital is at St. Lawrence, Ramsgate.

Forms of application may be had from, and inquiries addressed to, the Secretary, at the Hospital, Old-street, London, E.C.

Aug. 31st, 1898. W. H. BAIRD, Secretary.

SPRINGFIELD HOUSE PRIVATE ASYLUM, BEDFORD.

For forms of admission, &c., address DAVID BOWER, M.D., as above. (Dr. B. attends at 5, Duchess-street, Portland-place, W., on Tuesdays, from 3 to 4.)

Terms 2½ guineas per week.

There is a vacancy for one Gentleman. Vacancies for Ladies will be announced as they arise.

THE HUGUENOTS,

EAST HILL, WANDSWORTH.

A HOME FOR THE TREATMENT OF LADIES OF UNSOUND MIND.

TWELVE LADIES are received either under certificates or as Voluntary Boarders. The house has large grounds and is healthily situated near several commons. A Mental Specialist visits.

Resident Licensee, Mrs. LEECH.

Grove House, All Stretton, Church

STRETTON, SHROPSHIRE.

A PRIVATE HOME for the Care and Treatment of a limited number of Ladies mentally afflicted. Climate healthy and bracing.

Apply to Mrs. McLintock (widow of the late Dr. McLintock), the Resident Proprietress, or to the Medical Superintendent.

Wye House Asylum, Buxton, Derbyshire,

for the middle and upper classes of BOTH SEXES is beautifully situated in the healthy and bracing climate of the Derbyshire hills, and is directly accessible by the Midland and the London and North-Western Railways.—For terms and other particulars, address the Resident Physician and Proprietor, Dr. F. K. DICKSON.

INEBRIETY, THE MORPHIA HABIT, AND THE ABUSE OF DRUGS.

for the Treatment and Cure of Ladies of the Upper and Higher Middle Classes suffering from the above. Highly successful results. Medical Attendant: Dr. J. St. T. CLARKE, Leicester.—For terms, &c., apply, Mrs. THEOBALD, Tower House, Leicester.

Telegraphic Address: "Theobald, Leicester."

St. Andrew's Hospital for Mental DISEASES.

NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY.

President—The Right Honble. the EARL SPENCER, K.G.

The Institution is pleasantly situated in a healthy locality, one mile from the London and North-Western or Midland lines, and one and a half hour only from London.

It is surrounded by more than 100 acres of pleasure grounds.

Great care is exercised in the classification of the Patients according to their habits and different degrees of mental aberration, so that those who are quiet or convalescent may not associate with those whose minds are more affected.

Ample means of occupation and amusement are provided, including Cricket, Croquet, Lawn Tennis, and Archery. There are also Billiard Rooms, and a large Recreation Hall and Theatre.

The terms vary from 25s. to £4 4s. week, according to the requirements of the case.

Patients paying higher rates can have Special Attendants, Horses, and Carriages; and Private Rooms in the hospital; or in detached villas in the grounds of the hospital; or at Moulton Park, a branch establishment, two miles from the hospital.

There is also a Seaside House, to which Patients may be sent.

For further information apply to the Medical Superintendent.

Warneford Asylum, Oxford.—This

Asylum, for the care and treatment of the Insane of both sexes of the Middle and Upper Classes, is pleasantly situated on Headlington-hill, near Oxford, and has been recently enlarged. The grounds are extensive, and cricket, tennis, billiards, dances, and other amusements are amply provided. There are now vacancies for patients at moderate charges. Voluntary patients can also be received.—For particulars apply to the Medical Superintendent, Dr. NEIL.

NERVOUS & MENTAL AFFECTIONS

The Grove, Catton, near Norwich.—

A quiet HOME for the Special Treatment of a limited number of Ladies suffering from Nervous and Mental Affections. The house stands in beautiful grounds of about ten acres in extent, is situated a mile and a half from the City of Norwich, and contains the most modern requirements and comforts.

Carriage drives and amusements of all kinds are provided for patients. Boarders are also received without certificates.

For further particulars apply to the Resident Physician, CECIL A. F. OSBURNE (formerly Medical Attendant, Grove House Asylum and The Oaks Sanatorium, Hythe); or to the Misses McLintock.

INEBRIETY.

MELBOURNE HOUSE, LEICESTER.

Thirty Years' Experience. Excellent Medical References.
For terms and particulars apply Miss RILEY, or PRINCIPAL.

"PERITEAU."—A Private Asylum for five mentally afflicted Ladies conducted on the system of a private family, with an utter absence of anything that could remind the invalids that they are under care. A special feature of this establishment is the employment of ladies only as attendants, and numerically being one in excess of the patients. Medical Superintendent, E. W. SKINNER, M.D.—Address, Proprietress (Mrs. SKINNER, Senr.), "Periteau," Winchelsea, Sussex. Personal interview from 2 to 3.30 second Wednesday in every month.—33, Wimpole Street, Cavendish Square, W.

WEST MALLING PLACE, KENT, for MENTAL and NERVOUS DISORDERS. An easy distance from LONDON, between SEVENOAKS and MAIDSTONE. A commodious country residence, beautifully situated in a retired position, on its own ample grounds, in one of the healthiest localities in England. It is old-established, reconstructed. Most modern nursing and other requirements; HOME-LIKE. Dr. ADAM, Resident Physician, formerly Physician-Superintendent Crichton Royal and Metropolitan Public Institutions. London address, 64, Welbeck-st., Cavendish-sq., W. (Wednesday mornings). Voluntary boarders received. Teleg. ad.: "Adam, West Malling."

HAYDOCK LODGE, NEWTON-LE-WILLOWS, LANCASHIRE,

Is charmingly situated in a healthy and retired neighbourhood, midway between Liverpool and Manchester, about two miles from Newton-le-Willows Station on the London and North-Western Railway. It is a comfortably-furnished country mansion, especially adapted for the care and treatment of persons of unsound mind. Besides the use of the general sitting-rooms, &c., patients of both sexes can have private apartments and special attendants at moderate rates of payment. *Information as to terms, &c., may be obtained on application to the Resident Medical Superintendent*—CHARLES T. STREET, L.R.C.P.Lond., M.R.C.S.Eng., who attends at 51A. Rodney-street, Liverpool, every Thursday, from 2 to 4.
Telegrams: Street, Ashton-in-Makerfield. Telephone (National) No. 3, Ashton-in-Makerfield.

Salary £50, with board, apartments, and laundry.—Applications, with testimonials (copies) to be sent in on or before July 4th, to F. Henton Carver, Hon. Sec., 5, Rumford-place, Liverpool.

The appointment will be made as soon after this date as possible.

The Guest Hospital, Dudley. — Wanted, a RESIDENT ASSISTANT HOUSE SURGEON. Applications, stating age, with testimonials, will be received from qualified men, or from fourth year students, up to Thursday, June 30th.

Appointment for six months. Salary at the rate of £40 per annum, with board, lodging, and washing in the Hospital.

Applications to be addressed to the Secretary, Guest Hospital, Dudley.

County of Lanark.—District of the MIDDLE WARD.—RESIDENT PHYSICIAN wanted for the Middle Ward Isolation Hospital (100 beds). Salary £140 per annum, with board, &c. Will have medical charge of the patients under the County Medical Officer and be responsible for the general management. Must be duly qualified and registered. One with previous Hospital experience and able to undertake all bacteriological work preferred.

Applications, with copies of testimonials, to be addressed to the subscriber on or before 7th July.

County Buildings, Hamilton, June 22nd, 1898. J. B. FERGUSON, District Clerk.

Royal Halifax Infirmary.—Wanted, a HOUSE SURGEON, who must be unmarried, doubly qualified, and registered. Salary £80 per annum, advancing £10 per year up to £100, with residence, board, and washing.

Particulars of the duties, &c., may be obtained from the undersigned, to whom applications, with copies of testimonials, must be sent not later than Wednesday, June 29th. OATES WEBSTER, Secretary,

Royal Halifax Infirmary, June 14th, 1898.

Wolverhampton and Staffordshire GENERAL HOSPITAL.—The office of ASSISTANT HOUSE SURGEON is now vacant. A qualified man required. The appointment is held for six months, and a small honorarium will be given at the expiration of the term of office. Board, lodging, and washing provided. Testimonials, sealed and addressed to the Chairman of the Medical Committee, must be received not later than the first post on Friday, the 1st July.

By order.

EDWIN A. WHITE,

Wolverhampton, June 7th, 1898. House Governor and Secretary.

Wandsworth (centre).—To be Sold, a Freehold HOUSE, 2 and 3, Church-row, with twenty rooms, coachhouse, stable, and grounds 40 ft. by 197 ft., let on repairing lease, expiring at Christmas, at the low rental of £85, to Dr. Smith. The late Dr. Nicholas carried on a practice there between thirty and forty years. The Executors, desirous of closing their accounts, are willing to accept any reasonable offer if made at once.—Particulars from W. Allder Ridley, Esq., Solicitor, Burgh, Lincolnshire, or Mr. Cooke, 16, Victoria-avenue, Surbiton.

Sutton-Courtenay on Thames.— Most charmingly furnished HOUSE, August and September; eight minutes from river; 4 reception-, 8 bedrooms, bath-room (h. and c.), good offices, stabling, excellent gardens, and tennis lawn. Private landing-stage and garden on one of the loveliest backwaters of the Thames, also let with house. Terms most moderate. Three stations two and a half miles. Photos if desired.—F. C. T., Sutton-Courtenay House, Berks.

To be Let Furnished.—Musselburgh, near Edinburgh, close to the celebrated golf links. The PARSONAGE HOUSE, for July and August; seven rooms and the usual offices and conveniences, and large, well-stocked garden. Stabling and coachhouse if required. Terms moderate.—Apply, Mrs. Kemp at above, or if desired particulars and photograph can be had at 18, Beaumont-street, W.

To be Let, Ground Floor of 3 rooms, viz., fitted surgery, large consulting-room, and third room. Corner house; two entrances. Busy neighbourhood. Low rent.—Apply, Walter R. Aldridge, Auctioneer, 93, Southampton-row, W.C.

To be Let or Sold, situated in main thoroughfare of market and residential town in Shropshire, an old-established DOCTOR'S HOUSE, double-fronted and detached. Contains four reception and seven bedrooms, one of which would be fitted up as bath-room, and house decorated to suit tenant. Garden, stable, coachhouse, &c. Hunting, fishing, and boating in neighbourhood. Early possession. References.—For particulars address Mrs. Oldham, 60, Clarendon-road, Whalley Range, near Manchester.

Mayfair, near Piccadilly.—Large, well-furnished CONSULTING-ROOM with use of waiting-room in private house of University man; bedroom with breakfast if desired.—Address, H. B. C., care of Willing's Advertising Offices, 162, Piccadilly, W.

To Invalids.—A dwarf detached town HOUSE and secluded Grounds (about half an acre). All the rooms and offices are on two floors and all the principal rooms overlook the garden. Good stabling and yard.—Full particulars and cards to view of the agents, Messrs. H. and A. Swain, 26, High-street, Notting-hill-gate, W.

Ground Floor, 11, Princes-street, Cavendish-square, W. Suitable for professional or business men. Manservant. Electric light. Special terms for permanency.—Mrs. Sutton.

Small Holdings for Gentlemen who can appreciate superior surroundings, a high, healthy elevation, and extensive nature pictures. About 40 acres, occupying the very acme of position in the most select of residential districts, adjoining game woods on one side and Hook Golf Common on another. A mile from Hook Station and 4½ from Basingstoke.

Smallest sections, £85 each, calculated at £120 per acre. For larger sections offers are invited.

A purchaser could pay his purchase money at our office, receive a properly filled-up printed conveyance free of law costs, and take possession of his Freehold Land all within two hours.

The Title is from a well-known titled county family.

Not many trains, but sufficient even for a daily City man.

Hunting, shooting and fishing around.

Four small BUNGALOWS being erected for sale.

Dowsett, Knight, & Co., 3, Lincoln's-inn-fields, London.

THE SCHOLASTIC, CLERICAL, & MEDICAL ASSOCIATION, LTD.

MEDICAL DEPARTMENT.

This Association was established in 1880 as a Limited Liability Company under the direction of professional men, its object being the creation of a RESPONSIBLE and THOROUGHLY TRUSTWORTHY Agency. The Medical Department has met with so great success that it has been found necessary for one of the Managing Directors (Mr. G. B. Stocker) to devote his whole attention thereto; and he has the assistance of an experienced Medical Accountant and a large staff of clerks. Further, a Board composed entirely of gentlemen of high standing in the Medical Profession has been appointed, and to them matters of dispute and complaint are referred.

The Association undertakes the SALE of PRACTICES and PARTNERSHIPS; the Introduction of LOCUM TENENS and ASSISTANTS; MEDICAL ACCOUNTANCY (by a duly qualified Medical Accountant); INVESTIGATION and VALUATION of Practices, &c.; POSTING BOOKS and sending out Bills, &c., &c.

A Pamphlet relating to the Medical Department, with the names of the "Directors" and "The Medical Advising Board," and terms, will be sent on application to—MR. G. B. STOCKER,* MANAGING DIRECTOR, 8, LANCASTER PLACE, STRAND, W.C.

Telegraphic Address—"Triform, London." Telephone No. 1854 (Gerrard).

MEDICAL PARTNERSHIP AND CONVEYANCING AGENCY.

1, ADAM-STREET, ADELPHI, W.C.

The SALE of PRACTICES and PARTNERSHIPS NEGOTIATED.

Trustworthy LOCUM TENENS and ASSISTANTS can be had at a few hours' notice.

N.B.—No charge made to Purchasers.

Notice.—Mr. J. C. Needes, with an experience of over a quarter of a century, is in an exceptional position to give intending Purchasers independent information concerning most PRACTICES and PARTNERSHIPS. Those investments in the following List marked with an asterisk are well known to him, having been purchased through his Office by the present Incumbents years ago, and in many other cases an introduction can be given to gentlemen who have taken charge of the Practices during the absence of the Incumbents.

CASH PRACTICE situated in South London and averaging £12 per week. Premium £500. The rent and taxes of the House are only £30 a year and as the other expenses of the practice are very light, the purchase money could be easily saved in a couple of years.

PARTNERSHIP.—South-West of England.—The third share of a rapidly increasing practice situated in a pleasant country town containing nearly 12,000 inhabitants is for negotiation. The earnings of the practice last year amounted to £1200. The connexion includes the élite of the neighbourhood, and there is ample scope for further increasing the practice. Premium for third share £600. Hunting, fishing, shooting, &c.

PARTNERSHIP.—GUARANTEED INCOME.—An active Gentleman is required as Partner in a rapidly increasing PRACTICE, estimated to be worth about £1200 per annum. Situated in an important Town (over (100,000 inhabitants) in the Midland Counties. Appointments yield over £400. Third share for disposal. A minimum income of £400 a year will be guaranteed to the ingoing Partner. Premium two years' purchase.

SOUTH COAST.—In a large favourite Watering-place, a well-established PRACTICE, averaging about £500 per annum, is for negotiation. Appointments yield £60. Visiting fees 2s. 6d. to 7s. Midwifery has not been encouraged. Commodious house. Premium one and a half years' purchase. The incumbent has held the Practice twelve years and will give an efficient introduction.

IN A FLOURISHING NORTHERN TOWN (about 50,000 inhabitants close to the Sea, an old-established PRACTICE yielding about £700 last year is for Disposal owing to the retirement of the Incumbent. Appointments yield £120. Commodious family residence: rent £40 a year. Incumbent has held the Practice a number of years and will give an efficient introduction.

£1000 A YEAR.—The Succession to a good-class old-established country town PRACTICE of the above amount is offered to a married gentleman of age and experience. It is easily worked, the expenses are light, there is good society, and the town is within 100 miles of London. Six or twelve months' partnership introduction given. Personal application if possible.

MODERATE PREMIUM.—A Premium of £300 will be accepted for a well-established and increasing PRACTICE yielding last year over £1000 cash receipts. Situated in a country manufacturing town in Lancashire. Fees 2s. 6d. to 6s. 6d. Seventy cases of midwifery yearly. Convenient house containing two reception-rooms, five bedrooms, bathroom, &c. Horse not required. Books open to every investigation and satisfactory reasons for selling. An introduction of three months (or longer) will be given.

*CASH PRACTICE, easily worked and yielding £775 last year. Situated in a main thoroughfare within a mile of Charing cross. The Practice could be conducted without residence on the part of the principal if a qualified assistant were kept. Premium one year's purchase, to include drugs, fittings, and surgery furniture.

* LONDON, W.—Well-established CASH PRACTICE, yielding £650 a year and increasing. About fifty cases of Midwifery yearly at 1 to 2 guineas. Hours of attendance at the Surgery, 11 till 1 and 7.30 to 9.30. Vendor occupies an excellent family residence (rent £85) within a few hundred yards of the Surgery. An efficient introduction given.

Apply to J. C. NEEDES, 1, Adam-street, Adelphi, W.C.

Assistantship.—A qualified Gentle- man, about twenty-eight years of age, accustomed to good society, required to ASSIST in a first-class Practice in a fashionable watering-place. Duties light. Liberal terms (in-door) to a suitable gentleman.—Apply to J. C. Needes, 1, Adam-street, Adelphi, W.C.

Locum Tenens and Temporary ASSISTANTS.—Practitioners requiring the above can immediately obtain thoroughly reliable qualified Gentlemen upon application to 1, Adam-street, Adelphi, W.C. Every Gentleman engaged by the Office in either of the above capacities is personally known to Mr. J. C. Needes. An office fee of half a guinea is payable by the Principal

Messrs. Peacock & Hadley nego- TIATE the TRANSFER of PRACTICES and PARTNERSHIPS also undertake ARBITRATIONS, INVESTIGATION and VALUATION of Practices and all other business connected with MEDICAL AGENCY and ACCOUNTANCY.

LOCUM TENENS and ASSISTANTS with satisfactory testimonials can be engaged at very short notice.

BOOKS kept, ACCOUNTS made out, and DEBTS promptly collected in Town and Country.

No charge made to Purchasers or for enquiries.

Telegraphic address: "Herbaria, London."

London, S.W.—A high-class, entirely non-dispensing private PRACTICE in a good residential district. Visiting fees from 3s 6d. to 10s. 6d., no midwifery under £5 5s. Large good house, well situated. Receipts last year were £330, but could be easily increased as the vendor has not been able to devote more than a few hours daily to the practice. Premium £500. A thorough introduction, as long as desired, will be given.

London Suburb, Essex.—A well- established steadily increasing PRACTICE, worth about £500 a year. Surgery fees, 1s and upwards; Visits, 2s. and 2s. 6d.; Midwifery, 21s. Convenient corner house, with stabling; rent £35. No horse necessary. Vendor selling on account of illness. Premium £600 and a good introduction given.

Yorkshire.—West Riding. Small Town. PRACTICE to be sold immediately. Receipts without midwifery or night-work, which the vendor has not undertaken, are about £500 a year, including an appointment of £40. Opposition slight. Good residence with stabling, rent £35. Serious accident cause of selling. Premium £300 cash.

Western County.—A small country PRACTICE capable of being greatly increased, situated in a beautiful district. The cash receipts are about £250 a year; good fees. Nearest resident opponent is four miles distant. Convenient house, with good garden, stabling, and orchard; rent £36. Vendor having succeeded to a larger practice is desirous of selling at once and will accept £250 from a prompt purchaser.

Convalescent and Nursing Home for sale. Situated within 12 miles of London. Established seven years. Yearly Receipts are over £1600, and the nett profits are about £400. Large good house with about four acres of ground, admirably suited for the purpose. Premium for good will, furniture, fixtures, &c., £1200. This would suit a doctor and his wife or two nurses.

South Coast.—A good-class, well- established NUCLEUS in a popular watering-place. Receipts last year £350, visiting fees 2s. 6d. to 10s. 6d., partly non-dispensing. Good house, well-situated, rent £70, suitable for resident patients. Premium £400.

Liverpool. — Cash Practice.— Receipts for 1897 were £450, under management of an Assistant, but were previously £800 a year. Visiting fees 2s. 6d. upwards; no Midwifery under 21s. In order to effect an immediate transfer a very small premium will be accepted and payable by easy instalments.

Cash Practice. — Old-established. Situated in a populous district of London. Receipts average about £700 a year, and if actively worked could be considerably increased. Rent of house £60. Premium, to include drugs and fittings, £600; and if desired three months' introduction will be given.

Wales.—In a beautiful Country District, an old-established PRACTICE, held by vendor twelve years. Receipts, including transferable club appointments, are about £850 per annum. Visiting fees 2s. 6d. to 10s. 6d.; midwifery 21s. upwards. Good house, garden, and stabling. Rent under £30. Premium £400, and a good introduction will be given. One horse required.

Partnership.—London, S.E. — Cash PRACTICE, established and held by present owner five years. The annual receipts are about £650, but with the aid of an active Partner could be increased. Surgery fees from 1s. upwards, midwifery from 15s. to 21s. The house could be shared by the partners, or another house obtained in the neighbourhood. Premium for half-share £450, or the whole practice could be bought if desired.

Locum Tenens promptly provided. Several reliable, well-qualified gentlemen have been selected and are available at short notice.

Apply to PEACOCK & HADLEY, 19, Craven-street, Strand, W.C.

Mr. MORRIS, F.S.A.A., 8, Lancaster-place, W.C.

To Purchasers of Practices.—Before concluding arrangements the books should be examined and the numerous necessary inquiries as to bonâ-fides made by a Medical Accountant specially versed in such matters. With twenty years' experience and special facilities for making such inquiries Mr. Percival Turner will be happy to act for purchasers at short notice. Terms and full particulars on application, 4, Adam-street, Strand, London, W.C.

MEDICAL TRANSFER AND PARTNERSHIP,
32, Ludgate-hill.
Messrs. Orridge & Co., Medical Transfer Agents, Referees, and Valuers, in offering their services to the Profession, have pleasure in referring to the fact that for ABOUT HALF A CENTURY the name of Mr. ORRIDGE has been known in the advertising columns of the leading medical journals, and that a very large proportion of the Medical Men throughout the kingdom have confided their interests in the adjustment of PARTNERSHIPS and TRANSFERS to their care.
Purchasers who will communicate (confidentially) the NATURE and EXTENT of their wishes regarding investment can be apprised of appropriate opportunities as they occur.
On occasions where ADVICE is required in forming a correct conclusion as to the worth or eligibility of a Practice, Messrs. ORRIDGE & Co. trust that their familiarity with the various contingencies that govern value will be found of considerable service to those by whom they are employed. N.B.—No charge is made to purchasers.

MEDICAL TRANSFER AGENCY (ESTAB. 1860),
168, EUSTON-ROAD, N.W.
Mr. Herbert Needes (son of the late Mrs. Needes, and for more than ten years associated with her in the management of this old Agency) is still carrying on the Business, and will be glad to negotiate the Transfer of PRACTICES and PARTNERSHIPS on the usual terms. No connexion with any other office.
LOCUM TENENS.—Reliable Gentlemen always on the Books.
ASSISTANTS provided free of charge to Principals.
1. WITHIN 10 MILES OF LONDON, in a rapidly increasing locality, a well-established PRACTICE, returning in cash during the past 12 months £350 and capable of considerable extension. Capital house, built for a doctor; rent on lease £50. Premium, with a good introduction, £350.
2. MIDLAND COUNTY.—£1500 a year. Very old-established PRACTICE in a pleasant Country Town with but limited opposition and averaging for the past twenty years from £1300 to £1500 per annum including appointments. An efficient partnership introduction will be given and a premium of £3000 required, which will include a freehold property valued at about £1000. Mr. Needes is personally acquainted with the Vendor.
3. EXCHANGE—A Gentleman practising in a good residential Suburb and earning about £300 a year, with very good scope for increase, is desirous of effecting its Exchange for a Connexion in the Western district of London, or in a Seaside place within reasonable distance.—All details received in confidence by Mr. Herbert Needes.
4. YORKS.—Owing to permanent incapacity an old-established PRACTICE situate in a pleasant district and held by the Vendor sixteen years offers for immediate Sale. Average receipts £500 per annum. Midwifery and night work declined. Capital scope for a man of energy, as the opposition is slight. Good residence and stabling; rent £35. Price to a prompt buyer only £350.
5. UNOPPOSED PRACTICE within 40 miles of London, situate in a pleasant country village, with a population of over 3000 within a mile and a half; nearest resident doctor 4½ miles. Union and club appointments. Convenient cottage residence with garden, rent £18. An energetic man might soon make a good income. Premium £160.
6. LONDON SUBURB, W.—Non-Dispensing NUCLEUS of an old-established connexion, returning about £250 per annum, with good scope for extension. Capital corner house, specially arranged for a doctor, rent on lease only £55. Vendor, who possesses private means and has held possession some years, will give an efficient introduction. Premium £250.
7. LONDON SUBURB.—Very old-established PRACTICE at present returning about £350 a year, including £50 from an appointment. The income was formerly much larger and it is believed an energetic incumbent could considerably extend the connexion. Commanding corner residence on lease. Premium, with an efficient introduction, £500.
8. LOCUM SHASON, 1898.—Mr. Herbert Needes has various Vacancies on his Staff for the above.—Apply personally where possible.
Telegrams: "CURANDUS," LONDON.

Wanted, Practice, Partnership, or suitable opening at home or abroad, by M.D. Lond., aged forty, unmarried. Capital to £6500. An investment of £300 to £800 per annum preferred, but one for a larger amount would receive consideration.—Address, No. 312, THE LANCET Office, 423, Strand, W.C.

A Medical Man of 21 years' standing, having sold his Practice in London in consequence of his wife's ill-health, is desirous of purchasing a small PRACTICE or Partnership with a view to succession, in a Hill District, with dry climate.—Address, No. 325, THE LANCET Office, 423, Strand, W.C.

Practice wanted, Town or Country. Unopposed Country Practice preferred, but any good offer of Practice or Partnership entertained. Income of £400 or more desired. —Address, No. 328, THE LANCET Office, 423, Strand, W.C.

Wanted, by M.B. and C.M., a good-class PRACTICE or PARTNERSHIP in a large country town. Advertiser is experienced in hospital and private practice. A preference given to the Midlands.—Address, No. 331, THE LANCET Office, 423, Strand, W.C.

Wanted, a Practice, with house, or Partnership with view to succession, in Newcastle-on-Tyne. Purchaser is experienced and has the necessary capital.—Address, No. 335, THE LANCET Office, 423, Strand, W.C.

Wanted, by M.B., B.C.Cantab., a good-class PRACTICE in large Country Town or Seaside within easy access of London. Good house and garden essential. Advertiser is married, experienced, and has ample capital.—Address, No. 259, THE LANCET Office, 423, Strand, W.C.

Required, an active, energetic Widower or Bachelor with some means to help to make a General Practice in one of the best parts of the West-end. House, furniture, and servant provided; all taxes paid Divide fees. Board and residence 2 guineas a week; no other expense. Suit a practitioner reading for a degree. One with connexions in Kensington or Bayswater preferred.—For an appointment address No. 307, THE LANCET Office, 423, Strand, W.C.

Partner wanted after a few months' Assistancy, in a good increasing general Practice of about £1400 a year, within two hours of London in a good residential town. One-third Share will be offered on usual terms. Partner must be experienced and a graduate preferred. Every investigation.—Address, No. 338, THE LANCET Office, 423, Strand, W.C.

For Sale, an unopposed Country PRACTICE, doing over £300 per annum. Appointments about £160. Price, to include drugs, £350.—For particulars, address No. 280, THE LANCET Office, 423, Strand, W.C.

Valuable Nucleus, Cheap.—In the rising neighbourhood of Highgate, London, N., a Branch SURGERY, with Furniture, for Disposal. Rent only on lease 10s. per week. A bachelor could live on the premises or have apartments near. A splendid opportunity for developing a Practice. Neglected by the present principal. The parent Practice can be sold by arrangement, vendor retiring.—Apply by letter, A. W. Knox & Company, 22, Eldon-street, Broad-street, City, London.

For Sale, Nucleus of Practice in Western Suburb of London. House furnished or unfurnished; no horse required. Small premium; satisfactory reason for disposal.—Apply, Livingston and Dickson, W.S., 54, Queen-street, Edinburgh.

North Wales.—A well-established COUNTRY PRACTICE is for immediate disposal owing to family reasons. Receipts last twelve months £360, but as population is increasing rapidly there is room for increase. Rent £35 and all other expenses very light. Premium £325.—Address, No. 322, THE LANCET Office, 423, Strand, W.C.

Practice for Disposal near Oxford-street. The owner being obliged to relinquish practice is willing to accept £110 for the goodwill. Receipts are now at the rate of £15 per month, but have been much greater. Fees at surgery 1s. and upwards; Visits 2s. 6d. and 3s. 6d.; Midwifery 21s., mostly ready-money. Expenses light.—Address, No. 321, THE LANCET Office, 423, Strand, W.C.

Death Vacancy.—Manchester.—An old-established PRACTICE in a good suburb. Receipts about £350 a year; formerly much more. Small house; rent £25. Fees at Surgery 1s. and upwards, medicine extra. An energetic man would soon increase the Practice. Premium £200.—Address, No. 423, THE LANCET Office, 423, Strand, W.C.

A General Practice of nearly £300 a year, thoroughly genuine and capable of considerable increase, is to be sold. Locality—a residential suburb in Essex. Premium £250 or reasonable offer—Address, No. 308, THE LANCET Office, 423, Strand, W.C.

For Sale.—A Nucleus in populous country district within twenty miles of London. Established seventeen months. Receipts for last twelve months £150, including £50 from transferable clubs. Premium £50, including fixtures and drugs.—Address, No. 330, THE LANCET Office, 423, Strand, W.C.

First-class Nucleus on borders of W. and N.W. districts for disposal at once. Vendor leaving London. Only moderate sum asked. Excellent corner house and garden. Exceptionable opportunity and suitable for young practitioner with some capital.—Haste, care of Wilson and Co., 26, Charles-street, Pall Mall, S.W.

A Bargain.—Dispensary Practice, together with Drugs and all necessary Furniture, for Sale. Well established. Thorough investigation offered. As incumbent wishes to leave at once the price asked is only £125. Only those intending prompt interview are requested to apply.—Address, No. 332, THE LANCET Office, 423, Strand, W.C.

West-end Practice for Disposal.—A general PRACTICE returning £700 to £800 a year for Sale, with partnership introduction. No appointments. Fees 1s. 6d. to 10s. 6d. Midwifery 25s. to 105s. Corner house in excellent position. Every investigation. Patients all classes, none very poor. Premium £1100.—Address, No. 337, THE LANCET Office, 423, Strand, W.C.

Qualified Assistant in busy London Practice. Abstainer preferred. £100, in-door, with increase to suitable man. Dispenser kept.—Address, No. 318, THE LANCET Office, 423, Strand, W.C.

Advertiser, 5 years' experience, desires ASSISTANTSHIP, with view to leading to something better, in a high or middle-class Practice in London or suburbs. Age about thirty; excellently received; well up and tactical. Interview and references. No agents.—Address, No. 315, THE LANCET Office, 423, Strand, W.C.

Advertiser—in practice 30 years, now recovered protracted influenza, married—wants ASSISTANCY (or Locum). Small house, good and progressive salary. Little night work. Or would take charge of Institution or School or accompany patient to Cape.—Address, No. 317, THE LANCET Office, 423, Strand, W.C.

An M.R.C.S. Eng., L.R.C.P. Lond., aged thirty-five, desires an ENGAGEMENT from Sept. 29th. Terms: Board and lodging or an equivalent for self, wife, and child, and £60 a year. Testimonials as required.—Address, No. 258, THE LANCET Office, 423, Strand, W.C.

The Medical Officer of Health for a large town can take a PUPIL. Must be qualified. Term six months.—Full particulars on application to No. 210, THE LANCET Office, 423, Strand, W.C.

Assistants and Medical Men failing to obtain what they require should apply to ADAMS & PARKES (B.A. Cantab.), Medical Agents, 8, John-street, Adelphi, Strand. Telegraphic address: "Interjoin, London." No charges are made for unsuccessful service.

Qualified Assistant wanted at the end of July in South-West Yorkshire, to Visit, Dispense and help with the Books. Salary £80. Indoor. Enclose photo. Izal, care of Messrs. Woolley, Sons, and Co., Limited, Victoria Bridge, Manchester.

North of England.—Wanted, an ASSISTANT, with a view to immediate Partnership. To work a Branch Practice. The present terms would be at the rate of £70 yearly and half profits above that sum. This place is in a pleasant and rapidly rising district and to a suitable gentleman an immediate chance of doing well is offered.—Address, No. 311, THE LANCET Office, 423, Strand, W.C.

To a thoroughly qualified Gentle- man who wishes a Holiday on the South Coast board and residence is offered in exchange for services, which are exceptionally light, during principal's absence. Good golf, bathing, &c. Time last fortnight in July.—Address, No. 310, THE LANCET Office, 423, Strand, W.C.

To Medical Men requiring relaxa- tion, &c.—A thoroughly experienced Practitioner, L.R.C.P. Lond., &c., having sold large practice and now reading for higher qualification, is willing to give a brother practitioner a certain amount of HELP in return for comfortable quarters for himself and wife. A man can thus be relieved from the monotony of never going out without losing patients, and can refresh his mind for work by visiting his friends, the theatre, &c. in comfort. The neighbourhood must be respectable and within easy reach of Strand. Advertiser is strictly temperate, reliable, and honourable, aged thirty-seven, of good appearance and address, and used to good-class practice.—Address, No. 336, THE LANCET Office, 423, Strand, W.C.

Locum Tenens now disengaged.—An experienced Locum Tenens can be despatched at short notice on application to Mr. Percival Turner, who has organised a large staff of trustworthy gentlemen personally known to him. Fees from £3 3s. a week. No office fee charged to Principal.—Apply, Percival Turner, 4, Adam-street, Adelphi, London, W.C.
Telegraphic address—Epeomian, London.

Locum Tenens supplied on short notice. Apply to G. B. Stocker, Esq., Secretary, Medical &c. Assn., Ld., 8, Lancaster-place, Strand, W.C. The rule of the Association is that no Assistant or Locum Tenens shall be recommended till direct inquiries have been made as to his antecedents. Names of the Committee of Management and Medical Advising Board and descriptive pamphlet on application.—Telegraphic Address: "Triform, London." Telephone 1854 Gerrard.

PERFECTION OF SCOTCH WHISKEY.

For a long series of years we have devoted much attention to the selection of the finest of Scotch Whiskies and to their thorough maturing, as these, when skilfully blended, produce a **Liqueur** which is at once

PURE, DELICATE, and HEALTHFUL.

In the knowledge of its perfect purity, we with unfaltering confidence recommend it to all who are in search of a pleasing and wholesome stimulant.

THE LANCET, after analysing our whiskey, said:—

"It is excellent in every respect, smooth in taste and delicate in flavour."

Price FORTY-ONE SHILLINGS per DOZEN,

Inclusive of Bottles and Case, and Carriage paid to any Railway Station in England in quantities of Two Dozen.

A SAMPLE WILL BE SENT PER POST ON RECEIPT OF SIX STAMPS.

DOUGLAS & MASON,

DISTILLERS & WINE MERCHANTS, EDINBURGH.

THERE are two **distinct Springs**; the LEVICO **Mild**, and one much richer, both in Arsenious Acid and in Iron, obtained from the well, the LEVICO **Strong.** These waters are bottled without dilution as they issue from the two springs, and do not undergo any process whatever.

USES.

LEVICO Water, from its unique arsenio-ferric composition, is indicated in all cases where the administration of Arsenic in combination with Iron is required; that is to say, in all diseases which owe their origin to the unhealthy state of the Blood, **Scrofula, Anæmia, Chlorosis, Catamenia, Chorea, Phthisis, Syphilis, Chronic Skin Diseases, Neuralgia, Hysteria, Ague, and Malarial Fevers, &c.**

Price **1/8** *per Bottle.*

LEVICO. **The Best and Richest Arsenio-Ferric Natural Water.** From the South of Tyrol, Austria.

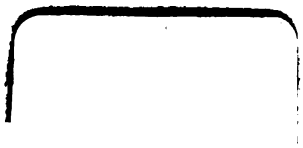
Children and Convalescents, as well as the aged, are able to take it without the occurrence of any unpleasant symptoms, so that it is peculiarly well suited for **chronic cases.**

LEVICO WATER, Mild and Strong, is sold in Great Britain and the Colonies with an English Label, giving the full address of the Sole Consignees—

A. & M. ZIMMERMANN, 9 & 10, ST. MARY-AT-HILL, LONDON, E.C.

Kindly note that any other Label, not in English and without this address, is not permitted to be sold in this country or its Colonies.

FREE SAMPLES TO THE MEDICAL PROFESSION ON APPLICATION.



PRINTED and PUBLISHED by the REGISTERED PROPRIETORS, at No. 423, Strand, and Nos 1 and 2, Bedford-street, adjoining, in the Parish of St. Martin-in-the-Fields, Westminster, in the County of London, and sold by all Booksellers and Newsvendors in Great Britain and Ireland and the Colonies.—Saturday, June 25th, 1898.
